State of Delaware
Detention, Jail, and Prison Population Forecast
1989 to 1994

This study was produced under a directive of the Criminal Justice Council Executive Committee and is a part of the long range work plan for Statistical Analysis Center. This study provides a forecast for the Delaware Department of Correction's detention, jail and prison populations. "Jail" is differentiated from prison by the length of the offender's sentence. Sentences of a year and less are counted as a jail term. Offenders with sentences longer than one year are counted as being in prison. Inmates that "flow down" from Level V to Level IV halfway house are counted in this forecast. Offenders sentenced directly to Level IV halfway house are not included in this forecast. Offenders on Supervised Custody are included.

The methodology used for the population forecast is a "components of change" forecasting methodology that takes into account the independent influences of variables that contribute to change in correction's populations. Components of change included in this forecast include:

1. The projected demographic patterns for the males and females between the ages of 18 and 39.
2. The changing patterns of admission rates for thirteen types of crime by gender.
3. The changing lengths of stay patterns for thirteen types of crime by gender.

Historical information for 1984 to 1988 was developed for each of the components of change. This information was then reviewed and studied by the following officials or agencies; the Attorney General, the Commissioner of Corrections, the management team for the Department of Corrections, the State Police, the Budget Office, the Comptroller's Office, and staff of the Criminal Justice Council.

With the advice of these persons, assumptions were established for each of the components of change. In all, 156 assumptions were agreed upon including projected admission rates and length of stay for each of the thirteen types of crime, gender, and types of imprisonment.

There are a number of very significant changes taking place in Delaware's criminal justice system that must be taken into account when considering the future pattern of the Department of Correction's incarcerated populations. In addition to the many assumptions in the forecast the impact of the new Truth in Sentencing law, new non violent misdemeanor sentencing guidelines, and the potential impact of future probation violation sentencing guidelines must be considered.

Truth in Sentencing, at this time, largely because of the necessary preparatory technical work, is not explicitly included in this forecast. The assumption used relating to Truth in Sentencing in this forecast is that its impact is population neutral. This is based on the Statistical Analysis Center's -- all things held constant -- assessment showing that the impact of Truth in Sentencing by itself is population neutral. This study, however, also acknowledges that the risks are on the high side. That is, if Truth in Sentencing has a population impact it will be an increase rather than a decrease in corrections' populations.

Another way Truth in Sentencing is expected to effect correction's populations is by altering the configurations of prisoners. The distribution of offenders across the types of crime will shift significantly with higher counts appearing for the more serious crimes such as homicide, assault and sex offenses and lower counts appearing for less serious crimes like fraud, theft, and burglary. The main reason for this change is that under Truth in Sentencing longer sentences will be served by serious offenders and shorter sentences will be served less serious offenders. The intent is to complete the technical work related to Truth in Sentencing, monitor the changes, and include them in the update forecast.

Beginning January 1990, the courts began to use a revised set of sentencing guidelines for non violent misdemeanors. The intent of the guidelines is to meet the goals of SENTAC in using less Level V and more alternative sentencing for this type offender. The impact of this policy change is not included in this forecast. The intent is to monitor this change and include the changes observed in an update forecast.

Much work has be done on developing guidelines relating to sentences for probation violations. Even though these guidelines are not in place yet, their impact has been anticipated. The assumptions in this forecast relating to admissions for probation violations show decreasing admissions for prison, but an increasing trend of admissions for detention. The reasoning behind this assumption is that as more offenders are sentenced directly to alternatives to Level V, there will be more probation violations, but that with revised sentencing guidelines fewer will be admitted to Level V.

THE "CONSENSUS" FORECAST

In this part of the document, the actual (1984 to 1988) population and the consensus forecast is provided for detention, jail, and prison by gender. Also included in this section is a brief summary of the key assumptions, and a graph of the Delaware's "at risk" population. Following this information, a separate forecast showing the type of crime, gender and types of imprisonment are presented as tables.

Between December 1988 and July 1989, Delaware has experienced its single largest increase in its incarcerated population -- about 350 offenders. This dramatic increase was largely influenced by significant increases for drug and probation violation offenders being admitted to prison. The drug population increased about 25 percent, and the probation violation population increased about 13 percent during this period. The impact of these crimes on the prison population is even more dramatic when the increase over the past five years is realized. The admission rate for both of these crime categories has tripled in this period. The increase in the incarcerated drug population is fairly well understood and expected, however the reasons for the increased population are not well understood.

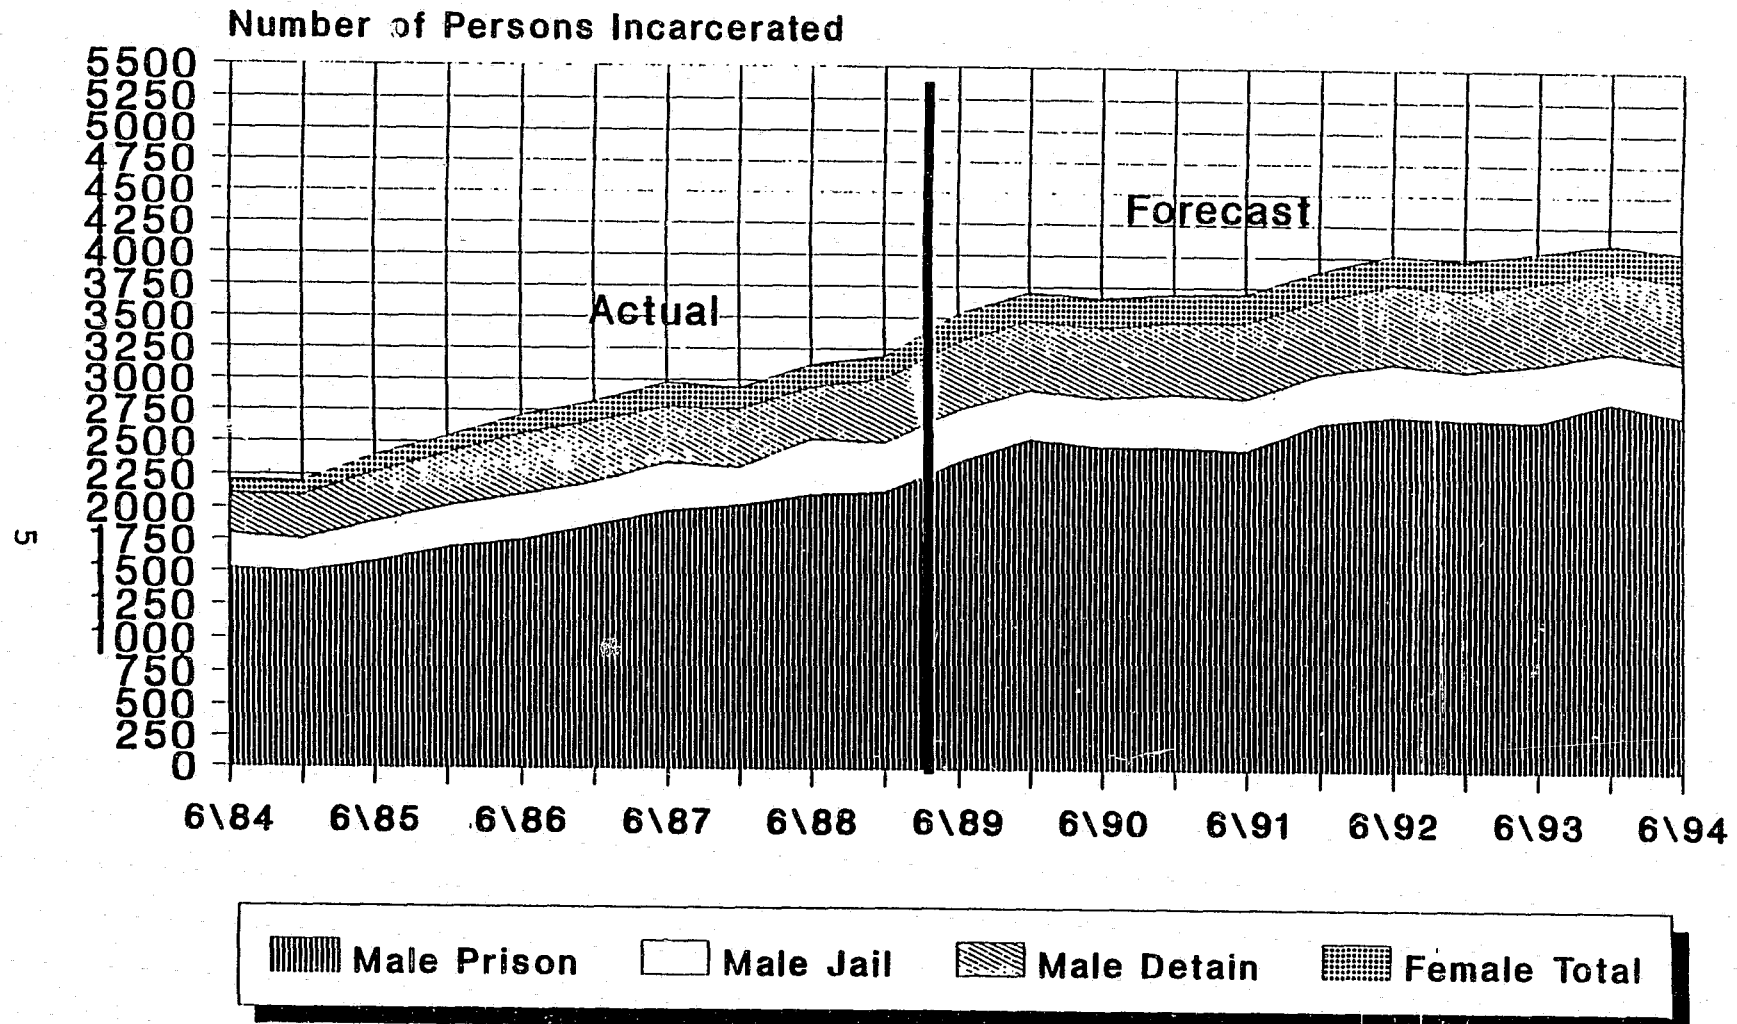

Although the rate of increase for the incarcerated population was at an all time high in 1989, it is not expected to continue at a linear rate. In fact the average forecasted population increase is about 160 per year out to 1994. This increase is lower than the growth experienced between 1984 and 1988 which was about 220 per year. Continued across the board increases for incarceration of drug offenders is projected, but the increase for probation violations is only expected for detention, because it is anticipated that new sentencing guidelines will stabilize admission to prison. Finally, the expected increase in assault admissions is expected to be 'relatively' slow and this increase is expected to mostly impact detention and jail and not the prison population.

Offsetting the upward pressures of admission rates for some of the crime categories are the stabilizing effect of the proposed probation violation sentencing guidelines, and the slowed growth for the number of at risk persons in Delaware. Between 1984 and 1988 the number of 18 to 39 year males increased by about 5 percent. This trend is expected to continue through 1990, after which the at risk male population is expected to increase very slowly. Between 1990 and 1994, the male at risk population is expected to increase only about 1 percent. The combination of increasing admission rates and increasing number of at risk males significantly contributed to the rapid rate of growth in the incarcerated population between 1984 and 1988. The stabilization of the at risk group contributes to the slower anticipated growth between 1989 and 1994.

FORECAST ASSUMPTIONS

In this part of the report, key incarceration population forecast assumptions are summarized. A summary of the major assumptions used in the forecast is provided on the following page. This list highlights the most significant reasons the incarcerated populations are forecasted to change. At this point in time, increases in the number of admissions for drug offenders, probation violators, and assaultive offenders are seen as the major causes for the forecasted increases in the incarcerated populations.

Following the summary of major assumptions are three pages that provide a detailed tabular review of males admission rates for the thirteen crime types for each type of incarcerated population -- detention, jail and prison. These tables allow for the comparison of admission rates between the different types of incarceration, as well as the comparison of rate of admission by crime type. For example, the 'total' detention rate for males in the last half of 1988 was almost 25 per 1,000 males between 18 and 39 years old (at risk males). In comparison, about 9 per 1,000 at risk males receive a sentence less than one year and about 4 per 1,000 at risk males receive a sentence greater than one year. The admission rates shown on these tables are for a semester, not a year. Annual admission rates can be calculated by adding any two adjoining admission rates. For instance, the annual detention rate in 1988 was 20.88 plus 24.64 or 45.52 per 1,000 males at risk.

Finally, a graph showing the changes in the male and female at risk populations is presented. This graph shows the rapid growth in the early 1980's for both the number of male and females between the ages of 18 and 39. This increase contributed to the rapid incarcerated population growth rate observed during this period. The growth in the number of 18 to 39 year olds is expected to level off significantly in the early 1990's. This stabilization in the size of the at risk population contributes to the slower incarcerated population growth pattern forecasted for the early 1990's. According to the forecast, the growth in the incarcerated population will be caused more by increasing admissions rates than by the increasing size of the at risk population.

MAJOR ASSUMPTIONS FOR
THE DELAWARE 1989 DETENTION AND INMATE FORECAST

DRUG RELATED ACTIVITY WILL INCREASE SIGNIFICANTLY

Current manpower and enforcements efforts aimed at illicit drugs are resulting in rapid increases of drug related cases. The rate of increase next year, however, will not be as fast as this year.

Detention: The admission rate is expected to increase from 3.57 to 5.57 per 1,000 males at risk over a 4 year period.
Jail: The admission rate is expected to increase from .39 to .59 per 1,000 males at risk over a 5 year period.
Prison: The admission rate is expected to increase from .59 to .88 per 1,000 males at risk over a 5 year period.

INCREASES IN ASSAULTIVE BEHAVIOR IS EXPECTED TO IMPACT ADMISSIONS

The increase in assaultive behavior is believed to be related to the increase in illicit drug activity.

Detention: The admission rate is expected to increase from 2.6 to 3.2 per 1,000 males at risk over a 3 year period.
Jail: The admission rate is expected to increase from .59 to .69 per 1,000 males at risk over a 4 year period.
Prison: No change. The admission rate will fluctuate between .41 and .49 per 1,000 males at risk for the duration of the forecast.

PROBATION VIOLATION PATTERNS ARE CHANGING

As the use of alternatives to Level V sanctions increase, so too will the number of probation violations. Fewer probation violators, however, will be given Level V sentences as the proposed probation violation guidelines are implemented and resources for alternatives to level V increase.

Detention: The admission rate is expected to increase from 5.7 to 11.6 per 1,000 at risk males over a 5 year period.
Jail: The admission rate is expected to decline from .77 to .55 over a 2 year period.
Prison: No Change. The admission rate will fluctuate between .43 and .48 for the duration of the forecast.

2. Sentences greater than a year are considered a prison sentence.

Delaware 'At Risk' Demographics

Population Ages 18 Through 39

THE ALTERNATIVE FORECASTS

One of the conclusions that was drawn relating to assumptions setting is that there is a fair amount of uncertainty relating to the projection of criminal justice events. There was also concern about not including 'some type of assumption' for some of the policy changes that are not included in the consensus forecast. To meet these concerns a "High" set and a "Low" set of correction's populations forecast assumptions were established by the Statistical Analysis Center. Except for the impact of Senate Bill 142, the alternative assumptions are best guess indicators that allow the impact of various sources of changes to be understood. There is no attempt to portray that the criminal justice community endorses these assumptions. The alternative assumption for Senate Bill 142 differs slightly from the initial report because it uses the first three months experience under the new law whereas the Senate Bill 142 report uses the first four months experience under the law.

The order of presentation in this section is:

1. Summary of alternative assumptions: High and Low (page 19).
2. A graph depicting the difference between High, Low, and Consensus assumptions for detention drug admission rates (page 20).
3. A graph comparing the combined detention, jail, and prison forecast using the High, Low, and Consensus assumptions (page 21).
4. A graph displaying the High Assumption Forecast (page 22).
5. A graph displaying the Low Assumption Forecast (page 23).
6. A table showing the actual and forecast corrections populations for each set of assumptions is provided (page 24).

"HIGH" FORECAST ASSUMPTIONS

1. Drug related cases will increase at a faster rate due to enhancements of law enforcement (\$1 million aid to local police and increases for State Police) and court, prosecutorial, and defense activities.
2. The burglary admission rate for each subpopulation of the forecast will increase by 5 percent a year. This increase would be related to drug related activity.
3. Theft, especially, auto theft is increasing. This will cause the theft admission rate for each subpopulation of the forecast to increase by 5 percent a year.
4. Probation violation admissions to Level V will continue to increase gradually.
5. Senate Bill 142 will cause the sentencing of 148 drug trafficking offenders a year to Level V for an average time served of 5.2 years.

"LOW" FORECAST ASSUMPTIONS

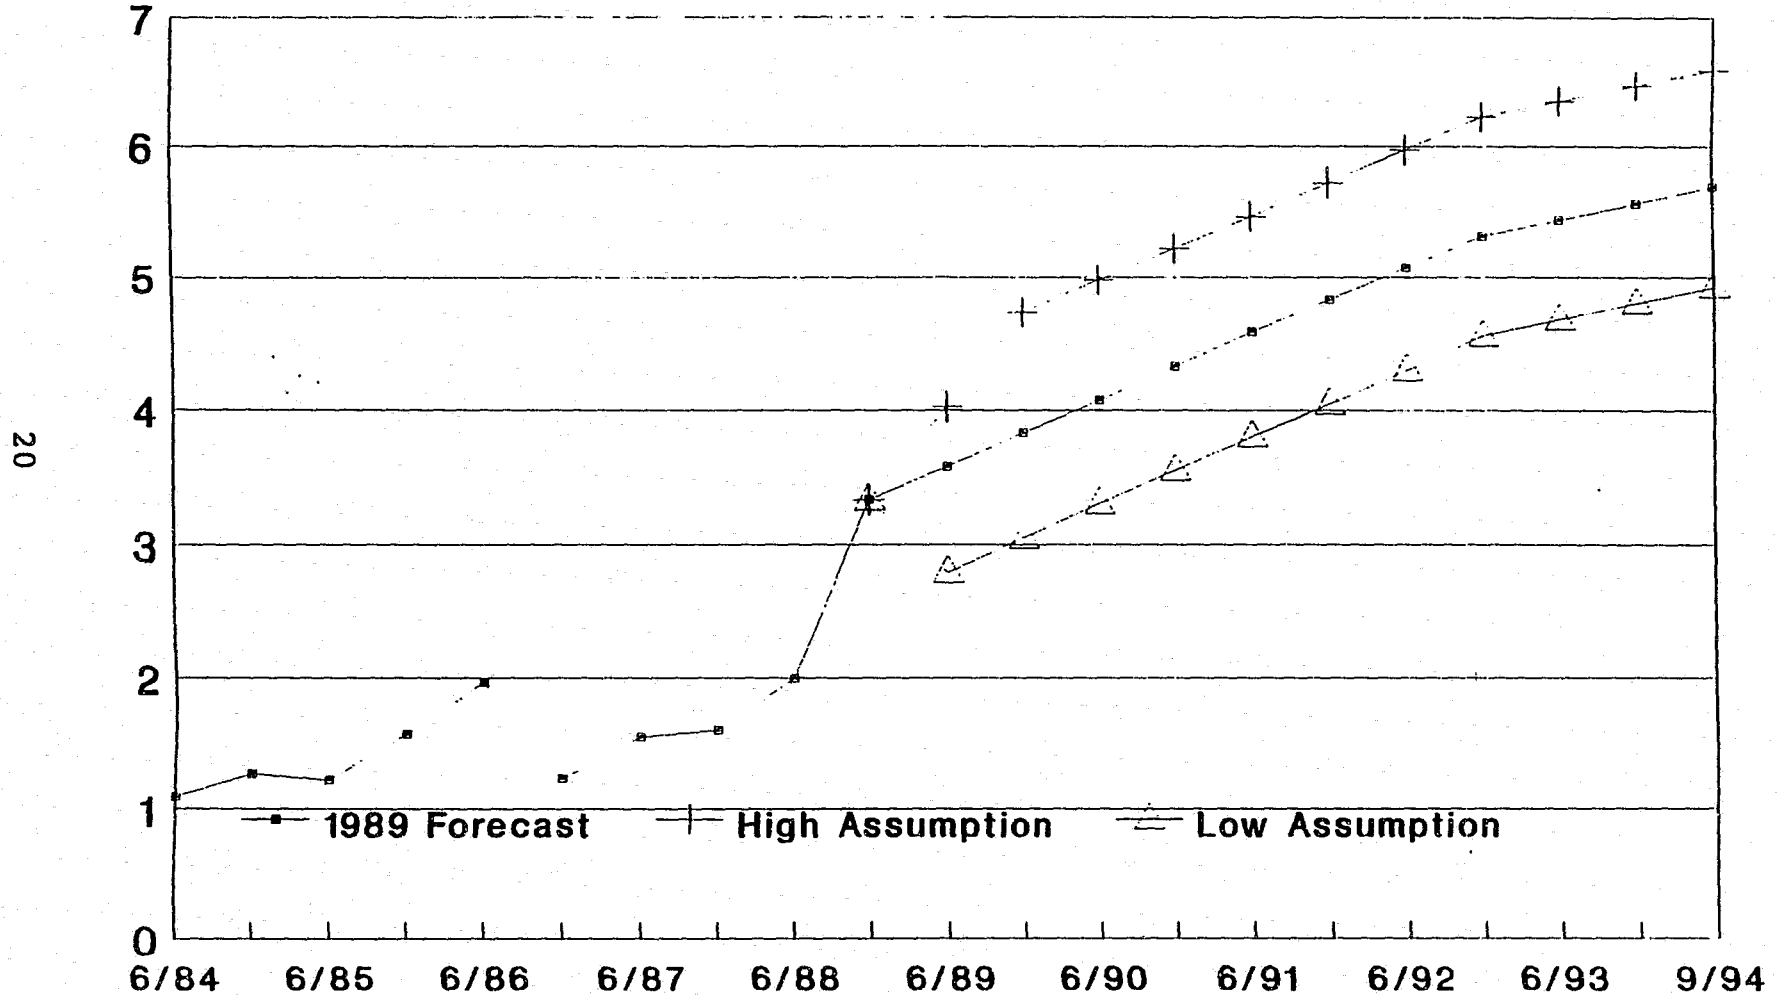

1. Drug related activity has reached a peak that cannot be sustained. Drug admissions will decrease before they begin to increase for the duration of the forecast.
2. The implementation of the new nonviolent misdemeanor sentencing guidelines will reduce both jail admissions and time served by 20 percent.
