## EXECUTIVE SUMMARY

The purpose of the study described in this report was to examine drug-related arrest and client data:

- 1) to determine if trends exist in patterns of illegal drug use in South Carolina,
- 2) to describe the demographic characteristics of the arrest and client populations, and
- 3) to provide more drug-specific information on arrests for drug law violations and client admissions for drug abuse problems than is found in standard reports which are generated from these data.

This study represents the first time this type of analysis has been conducted with arrest and client data. The principal findings are summarized below.

Cocaine use is increasing dramatically in South Carolina; client admissions for cocaine problems increased over 600 percent between 1980 and 1984 and cocaine arrests increased over 300 percent between these years.

Changes in the number of arrests and client admissions associated with marijuana and narcotic drugs appear to be random, indicating relatively stable patterns of use of these drugs.

Between 1980 and 1984, the proportion of individuals age 26 and older increased in both the arrest and client populations for all types of drugs.

Females are found in higher proportions in the client than arrest population; the highest proportion was among clients seeking services for problems with tranquilizers, where females represented over 50 percent of the client population in 1984.

In 1984, almost four times as many individuals sought services for heroin problems than were arrested for heroin violations; blacks represented half of the client population, but almost 90 percent of those arrested.

In 1984, there were 8,308 arrests for marijuana violations but only 2,115 marijuana client admissions. Not only do marijuana arrests far exceed client admissions, only 5 percent of these admissions were

through Drug Diversion, an intervention program established for individuals arrested for certain drug law violations.

Detoxification admissions of drug clients increased significantly between 1980 and 1984, most notably among clients seeking services for problems with cocaine, heroin and other narcotic drugs.

These findings, especially those concerning cocaine and marijuana, have implications for future intervention and treatment programming for drug clients. Persons arrested for drug law violations, for example, are shown to be greatly underrepresented in the client population. It seems only reasonable to conclude that a much higher proportion of these individuals are in need of intervention and treatment services, and further investigation toward developing more effective intervention mechanisms for this target group is needed.

## INTRODUCTION

The purpose of this document is to provide a comparative analysis of arrests for drug law violations and drug client admissions to local alcohol and drug abuse programs. While such data cannot indicate the true extent of drug abuse problems in South Carolina, it may provide some insight into the nature of the problem in the state.

The arrest data presented in this report are from the Uniform Crime Reporting (UCR) System, an incident-based records management system which is maintained by the State Law Enforcement Division. The data base consists of incident records which indicate the type and date of offense as well as the race, sex and age of the offender. When an arrested individual is charged with multiple offenses, only one record is created reflecting the most serious offense. As a result, arrests for drug law violations are underreported in the UCR data base. It is important to recognize that arrest data reflect the level of enforcement activity directed at the illegal possession, sale and manufacturing of drugs as well as the actual level of illegal drug activity.

The client data presented in this report are from the Substance Abuse Agencies Management Information System (SAAMIS). The SAAMIS is a client and personnel management system used by local alcohol and drug abuse programs. This system, which is maintained by the South Carolina Commission on Alcohol and Drug Abuse, contains extensive client demographic and service data. Although this data base does not represent all individuals who seek treatment for drug abuse problems, it is the largest one available to represent this population. It should be noted that the availability of treatment services and the existence of intervention mechanisms, in addition to the extent of drug problems, can be important determinants of the number of admissions to treatment.

## METHOD

Five calendar years (1980-1984) of Uniform Crime Report arrest data were used for this report. All arrest records representing drug law violations during that time period were included. Both yearly and quarterly arrest totals were calculated from this data for the following drugs or drug categories:

Heroin

Other Opiates and Synthetics (includes all narcotic drugs except heroin)

Cocaine

Marijuana (includes THC and hashish)

Hallucinogens

Stimulants (includes amphetamines and appetite sedatives)

Sedatives (includes barbiturates and other sedatives)

Tranquilizers (includes antidepressants)

Non-Narcotic Prescription Drugs (includes all non-narcotic prescription drugs)

This reporting format was constructed in order to create comparable arrest and admission data based on the reporting codes used by the UCR and SAAMIS data bases, while allowing for the maximum detail in reporting the drugs involved. For example, the UCR uses three separate codes for narcotic drug arrests; one for heroin, one for other opiates and one for synthetic narcotics. In the SAAMIS, heroin and methadone problems are each reported separately with an additional code for the remaining opiate and synthetic narcotics. Because of these reporting differences, of the narcotic drugs, only heroin can be distinguished in both data bases. Another difference between the UCR and SAAMIS reporting formats resulted in the establishment of the Non-Narcotic Prescription Drug category. The SAAMIS has a problem code called "other drugs" that contains admissions which might be categorized as stimulant, sedative or tranquilizer-related. In order to include these clients in the analysis, the Non-Narcotic Prescription Drug category was established. This category of admissions includes those reported in the Stimulant, Sedative and Tranquilizer categories as well as those reported as "other drugs" to the SAAMIS. This category of arrests is simply an aggregate of arrests reported in the Stimulant, Sedative and Tranquilizer categories.

Six fiscal years (FY80 through FY85) of client data were used for this report. Clients included were those who reported a drug as the primary problem or as a secondary problem in combination with a non-substance primary problem. These client data represent only admissions during each year and do not reflect the actual number of clients receiving services during those times. In order to compare annual arrest and admission totals, calendar rather than fiscal year admission figures were calculated for the various drug categories. However, since the client data represent six fiscal years, the quarterly admission series begins two quarters ahead of the arrest series and extends two quarters past it.

Yearly arrest and admission data are displayed in summary tables at the end of this document. Because of SAAMIS confidentiality policies, the admission data are displayed only for the state, although the arrest data are displayed by county and state.

It was anticipated that similarities between arrest and client admission trends might be due to client admissions resulting from drug arrests. In order to control for this, the client data were separated into two quarterly series, one representing client admissions resulting from drug arrests and one representing the remaining client admissions. It is important to note that a client who enters as a result of a drug arrest may have been arrested for a drug other than the one which is reported as the problem. After the quarterly arrest and admission data were calculated, these figures were adjusted for seasonal patterns and outliers using the SAS X-11 procedure.

References to national trends in drug use in this document are based on information from 1984 National Strategy for Prevention of Drug Abuse and Drug Trafficking published by the White House, Office of Policy Development.

## RESULTS

### Heroin

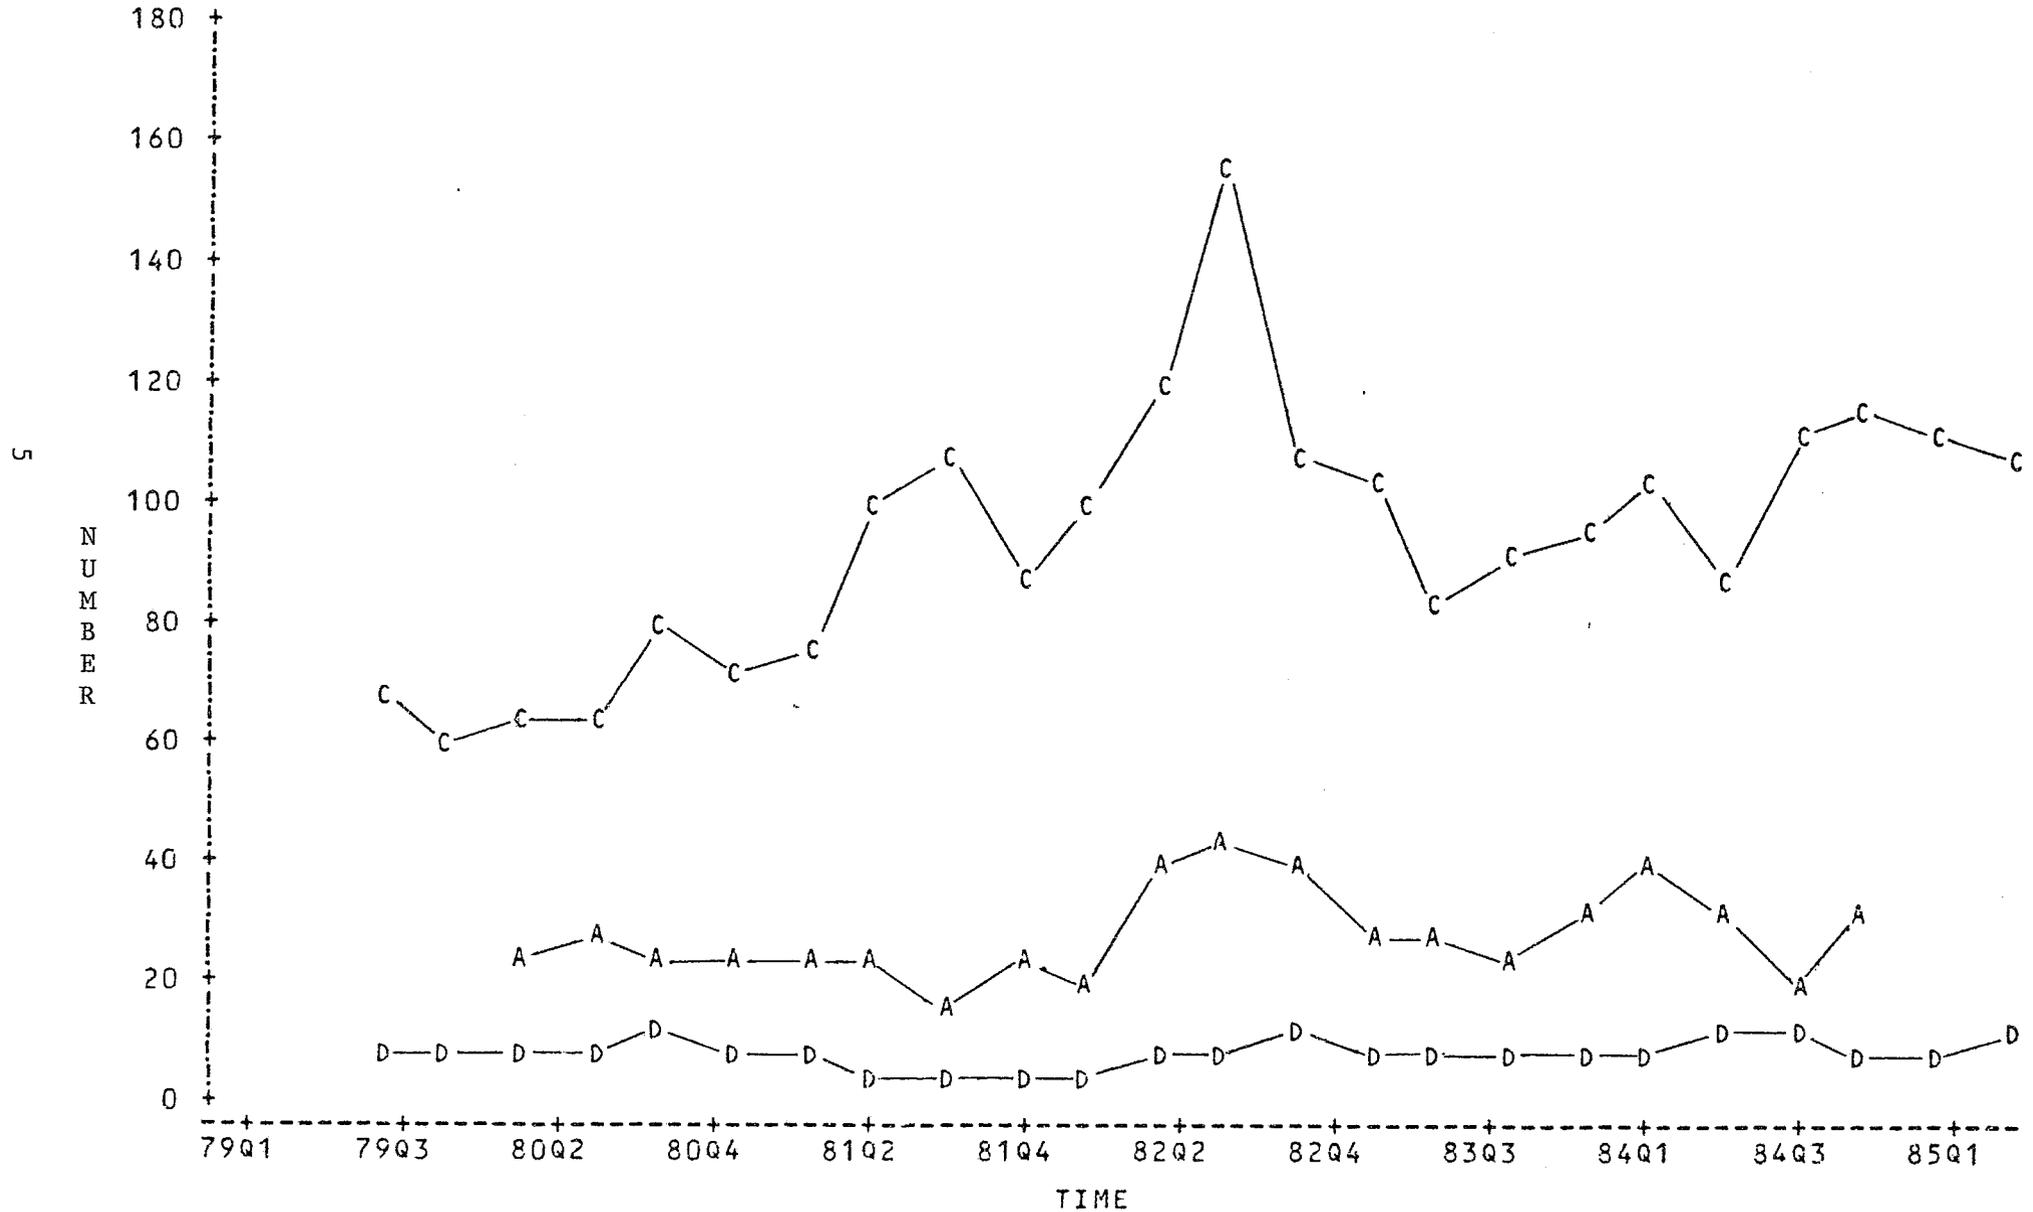

In South Carolina, arrests for heroin violations increased during the second quarter of 1982 and have exhibited quarterly variation since then, but no consistent trend is apparent (Figure A). Client admissions not resulting from drug arrests increased early in 1981, prior to the increase noted for arrests, and continued through the third quarter of that year. Since then, these admissions have fluctuated between quarters but have not exhibited a consistent trend. Client admissions resulting from drug arrests maintained a low, steady trend for the entire period and accounted for only 7 percent of all heroin client admissions between 1980 and 1984.

Estimates of the number of heroin addicts in the United States have been relatively stable since the mid-70s. National data indicate that current users are predominantly older addicts and that use among new, younger users is decreasing. The arrest and client data for South Carolina support the notion of the aging of the heroin-abusing population (Tables 1 and 2). In 1984, individuals aged 26 and older represented higher proportions of both the arrest and client populations than they had in 1980. The average age of heroin offenders increased from 28 in 1980 to 31 in 1984 and a similar increase occurred in the client population.

Females, who account for 51 percent of the state population, are underrepresented in both the client and arrest populations although the proportions of females in the client and arrest populations were higher in 1984 than in 1980. Although females made up only 30 percent of admissions in 1984, the increase in admissions in 1984 over 1980 was greater in number among females than males. Blacks are also disproportionately represented in the arrest and client populations; but in the opposite direction than females. Blacks, in both 1980 and 1984, accounted for over 80 percent of those arrested for heroin violations yet they comprise only 31 percent of the state population. Although the arrest data indicate that heroin use may be a more serious problem among blacks than whites, the proportions of whites in the client population increased substantially between 1980 and 1984. The increase in client

admissions for heroin problems in 1984 over 1980 is totally accounted for by admissions of whites.

| <b>Total</b>                | <b>328</b> | <b>100</b> | <b>448</b> | <b>100</b> |

In South Carolina, arrests for heroin violations occur more frequently in counties where there are major metropolitan areas. Between 1980 and 1984, over 80 percent of the heroin clients were served by local alcohol and drug abuse programs in these counties, two of which have methadone maintenance components in their outpatient treatment program. In both 1980 and 1984, the majority of heroin client admissions occurred in outpatient treatment programs, although increases in detoxification admissions more than accounted for the total numerical increase in heroin clients in 1984 over 1980.

### Other Opiates and Synthetic Narcotics

As is true for heroin, client admissions for other narcotic drugs far exceed the number of arrests for these drugs each year, and the majority of these clients do not enter as a result of a drug arrest (Figure B). Other narcotic admissions not resulting from arrests began increasing during the first quarter of 1981 and continued to increase through the first quarter of 1983. Admissions then dropped each quarter for the rest of 1983 but increased again during 1984 and decreased during the first two quarters of 1985. Throughout the period, admissions resulting from drug arrests exhibited a low, fairly stable pattern. Arrests for other narcotic violations were up slightly during the last half of 1981 and most of 1982 but decreased and have remained relatively low since then.

Very few individuals are arrested each year for other opiate and synthetic narcotic violations, but, unlike heroin arrestees, the majority of these are white (Table 3). Whites also constitute the majority of the client population (Table 4). Females are underrepresented in the arrest and client populations, although their representation increased in 1984. The average age of individuals arrested for other opiate and synthetic narcotic violations increased from 24 in 1980 to 36 in 1984. The average age of clients also increased from 29 years in 1980 to 33 in 1984.

In both 1980 and 1984, the majority of clients seeking service for problems with narcotic drugs other than heroin entered through outpatient or detoxification programs, although detoxification programs accounted for six times as many clients in 1984 as in 1980, and for the entire client increase in 1984 over 1980.

Cocaine

Cocaine use has been increasing throughout the United States in recent years and this trend is apparent in South Carolina. The quarterly data in Figure C show gradual increases in arrests and admissions not resulting from arrests between 1980 and 1982, followed by marked increases for almost every quarter since then. There has been a gradual

increase in cocaine clients entering as a result of drug arrests during this five-year period. Clients entering as a result of drug arrests accounted for only 20 percent of all cocaine clients between 1980 and 1984, although cocaine arrests have exceeded client admissions throughout this period.

Accompanying the overall increase in cocaine arrests and client admissions between 1980 and 1984 were some interesting changes in the racial and age composition of these populations. Blacks represented higher proportions of the arrest and client populations in 1984 than in 1980 (Tables 5 and 6), but this change was more pronounced in the arrest population. In 1984, over half of the arrest and client populations were age 26 and older, although in 1980 the majority of the cocaine offenders and clients were 18 to 25 years old. This shift, combined with dramatic increases in cocaine arrests and client admissions of individuals age 26 and older, indicates a much greater incidence of cocaine use among these individuals than in younger age groups. In both 1980 and 1984, females were underrepresented in the arrest and client populations.

| <b>Total</b>                | <b>91</b> | <b>100</b> | <b>687</b> | <b>100</b> |

Between 1980 and 1984, only one county did not report cocaine arrests and only two local alcohol and drug programs did not admit cocaine clients. The greatest proportion of cocaine clients are admitted through outpatient treatment programs, although detoxification admissions increased substantially in 1984, accounting for almost one-third of the cocaine client admissions during that year.

Marijuana

Marijuana is the most commonly used illicit drug in the United States, and this is also true in South Carolina, where marijuana-related arrests and client admissions exceed by far those for other drugs. Each year, arrests for marijuana violations account for over 80 percent of

all drug arrests, and over half of all drug clients report marijuana problems. Since 1980, quarterly arrests for marijuana violations have been characterized by upward and downward swings rather than a consistent increasing or decreasing trend (Figure D). As shown in Figure D, marijuana admissions resulting from drug arrests have been declining gradually while the remaining marijuana admissions, following a decrease between 1980 and 1981, have not demonstrated a consistent increasing or decreasing trend.

In both 1980 and 1984, the arrest population was predominantly male (Table 7). This was true in the client population as well, although females represented a larger proportion of the client than the arrest population (Table 8). In both 1980 and 1984, blacks constituted a higher proportion of the arrest than the client population. Individuals under age 18 represent significantly larger proportions of the client than the arrest population.

In both 1980 and 1984, the majority of marijuana client admissions were through intervention programming; however, Drug Diversion admissions were significantly lower in 1984 than in 1980. School Intervention (ScIP) admissions accounted for the largest proportion of marijuana clients in both 1980 and 1984.

Hallucinogens

Arrests and client admissions associated with hallucinogens in South Carolina are so infrequent that it appears that very few individuals are using these drugs in this state. National data indicate decreases in the use of hallucinogens, although PCP use continues to be a problem in some urban areas. This drug has replaced LSD as the drug of choice among users of hallucinogenic substances.

Graphs of the quarterly arrest and admission data are presented in Figure E, but since the quarterly figures are so low there is no purpose in examining trends in these data. Tables 9 and 10 display selected characteristics of individuals in the arrest and client populations. According to these data, hallucinogen offenders and clients are most

FIGURE E

frequently white and male. Individuals under age 18 are found in greater proportions among clients than offenders. In fact, there were no reported arrests of individuals under age 18 for hallucinogen violations in 1984.

| <b>Total</b>                | <b>59</b> | <b>100</b> | <b>33</b> | <b>100</b> |

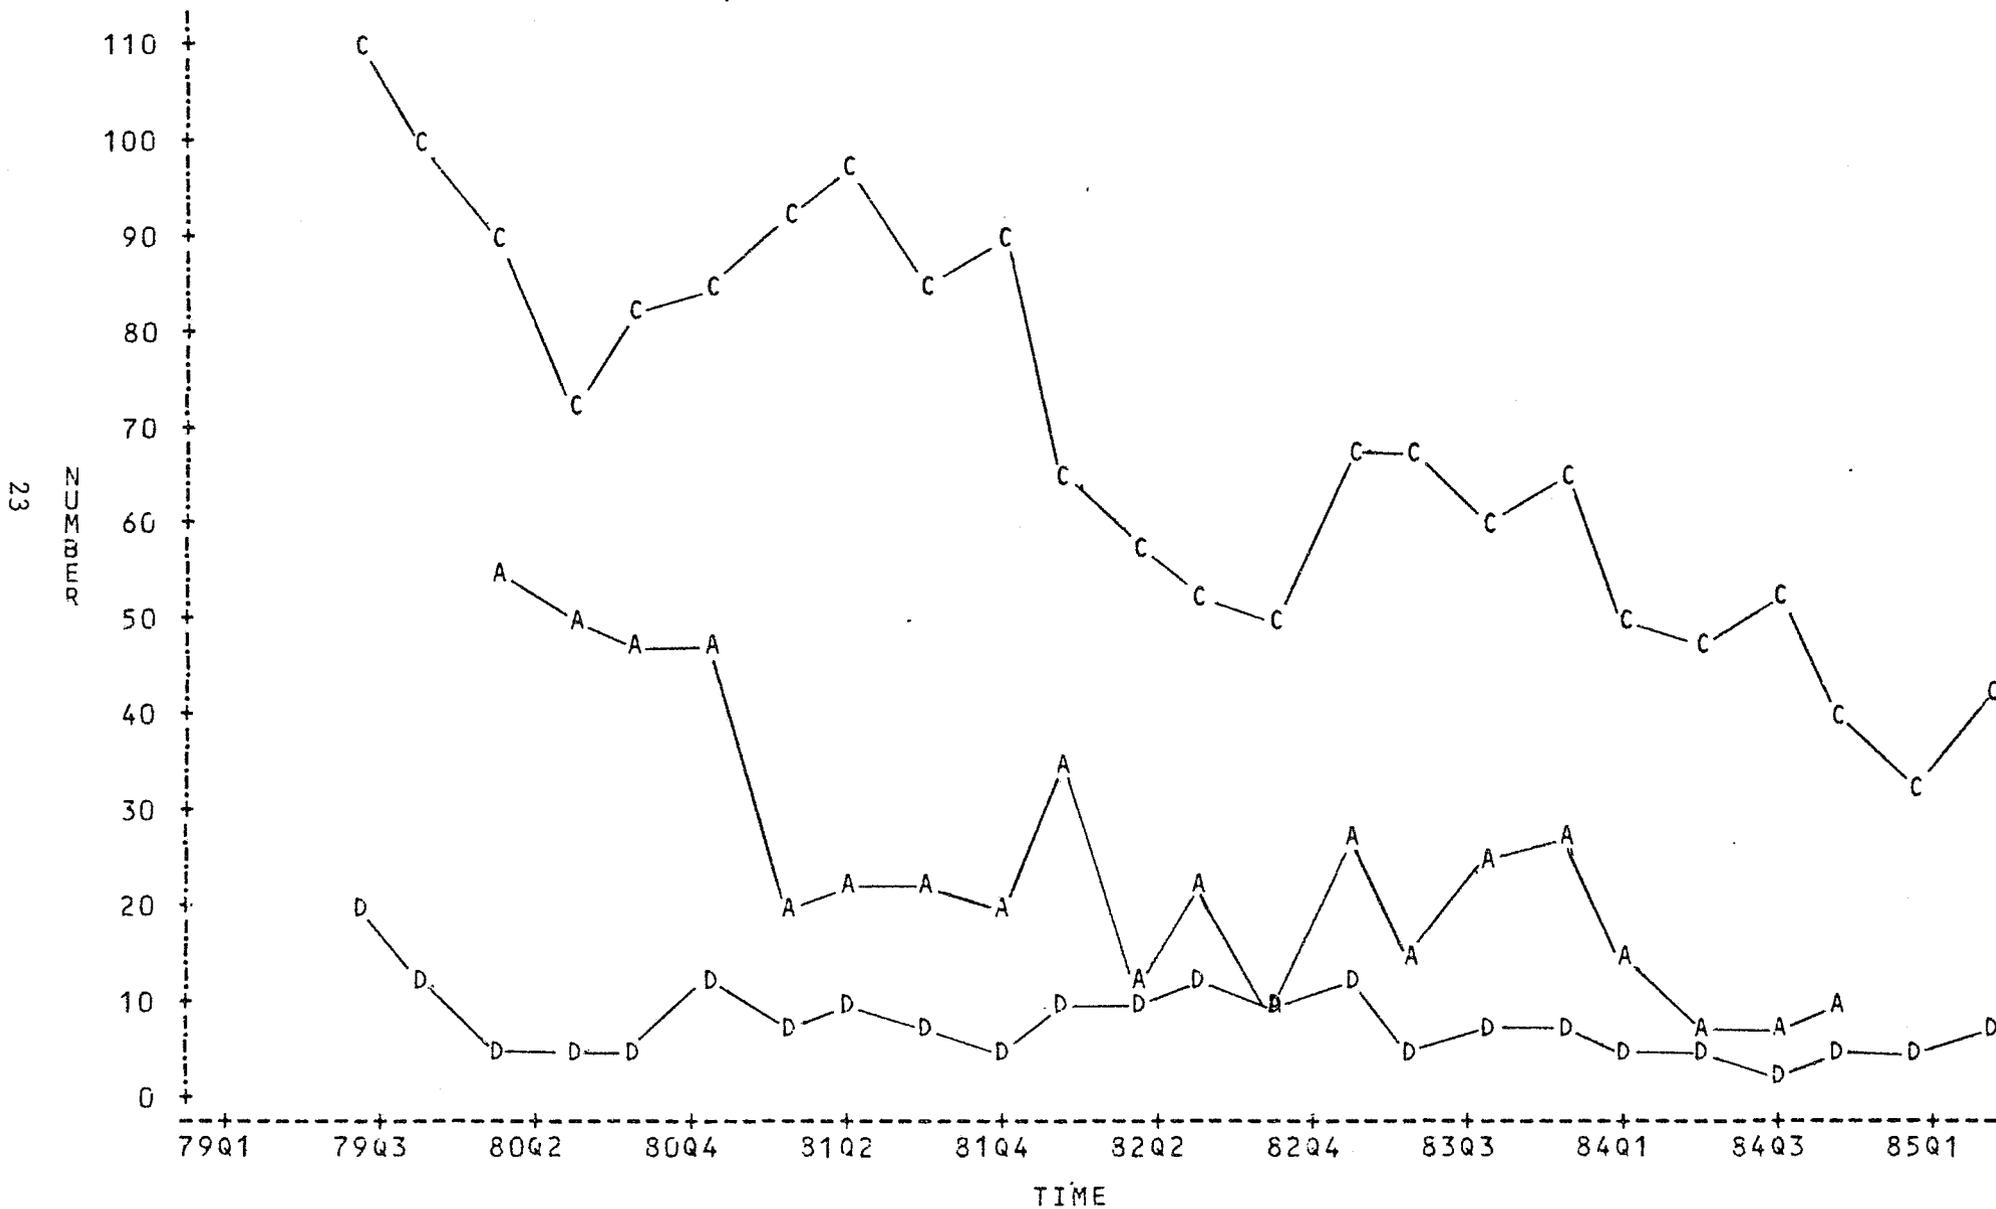

In both 1980 and 1984, three-quarters of the hallucinogen clients were admitted through outpatient treatment or detoxification programs, although detoxification admissions accounted for a larger proportion of these clients in 1984 than in 1980.

#### Stimulants

Arrests for stimulant drug violations dropped significantly between the last quarter of 1980 and the first quarter of 1981 and have remained at a fairly low level since that time (Figure F). Since 1980, stimulant client admissions not resulting from drug arrests have exhibited a few quarterly increases but overall have been gradually declining. Intakes resulting from drug arrests have maintained a low and relatively stable

FIGURE F  
 STIMULANT ARRESTS AND CLIENT ADMISSIONS  
 IN SOUTH CAROLINA: 1980-1984

C = CLIENT ADMISSIONS NOT RESULTING FROM DRUG ARRESTS  
 D = CLIENT ADMISSIONS RESULTING FROM DRUG ARRESTS  
 A = ARRESTS

pattern since 1980. There are more client admissions reporting problems with stimulant drugs than arrests for stimulant violations each year.

Whites dominate both the arrest and client populations, although blacks were represented in higher proportions in the client population than in the arrest population (Tables 11 and 12). Females represented 41 percent of the client population in both 1980 and 1984 although they represented less than a third of the arrest population in each of those years. In both years, approximately one quarter of the client population was under age 18, yet only one individual under age 18 was arrested for a stimulant drug violation in 1984.

In 1980, over 60 percent of the stimulant clients entered through outpatient treatment programs, compared to 33 percent in 1984. Detoxification admissions were twice as high in 1984 as they had been in 1980, and accounted for one-quarter of the stimulant client admissions in 1984. SCIP clients with a stimulant problem doubled between 1980 and 1984, but this is likely due to increased SCIP programming rather than an indication of increased stimulant use among teenagers, particularly since there were fewer clients age 18 and under in 1984 than there were in 1980.

### Sedatives

According to national data, non-medical use of barbiturates and other sedatives, particularly methaqualone, has been declining in the United States. In South Carolina, both arrests and client admissions for sedative drugs have been declining since 1980 (Figure G). Overall, client admissions have been higher than arrests, with admissions resulting from drug arrests contributing 16 percent of the total sedative client population between 1980 and 1984.

Whites dominate both the client and arrest populations, as do males (Tables 13 and 14). Females are found in significantly higher proportions in the client than the arrest population. Representation of individuals under age 18 dropped in both the arrest and client populations between 1980 and 1984.

In both 1980 and 1984, the largest proportion of client admissions was in outpatient treatment programs.

Tranquilizers

Since 1980, arrests for tranquilizer and antidepressant drug violations have represented the majority of arrests for non-narcotic prescription drugs each year. As shown in Figure H, arrests for these drugs increased between the last quarter of 1980 and the first quarter of 1981, continued to increase through 1981, and have exhibited a declining trend since then. Client admissions associated with tranquilizers and antidepressant drugs fluctuated slightly between quarters but have been gradually declining since 1980. Client admissions resulting from drug arrests have maintained a stable pattern of between two to 10 per quarter throughout the five-year period.

FIGURE H

 IN SOUTH CAROLINA: 1980-1984

C = CLIENT ADMISSIONS NOT RESULTING FROM DRUG ARRESTS  
 D = CLIENT ADMISSIONS RESULTING FROM DRUG ARRESTS  
 A = ARRESTS

Whites constitute the majority of both the arrest and client populations although blacks represent a larger proportion of the arrest than client population (Tables 15 and 16). Females, who represented only 19 percent of the arrest population in both 1980 and 1984, are found in much greater proportions in the client population. Individuals under age 18 decreased proportionately in both the arrest and client populations between 1980 and 1984.

| School Intervention         | 21   | 10  | 11   | 8   |
| Other                       | 10   | 5   | 14   | 10  |
| Total                       | 209  | 100 | 145  | 100 |

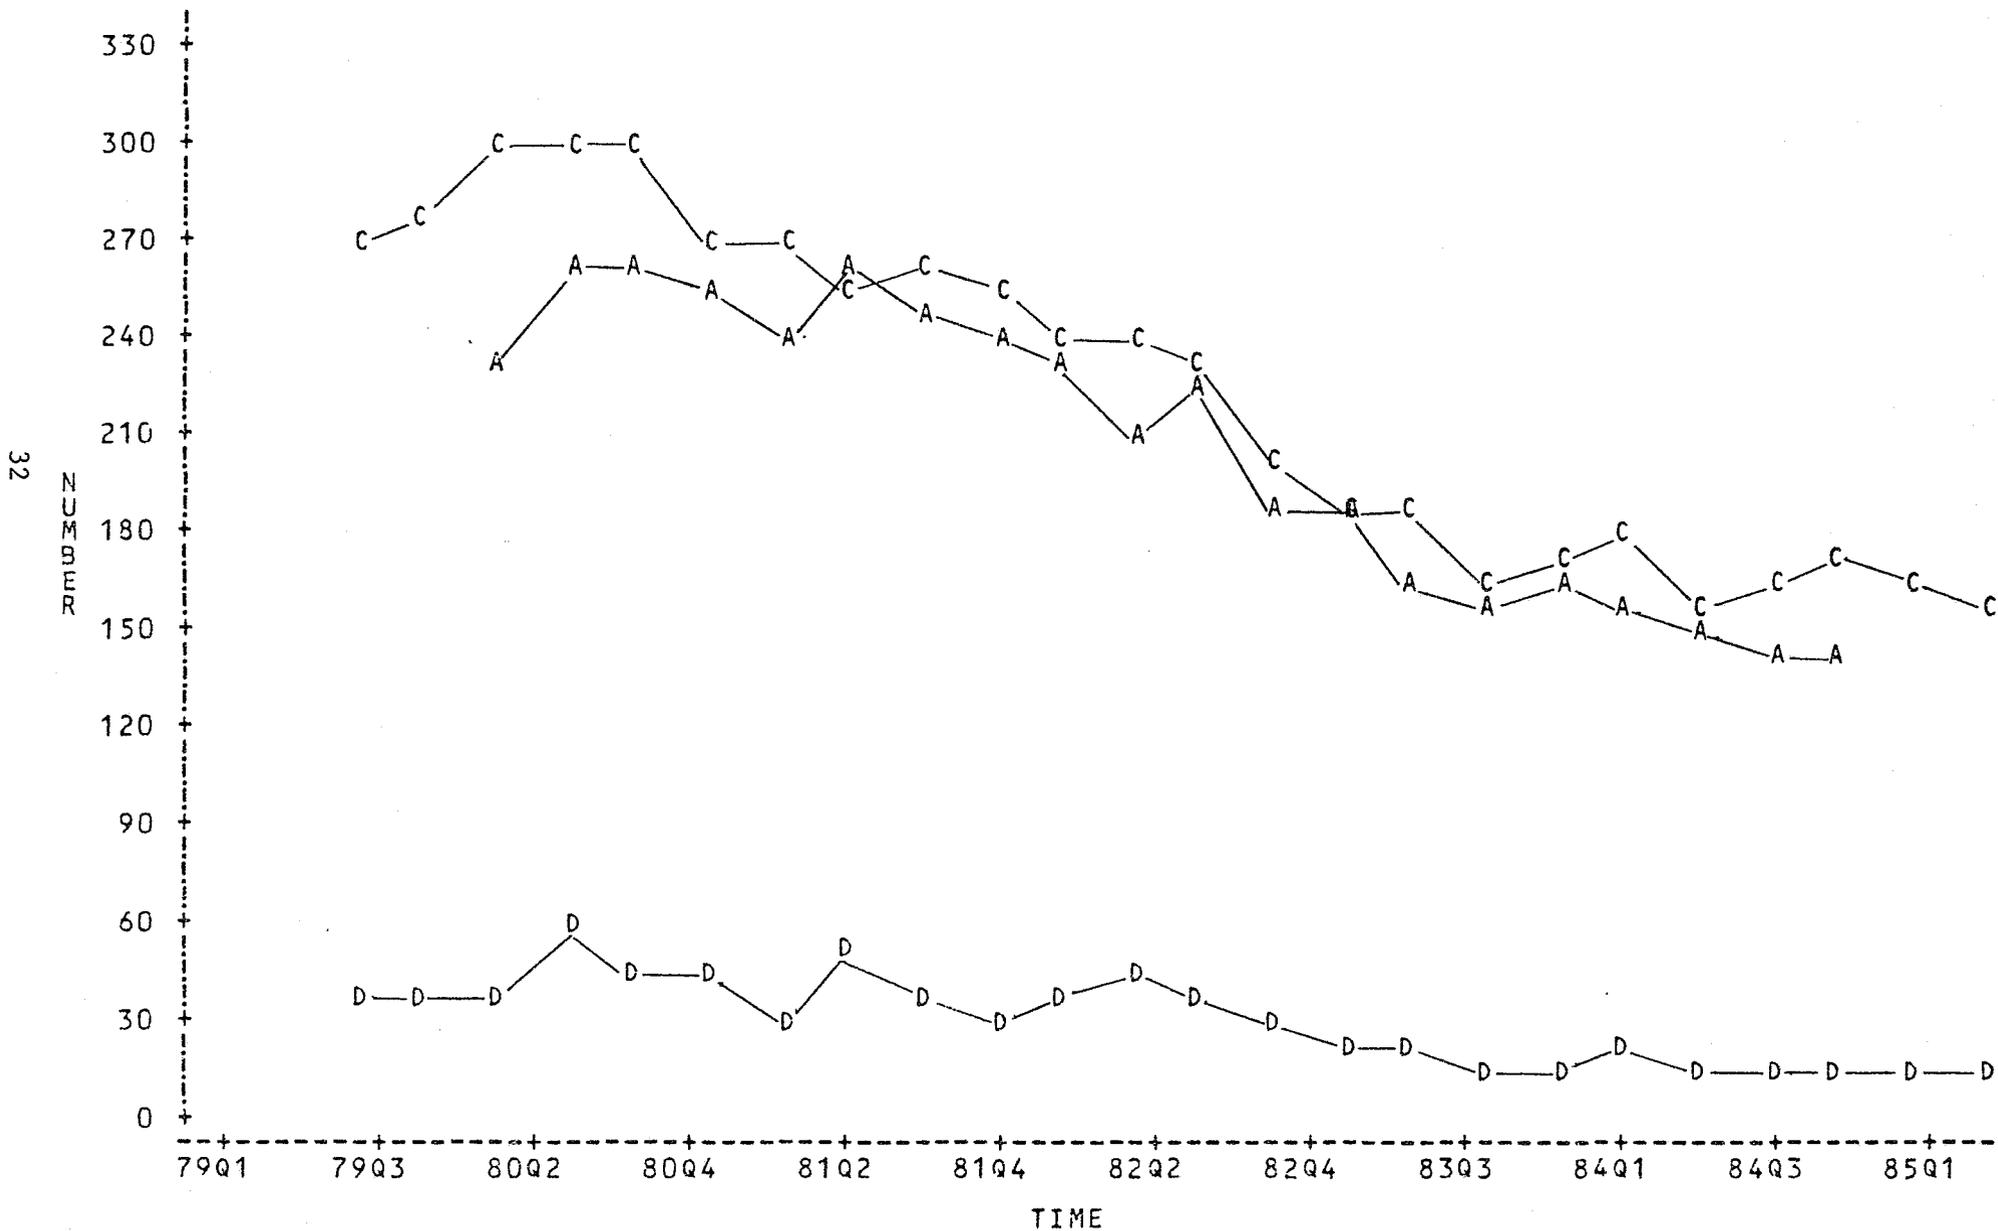

About half of clients who seek services for problems with tranquilizers and antidepressant drugs enter through outpatient treatment programs. Detoxification admissions almost doubled between 1980 and 1984.

#### Non-Narcotic Prescription Drugs

Arrests for non-narcotic prescription drugs since 1981 have most often been made for violations associated with tranquilizers and antidepressants. Client admissions, on the other hand, have most frequently been for problems with sedatives and barbiturates. As shown in Figure I, quarterly arrests and admissions for non-narcotic prescription drugs decreased during 1981 and 1982 but have remained fairly

FIGURE I  
 NON-NARCOTIC PRESCRIPTION DRUG ARRESTS AND CLIENT ADMISSIONS  
 IN SOUTH CAROLINA: 1980-1984

C = CLIENT ADMISSIONS NOT RESULTING FROM DRUG ARRESTS  
 D = CLIENT ADMISSIONS RESULTING FROM DRUG ARRESTS  
 A = ARRESTS

stable since then. Admissions resulting from drug arrests have shown a slight decreasing trend throughout the five-year period. Admissions have been slightly higher than arrests, with admissions resulting from drug arrests representing only a small proportion of all non-narcotic prescription drug admissions.

Blacks are underrepresented in both the arrest and client populations (Tables 17 and 18). Females are found in the client population in proportions fairly consistent with their representation in the general population although they were underrepresented in the arrest population in both years. In 1984, both the arrest and client populations were composed of more individuals in the 26 and older age group than in 1980. Individuals under 18 were found less frequently in the arrest and client populations in 1984 than they were in 1980.

In both 1980 and 1984, the largest proportion of these clients entered through outpatient treatment programs. Although SCIP client admissions increased in 1984, this is probably due to expanded SCIP programming rather than an indication of increased non-narcotic prescription drug use among teenagers, particularly since there were fewer clients under age 18 in 1984 than in 1980.

## DISCUSSION

While there are many reasons to be cautious in interpreting the information in this document, there are some interesting observations that result from the data provided. If the arrest and client data are indications of trends in drug use in South Carolina, it appears that abuse of non-narcotic prescription drugs and hallucinogens is declining, cocaine use is increasing, and marijuana and narcotic drug use is relatively stable. These findings are consistent with national trends, although changes in patterns of drug use in South Carolina tend to lag somewhat behind those noted for the United States.

In general, clients entering as a result of drug arrests account for only a small proportion of clients who receive services for drug problems. With the exception of clients who seek service for marijuana problems, many more clients enter through outpatient treatment than intervention programs. The proportion of drug clients entering through Drug Diversion, an intervention program established for individuals arrested for certain drug law violations, was lower in 1984 than in 1980. Because arrests for drug law violations are far in excess of the numbers of drug clients entering as a result of drug arrests, it appears that current intervention programming is not adequately serving the population of individuals who are arrested for drug law violations. There are legal impediments to serving this population; for example, penalties for some drug law violations require incarceration, and a first offense conviction for simple possession of marijuana has been virtually decriminalized in this state. Nevertheless, it seems reasonable to conclude that many individuals arrested for drug law violations need some type of intervention or treatment services and are not receiving them.

Another change that occurred in admissions of drug clients to local alcohol and drug abuse programs between 1980 and 1984 was an increase in the proportion and number of clients being admitted to detoxification programs. Increases in detoxification admissions were particularly dramatic among clients seeking services for problems with cocaine, heroin and other narcotic drugs. Largely because of the increase in

detoxification admissions, admissions to outpatient treatment programs accounted for smaller proportions of clients in 1984 than in 1980.

National data indicate that drug use among individuals under age 18 has stabilized or been decreasing, depending on the type of drug involved. In South Carolina, arrest and client data indicate patterns of drug use among teenagers that is consistent with the national trends. Arrests of individuals under 18 for all types of drugs were either unchanged or lower in 1984 than they were in 1980. Admissions for cocaine problems were the only type of drug admissions for this age group to increase in 1984.

Along with the decline in arrests and admissions of youths were other changes in the age composition of the arrest and client populations. Individuals age 18-25 accounted for smaller proportions of the arrest and client populations in 1984 than in 1980, while the proportion of individuals age 26 and older increased in the arrest and client populations in 1984.

Females, who represent 51 percent of the general population in South Carolina, are underrepresented in the arrest and client populations for all types of drugs in relation to their presence in the general population. This underrepresentation of females is more pronounced in the arrest population than it is in the client population. This indicates that although females are somewhat less likely to abuse drugs than males, they are much less likely to be arrested for drug law violations than males. As a result, client data are probably a better indication of patterns of illegal drug use among females than the arrest data. Because marijuana use is so prevalent, more females seek services for marijuana problems each year than for other drugs. However, females are found in higher proportions among clients seeking services for problems with non-narcotic prescription drugs, particularly tranquilizers, than among clients seeking services for other drugs, including marijuana.

Blacks are also disproportionately represented in the arrest and client populations, although in a somewhat inconsistent pattern. For example, blacks, who represent 31 percent of the general population, account for almost 90 percent of the heroin arrests but make up less than half of the heroin client population. In contrast, blacks are

underrepresented in both the arrest and client populations associated with other narcotic drugs and non-narcotic prescription drugs. Blacks do appear in the cocaine and marijuana arrest and client populations in proportions more consistent with their representation in the general population although they tend to be found in higher proportions in the arrest population than in the client population.
