ACKNOWLEDGEMENT OF ASSISTANCE

All manuscripts utilizing data made available through the Consortium should acknowledge that fact as well as identify the original collector of the data. The ICPSR Council urges all users of the ICPSR data facilities to follow some adaptation of this statement with the parentheses indicating items to be filled in appropriately or deleted by the individual user.

The data (and tabulations) utilized in this (publication) were made available (in part) by the Inter-university Consortium for Political and Social Research. The data for JUVENILE DELINQUENCY AND ADULT CRIME, 1948-1977 [RACINE, WISCONSIN]: THREE BIRTH COHORTS were originally collected by Lyle W. Shannon of the Iowa Urban Community Research Center. Neither the collector of the original data nor the Consortium bear any responsibility for the analyses or interpretations presented here.

In order to provide funding agencies with essential information about the use of archival resources and to facilitate the exchange of information about ICPSR participants' research activities, each user of the ICPSR data facilities is expected to send two copies of each completed manuscript or thesis abstract to the Consortium. Please indicate in the cover letter which data were used.

INTRODUCTION

STUDY DESCRIPTION

The Juvenile Delinquency and Adult Crime, 1948-1977 [Racine, Wisconsin]: Three Birth Cohorts dataset was funded by two agencies, the National Institute for Juvenile Justice and Delinquency Prevention, U.S. Department of Justice, and the Max C. Fleishmann Foundation. This study contains data on juvenile delinquency and adult crime for three birth cohorts, 1942, 1949, and 1955, in Racine, Wisconsin.

There are three types of files; 1) the individual level file "police contact" data for all three cohorts, 2) individual-level interview and contact data for 1942 and 1949 cohorts, and 3) individual-level contact data classified by age for all three cohorts, "Age-by-Age" data. The data are contained in eight files.

DATA COLLECTION DESCRIPTION

The individual-level contact data sets, referred to as the "police contact data," contain equivalent data for all three cohorts. The data consist of the type and frequency of police contacts by individuals as well as the date, location, and contact number (e.g., first contact) among other things. Individual cohort members are the units of analysis.

The interview datasets contain data on police contacts as well as a number of variables measured during personal interviews with a sample of the 1942 and 1949 cohorts. The interview variables include retrospective measures of the respondent's perception of his or her past police contacts, attitudes toward the police, and a variety of other variables such as socioeconomic status and age at marriage.

The "age-by-age" dataset contains juvenile court and police contact data classified by age. The data are organized into three equivalent datasets, one for each cohort, and the individual cohort member is the unit of analysis. In contrast to the cohort data, however, the police contact data are organized according to the age of the cohort member at the time of the contact(s). Thus, variables have been constructed which measure and summarize the number, type(s), and seriousness of contacts at a given age. These datasets also contain detailed data on the type(s) of disposition(s) received by cohort members at various ages.

METHODOLOGY

Cohort Selection

The availability of data placed some limitation on which birth cohorts could be selected for longitudinal analysis. Since police records in Racine were well established by 1950 (when persons born in 1942 were 8 years of age) and other records that could be utilized in selection of the cohorts existed for a 1942 birth year at the earliest, this group was selected as insurance against the reasonable criticism that could be directed against a single cohort's representativeness. The choice of 1949 as a birth year was made because these persons would have at least 4 years in which to establish an adult record of police contacts, subsequent referrals, and court dispositions prior to the original date for data collection cut-off (May 31, 1974). During the period in which preparations were being made for coding the police contact data, interested community leaders approached the principal investigator with regard to the possibility of selecting a still younger cohort. In response to their interest, the birth year of 1955 was selected for a third cohort. By the cut-off date in 1974 these persons would have reached (and passed) the age of 18. When a shortage of funds prevented complete data collection on this group in 1974 the project staff suspended work on the 1955 Cohort. Later funding not only allowed completion of the police contact data collection but extension of the cut-off date to September 1, 1977, giving us over three and a half years of the adult (18+) experiences as well as their juvenile experiences.

Each cohort was identified as White, Black, or Chicano. The source of names and birth dates also provided an indicator of race/ethnicity and sex, which was checked against knowledge of the community as well as against other available sources of such information, such as blood tests for marriage and siblings who could be identified. The U.S. Census for 1960 reported that 4.3% of the persons enrolled in high school in Racine's urbanized area were non-Whites. The 1942 Cohort was 3.6% Black. This is about what one would expect since they were 18 years of age in 1960 and therefore did not have quite as large a proportion of non-Whites as did younger cohorts still in high school. The 1949 Cohort was 6.3% Black. They were 11 years of age in 1960 and at that time 6.35% of the students enrolled in

Racine's elementary schools were non-White. The 1955 Cohort was 11 years of age at the time of selection from 1966 records; 8.8% were Black and 3.8% were Chicano. This represents more than twice the percentage of Blacks as in the 1949 Cohort but less than 12.6% Black and 4.7% Chicano composition of elementary school children according to the 1970 Census. Since non-White percentage of the school population was increasing each year, it was not expected that the 1955 Cohort was to have as large a proportion of minority group members at the age of 11 as did the younger elementary school population by 1970. The increase in Blacks and Chicanos in the 1955 Cohort over the 1949 Cohort suggested that the identification was probably very accurate. Interviews from the 1942 and 1949 Cohorts confirmed this because only two or three errors in identification had been made in each group.

Data Collection

The length of time each member of each cohort resided in the community was determined in order to identify those with partial vs. continuous residence. This facilitated dealing with the problem of mortality, except that the principal investigator was also concerned with those who entered the system later than their birth date (for all practical purposes later than age 6), those who left Racine before the age of 18, and those who left before the data collection cut-off date for their cohort. A set of Racine City Directories for 1947 through 1974 was used as was telephone directories from the Wisconsin Bell Telephone Company for the period covered by the study for Racine, Kenosha, and surrounding areas. Each person's residence duration was coded for the years age 6 through 1976.

The location and verification process was continued in Racine during the interview phase for anyone in the 1942 and 1949 Cohorts whose presence had not been established by other means available in Iowa City.

Police Contact Data

Juvenile and adult complaint information from the files of the Juvenile Bureau and the Records Division of the Racine Police Department were read and coded on a series of forms under the supervision of the Center's field director. Reasons for police contact were coded into 26 basic categories consistent with Part I and Part II Offenses of the Uniform Crime Reports, but with added

meaningful "conditions" for juveniles. Many of these contacts were for very minor violations, or for Suspicion, investigation, or information, or Traffic violations, yet if the record was to be complete it was necessary to code these as thoroughly as the more serious contacts were coded.

During the police contact coding operation, the address at which the cohort member lived at the time of each contact and the address at which the contact occurred were coded according to a block numbering system established by the U.S. Census in 1970. To each Census block number was assigned Cartesian coordinates so that addresses of cohort members at date of contact and places of contact could be computer mapped by any other variables collected from the official files or the interviews which were conducted with almost 50% of those with continuous residence from the 1942 and 1949 Cohorts. These in turn may be located in their appropriate ecological or natural area for either 1960 or 1970, thus making it possible to create visual representations of the distribution of police contacts by place of residence or place of contact according to type of contact, age of person, sex of person, race/ethnicity of person, etc.

The coding scheme also enables use of the age of the individual at each contact and the date of each contact, and permits determination of whether contacts occur in rapid succession with only a few days between them or whether they are spaced out over the entire span of years in which contacts occurred. Each date of disposition by police has also been coded so that one can determine if there are multiple contacts soon after the individual has been dealt with by authorities in one manner or another or if attempts to control by the authorities result in considerable time lapse before that person has another contact with authorities.

The Age-by-Age Data

Juvenile court and adult arrest records were also read and coded for all persons with continuous residence whose records of police contact indicated a referral. In some cases, dispositions were found where there was no record of a police contact, and were usually the result of school or agency action. When this occurred, the incident was included in that age's record of incidents. Since this operation occurred subsequent to the original police contact coding operation, the number of contacts in the age-by-age data sets is sometimes slightly larger for a given

individual than in the police contact data sets (each type of data set is described later in this codebook).

In coding dispositions for juveniles, only those dispositions arising from juvenile misconduct were included. For instance, changes in custody arising from problems within the family and not originating with the child were not considered part of the dispositions history. Once it had been determined that records of arrest dispositions in various courts were complete, these were re-coded as indicators of the severity of sanctions. These sanctions data became part of the age-by-age data sets.

FILE STRUCTURE

Juvenile Delinquency and Adult Crime, 1948-1977 [Racine, Wisconsin]: Three Birth Cohorts is available from the ICPSR in two formats: card image and OSIRIS. The card image file contains several decks per case in a format based on 80 column punched cards. The data are sorted by case with all decks for a case together in ascending order.

The OSIRIS dictionary gives the format and other information for each variable in the OSIRIS data file. The dictionary or dictionary-codebook file is used in conjunction with the OSIRIS software package. The OSIRIS data file is constructed with a single logical record for each case.

The OSIRIS data file can be accessed directly through software packages or programs which do not use the OSIRIS dictionary by specifying the tape locations of the desired variables. These tape locations are given in the OSIRIS dictionary-codebook.

CODEBOOK INFORMATION

The example below is a reproduction of information appearing in the machine-readable codebook for a typical variable. The numbers in brackets do not appear but are references to the descriptions which follow this example.

- 2. Females Only
- 3. Mixed

- 9. NA
 - 0. Inap.
-

- [1] Indicates the variable and reference numbers. A variable number and a reference number are assigned to each variable in the data collection. In the present codebook which documents the archived data collection these numbers are identical. Should the data be subsetted or rearranged by an OSIRIS program (e.g., MMP to intersperse data from another source, or TCOT to produce an analysis deck), the variable numbers would change to reflect the order of the new data collection, while the reference number would remain unchanged to reflect the variable number in the codebook describing the archived data collection.
- [2] Indicates the abbreviated variable name (maximum of 24 characters) used in the OSIRIS system to identify the variable for the user. An expanded version of the variable name can be found in the variable description list.
- [3] Indicates the code values of missing data. In this example, code values equal to 0 or greater than or equal to 9 are missing data (MD=0 OR GE 9). Alternative statements for other variables are "MD=8," "MD GE 999," or "NO MISSING DATA CODES." Some analysis software packages (including the OSIRIS software package) require that certain types of data which the user desires to be excluded from analysis be designated as "MISSING DATA," e.g., inappropriate, unascertained, unascertainable, or ambiguous data categories. Although these codes are defined as missing data categories, this does not mean that the user should not or cannot use them in a substantive role if so desired.
- [4] Indicates the starting location and width of this variable when the data are stored on a magnetic tape in the OSIRIS format. If the variable is of a multiple-response type, the width referenced is that of a single response. In this example the variable named "SEX COMP OF GRP, 1ST C" is 1 column wide and is located in the 86th column within the record.
- [5] Indicates the location by deck and column of this variable when the data are stored on cards or in card-image format (80-column format).

- [6] A variable containing data with implied decimals is denoted by the message "IMP DEC= --," where -- is the number of decimal places implied in the variable. There are no variables with implied decimal places in this codebook.
- [7] This is the full text (question) supplied by the investigator to describe the variable. The question text and the numbers and letters that may appear at the beginning reflect the original wording of the questionnaire item.
- [8] Indicates an additional comment or explanation appended to the variable description.
- [9] A variable which has a footnote associated with it is denoted by the message, "See Appendix --" where -- is the number of the footnote referenced.
- [10] "Actual number is coded" appears in the codebook to indicate that the variable has been declared continuous.
- [11] Indicates the frequency of occurrence of each code value for this variable. Frequencies are not included in this codebook.
- [12] Indicates the code values occurring in the data for this variable.
- [13] Indicates the textual definitions of the codes. Abbreviations commonly used in the code definitions are "DK" (Do Not Know), "NA" (Not Ascertained), and "Inap." (Inappropriate).

ICPSR PROCESSING INFORMATION

The data collection was processed according to the standard ICPSR processing procedures. The data were checked for illegal or inconsistent code values which, when found, were recoded to OSIRIS missing data values. No consistency checks were performed. Statements bracketed in "[" and "]" signs in the body of the codebook were added by the processors for explanatory purposes.

- [6] A variable containing data with implied decimals is denoted by the message "IMP DEC= --," where -- is the number of decimal places implied in the variable. There are no variables with implied decimal places in this codebook.
- [7] This is the full text (question) supplied by the investigator to describe the variable. The question text and the numbers and letters that may appear at the beginning reflect the original wording of the questionnaire item.
- [8] Indicates an additional comment or explanation appended to the variable description.
- [9] A variable which has a footnote associated with it is denoted by the message, "See Appendix --" where -- is the number of the footnote referenced.
- [10] "Actual number is coded" appears in the codebook to indicate that the variable has been declared continuous.
- [11] Indicates the frequency of occurrence of each code value for this variable. Frequencies are not included in this codebook.
- [12] Indicates the code values occurring in the data for this variable.
- [13] Indicates the textual definitions of the codes. Abbreviations commonly used in the code definitions are "DK" (Do Not Know), "NA" (Not Ascertained), and "Inap." (Inappropriate).

APPENDIX 1

DETAILED NATURAL AREA CODES

The natural area codes (range 1-26) represent a rank ordering of various areas of Racine in terms of their average census block characteristics. A rank of 1 represents an area with low socioeconomic status and a rank of 26 represents an area with high socioeconomic status. This rank ordering is based mainly on geometric scores which reflect each block's characteristics as described below. In a few cases, the average geometric score for an area was based on very few blocks and appeared to be too extreme. In these cases, the rank assigned to an area was based on its average factor score which was considered to be more representative of the area's actual rank. The block characteristics used to obtain the geometric scores and the factor scores are (1) average dollar value of owner-occupied housing, (2) average contract rent, (3) percent lacking some or all plumbing, (4) percent units renter-occupied, and (5) percent units overcrowded (1.01 or more persons per room). The block characteristics are taken from the U.S. Census of Housing. The analysis which resulted in the assignment of geometric scores and factor scores is reported in "The Ecological Distribution of Negroes in Racine, Wisconsin 1960-1970" by Lyle W. Shannon, John R. Faine, and Judith L. McKim which is available in mimeo from Iowa Urban Community Research Center; University of Iowa; Iowa City, Iowa 52242.

As applied to the cohort delinquency study, the natural area codes provide an aggregate-level measure of the socioeconomic characteristics of the area(s) in which the cohort member lived during the ages 6-17, or for any time at which a member of the cohort had a police contact. Each cohort member's residence during the juvenile period was traced as far as possible. Those individuals whose residence could not be determined for more than three years are considered to be "not continuous residence" and generally are not included in most of our analyses. Other researchers, however, may wish to employ a different definition of continuous residence.

Natural area codes 1 through 26 indicate that the cohort member lived in one area during ages 6-17. Codes 30-60 indicate that the cohort member lived in more than one

natural area. These combination codes are presented below in terms of groups of areas to simplify the presentation. The groups consist of areas with similar characteristics. Codes 61-99 indicate areas outside Racine with 99 - not ascertained.

Group A = Areas 1 and 2
 Group B = Areas 3 through 8
 Group C = Areas 9 through 14
 Group D = Areas 15 through 19
 Group E = Areas 20 through 26

Code	Area Group(s)	Code	Area Group(s)	Code	Area Group(s)
30	A	40	B+D	50	B+C+D
31	B	41	B+E	51	B+C+E
32	C	42	C+D	52	B+D+E
33	D	43	C+E	53	C+D+E
34	E	44	D+E	54	A+B+C+D
35	A+B	45	A+B+C	55	A+B+C+D+E
36	A+C	46	A+B+D	56	A+C+D+E
37	A+D	47	A+B+E	57	B+C+D+E
38	A+E	48	A+C+D	58	A+B+C+D+E
39	B+C	49	A+D+E	59	A+B+C+E
				60	A+C+E

The recoding schemes for the combination codes (30-60) that were used by the PI are described below.

Natural Area Recodes

The codes for the individual natural areas (1 through 26) yield a rank ordering of individual areas. However, using these codes and the associated area combination codes in an analysis requires some data manipulation. The procedure used depends on the type of analysis involved. For tabular analyses, the codes need to be collapsed and integrated in a meaningful way. For correlational analyses, the combination codes need to be assigned a value consistent with the rank ordering of individual areas whether or not one wishes to treat the scores as ordinal or interval data. Regardless of the procedure used, however, no quantitative measures for areas outside Racine are currently available. Although we cannot foresee the specific needs of other researchers, the following recodes are based on long experience with quantifying the ecological characteristics of Racine in a

(CONTINUED)

meaningful and useful manner.

1. Suggested Natural Area Recodes for Tabular Analysis

We have used two methods to simplify the classification of natural areas. In the first method, natural areas are grouped into five categories. The second method involves dichotomizing the natural area codes.

Five-Category Classification of Natural Areas

- 1 = Codes 1, 2, and 30 (Inner City)
- 2 = Codes 3 through 8, and 31 (Interstitial Areas)
- 3 = Codes 9 through 14, and 32
- 4 = Codes 15 through 19, and 33
- 5 = Codes 20 through 26, and 34

Combination codes which cut across the five areas may be treated as a residual category or excluded from the analysis.

Two-Category Classification of Natural Areas

- 1 = Codes 1, 2, 3 through 8, 30, 31, and 35 (Inner City and Interstitial Areas)
- 2 = Codes 9 through 26, 32, 33, 34, 42, 43, 44, and 53

Combination codes which cut across the two areas may be treated as a residual category or excluded from the analysis.

2. Suggested Natural Area Recodes for Correlational Analysis.

This procedure assigns an average rank score to combination codes. Thus, cohort members who lived in different areas may be assigned a value which reflects the average rank of the areas they lived in during ages 6-17. The only individuals excluded in this procedure are those for whom no natural area rank was assigned in the first place, generally those living outside Racine.

APPENDIX 2

COMPUTING AGE AT FIRST CONTACT

Age at first contact is not currently included in the age-by-age data sets. The following procedure describes how this variable may be computed from other variables now in the data sets. The procedure yields a variable which measures the cohort member's age at first contact as actual age. Those individuals who have never had a contact may be excluded from the analysis or assigned an age at first contact equal to the age next higher than the one being used in the analysis. For example, if the analysis includes data on police contacts for ages 6 through 31 in the 1942 Cohort, those with no contact may be assigned an age at first contact of 32. This procedure is somewhat arbitrary but has worked well in our own correlational analyses. For other types of analyses, it will generally not be necessary to recode this variable. The procedure is as follows:

- (1) For age commencing at age 7, compute a new variable which equals zero if the number of contacts prior to a given age (NCPRE) is zero or actual age (AGE) if the number of contacts is not equal to zero.
- (2) Compute a new variable which equals the sum of all the variables created for each age in step 1. This variable will be set equal to the age at which the first contact occurred since the age variables are a constant for each age and prior contacts are required to be zero.
- (3) An example using the DO REPEAT feature is SPSS:

```
DO REPEAT  XAGE=AGE7,...,AGEN
           XPRIOR=NCPRE7,...,NCPREN
           XPRES=NCPR7,...,NCPRn
           XAGES=AGE7,...,AGEN
COMPUTE   XAGES=0
IF        (XPRIOR EQ 0 AND XPRES GT 0) XAGES=XAGE
END REPEAT
COMPUTE   AGEFC=XAGES7+XAGES8+...+XAGESn
IF        (NCPR6 GT 0) AGEFC=6
RECODE    AGEFC (0=N+1) (optional)
```

Where n=highest age being used in the analysis.

APPENDIX 3

SIX POINT SERIOUSNESS SCALE

The seriousness scale ranges from a low of one to a high of six and is coded as follows:

1. Lowest degree of seriousness
 Contact for suspicion, investigation, information (23).
2. Juvenile status offenses: vagrancy (06), disorderly conduct (05), incorrigible runaway (08), truancy (09).
3. Minor misdemeanor: obscene behavior (24), disorderly conduct (05), vagrancy (06), liquor (07), sex offenses (11), moving traffic offenses (15), other traffic violations (16), gambling (20), family problems (19).
4. Major misdemeanor: escapee (21), theft (04), narcotics and drugs (12), weapons (17), assault (10), fraud (18), violent property destruction (22), burglary (02), forgery (13).
5. Felony against property: burglary (02), theft (03), auto theft (04), forgery (13), fraud (18), violent property destruction (22).
6. Highest degree of seriousness
 Felony against persons: robbery (01), assault (10), sex offenses (11), narcotics and drugs (12), homicide (14), escapee (21), suicide (28).
0. No contacts

APPENDIX 4

DETAILED CODES FOR COURT DISPOSITIONS

Each person with continuous residence (or who was interviewed) in each cohort whose record of police contact indicated a referral for further action became one whose court record was checked for formal juvenile or adult dispositions. Detailed reports of court action for each of these persons were returned to Iowa City for development of a dispositions type scale which was later modified and converted to a severity of sanctions scale.

A staff specializing in age-by-age coding generated a large number of categories representing each unique combination of dispositions for past court appearances, appearances during the present age, and appearances to come in the future. Obviously, this resulted in a completely unuseable number of categories. Frequencies were run and the categories were "collapsed" into 788.

The initial coding was done on a basis of expected categories (sentence suspended, commuted, etc., 20 categories of fines, 11 categories for time in institutions, etc.) which were then combined within each type of category on a basis of degrees of penalties imposed. This collapsing process resulted in a set of basic code categories, which were ranked from least to most severe.

With the data collapsed and the penalty groups rank ordered, the data were converted to a Dispositions Type Geometric Score (GE01) by assigning a code of 1 to a single dismissal, 2 to 2-3 dismissals, 4 to 4-5 dismissals, through 1,048,576 for 1 or more years of institutionalization. The lowest Geometric score involving a sentence of time was 131,072. If the score was 1,048,576 for 1 or more, then the person had been incarcerated for a minimum of one year. This was, of course, a rather unwieldy scoring technique but it did enable us to determine at any time if the Geometric scale score included served jail time of up to one year or served prison sentences of one year or more. Computer runs for dispositions after age 6 enable us to determine the total sanctions ever received by a person.

Having established a scale that might be considered

(CONTINUED)

too unwieldy for preliminary application to the data, we next constructed an abbreviated version by collapsing categories into basic types of dispositions with no indication of degree within categories and assigning each a geometric score. These Geometric scores could range from 1 to 63 for any period of time. Each person's new Dispositions Type Geometric score (GE02) was then recoded, age-by-age, according to this scoring system, and these scores became a part of the data set.

While Geometric scores may be used to generate cross-tabulations, they should not be used in correlational analyses without some transformation technique. A table was constructed showing each combination of sanctions (there were 788 combinations based on the 21 categories in the expanded GE01) from one dismissal (a score of 1) to the most extensive combination of sanctions acquired by anyone in the three cohorts including more than a year in the penitentiary (a score of 1,132,616). Each Geometric score received a rank order (see the initial coding scheme) based on the severity of sanctions which it represented with similar combinations of sanctions combined so that scores now ranged from 0 to 60 (dismissals were recoded to 0 so that a score of 1 represents juvenile supervision). Thus, severity of sanctions during any age period could be correlated with measures of frequency and seriousness of offenses. For example, at age 18 severity of sanctions, past and present for the 1942 Cohort, had a Pearsonian correlation of .34 with number of police contacts in the future and a Somers's D of .65. For the 1949 Cohort the corresponding correlations were .32 and .62, and for the 1955 Cohort they were .40 and .50.

Since dispositions are also coded for accumulated dispositions over time, there are actual codes which fall between or exceed the codes shown here. For example, an individual who has accumulated dispositions which include 6 dismissals, probation less than one year, and a \$100 fine would have GE01 code of 33288 (8+32768+512), a GE02 code of 13 (1+4+8), and a severity of sanctions code of 18 (0+12+6). The actual ranges are GE01, 0-1,132, 616; SDSV, 0-60; and GE02, 0-63. Combination codes for the type of disposition variables (SDAC, SDPR, SDACA) may be obtained from the Iowa Urban Community Research Center.
