Introduction

The objective of this publication is to supplement Crime in the United States statistics by providing Uniform Crime Reporting (UCR) data users with arrest statistics related to the age and race of arrestees. Age-specific arrest rates, the average ages of arrestees, and race-specific arrest rates are tabulated for Crime Index, violent crime, property crime, each Crime Index offense, and selected Part II offenses (forgery and counterfeiting, fraud, embezzlement, stolen property, weapons violations, sex offenses, drug abuse violations, and gambling) for each of the 28 years during the period 1965-1992. Included are age breakdowns representing juvenile and adults.

An age-specific arrest rate refers to the number of arrests made per 100,000 inhabitants belonging to a prescribed age group. Technical Note A describes the computational procedures used to derive age-specific arrest rates. Technical Note B describes the methodology used to compute the average of the arrestees. It is noted that the average age of the arrestees reflects non-criminal factors such as the age composition of the U.S. population. Therefore, any shift in the average age of the arrestees should not be immediately associated with a change in criminal pattern.

A race-specific arrest rate refers to the number of arrests made per 100,000 inhabitants belonging to a prescribed race. Race-specific data used in this publication have been updated, and therefore, may differ slightly from the national average as earlier released in Crime in the United States. The rates represent that portion of the population that contributed race statistics relating to the given offenses. The population coverage for race statistics is lower than that for age statistics due to the historical reporting patterns of UCR arrest data.

Methodological Issues

Arrest data presented in this report were obtained from the Uniform Crime Reporting (UCR) Program and cover the 28-year period, 1965-1992. UCR arrest data as they relate to age-specific arrest rates and race-specific arrest rates have undergone the following historical changes:

1. With respect to the classification of age, the categories "10 and under" and "11 and 12" were used through 1979. Starting in 1980, these categories were replaced by the age groups "under 10" and "10 through 12."
2. In 1980, the "age not known" category was dropped. The impact of this action was negligible as the category constituted only a fraction of one percent of total arrests.
3. UCR arrest data were gathered annually until 1973. In 1974, monthly reporting of arrest data was implemented.
4. In 1980, the race categories were revised. The classification White, Negro, Indian, Chinese, Japanese, and "all others" was used through 1979. In 1980, these categories were changed to White, Black, American Indian or Alaskan Native, and Asian or Pacific Islander.

In order to make the classification of age prior to 1974 comparable with the data published in succeeding years, the two categories involving individuals up to the age of 12 were combined into a "12 and under" category. With respect to 1965-1973 age-specific arrest rates and race-specific arrest rates, only the arrest data and the population of agencies having submitted complete annual arrest statistics were used. For the period 1974-1992, only arrest data from agencies having submitted complete 12-month reports and corresponding populations were utilized. The number of agencies represented in this report and their respective populations are listed below:

The size of the population pertaining to a prescribed age group was computed, for each year, by distributing the UCR contributors' population through the use of age distributions derived from U.S. Census publications. A similar procedure was used for race classifications - distributing the UCR contributors' population through the use of race distributions. Race classifications were divided into white and nonwhite. The nonwhite category includes all races other than white.

A Method for Computing the Average Age of Arrestees from UCR Data

UCR arrest data can be broken down into age groups; some are single-age categories (e.g., 20-year-old category) while others are multiple-age categories (e.g., 20-24-year-old category). This type of classification scheme is not a convenient basis for computing the average age of arrestees. A simple method of overcoming this difficulty is suggested below.

Let $[x', x'')$ denote the age interval $\{x | x' \leq x < x''\}$. For example, the UCR age group "25 through 29" is expressed as $[25, 30)$. Let $[x_0, x_1)$, $[x_1, x_2)$, $[x_2, x_3)$ be consecutive age intervals, and $f(x)$ be a quadratic function of the form $f(x) = 3ax^2 + 2bx + c$. It is required that the function $f(x)$ satisfies the following conditions:

$$(1). \quad \int_{x_0}^{x_1} f(x) dx = D, \quad \int_{x_1}^{x_2} f(x) dx = E, \quad \text{and} \quad \int_{x_2}^{x_3} f(x) dx = F,$$

where D, E, and F represent the number of UCR arrests for the consecutive age intervals $[x_0, x_1)$, $[x_1, x_2)$, and $[x_2, x_3)$.

The system of equations (1) can be solved for the unknowns a, b, and c. Using the notation

$$G = \begin{vmatrix} x_1^3 - x_0^3 & x_1^2 - x_0^2 & x_1 - x_0 \\ x_2^3 - x_1^3 & x_2^2 - x_1^2 & x_2 - x_1 \\ x_3^3 - x_2^3 & x_3^2 - x_2^2 & x_3 - x_2 \end{vmatrix} \quad H = \begin{vmatrix} D & x_1^2 - x_0^2 & x_1 - x_0 \\ E & x_2^2 - x_1^2 & x_2 - x_1 \\ F & x_3^2 - x_2^2 & x_3 - x_2 \end{vmatrix} \quad I = \begin{vmatrix} x_1^3 - x_0^3 & D & x_1 - x_0 \\ x_2^3 - x_1^3 & E & x_2 - x_1 \\ x_3^3 - x_2^3 & F & x_3 - x_2 \end{vmatrix} \quad J = \begin{vmatrix} x_1^3 - x_0^3 & x_1^2 - x_0^2 & D \\ x_2^3 - x_1^3 & x_2^2 - x_1^2 & E \\ x_3^3 - x_2^3 & x_3^2 - x_2^2 & F \end{vmatrix}$$

the solution for (1) is expressed as

$$(2). \quad a = H/G, \quad b = I/G, \quad \text{and} \quad c = J/G.$$

The distribution $f(x)/E$, $x_1 \leq x < x_2$, is then applied to obtain the average age of the arrestees on the interval $[x_1, x_2)$:

$$(3). \quad \int_{x_1}^{x_2} x \cdot f(x)/E \, dx = \frac{[9(x_2^4 - x_1^4)H + 8(x_2^3 - x_1^3)I + 6(x_2^2 - x_1^2)J]}{12EG}$$

Therefore, the average age is represented by the weighted sum over all age intervals. The result of this model is presented on pages 169-170.
