Section 1: Forecast Results

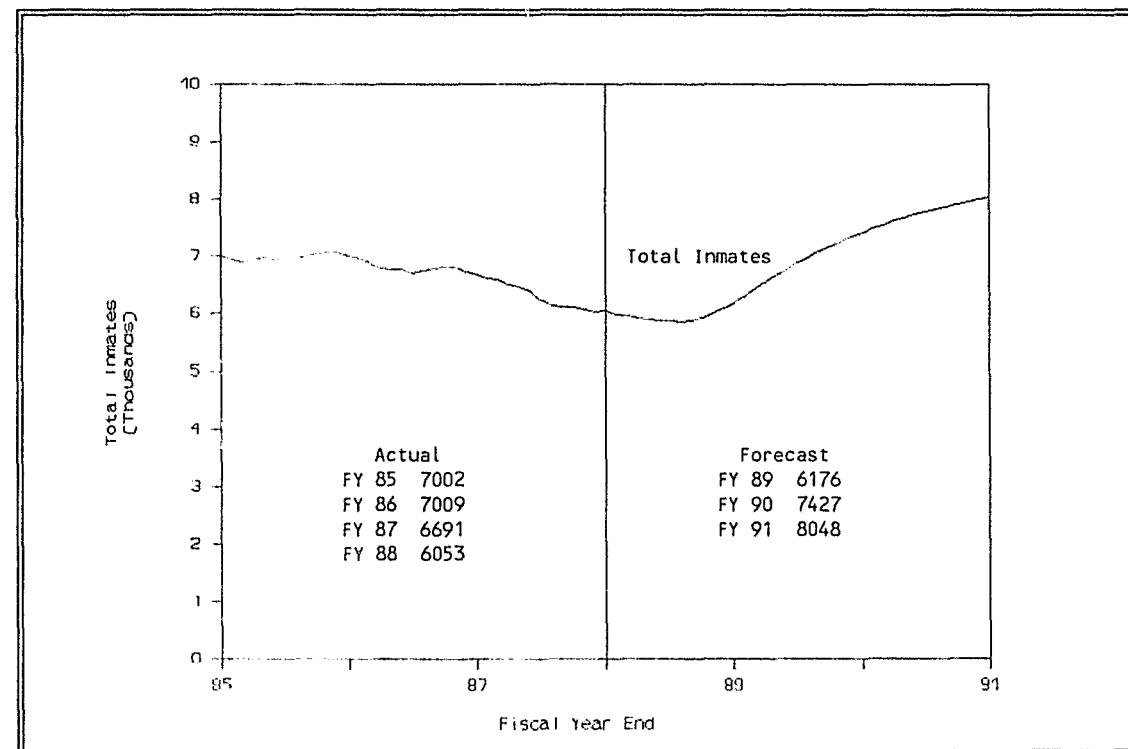

Figure 1: 1989-91 Biennium Inmate Population Forecast, All Inmates

Forecast Overview

The Department of Corrections (DOC) is responsible for the supervision of convicted felons committed to its jurisdiction by the courts. DOC may also board offenders from other states or local jails. This forecast does not include boarders.

Only felons receiving a sentence greater than one year are committed by the courts to DOC. Offenders are supervised in two programs: Prisons and community corrections. Prison inmates are explicitly forecast as the population in prison institutions, and in inmate work release. Community corrections cases are implicitly forecast as the remainder of convicted felons who do not receive a prison sentence. This forecast of the prison and work release inmate population is referred to

as the inmate population forecast.

In Fiscal Year 1989 the inmate population is expected to reach the bottom of a decline that started in 1986.

The recent decline in the inmate population is due to increased numbers of releases, not to a decline in admissions. This is due in part to a 1986 statutory change (SHB 1400, Chapter 224, Laws of 1986, revising RCW 9.95.009(2)). SHB 1400 required the Indeterminate Sentence Review Board (ISRB) to review the minimum terms of all inmates in prison who were not sentenced under the Sentencing Reform Act (SRA) of 1981. SHB 1400 specified how the Sentencing Reform Act was to be applied to these old law cases, and resulted in an earlier release for many inmates.

The expected rapid growth in the inmate population after January 1989 is also affected by SHB 1400. The high numbers of releases in 1987 and 1988 will result in lower volumes of future releases. These are actually early releases being "borrowed" from the future. As the future pool of inmates eligible for release shrinks, the number of releases will fall, and the population will begin to increase.

Drug offenses are also expected to cause a large increases in the inmate population. The number of drug offenders in prison is expected to triple by the end of Fiscal Year 1991.

Other sources of increase are the new Automated Fingerprint Identification System, small increases in other crime types, other statutory changes, and state population increases.

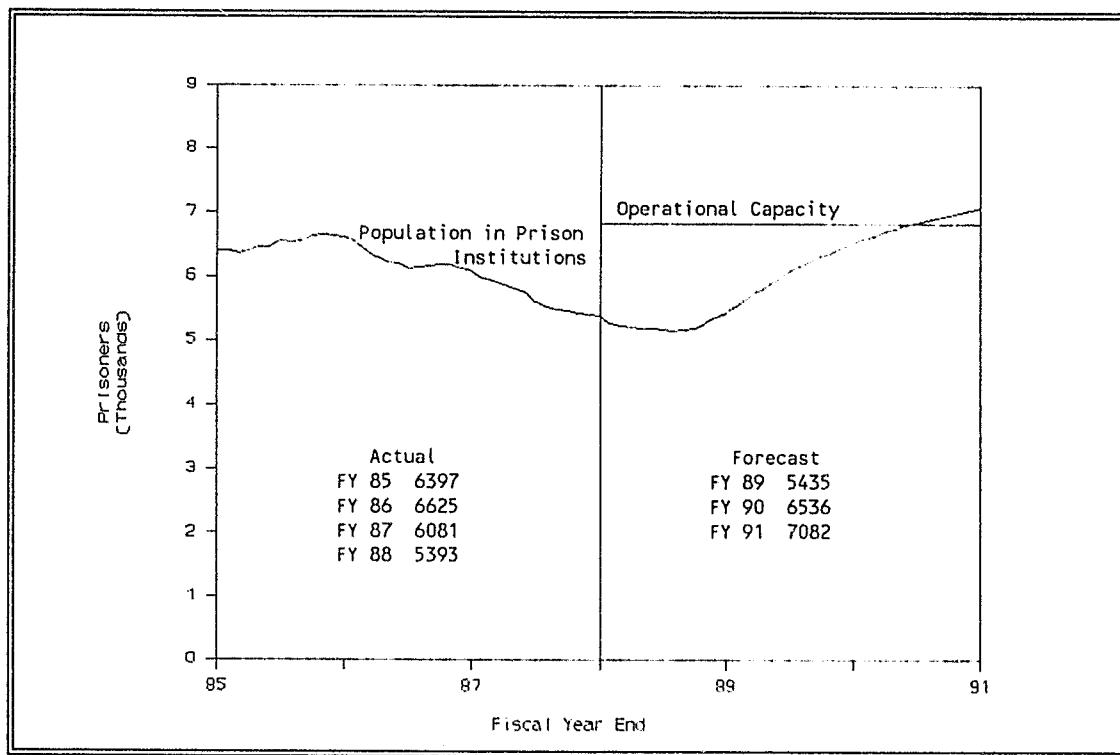

Figure 2: Forecast Prison Population Compared to July 1988 Operational Capacity

Prison Capacity

Prison capacity is measured in two ways: rated capacity and operational capacity. Rated capacity is defined by a space standard of 60 square feet per inmate housed in a cell; 50 square feet per inmate housed in a dormitory. Rated capacity does not include temporary use quarters such as segregation, hospitals, and mental health facilities.

Operational capacity defines the housing adjustments which are made to accommodate inmate population beyond rated capacity. These adjustments take into account operational factors including security, programming, physical plant capabilities, statutes, and court orders.

The DOC Division of Prisons published the **Institution**

Capacity Report in May 1980. That report provides a detailed breakdown of all housing adjustments made in the determination of operational capacity.

Both rated and operational capacity are subject to rapid changes. Factors that reduce capacity are statutes, court orders, changes in the availability of contracted bed space, and building renovations. Some of these factors can also cause capacity increases.

Figure 2 shows the forecast population of prison inmates compared to the operational capacity of Washington prisons in July of 1988. At that time the operational capacity was 6,831 and the rated capacity was 6,056.

Prison inmates are the total inmate population less work

release inmates. Total inmates are forecast and subsequently divided into work release and prison components. The 1989-91 Biennium forecast assumes 88 percent of the inmates will reside in prison, shown in Figure 2, and the remaining 12 percent will be housed in inmate work release facilities.

Out-of-State Boarders

SHB 1400 caused a temporary dip in the prison population. In Fiscal Year 1988 DOC began to rent the resulting extra space to other states and the federal government on a temporary basis, under the Federal Prisoner Contract Program.

The availability of contract beds and receipt of contract inmates is dependent on the capacity needs of the state prison inmate population, which is forecast to exceed capacity in January 1991.

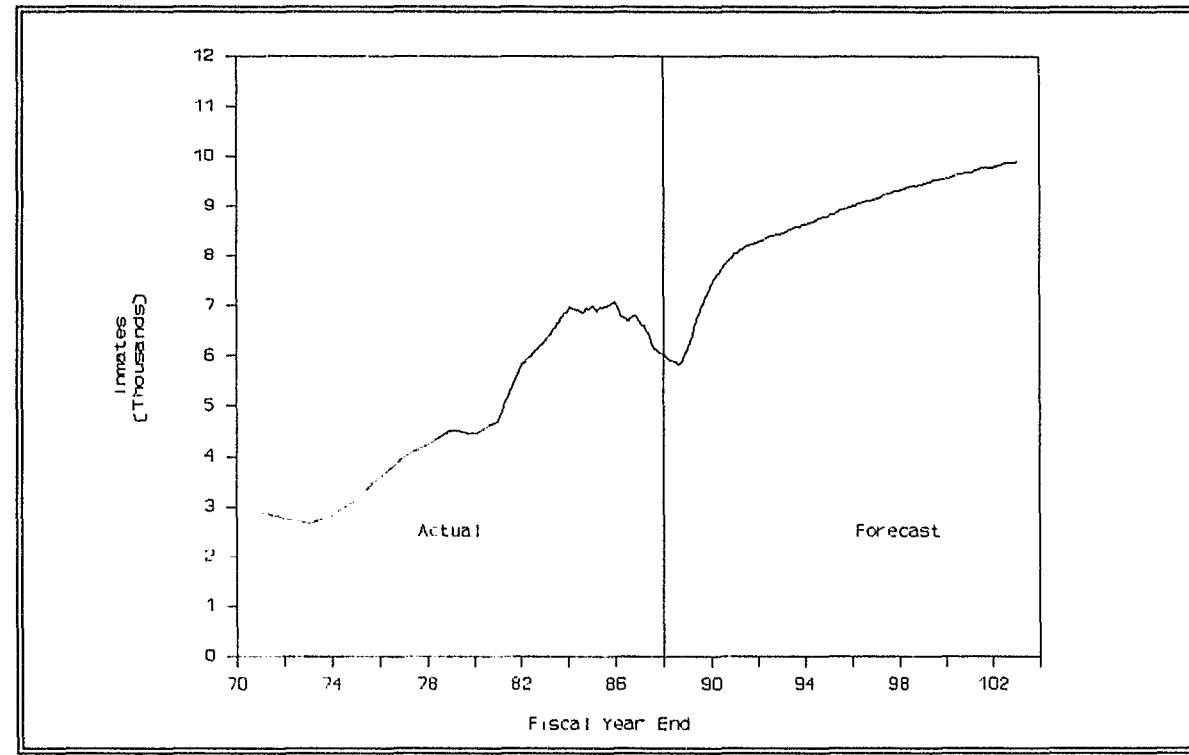

Figure 3: Long Range Inmate Population Forecast

Long Range Forecast

The long range forecast of the inmate population shows steady growth during the next decade. The rapid growth rate expected during the next biennium is attenuated in the long term, as the impact of SHB 1400 tapers off.

While the biennium forecast can include several hundred assumed short term changes in the criminal justice system, this forecast assumes long term stability in the criminal justice system. The long range forecast continues the effects of the biennium forecast assumptions, but typically does not include new assumptions about changes in the criminal justice system beyond the period of the ensuing biennium.

Biennium forecast assumptions that are expected to have a long term impact on the inmate population are increased drug

Table 1: Long Range Inmate Population Forecast

crime convictions and the Automated Fingerprint Identification System.

Some implicit assumptions have a major impact on the long term forecast, including state population growth, increasing Lengths of Stay, recidivism, and increases in the average number of prior convictions for

offenders. Explicit assumptions have not been set for these sources of change, but they are reflected in the base data for the forecast.

Explicit assumptions will be made about these sources of change, if they begin to have more immediate effects on the inmate population.

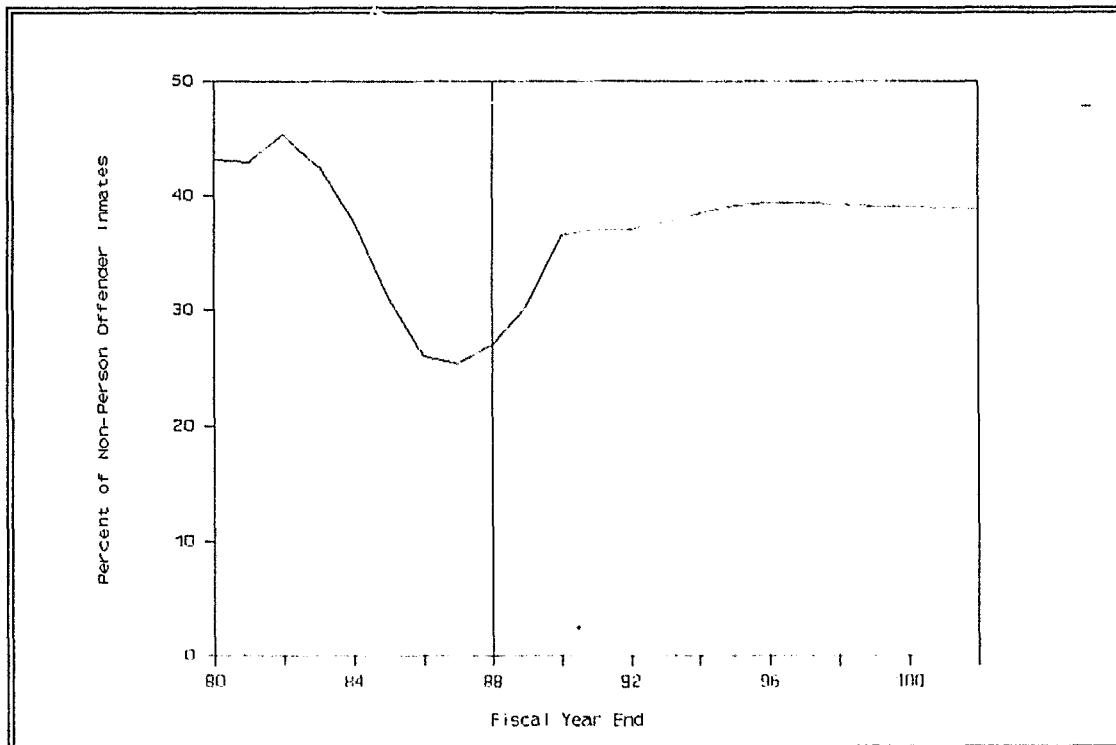

Figure 4: Long Range Inmate Population Forecast: Percent Person Offenders

Offender Types

Table 2 is the forecast of inmates by crime type. Murder 1, Murder 2, Manslaughter, Sex Crimes, Robbery, and Assault are known as person offenses. Property, Drug, and Other

offenses are nonperson offenses.

Under the SRA the proportion of nonperson offenders in the population was expected to decline. This occurred until 1988, when there were rapid

increases in admissions for nonperson drug crimes and SHB 1400 early releases for serious person offenders. These changes combined to cause an increase in the proportion of nonperson inmates.

Expectations and Assumptions

The inmate population forecast model is a simulation of the process of conviction, admission, release and recidivism of monthly groups of offenders. Each event in this process represents an assumption, set for nine crime types by sex. In addition, special assumptions are often set to reflect anticipated policy changes or other unique

events, such as the state's new Automated Fingerprint Identification System (AFIS). The state population forecast of 16 to 54 year-olds forms the base on which all other assumptions are built.

The Governor's Interagency Criminal Justice Work Group sets the assumptions for the inmate forecast. They focus primarily on conviction,

admission, and special assumptions. Assumptions for length of stay (releases) and recidivism usually are based on the most recent actual data-point. If it is known that these components will change from recent experience, the expected changes are addressed as special assumptions. The following assumptions apply to the 1989-91 Biennium inmate forecast:

Table 3: Summary of Assumptions, 1989-91 Biennium Inmate Population Forecast

- o The Fall 1988 Office of Financial Management State Population Forecast of 16 to 54 year-olds, by single year of age.
- o The conviction rate, excluding convictions for recidivists, is expected to increase from 5.244 convictions per 1000 16 to 54 year-olds, 13,599 convictions, in Fiscal Year 1988, to:
 - 5.727 in Fiscal Year 1989 -- 15,246 convictions
 - 5.858 in Fiscal Year 1990 -- 15,865 convictions
 - 5.782 in Fiscal Year 1991 -- 15,874 convictionsAn increase of almost 1,300 convictions between Fiscal Years 1988 and 1989 is due to expected increased convictions for drug offenses. Six hundred additional convictions for drug offenses are expected to occur between Fiscal Years 1989 and 1990.
- o The admission rate is calculated as the percentage of convictions that receive prison sentences, excluding recidivists. This measure is called the Judicial Decision to Imprison, or JDI. The JDI is expected to increase from 13.6 percent, 1,845 admissions, in Fiscal Year 1988, to:
 - 14.3 percent in Fiscal Year 1989 -- 2,187 admissions
 - 14.9 percent in Fiscal Year 1990 -- 2,371 admissions
 - 14.9 percent in Fiscal Year 1991 -- 2,373 admissions
- o The recidivism rate measures the the percentage of releases from Washington prisons who return there within five years. Thirty two percent of released inmates are expected to return within five years.
- o AFIS is expected to account for 25 prison admissions in Fiscal Year 1989. By the end of Fiscal Year 1991 that number is expected to reach 94, and by the mid 1990s it will exceed 200.

Special assumptions were set for Washington's new Automated Fingerprint Identification System. Most offenders identified by AFIS must have at least one prior felony conviction

(to be in the fingerprint database). Consequently, AFIS caused admissions were assigned the longer lengths of stay used for recidivists, who must also have at least one prior

conviction. AFIS is expected to have an increasing impact on prison admissions as the Seattle system becomes fully operational and as planned remote sites come on line.

Section 2: Components of Change

Component of Change Overview

The inmate forecast is a simulation, or components of change, forecast model. This refers to a method of identifying the components of a system which cause changes in a population associated with that system.

Table 4 is a summary of criminal justice components of change for which explicit

assumptions are set. These include felony convictions, new prison admissions, recidivist prison admissions, and releases.

Explicit assumptions cannot be set for every component of the criminal justice system. Some components are based on assumptions from other forecasts, like the state population forecast, and other components are studied but not explicitly forecast, like crime

rates. Finally, some assumptions about components are technical exercises, such as reading inmates' expected release dates into the forecast model.

This section contains detailed information about most of the explicit forecast assumptions, as well as highlights of other criminal justice system components. The appendices contain further information about the forecast assumptions.

¹Felony Commitments to DOC, excluding recidivists to prison (see #4).

²Net Miscellaneous Change: positive or negative "admissions". The difference between miscellaneous movements in and out of prison, including escape returns, escapes, and community service detainees.

³New Admissions to Prison: Total admissions excluding recidivists (see #4).

⁴Recidivists: Prior to FY 1985 all recidivists were defined as parole violators returned to prison. Since FY 1985 recidivists are defined as readmissions of previous DOC inmates.

⁵Inmate Work Release population: Assumed to be 12 percent of the forecast inmate population.

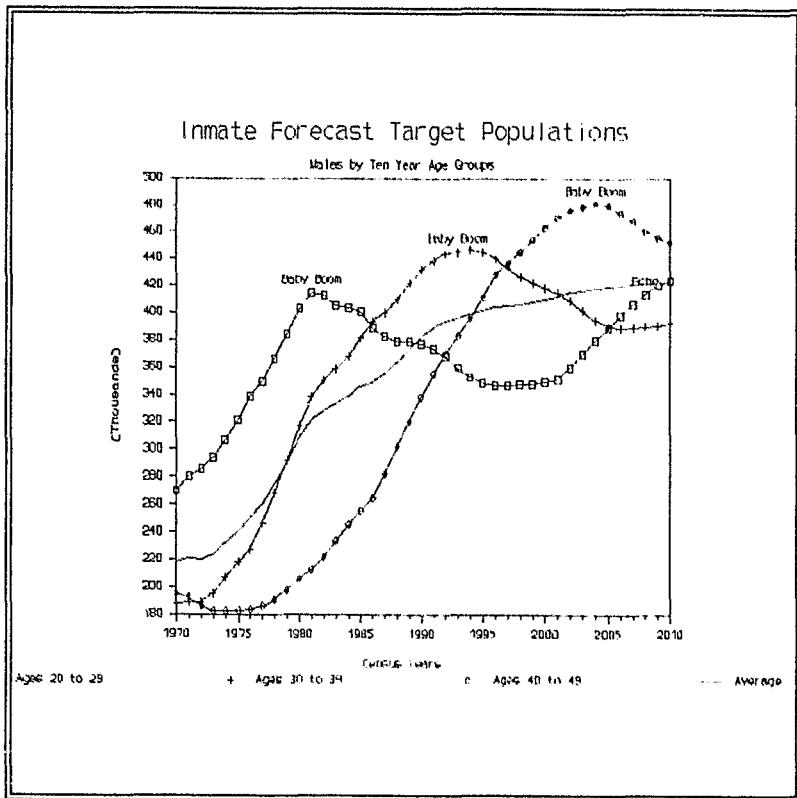

Figure 5: Inmate Forecast Target Populations

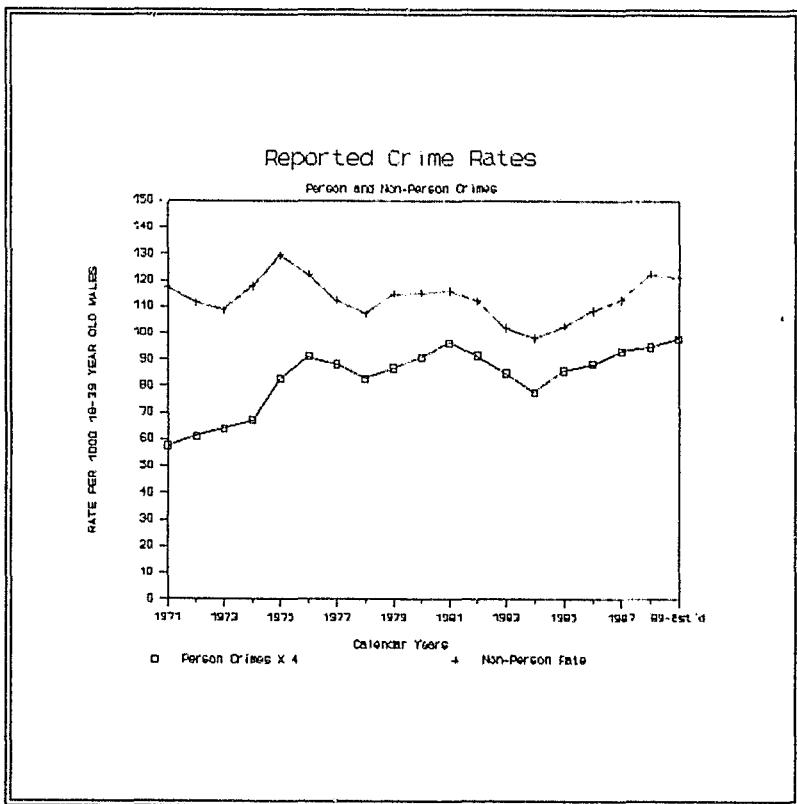

Figure 6: Reported Crime Rates, Washington UCR

Target Population

The inmate forecast is based on the population 16 to 54 years of age, for both sexes. Males between the ages of 18 and 39, however, account for 75 percent of adult felony convictions, and 80 percent of prison admissions. Consequently, the 18 to 39 year old population of males is another frequently used base for criminal justice analyses.

Crime and incarceration rates accelerated while the population of 20 to 29 year-olds was growing under pressure from the Baby Boom. This large birth cohort exhibits unusually high rates of criminality. Baby Boom offenders also tend to remain criminally active longer. So there may not be immediate relief as the baby boom ages out of what traditionally are the crime prone years.

The Baby Boom Echo will be larger than the Baby Boom. If the criminal activity of this generation is as great as its parents, prison populations could grow rapidly.

Crime

Crime volumes have increased rapidly, but crime rates, the number of crimes per unit of population, show a different pattern. The chances of a given person committing a crime are not much greater than 18 years ago, but the number of people who might commit crimes has increased.

During the early 1970s person crimes increased as the Baby Boom aged into adulthood. Both person and non-person crimes (burglary and auto theft) have increased steadily since 1983. The experience of police, courts, and corrections suggests these increases may be drug related.

Conviction Rates

Conviction rates have increased steadily during the 1980s. The evidence from crime and arrest rates indicates this is not just because people are becoming more criminal. Since 1984 the number of crimes increased 23 percent faster than the population, but the number of convictions increased 40 percent faster.

Possible causes are enhanced law enforcement, public attitudes against crime, a greater willingness to punish for crimes already on the books, and the enactment of new criminal statutes.

- Conviction rates are the initial component modeled in the inmate forecast. The forecast of convictions is for a continued sharp increase through FY 1990, due mainly to expected increases in drug convictions. After FY 1990 the forecast conviction rates are essentially flat.

Judicial Decision to Imprison

Assumptions for new admissions to prison are expressed as the percentage of convicted felons who will receive prison sentences, called the Judicial Decision to Imprison (JDI).

After FY 1984, By design of the SRA, the JDI for less serious offenders fell, and the JDI for serious offenders increased. Since admissions for property and less serious offenses outnumbered those for violent and serious offenses, the total JDI dropped. Conviction volumes, however, increased during this period, so the number of admissions increased.

The forecast increase in the JDI is mainly due to expected increases in admissions for drug crimes.

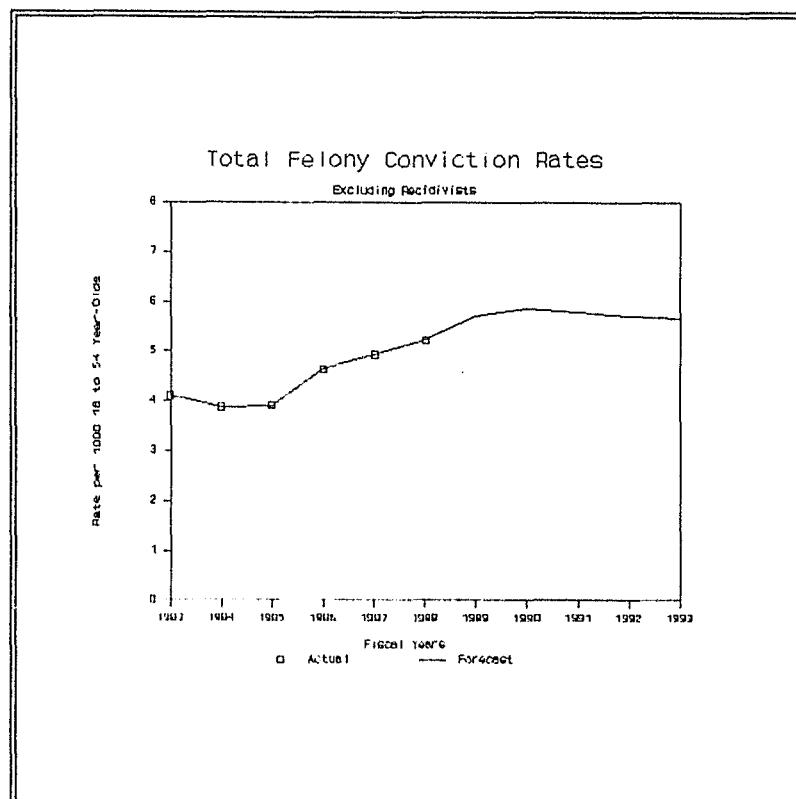

Figure 7: Total Felony Conviction Rates

Appendix Three: Forecast Assumptions

| <u>Sex</u> | <u>Crime</u> | <u>Variable</u> | <u>Forecast Rate(s)--Rationale</u> |
|------------|--------------|-----------------|---|
| Male | Murder1 | ConvRate | 0.0373, hold constant--Select rate so murder convictions for 1989 are equal to 50, the apparent system upper limit. |
| Male | Murder1 | JDI | 100%, hold constant--Statutory. |
| Male | Murder2 | ConvRate | 0.032, hold constant--Unchanged from FY 1988. |
| Male | Murder2 | JDI | 100%, hold constant--Statutory. |
| Male | Mansl. | ConvRate | 0.065, hold constant--Unchanged from FY 1988. |
| Male | Mansl. | JDI | 75%, hold constant--Has been constant for two years at 75 to 76%. |
| Male | SexCrime | ConvRate | 0.787, hold constant--Midway between FY 1988 forecast and actual, anticipated mild increase. |
| Male | SexCrime | JDI | 45%, hold constant--Rate expected for FY 1991, as SOSSA alternates were depleted. This apparently occurred early. |
| Male | Robbery | ConvRate | 0.293, hold constant--Unchanged from FY 1988. |
| Male | Robbery | JDI | 60.3%, hold constant--Unchanged from FY 1988. |
| Male | Assault | ConvRate | FY 89 - 0.695, FY 90 - 0.698, FY 91 - 0.701, hold constant--Unchanged from FY 1988. |
| Male | Assault | JDI | 20.0%, hold constant--Unchanged from FY 1988. |
| Male | Property | ConvRate | 3.712, hold constant--Last actual; had expected dramatic increases due to drug-related crimes. These increases were instead picked up as drug crimes. |
| Male | Property | JDI | FY 89 - 8.2%, FY 90 - 8.4%, hold constant--Reflects recent history. |
| Male | Drug | ConvRate | FY 89 - 2.754, FY 90 - 3.092, hold constant--Rate to reflect increases of 1000 and 500 convictions for FY 89 and 90, respectively. Probable upper limit of system capabilities. |
| Male | Drug | JDI | FY 89 - 14.9%, FY 90 - 16.7%, hold constant--1.2% and 1.8% increases in FY 89 and FY 90, respectively. Anticipated increases, mitigated by probable system capability limits. |
| Male | Other | ConvRate | 1.127, hold constant--Unchanged from FY 1988. |
| Male | Other | JDI | 1.0%, hold constant--Unchanged from FY 1988. |
| Fem | Murder1 | ConvRate | 0.003, hold constant--Unchanged from FY 1988. |
| Fem | Murder1 | JDI | 100.0% hold constant--Statutory. |
| Fem | Murder2 | ConvRate | 0.004, hold constant--Unchanged from FY 1988. |
| Fem | Murder2 | JDI | 100.0% hold constant--Statutory. |
| Fem | Mansl. | ConvRate | 0.010, hold constant--Same as FY 1988. |
| Fem | Mansl. | JDI | 71.4%, Hold constant--Same as FY 1988. |
| Fem | SexCrime | ConvRate | 0.026, hold constant--Set a peak of recent increase (FY 1987). |
| Fem | SexCrime | JDI | 24.0% hold constant--Unchanged from FY 1988. |

| <u>Sex</u> | <u>Crime</u> | <u>Variable</u> | <u>Forecast Rate(s)--Rationale</u> |
|------------|--------------|-----------------|---|
| Fem | Robbery | ConvRate | 0.030, hold constant--Unchanged from FY 1988. |
| Fem | Robbery | JDI | 53.6% hold constant--Unchanged from FY 1988. |
| Fem | Assault | ConvRate | 0.086, hold constant--Continue three year increasing trend. |
| Fem | Assault | JDI | 12.5%, hold constant--Lower to approximate mean of last four years. |
| Fem | Property | ConvRate | 0.95, hold constant--Increase as expected in FY 1988 assumptions, but 0.05 less in anticipation of more Property being picked up under Drug. |
| Fem | Property | JDI | 2.4%, hold constant--Last actual. |
| Fem | Drug | ConvRate | FY 89 - 0.580, FY 90 - 0.642, hold constant--Rate to reflect increases of 177 and 89 convictions for FY 89 and 90, respectively. Probable upper limit of system capabilities. |
| Fem | Drug | JDI | FY 89 - 8.0%, FY 90 - 8.5%, hold constant--Increases anticipated in FY 1988, mitigated by probable system capability limits. |
| Fem | Other | ConvRate | 0.134, hold constant--Unchanged from FY 1988. |
| Fem | Other | JDI | 0.0%, hold constant--Unchanged from FY 1988. |
