International Control of Cannabis: 1911-1925

Yet, the United States continued to press for international control of cannabis, as well as of other drugs. International drug control, if obtained, would have solved much of the American problem since opiates, coca leaves, and some cannabis were imported. The cool reception other nations gave the American proposals to control cannabis did not discourage the American delegation, but rather added one more proof of international perfidy. Since the earliest stirrings of an international campaign by the United States, American diplomats believed that other nations, some of whom received considerable revenue from the narcotic traffic, used various stratagems to discourage or nullify American efforts. That foreign governments should also oppose the inclusion of cannabis in a schedule of controlled drugs was almost a confirmation of the wisdom of controlling the cannabis market.

The United States, having started the antinarcotic campaign which resulted in the Hague Opium Convention of 1912, lost its premier role during the 1920s. The League of Nations assumed responsibility for the Hague Convention from the government of the Netherlands, a transfer which the United States would not recognize, Although the intricate formalities by which the State Department avoided any appearance of "recognizing" the League were certainly effective in achieving their goal, such actions also lost the United States its leadership in the world antinarcotic movement.

Repeatedly the League tried to involve the United States in planning for the international control of narcotics. While the United States maintained meticulously distant relations with the League's Advisory Committee on the Traffic in Opium and Other Dangerous Drugs, American cooperation did emerge. These hopeful signs were reversed, however, by the walkout of the American delegation, led by the chairman of the House Committee on Foreign Affairs, from the Second Geneva Opium Conference in February 1925.[12]

The delegates' exit was based on righteous indignation at the weak will of other nations: they left behind an opportunity to sign the first Convention which sought to bring the cannabis traffic between nations under international supervision.

Five years would pass before the United States would again sit in such an international meeting.

Rising Domestic Fear of Cannabis: 1920-1934

Fear of cannabis, or as it was beginning to be known, marihuana, was minor throughout most of the nation in the 1920s. Nevertheless, it still concerned the federal government. For example, in January 1929 Congress authorized two narcotic farms to be operated by the Public Health Service largely for the treatment of addicted federal prisoners. The law specifically defined "habit-forming narcotic drug" to include "Indian Hemp" and made habitual cannabis users, along with opium addicts, eligible for treatment.[13] Although there seems to have been almost no transfer of cannabis users to the two "farms," later known as the Lexington and Fort Worth Hospitals, it is significant that congressional worry about cannabis continued after passage of the Pure Food and Drug Act and clearly was present before the Federal Bureau of Narcotics (FBN) was established in 1930.

In certain areas of the United States, however, the fear of marihuana was more intense. These areas mostly coincided with concentrations of Mexican immigrants who tended to use marihuana as a drug of entertainment or relaxation. During the decade Mexican immigration, legal and illegal, rapidly increased into the region from Louisiana to California and up to Colorado and Utah. Mexicans were useful in the United States as farm laborers, and as the economic boom continued they received inducements to travel to the Midwest and the North where jobs in factories and sugar beet fields were available.[14]

Although employers welcomed them in the 1920s, Mexicans were also feared as a locus of crime and deviant social behavior. By the mid-1920s horrible crimes were attributed to marihuana and its Mexican purveyors. Legal and medical officers in New Orleans began studies on the evil, and within a few years published articles claiming that many of the region's crimes could be traced to marihuana. They implicated it particularly in the most severe crimes, for they believed it to be a sexual stimulant which removed civilized inhibitions.[15] As a result, requests were made to include marihuana in the federal law which controlled similar substances, the Harrison Narcotic Act.[16]

When the great Depression settled over America, the Mexicans, who had been welcomed by at least a fraction of the communities in which they lived, became an unwelcome surplus in regions devastated by unemployment. Considered a dangerous minority which should be induced to return to Mexico by whatever means seemed appropriate, they dwelt in isolated living groups. A contemporary writer described their mood in 1930, the first year of the Depression:

> A . . . factor in decreasing Mexican immigration is what officials call "the fear of God." It may be indefinite, but it is real; and the quality is standard all the way from California to Texas.
>
> And that *fear* hovers over every Mexican Colony in the Southwest is a fact that all who come in contact with them can readily attest. They fear examination by the border patrol when they travel; they fear arrest; they fear jail; they fear deportation; and whereas they used to write inviting their friends, they now urge them not to come.[17]

Naturally, the cotton, fruit, and vegetable growers in the Southwest and sugar beet farmers in Colorado, Michigan, Montana, and the Northwest favored further immigration. On the other hand, the American Federation of Labor understandably favored strict bars against foreign labor. But another group which worked for an end to Mexican immigration as energetically as those with economic interests did so for social reasons, afraid that mixture with an "inferior race" was causing "race suicide." Citizens anxious to preserve what they believed valuable in American life banded together into "Allied Patriotic Societies," "Key Men of America," or the group which united many of these associations, the "American Coalition" whose goal was to "Keep America American."[18] One of

the prominent members of the American Coalition, C. M. Goethe of Sacramento, saw marihuana and the problem of Mexican migrants as closely connected (*New York Times*, Sept 15, 1935, section IV, p 9):

> Marihuana, perhaps now the most insidious of our narcotics, is a direct by-product of unrestricted Mexican immigration. Easily grown, it has been asserted that it has recently been planted between rows in a California penitentiary garden. Mexican peddlers have been caught distributing sample marihuana cigarets to school children. Bills for our quota against Mexico have been blocked mysteriously in every Congress since the 1924 Quota Act. Our nation has more than enough laborers.

Southwest police and prosecuting attorneys likewise raised a continual protest to the federal government about the Mexicans use of the weed (H. J. Anslinger, oral communication, June 30, 1970).

In 1934 a US Marshall in Tulsa, Okla, wrote to the FBN, describing marihuana as a most dangerous and crime-causing drug which gave its users the feeling that they had "superman and superwoman" powers.[19] Newspapers occasionally headlined the weed as a cause of horrible crimes. For example, in 1933 the New York *Mirror* presented an article in its Sunday supplement on "Loco Weed, Breeder of Madness and Crime." That same year Dr. Walter Bromberg, a respected researcher, informed a meeting of the American Psychiatric Association that some authors had estimated the number of marihuana smokers in the southern states to be one out of four.[20] Dr. Bromberg, who did not subscribe to the alarm over marihuana displayed by some writers, nevertheless told of its spread from the South to the large cities and to New York, "where its use is widespread."[20](p317) He noted that marihuana's inclusion in the Harrison Narcotic Act had been requested. Although denying that crimes were directly and simply caused by marihuana and asserting that it was something like alcohol in its effect, nevertheless, on the basis of good physiological and psychological studies of cannabis, he was persuaded that it was "a primary stimulus to the impulsive life with direct expression in the motor field."[20](p320) Marihuana "releases inhibitions and restraints imposed by society and allows individuals to act out their drives openly," and "acts as a sexual stimulant," particularly to "overt homosexuals."[20](p320)

Dr. Bromberg's description of marihuana in 1933 differed in quality from the writings, for example, of New Orleans' Prosecuting Attorney who, in 1931 fearfully portrayed "Marihuana as a Developer of Criminals."[21] Yet, Dr. Bromberg's statements would not have calmed the apprehensive. Furthermore, neither the New Orleans studies, which began at least in the late 1920s nor Dr. Bromberg's research can be ascribed to any "campaign" by the FBN for a federal marihuana law. It is reasonable to assume that in the first few years of the 1930s, marihuana was known among police departments and civic leaders, particularly those connected with Mexican immigrants and even among scientific investigators as a drug with dangerous propensities. This situation led naturally to pressure on the federal government to take "some action" against marihuana. What was the attitude of the new Federal Bureau of Narcotics to the growing concern over marihuana?

The Decision To Seek a Federal Anti-marihuana Law: 1935-1937

During its first few years, the FBN, as judged from its annual reports, minimized the marihuana problem and felt that control should be vested in the state governments. The report published in 1932 commented that:

> This abuse of the drug is noted among the Latin-American or Spanish-speaking population. The sale of cannabis cigarettes occurs to a considerable degree in States along the Mexican border and in cities of the Southwest and West, as well as in New York City and, in fact, wherever there are settlements of Latin Americans.
>
> A great deal of public interest has been aroused by newspaper articles appearing from time to time on the evils of the abuse of marihuana, or Indian hemp, and more attention has been focused upon specific cases reported of the abuse of the drug than would otherwise have been the case. This publicity tends to magnify the extent of the evil and lends color to an inference that there is an alarming spread of the improper use of the drug, whereas the actual increase in such use may not have been inordinately large.[22]

That year the FBN strongly endorsed the new Uniform State Narcotic Act and repeatedly stressed that the problem could be brought under control if all the states adopted the Act.[23] As late as January 1937, Commissioner Anslinger was quoted as advising that the distribution of marihuana was an "intrastate problem" and that "hope for its ultimate control lies . . . in adoption by states of the Uniform Narcotic Act" (*New York Times*, Jan 3, 1937, section 3, p 6). Study of the annual reports reveal an increasing amount of space taken up by marihuana-associated crime after 1935, but the FBN continued to recommend the Uniform Act. There seem to be several reasons why the FBN delayed advocacy of a federal marihuana law.

The Commissioner recalls that marihuana caused few problems except in the Southwest and the Western states. There the growing alarm was directed at the "Mexicans" whom the "sheriffs and local police departments claimed got loaded on the stuff and caused a lot of trouble, stabbing, assaults, and so on." These states were "the only ones then affected . . . we didn't see it here in the East at all at that time." To Anslinger, the danger of marihuana did not compare with that of heroin and, after the Act's passage in October 1937, he states that he warned his agents to keep their eyes on heroin. If an agent started to make a series of arrests for marihuana possession, he was told to get back to "the hard stuff" (H. J. Anslinger, oral communication, June 30, 1970).

In addition to questioning whether a federal law would significantly ameliorate the "marihuana problem", the Commissioner also doubted the possibility of a law which would be constitutional. When the idea of a transfer tax was first broached to him by the Treasury's General Counsel, Herman Oliphant, he thought the notion was "ridiculous." Even after the decision was made to recommend the transfer tax to Congress, Anslinger "couldn't believe it would go through." It was not that he did not abstractly favor a marihuana law, but he had doubts about its constitutionality and about whether it would have any substantial effect on the problem of marihuana use (H. J. Anslinger, oral communication, June 30, 1970).

Lastly, the FBN had "put sandbags against the door" whenever anyone suggested it take over control of barbiturates and amphetamines. Such controls would mean very difficult problems in adjudicating "proper uses" and legitimate exceptions. The FBN preferred heroin as a target; it had no legal uses whatever. The whole question of enforcement was enormously simplified by tracking down a totally prohibited drug. Such an attitude would be consistent with hesitating to take on marihuana which, unlike heroin, was not imported but rather grew, as the Commissioner ruefully pointed out in 1936, "like dandelions," and which had a few legitimate uses.[11] It is significant that when marihuana was finally controlled by the federal government, almost all uses were outlawed with the exception of its use in bird seed (and then only if sterilized). The regulations for its use by physicians were so complicated that possibly no general physician has legally prescribed it since 1937.

The pressure for a federal anti-marihuana law was, Anslinger states, "political," traveling from local police forces in affected states to the governors, then to the Secretary of the Treasury, Henry Morgenthau, Jr., and from him to the General Counsel, and the Commissioner of Narcotics (H. J. Anslinger, oral communication, June 30, 1970). Apparently the decision to seek a federal law was made in 1935, since by January 1936 Anslinger was holding conferences on what course to take to accomplish that end. The FBN's search for grounds on which to base a federal law was almost unsuccessful. It first claimed that only the treaty-making power of the federal government could sustain an anti-marihuana statute. Such a treaty was then attempted, but with an appeal to other nations which had almost no chance of success. If the FBN did not actually want a federal marihuana law, it had performed faithfully the task it had been given and the effort was about to fall short, when, claims Anslinger, the Treasury's General Counsel ingeniously contrived the "transfer tax."

The pressure on the Treasury could well have been sufficient to induce such cleverness, as the following letter of 1936 (Anslinger papers, Box 6) from the editor of the Alamosa, Colo, *Daily Courier* suggests:

> Is there any assistance your Bureau can give us in handling this drug? Can you suggest campaigns? Can you enlarge your Department to deal with marihuana? Can you do anything to help us?
>
> I wish I could show you what a small marihuana cigarette can do to one of our degenerate Spanish speaking residents. That's why our problem is so great; the greatest percentage of our population is composed of Spanish speaking persons, most of whom are low mentally, because of social and racial conditions.
>
> While marihuana has figured in the greatest number of crimes in the past few years, officials fear it, not for what it had done, but for what it is capable of doing. They want to check it before an outbreak does occur.
>
> Through representatives of civic leaders and law officers of the San Luis Valley, I have been asked to write to you for help.

It was this kind of attitude which the Tax Act was designed "to placate," according to Anslinger, although he felt that little besides a law on the books could be offered the fearful citizens of the Southwest and their importuning officials (H. J. Anslinger, oral communication, June 30, 1970).

The Marihuana Tax Act

With the goal of trying to figure out how the federal government could pass such a law, the Narcotics Commissioner traveled in January 1936 to New York. There he met with a group of distinguished experts—a representative of the Foreign Policy Association; Joseph Chamberlain, Professor of Law at Columbia; Herbert L. May, a member of the permanent Central Board of the League of Nations; and Stuart Fuller, Assistant Chief of the Division of Far Eastern Affairs of the State Department. They concluded, Anslinger reported to Assistant Secretary of the Treasury Stephen B. Gibbons in a confidential memorandum, "that under the taxing power and regulation on interstate commerce it would be almost hopeless to expect any kind of adequate control."[12]

The Commissioner's recommendation was to follow the example of the Migratory Bird Act which had been declared constitutional, although it entered into the police powers of the states, because it was enacted as a requirement of international treaties with Canada and Mexico vs Holland, 252 US 416). He suggested a treaty requiring the control of marihuana. Once the treaty was ratified by the Senate, a federal law could be enacted which would not meet the constitutional blocks which he felt sure an anti-marihuana law would face if based on federal tax or commerce powers. Otherwise, the various details which imperiled simple prohibitition of marihuana were coming near solution:

> The State Department has tentatively agreed to this proposition, but before action is taken we shall have to dispose of certain phases of legitimate traffic; for instance, the drug trade still has a small medical need for marihuana, but has agreed to eliminate it entirely. The only place it is used extensively is by the veterinarian, and we can satisfy them by importing their medical needs.
>
> We must also satisfy the canary bird seed trade, and the Sherwin Williams Paint Company which uses hemp seed oil for drying purposes. We are now working with the Department of Commerce in finding substitutes for the legitimate trade, and after that is accomplished, the path will be cleared for the treaties and for federal law.[13]

The Commissioner was permitted to try his idea in June of the same year when he and Fuller represented the United States at the Conference for the Suppression of Illicit Traffic in Dangerous Drugs, held in Geneva. The United States sought to incorporate a requirement for domestic cannabis control in a treaty with 26 other nations. Perhaps to have additional leverage, or perhaps to dramatize the opposition of other governments, the US delegation asked just before the conference opened for permission to walk out if the American proposals were turned down. Still recalling the regrettable isolation which followed American departure from a similar conference in 1925, the State Department refused permission. So, although their views were outvoted, the delegation stayed, but did not sign the Convention. It was the only nation represented which did not do so.[14]

In the summer of 1936, therefore, it became obvious that there would be no law to placate the police of the Southwest unless some federal legislation under the traditional legal powers was enacted. General Counsel Oliphant then suggested the marihuana transfer tax about

which the Commissioner had strong doubts. (H. J. Anslinger, oral communication, June 30, 1970). The FBN loyally went along with the plan, though, and did its best to present a very strong case to Congress so as to ensure the greatest chance of passage. To Anslinger, Congress did not seem very concerned and "the only information they had was what we could give them in our hearings" before the Appropriations Committee or when the Tax Act was pending (H. J. Anslinger, oral communication, June 30. 1970).

The Treasury Department collected and considered scientific and medical opinion prior to the Tax Act hearings. But the desire to present a solid front when the Department appeared before the committees of Congress caused the officials to ignore anything qualifying or minimizing the evils of marihuana. As suggested above, the political pressure to put "something on the books" and the doubt that it could be done combined to make the marihuana hearings a classic example of bureaucratic overkill.

For a balanced interpretation of the hearings it is necessary to keep in mind that marihuana had been extravagantly condemned in the halls of Congress at least as early as 1910 and that in some areas of the nation it was at that time an object of horror to respectable and vocal citizens. The Bromberg study would have offered ample reason for concern, although it can be read as reassuring about the dangers of marihuana. After the Tax Act was passed, even Dr. Lawrence Kolb, Sr., certainly no booster of the FBN, warned that "Continued use of the drug causes insanity in many cases, but very unstable persons may have a short psychotic episode from only a few doses. . . . No matter by what means taken marihuana is a dangerous drug . . . much more harmful in certain respects than opium. . . . Enough is known about the drug to brand it as a dangerous one that needs to be strictly controlled" (Federal Probation 2:22-25, 1938).

The Treasury presentation to Congress may, therefore, have been exaggerated, but it was not without foundation in the current thinking of medical research. The government's witnesses could also be fairly confident that the congressmen had no preconceived favorable, or even informed opinions.

In the tradition of federal departments, everyone from the Treasury Department who appeared for the Tax Act gave it full support, while those who might have had more moderate views remained in the background. In particular, the Public Health Service was not represented, although the opinion of its Division of Mental Hygiene (now the National Institute of Mental Health) was available to the Treasury Department months prior to the hearings in April. Like other authorities, Dr. Walter L. Treadway was asked a series of questions about marihuana, probably in late 1936, when the Treasury was gathering expert opinion on the botanical, chemical, pharmacological, and behavior-modifying characteristics of cannabis. To the question "What are the proofs that the use of marihuana in any of its forms is habit forming or addictive, and what are the indications and positive proofs that such addiction develops socially undesirable characteristics in the users?" Dr. Treadway replied in full:

> Cannabis Indica does not produce dependence as in opium addiction. In opium addiction there is a complete dependence and when it is withdrawn there is actual physical pain which is not the case with cannabis. Alcohol more nearly produces the same effect as cannabis in that there is an excitement or a general feeling of lifting of personality, followed by a delirious stage, and subsequent narcosis. There is no dependence or increased tolerance such as in opium addiction. As to the social or moral degradation associated with cannabis it probably belongs in the same category as alcohol. As with alcohol, it may be taken a relatively long time without social or emotional breakdown. Marihuana is habit forming although not addicting in the same sense as alcohol might be with some people, or sugar, or coffee. Marihuana produces a delirium with a frenzy which might result in violence; but this is also true of alcohol.[26]

Having received Dr. Treadway's opinion and that of other authorities, the Department held a conference in the Treasury Building on Jan 14, 1937. Attending were 14 government officials and consultants, many of whom would testify a few months later before the Congressional committees deliberating on the Tax Act.[27] The purpose of the conference was to prepare a satisfactory legal definition of marihuana for the proposed legislation and to make some final arrangements for the presentation to Congress. Dr. Treadway was not present, although Dr. Carl Voegtlin, Chief of the Division of Pharmacology of the National Institute of Health, was there to assist, along with some chemists, pharmacologists, and Commissioner Anslinger. Two members of the Department's General Council's Office of the FBN's General Counsel were also present.

Fortunately, the conference was stenographically transcribed so that we can gain some appreciation of the attitudes surrounding the proposed legislation by the individuals who would present it to the House and Senate. Most of the conference was devoted to which part of the marihuana plant was pharmacologically active and what should be the name of the soon-to-be-taxed substance. Conversation was chiefly between the scientists and the Treasury lawyers and reveals that the Department did take into consideration scientific and medical opinion in the preparation of the marihuana legislation.

The upcoming hearing was on the minds of the participants. They knew that they would have to be prepared to rebut any suggested valid use or to include it through some exemption. The goal, however, was to have a prohibitive law to the fullest extent possible. Exceptions, particularly trade or medical exceptions, would make enforcement considerably more expensive and the Act's future cost concerned the conference. Such a desire prior to the Act and the lack of any increased appropriations for several years after the Act are consistent with Anslinger's claim that the Tax Act was no boon to his bureaucratic structure.[27]

Tennyson, the FBN's Counsel, emphasized to the group that every detail of the legislation would have to be worked out well ahead of the hearings, because "we have to support it and everything in it when we go before the Committee."[27] Perhaps a little defensively, the Commissioner wanted the group to know that the enterprise was not "a fishing expedition"; 296 seizures had been made of cannabis in 1936 alone. "The illicit traffic", he complained, "shows up in almost every state."[27]

After about an hour the scientific evidence on the plant and its active principle had been exhausted and the group reverted to the hearings. With regard to the effects of marihuana on the personality, S. G. Tipton of the Department's General Counsel's Office asked the Commissioner: "Have you lots of cases on this–horror stories–that's what we want."[25] The Commissioner did indeed have a collection. Then, in one of the most significant moments in the meeting, Anslinger asked the opinion of Dr. Voegtlin on whether marihuana actuallly produces insanity. The NIH pharmacology expert replied: "I think it is an established fact that prolonged use leads to insanity in certain cases, depending on the amount taken, of course. Many people take it and do not go insane, but many do."[25] To which the Secretary of the Treasury's Consulting Chemist, H. H. Wollner, responded with a characteristic comparison of American frankness to foreign vacillation: "At the League of Nations they white-washed the whole thing."[25]

The hearings before the House were held in late April and early May.[26] They were curious events. The Treasury's presentation to Congress has been adequately described many times, although no retelling has equalled reading the original transcript. As anticipated, the Representatives accepted whatever the Treasury Department asserted. The only witness to appear in opposition to the administration's proposal, AMA spokesman William C. Woodward, was barraged with hostile questions. One member of the Committee even questioned whether the veteran of many legislative battles dating back to before the Harrison Act actually represented the AMA. Nevertheless, he was able to get his message across: there was no need to burden the health profession with the bill's restrictions, the states could handle the problem without any additional assistance from the federal bureaucracy than was already available, and, finally, the evidence against marihuana was incomplete. He pointedly asked where the Public Health Service and Children's Bureau experts were, if it were true that the weed did have horrible physiologic effects and was wreaking havoc among America's school children. Dr. Woodward's arguments were ignored. One reason for his poor showing was that the AMA had aroused a lot of hostility by its successful defeat of President Roosevelt's plan to include health insurance in the Social Security Act. In a way reminiscent of the battle lines over the Harrison Act, the most "liberal" spokesmen were among the most eager to effect the protection of the public through the prohibition of cannabis.[3]

After the House and Senate hearings the bill was passed by Congress with no difficulty and came into effect on Oct 1, 1937. One of the regrettable aspects of the Marihuana Tax Act was that its role as a symbolic legislative gesture toward fearful groups made any qualification or moderation of the drug's intrinsic dangers a threat to the FBN. Anything less than prohibition would greatly diminish its value as a symbol as well as making enormously more difficult legal control with no additional appropriations. As regards enforcement, this task continued to be primarily the responsibility of local police aided by the occasional efforts of FBN agents. The arrest of those who violated the marihuana law was not difficult when compared to the task of stopping heroin smuggling, and, with no more agents, the FBN was able to put an impressive number of arrests before the public. After the Act's passage the educational campaign of the FBN stepped up, but other publicity campaigns, by lay organizations who claimed that the menace was still out of hand, were muted by FBN opposition. For example, the creators of the often reprinted marihuana poster warning children of the "Killer Drug Marihuana" were in fact put out of business by the FBN because their tactics were beginning to alarm the citizens of Chicago.[3] It may surprise some to learn that the FBN attacked such apostles of fear and had only contempt for their profit making. One reason for the FBN's action may have been its policy of designing educational literature in such a way that no youth would be tempted to try the substance.[3] Another reason may have been a reflection of the Commissioner's belief that the problem was under control in the vast majority of the nation's communities and any impression that it was out of control would only embarrass the Treasury Department.

On the other hand, the FBN resented later medical rebuttal of claims that marihuana was not an extreme danger, as, for example, the LaGuardia Report (1944).[27] Two responses from the FBN–closing down the Inter-State Narcotic Association for spreading disturbing scare stories and a strong and publically effective attack on the medical criticism of the FBN's position on marihuana–demonstrate both the effectiveness and the philosophy of the FBN. Two goals seem to have guided the FBN's actions: to show (1) that the FBN fought a great menace and (2) that the menace was under control.

Why the marihuana law was so eagerly desired by some and, when enacted, so effectively placating are fundamental questions. From the evidence examined, the FBN does not appear to have created the marihuana scare of the early 1930s nor can the law be simply ascribed to the Commissioner's determined will. Such scapegoating offers no more than it did in the era when marihuana was blamed for almost any vicious crime. When viewed from the narrow goal of placating fears about an "alien minority," the Act was serviceable for more than a quarter of a century. For the broader significance of the marihuana law and an understanding of the dynamics involved in prohibitive legislation, the Tax Act must be placed in its cultural and institutional context.

[PUBLIC—No. 238—75TH CONGRESS]
[CHAPTER 553—1ST SESSION]
[H. R. 6906]

AN ACT

To impose an occupational excise tax upon certain dealers in marihuana, to impose a transfer tax upon certain dealings in marihuana, and to safeguard the revenue therefrom by registry and recording.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That when used in this Act—

(a) The term "person" means an individual, a partnership, trust, association, company, or corporation and includes an officer or employee of a trust, association, company, or corporation, or a member or employee of a partnership, who, as such officer, employee, or member, is under a duty to perform any act in respect of which any violation of this Act occurs.

(b) The term "marihuana" means all parts of the plant Cannabis sativa L., whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture, or preparation of such plant, its seeds, or resin; but shall not include the mature stalks of such plant, fiber produced from such stalks, oil or cake made from the seeds of such plant, any other compound, manufacture, salt, derivative, mixture, or preparation of such mature stalks (except the resin extracted therefrom), fiber, oil, or cake, or the sterilized seed of such plant which is incapable of germination.

(c) The term "producer" means any person who (1) plants, cultivates, or in any way facilitates the natural growth of marihuana; or (2) harvests and transfers or makes use of marihuana.

(d) The term "Secretary" means the Secretary of the Treasury and the term "collector" means collector of internal revenue.

(e) The term "transfer" or "transferred" means any type of disposition resulting in a change of possession but shall not include a transfer to a common carrier for the purpose of transporting marihuana.

SEC. 2. (a) Every person who imports, manufactures, produces, compounds, sells, deals in, dispenses, prescribes, administers, or gives away marihuana shall (1) within fifteen days after the effective date of this Act, or (2) before engaging after the expiration of such fifteen-day period in any of the above-mentioned activities, and (3) thereafter, on or before July 1 of each year, pay the following special taxes respectively:

(1) Importers, manufacturers, and compounders of marihuana, $24 per year.

(2) Producers of marihuana (except those included within subdivision (4) of this subsection), $1 per year, or fraction thereof, during which they engage in such activity.

(3) Physicians, dentists, veterinary surgeons, and other practitioners who distribute, dispense, give away, administer, or prescribe

marihuana to patients upon whom they in the course of their professional practice are in attendance, $1 per year or fraction thereof during which they engage in any of such activities.

(4) Any person not registered as an importer, manufacturer, producer, or compounder who obtains and uses marihuana in a laboratory for the purpose of research, instruction, or analysis, or who produces marihuana for any such purpose, $1 per year, or fraction thereof, during which he engages in such activities.

(5) Any person who is not a physician, dentist, veterinary surgeon, or other practitioner and who deals in, dispenses, or gives away marihuana, $3 per year: *Provided*, That any person who has registered and paid the special tax as an importer, manufacturer, compounder, or producer, as required by subdivisions (1) and (2) of this subsection, may deal in, dispense, or give away marihuana imported, manufactured, compounded, or produced by him without further payment of the tax imposed by this section.

(b) Where a tax under subdivision (1) or (5) is payable on July 1 of any year it shall be computed for one year; where any such tax is payable on any other day it shall be computed proportionately from the first day of the month in which the liability for the tax accrued to the following July 1.

(c) In the event that any person subject to a tax imposed by this section engages in any of the activities enumerated in subsection (a) of this section at more than one place, such person shall pay the tax with respect to each such place.

(d) Except as otherwise provided, whenever more than one of the activities enumerated in subsection (a) of this section is carried on by the same person at the same time, such person shall pay the tax for each such activity, according to the respective rates prescribed.

(e) Any person subject to the tax imposed by this section shall, upon payment of such tax, register his name or style and his place or places of business with the collector of the district in which such place or places of business are located.

(f) Collectors are authorized to furnish, upon written request, to any person a certified copy of the names of any or all persons who may be listed in their respective collection districts as special taxpayers under this section, upon payment of a fee of $1 for each one hundred of such names or fraction thereof upon such copy so requested.

SEC. 3. (a) No employee of any person who has paid the special tax and registered, as required by section 2 of this Act, acting within the scope of his employment, shall be required to register and pay such special tax.

(b) An officer or employee of the United States, any State, Territory, the District of Columbia, or insular possession, or political subdivision, who, in the exercise of his official duties, engages in any of the activities enumerated in section 2 of this Act shall not be required to register or pay the special tax, but his right to this exemption shall be evidenced in such manner as the Secretary may by regulations prescribe.

SEC. 4. (a) It shall be unlawful for any person required to register and pay the special tax under the provisions of section 2 to import, manufacture, produce, compound, sell, deal in, dispense,

distribute, prescribe, administer, or give away marihuana without having so registered and paid such tax.

(b) In any suit or proceeding to enforce the liability imposed by this section or section 2, if proof is made that marihuana was at any time growing upon land under the control of the defendant, such proof shall be presumptive evidence that at such time the defendant was a producer and liable under this section as well as under section 2.

SEC. 5. It shall be unlawful for any person who shall not have paid the special tax and registered, as required by section 2, to send, ship, carry, transport, or deliver any marihuana within any Territory, the District of Columbia, or any insular possession, or from any State, Territory, the District of Columbia, any insular possession of the United States, or the Canal Zone, into any other State, Territory, the District of Columbia, or insular possession of the United States: *Provided*, That nothing contained in this section shall apply to any common carrier engaged in transporting marihuana; or to any employee of any person who shall have registered and paid the special tax as required by section 2 while acting within the scope of his employment; or to any person who shall deliver marihuana which has been prescribed or dispensed by a physician, dentist, veterinary surgeon, or other practitioner registered under section 2, who has been employed to prescribe for the particular patient receiving such marihuana; or to any United States, State, county, municipal, District, Territorial, or insular officer or official acting within the scope of his official duties.

SEC. 6. (a) It shall be unlawful for any person, whether or not required to pay a special tax and register under section 2, to transfer marihuana, except in pursuance of a written order of the person to whom such marihuana is transferred, on a form to be issued in blank for that purpose by the Secretary.

(b) Subject to such regulations as the Secretary may prescribe, nothing contained in this section shall apply—

(1) To a transfer of marihuana to a patient by a physician, dentist, veterinary surgeon, or other practitioner registered under section 2, in the course of his professional practice only: *Provided*, That such physician, dentist, veterinary surgeon, or other practitioner shall keep a record of all such marihuana transferred, showing the amount transferred and the name and address of the patient to whom such marihuana is transferred, and such record shall be kept for a period of two years from the date of the transfer of such marihuana, and subject to inspection as provided in section 11.

(2) To a transfer of marihuana, made in good faith by a dealer to a consumer under and in pursuance of a written prescription issued by a physician, dentist, veterinary surgeon, or other practitioner registered under section 2: *Provided*, That such prescription shall be dated as of the day on which signed and shall be signed by the physician, dentist, veterinary surgeon, or other practitioner who issues the same: *Provided further*, That such dealer shall preserve such prescription for a period of two years from the day on which such prescription is filled so as to be readily accessible for inspection by the officers, agents, employees, and officials mentioned in section 11.

(3) To the sale, exportation, shipment, or delivery of marihuana by any person within the United States, any Territory, the District

of Columbia, or any of the insular possessions of the United States, to any person in any foreign country regulating the entry of marihuana, if such sale, shipment, or delivery of marihuana is made in accordance with such regulations for importation into such foreign country as are prescribed by such foreign country, such regulations to be promulgated from time to time by the Secretary of State of the United States.

(4) To a transfer of marihuana to any officer or employee of the United States Government or of any State, Territorial, District, county, or municipal or insular government lawfully engaged in making purchases thereof for the various departments of the Army and Navy, the Public Health Service, and for Government, State, Territorial, District, county, or municipal or insular hospitals or prisons.

(5) To a transfer of any seeds of the plant Cannabis sativa L. to any person registered under section 2.

(c) The Secretary shall cause suitable forms to be prepared for the purposes before mentioned and shall cause them to be distributed to collectors for sale. The price at which such forms shall be sold by said collectors shall be fixed by the Secretary, but shall not exceed 2 cents each. Whenever any collector shall sell any of such forms he shall cause the date of sale, the name and address of the proposed vendor, the name and address of the purchaser, and the amount of marihuana ordered to be plainly written or stamped thereon before delivering the same.

(d) Each such order form sold by a collector shall be prepared by him and shall include an original and two copies, any one of which shall be admissible in evidence as an original. The original and one copy shall be given by the collector to the purchaser thereof. The original shall in turn be given by the purchaser thereof to any person who shall, in pursuance thereof, transfer marihuana to him and shall be preserved by such person for a period of two years so as to be readily accessible for inspection by any officer, agent, or employee mentioned in section 11. The copy given to the purchaser by the collector shall be retained by the purchaser and preserved for a period of two years so as to be readily accessible to inspection by any officer, agent, or employee mentioned in section 11. The second copy shall be preserved in the records of the collector.

SEC. 7. (a) There shall be levied, collected, and paid upon all transfers of marihuana which are required by section 6 to be carried out in pursuance of written order forms taxes at the following rates:

(1) Upon each transfer to any person who has paid the special tax and registered under section 2 of this Act, $1 per ounce of marihuana or fraction thereof.

(2) Upon each transfer to any person who has not paid the special tax and registered under section 2 of this Act, $100 per ounce of marihuana or fraction thereof.

(b) Such tax shall be paid by the transferee at the time of securing each order form and shall be in addition to the price of such form. Such transferee shall be liable for the tax imposed by this section but in the event that the transfer is made in violation of section 6 without an order form and without payment of the transfer tax imposed by this section, the transferor shall also be liable for such tax.

(c) Payment of the tax herein provided shall be represented by appropriate stamps to be provided by the Secretary and said stamps shall be affixed by the collector or his representative to the original order form.

(d) All provisions of law relating to the engraving, issuance, sale, accountability, cancelation, and destruction of tax-paid stamps provided for in the internal-revenue laws shall, insofar as applicable and not inconsistent with this Act, be extended and made to apply to stamps provided for in this section.

(e) All provisions of law (including penalties) applicable in respect of the taxes imposed by the Act of December 17, 1914 (38 Stat. 785; U. S. C., 1934 ed., title 26, secs. 1040–1061, 1383–1391), as amended, shall, insofar as not inconsistent with this Act, be applicable in respect of the taxes imposed by this Act.

SEC. 8. (a) It shall be unlawful for any person who is a transferee required to pay the transfer tax imposed by section 7 to acquire or otherwise obtain any marihuana without having paid such tax; and proof that any person shall have had in his possession any marihuana and shall have failed, after reasonable notice and demand by the collector, to produce the order form required by section 6 to be retained by him, shall be presumptive evidence of guilt under this section and of liability for the tax imposed by section 7.

(b) No liability shall be imposed by virtue of this section upon any duly authorized officer of the Treasury Department engaged in the enforcement of this Act or upon any duly authorized officer of any State, or Territory, or of any political subdivision thereof, or the District of Columbia, or of any insular possession of the United States, who shall be engaged in the enforcement of any law or municipal ordinance dealing with the production, sale, prescribing, dispensing, dealing in, or distributing of marihuana.

SEC. 9. (a) Any marihuana which has been imported, manufactured, compounded, transferred, or produced in violation of any of the provisions of this Act shall be subject to seizure and forfeiture and, except as inconsistent with the provisions of this Act, all the provisions of internal-revenue laws relating to searches, seizures, and forfeitures are extended to include marihuana.

(b) Any marihuana which may be seized by the United States Government from any person or persons charged with any violation of this Act shall upon conviction of the person or persons from whom seized be confiscated by and forfeited to the United States.

(c) Any marihuana seized or coming into the possession of the United States in the enforcement of this Act, the owner or owners of which are unknown, shall be confiscated by and forfeited to the United States.

(d) The Secretary is hereby directed to destroy any marihuana confiscated by and forfeited to the United States under this section or to deliver such marihuana to any department, bureau, or other agency of the United States Government, upon proper application therefor under such regulations as may be prescribed by the Secretary.

SEC. 10. (a) Every person liable to any tax imposed by this Act shall keep such books and records, render under oath such statements, make such returns, and comply with such rules and regulations as the Secretary may from time to time prescribe.

(b) Any person who shall be registered under the provisions of section 2 in any internal-revenue district shall, whenever required so to do by the collector of the district, render to the collector a true and correct statement or return, verified by affidavits, setting forth the quantity of marihuana received or harvested by him during such period immediately preceding the demand of the collector, not exceeding three months, as the said collector may fix and determine. If such person is not solely a producer, he shall set forth in such statement or return the names of the persons from whom said marihuana was received, the quantity in each instance received from such persons, and the date when received.

SEC. 11. The order forms and copies thereof and the prescriptions and records required to be preserved under the provisions of section 6, and the statements or returns filed in the office of the collector of the district under the provisions of section 10 (b) shall be open to inspection by officers, agents, and employees of the Treasury Department duly authorized for that purpose, and such officers of any State, or Territory, or of any political subdivision thereof, or the District of Columbia, or of any insular possession of the United States as shall be charged with the enforcement of any law or municipal ordinance regulating the production, sale, prescribing, dispensing, dealing in, or distributing of marihuana. Each collector shall be authorized to furnish, upon written request, copies of any of the said statements or returns filed in his office to any of such officials of any State or Territory, or political subdivision thereof, or the District of Columbia, or any insular possession of the United States as shall be entitled to inspect the said statements or returns filed in the office of the said collector, upon the payment of a fee of $1 for each 100 words or fraction thereof in the copy or copies so requested.

SEC. 12. Any person who is convicted of a violation of any provision of this Act shall be fined not more than $2,000 or imprisoned not more than five years, or both, in the discretion of the court.

SEC. 13. It shall not be necessary to negative any exemptions set forth in this Act in any complaint, information, indictment, or other writ or proceeding laid or brought under this Act and the burden of proof of any such exemption shall be upon the defendant. In the absence of the production of evidence by the defendant that he has complied with the provisions of section 2 relating to registration or that he has complied with the provisions of section 6 relating to order forms, he shall be presumed not to have complied with such provisions of such sections, as the case may be.

SEC. 14. The Secretary is authorized to make, prescribe, and publish all necessary rules and regulations for carrying out the provisions of this Act and to confer or impose any of the rights, privileges, powers, and duties conferred or imposed upon him by this Act upon such officers or employees of the Treasury Department as he shall designate or appoint.

SEC. 15. The provisions of this Act shall apply to the several States, the District of Columbia, the Territory of Alaska, the Territory of Hawaii, and the insular possessions of the United States, except the Philippine Islands. In Puerto Rico the administration of this Act, the collection of the special taxes and transfer taxes, and the issuance of the order forms provided for in section 6 shall be

performed by the appropriate internal-revenue officers of that government, and all revenues collected under this Act in Puerto Rico shall accrue intact to the general government thereof. The President is hereby authorized and directed to issue such Executive orders as will carry into effect in the Virgin Islands the intent and purpose of this Act by providing for the registration with appropriate officers and the imposition of the special and transfer taxes upon all persons in the Virgin Islands who import, manufacture, produce, compound, sell, deal in, dispense, prescribe, administer, or give away marihuana.

SEC. 16. If any provision of this Act or the application thereof to any person or circumstances is held invalid, the remainder of the Act and the application of such provision to other persons or circumstances shall not be affected thereby.

SEC. 17. This Act shall take effect on the first day of the second month after the month during which it is enacted.

SEC. 18. This Act may be cited as the "Marihuana Tax Act of 1937."

Approved, August 2, 1937.

MARIHUANA

The legitimate sources and uses of Cannabis have been controlled by law, but the drug will continue to jeopardize American children until the many illegal sources of production and the rampant illegal peddling of "reefers" are curbed

By GEORGE C. SCHICKS
Assistant Dean
Rutgers University College of Pharmacy

"Do you want to be happy?
Hey, kid! Do you want to be happy?"

AND so our children, homeward bound from school, are being introduced to the greatest curse today in the form of a drug—the deliriant narcotic—Cannabis.* Cannabis is so labelled, not because as a drug it is more dangerous than opium, cocaine, heroin or morphine, for it is not habit-forming in the same sense as are the aforenamed drugs, but by reason of the fact that smokers of Cannabis return to its use because of pleasurable sensations. The curse lies in the fact that this deliriant narcotic drug is practically uncontrolled in so far as its growth, cultivation, harvesting and peddling are concerned. Cannabis grows in practically every State in this country. It requires no special care, growing abundantly along roadsides, vacant lots, in fields, and rubbish heaps. The fact that it grows so readily with little or no attention makes its control very difficult.

Delusion, remorse, and insanity stalk in the wake of this drug. In the course of its action, Cannabis has been the excuse offered for atrocious attacks, for robberies, thefts, and murders. A drug which can cause persons to commit these acts without realizing they are wrong is as dangerous a weapon to humanity as has ever been used by man.

The effects of Cannabis may be obtained from smoking, chewing, or swallowing the drug. The quickest effect is probably obtained by smoking. The volatile principles enter the lungs and are then taken into the circulation. The drug acts by affecting the higher nerve centers in the brain. The action is different in different individuals. The first effect is usually one of exhilaration. The smoker becomes happy—a feeling of self-sufficiency engulfs him, and all is well with the world. The mind is free from restraint, imaginary experiences become as real as actual experiences. These may be of a pleasing or of a sensual nature, or may be gruesome. Self-control is lost. The sense of time and distance is greatly exaggerated. Minutes seem as hours or years, while objects near at hand may appear far away. If enough of the drug has been smoked, the exhilarating action soon wears off and depression sets in. There may be a fear of impending death. The temperament or idiosyncrasies of the person may assert themselves at this point, and the surroundings and environment may play an important part in the action of the addict. The person may be very susceptible to suggestion. There may be a strong urge toward the commission of criminal acts. The addict at this stage is dangerous. He may commit the most shocking or violent of crimes and not know what he is doing. Finally he falls into a stupor or deep sleep, wakens the next morning without a hangover, and perhaps realizes for the first time some unfortunate act he has committed. Fortunately, all excessive users of Cannabis do not commit crime, but more cases of crime as a result of the drug action are being reported. Prolonged use of the drug causes defective mentality. A letter which came to the author's office a few days ago relates the case of a young man who killed his best friend while under the influence of the drug. When he regained his normal consciousness he realized what he had done, and gave himself up to

* In a large eastern metropolitan district peddlers of Mexican Reefers solicit their trade by accosting prospective customers with "Do you want to be happy?"

. . . . depraver of youth

Photos by Rudy Arnold from Black Star

Left: The peddler rolls a "reefer" or marihuana cigarette which he will sell to a high school youth for twenty-five cents.

Above: Police officials destroying five acres of growing marihuana near New York City.

Right: A member of the New York City Police Department examines a marihuana plant.

the police. He has since been committed to a home for the insane, having been an addict for some time.

The man on the street has come to know this brain-twisting drug through the medium of the Mexican Reefer, the cigarette which changes paupers into kings, weaklings into giants, minutes into years, impossibility into possibility and wrong into right. The name given the same cigarette varies in different sections of the country, but whether it be Mary Warners, Goof Butts, Muggies, Tea, Gage, or Mexican Reefers, the little white fag, closed at either end, contains the same gloom-dispelling delirant narcotic—Cannabis.

Cannabis in many sections of the country is incorrectly termed Loco Weed. Botanically, Loco Weed is a legume, the chief Loco plants being Astragallus Lamberti and Astragallus Mollissimus.

Scientifically, Cannabis is known by many names; i. e., Cannabis Indica, because of its importation from India; Indian Hemp, American Hemp, Gauza, Ganjah, Churras, Hashish and Bhang. It is recognized in the Mexican Pharmacopoeia as Marihuana and in the United States Pharmacopoeia as Cannabis Sativa Linne.

Cannabis was first mentioned in the United States Pharmacopoeia of 1870, where two varieties were described—Cannabis Americana and Cannabis Indica. The 1880 editions of the United States Pharmacopoeia retained these varieties, but later editions dropped the American variety and gave recognition only to the Asiatic plant. In the 1910 edition no distinction is made between Cannabis Sativa and Cannabis Indica. The present Pharmacopoeia, 1930 (official 1936), recognized Cannabis as the dried flowering tops of the pistillate plants of Cannabis Sativa Linne belonging to the Moraceae Family.

Years ago it was thought that there were a great number of different species of Cannabis. The same plant grown in several different geographical locations proved that the plant changes its characteristics, which causes some confusion, but now it is agreed that all Cannabis belongs to the species Cannabis Sativa.

Herbs, shrubs and trees belonging to the Moraceae Family, of which Cannabis is a member, are characterized by a milky juice. This juice exists in laticiferous tubes and may be present in the entire plant or confined to fibrovascular regions, as in the fig. Cannabis, because of its dangerous properties, is quite generally considered as having no good use in medicine. It is seldom prescribed in the treatment of disease. In the United States Pharmacopoeia and National Formulary Prescription Survey the drug appeared in seven out of every 1,000 prescriptions. Other drugs with less harmful properties and with more satisfactory results are available to the medical profession.

Cannabis dates back to prehistoric times. Its use as an intoxicant is lost in antiquity. The name Cannabis, Hashish or Bhang, is commonly found in the literature of Arabia and India. Constant reference is made to this drug in Arabian Nights. Here it speaks of "Going up to Gharib, he blew the powdered bhang into his nostrils till he lost his senses." Galen makes mention of the intoxication caused by hemp. The "Bushman and other wild tribes of South Africa threw their Dakha (Cannabis Indica) on the fire and sat around it inhaling the intoxicating fumes." In the "Story of the Three Sharpers" the word referred to as "bast" is bhang or Cannabis. Flying bhang refers to the best quality; in other words, that which flows fastest to the brain. Quoting, "Lastly she brought them coffee, which they drank; but hardly had it settled in their maws when the forty thieves fell to the ground, for she had mixed up with it Flying Bhang, and those who had drunk thereof became like dead men." In the History of the Lovers of Syria, the Bhang mixture was probably concentrated Bhang with opium. A drachm or teaspoonful of it would overthrow an elephant. It states, "Hardly had it settled well in his stomach when his head farwent his feet and he was as though he had been a year asleep."

In Hindustan, Persia, and other Eastern parts, hemp, representing both male and female plants, is used for its narcotic and intoxicating effect. Bhang is made from the best larger leaves and tops of both plants. These are dried, but will lose their effect unless carefully preserved. In some places where the drug is cultivated, care is taken to destroy all the male plants. It is thought that by so doing the resinous content of the female plant is increased. At least a great production of seeds is eliminated. Both male and female plants may be physiologically active, but the female plant is preferred because of its greater resin content.

Ganjah or Gunjah represents the carefully dried female tops stuck together with resin from the plants. The product is marketed in round or flat bundles two to four feet long and three inches in diameter. That coming from Bengal is usually round, and considered a better grade than that from Bombay, which is marketed in flat bundles. These bundles are made to assume their shape by the feet of natives, who tread the plant, working the resin into the leaves and tops, and thus shaping them.

In India, Cannabis, known as Ganjah, deteriorates rapidly on keeping. After having been stored a year it is but one-fourth as active as the fresh drug. In two years time it is considered practically inactive. After two years the Indian Government requires that the drug be destroyed in the presence of government officers. Much of this older product probably finds its way into the world market.

The crude method in Baluchistan for collecting Charas or Churrus, the resin or oleoresin from Cannabis, is interesting if not altogether appealing to the senses. Munch and other authorities state that the fresh cut flowering tops are dried and beaten on woolen carpets. The dust which is shaken off contains the active principle called "rup." An inferior grade, "tahgalim," is obtained from shaking the rug a second time. The third shaking produces "Ganja," the poorest grade. The resin is said also to be collected by men clothed in leather suits who thrash around in the standing plants, the resin attaching itself to the leather, which resin is subsequently scraped off. Horses are also driven through the fields of living plants, rubbing and brushing over the leaves and stalks, with the result that the resin is deposited on their bodies and is then scraped off. After the resin has been collected in the aforesaid manner it is rolled into balls for convenience in use. This resin is also known as the Hashish (or Hasheesh) of the Arabs. Hashish is the name of the intoxicating confection made of hemp, aromatic roots and sugar and chewed by the Hashshashins in their escapades of daring, violence and murder. Through the atrocities of the Hashshashins they became known as Assassins.

Cannabis Sativa was first known in America about 1630. It is used commercially as a source of hemp rope and hemp cloth. The long, fibrous outer layers of the stem, easily separated, are tough and strong. Hemp may be either the male or female plant, but when used in official medicine as recognized by the United States Pharmacopoeia, only the flowering tops of the female plant are used.

A great many attempts have been made to isolate the active principle of Cannabis. This principle no doubt is contained in the resin. Many names have been given to principles extracted from the plant, but Cannabinol at present is quite generally accepted as

the active principle. It is a red oil separated by extraction from the plant.

A special color reaction test used to detect Cannabis and its preparations has been developed by William Beam of the Welcome Tropical Research Laboratories in Khartoum. A petroleum ether extract of the suspected material is prepared and evaporated to a dryness in a test tube. A few cubic centimeters of a reagent made by saturating absolute alcohol with dry hydrogen chloride gas is added to the residue in the tube. If Cannabis is present the liquid acquires a bright cherry red color, which is destroyed by adding either water or alcohol.

Viehoever states a special chemical field test for Cannabis in the presence of other substances in cigarettes:

> A portion, one-third or more, of a suspected cigarette (without the wrapper), or as little as one-tenth of a gram of the suspected weed, dried and somewhat comminuted, is placed in small, wide-mouthed containers. To it is added, followed by immediate shaking for five seconds, a small but excessive amount in volume of a test solution, consisting of benzene (nine parts) and sodium hydroxide (2 percent) dissolved in ethyl alcohol (one part). The liquid is then immediately decanted into an evaporating cup. Very satisfactory results have been obtained when Cannabis was extracted with benzene for fifteen to ninety seconds, the slightly yellowish benzene solution then immediately decanted and mixed with equal amounts of alcoholic sodium hydroxide (2 percent).
>
> Rapid removal of the solvent prevents the excessive extraction of green and yellow plant pigments (chlorophyll, etc.), which, more or less, interfere with the speedy and unmistakable color development of the test.
>
> A positive test, recognized by the appearance of a color change from slightly yellowish to pinkish within one to two minutes, becoming deeper red after standing a short time, indicated the presence of cannabinol. For its further characterization, spontaneous evaporation of the reddish liquid leaves a dry, partially pinkish to violet, rather persistent residue. This dissolves to an orange-red solution in strong ammonia and with a violet to almost bluish-violet color in acetone.

It is a difficult problem to standardize Cannabis or Marihuana for internal use in medicine. There is no chemical process by which the action of the drug can be determined. It was thought that the resin content could be depended upon to represent the degree of activity of the drug, but this has proven unsuccessful. The United States Pharmacopoeia X standardizes the drug by the physiological assay on dogs. This test is based on the degree of incoordination produced in dogs in comparison with that produced by a standard preparation. Fox terriers react well to this test, and can be used about once a week for perhaps a period of a year. After the dog is used for a period of time the detrimental effect of the drug on the brain demonstrates itself.

61-801 O - 77 - 48

. . .

The dog is used in this assay because it is an intelligent animal and possesses a central nervous system more like that of man than any other laboratory animal. The response of the dog to the action of Marihuana in many respects is similar to that produced in man. Despite the effect the drug has on the dog, the physiological test is not a satisfactory one, because the real potency of the drug cannot be accurately determined. For this reason the United States Pharmacopoeia XI dropped the test. The drug should be dropped from the pharmacopoeia altogether. A prescription calling for Cannabis or any of its preparations cannot be filled in most drug stores, for pharmacists are refusing to stock it under the new law. It is a drug which can wisely be discarded.

The United States Pharmacopoeia XI and National Formulary VI recognize the following preparations of the drug or preparations in which Cannabis is an ingredient: Extract of Cannabis, dose ¼ grain; Fluidextract of Cannabis, dose 1½ minims; Collodium Salicylicum Compositum for external use to remove warts or corns; Tincture of Cannabis, 10 minims, and Elixir Chloralis et Potassii Bromidi Composita, dose 1 drachm.

The potency of the official preparations of the drug may last indefinitely if properly protected and preserved. Under proper conditions these preparations may retain activity up to fifteen years or more. The crude drug, after having been stored from one to two years, has been found to have lost much of its potency.

Ten years ago the use of the drug in this country was confined almost entirely to its use in medicine, which use was never extensive, but the underworld has seen an opportunity to make money through its sale as a deliriant narcotic. Today it can be purchased with little difficulty throughout the width and breadth of our land.

An analysis of Mexican Reefers purchased in a large eastern city showed the cigarettes to be 100 percent Cannabis. There was an average of about 9 grains of Cannabis to each cigarette. In other words, each cigarette contained approximately 6½ times the average dose of the crude drug—1½ grains being the average internal dose. It is reported that the drug is considered more effective when smoked than when swallowed. If four or five marihuana cigarettes are smoked daily, a small average for a cigarette smoker, the user would soon become an addict and a danger to society. It is a smoker's desire to keep in "high," which eventually makes him a slave to the Mexican Reefer.

Since Cannabis can be grown with practically no cultivation, there is no cost of production. A current drug price list quotes Cannabis at 28 cents a pound. The average price of Mexican Reefers has been found to be 25 cents apiece, making the profit on the 28 cents a pound drug Cannabis, when put into cigarette papers, $194.

There have been campaigns, especially in larger cities, to eradicate the drug from vacant lots and door gardens, but the movement has not become general enough to be as effective as it should be.

The Federal government, in an attempt to safeguard the public from the spreading use of Cannabis, passed an act which was signed by President Roosevelt on August 2, 1937. This act—Public No. 238 under the Treasury Department, Bureau of Narcotics—relates to the importation, manufacture, production, compounding, sale, dealing in, dispensing, prescribing, administering and giving away of Marihuana. This law attempts to control the drug by taxing those who handle it. All persons dealing with the drug in any way are required to register with the government and pay a special tax. The list of persons who are required to pay the tax includes importers, manufacturers, compounders and producers of Marihuana, physicians, dentists, veterinary surgeons, pharmacists, laboratories and institutions doing research on the plant.

This law obviously controls the legitimate sources of the drug, but Marihuana will continue to be the greatest curse today in the form of a drug, unless the illegitimate sources of production and the illegal distribution of the drug in the form of cigarettes can be curbed.

Every State but one in this country has regulations pertaining to Marihuana, but the major portion of the legislation controls the legitimate sources of the drug. These same States will carefully search incoming motors in an attempt to stamp out the corn borer or the Japanese beetle in order that their citizen's foods supply might be preserved. Why will not those same States police a thousand times more effectively the illegal cultivation, distribution and consumption of a weed which is jeopardizing American youth—a weed which makes irresponsible, degenerate or criminal those young people who are attempted by the fag with the knockout punch?

It should be a challenge to the parents of every child in this land to demand that the voice be forever stilled that calls so temptingly,

"Do you want to be happy?
Hey, kid! Do you want to be happy?"

THE MARIAHUANA MENACE*

A. E. FOSSIER, M. D.,

NEW ORLEANS.

History tells us that about the year 1090 A. D., the military and religious order or sect of the Assasins was founded in Persia by Hassan ben Sabbat.

This diabolical, fanatical, cruel and murderous tribe, although isolated in the mountains of Lebanon, and in the valleys and glens of Persia and Syria became remarkable for its secret murders committed in blind obediance to the will of their chief, and the heniousness of its crimes was bruited the world over. Their numerous acts of cruelty cast dire panic and consternation in the stoutest hearts not only in Asia but in Europe as well. This branch of the shiite sect, known as Ismalites, was called Hashishan, derived from Hasish, a confection of hemp leaves, cannabis indica. From the Arabic "hashishan" we have the English word "Assasin".

It was their custom that whenever the Sheik required the services of an assasin, a distinctive class, the "fedais" were intoxicated with the hasish. When in this state they were introduced into the splendid gardens of the Sheik, and surrounded with every sensual pleasure. Such a foretaste of paradise only to be granted by the supreme ruler, made them eager to obey his command. With blind obediance to his slightest wish they willingly sacrificed their lives because of the belief, intensified by the influence of the weed, that the Holy Spirit resided in their chief, and that his wish was the will of God.

During the time of the Crusades, they resorted to every kind of violence. Their utter disregard for death and the ruthlessness of their atrocities presented a formidable obstacle to the arms of the Christians, because under the influence of hashish those fanatics would madly rush at their enemies, and ruthlessly massacre every one within their grasp. It was only about the year 1272 that they were conquered by the Sultan Bibars.

Although cannabis indica has been accused of exciting the basest and most criminal tendencies in the minds of its addicts, at the same time some of the most brilliant creations of the human intellect, especially erotic in character, have been conceived in brains under the influence of that nefarious weed. This may also be said of nearly every intoxicant or narcotic.

It is claimed that the various tenets of the school of the philosopher Pythagoras were inspired by the influence of hashish. This weed known to the Greeks as "nepenthe" was lauded in the immortal Odyssey as a drug to lull all pains and anger, and to bring forgetfulness to all sorrow. And but comparatively recently it was praised by, and was a source of inspiration to many of its illustrious devotees, among whom must be noted the great Theophile Gautier and the renown poet Charles Baudelaire.

The manifold action of Indian hemp has been attested to in history and romance. Under its addiction the most brutal and beastial crimes have been perpetrated, armies were transformed into fanatical hordes, dervishes have performed apparently impossible feats of human endurance, and intellectuals have soared to the heights of imagination; withal, nations and races in the grasp of its nefarious influence have degraded to the lowest plane of civilization.

Mariahuana, vulgarly called "muggles", is Cannabis sativa, derived from the flowering tops of the female plant of hemp grown in semi-tropical and temperate America. It was once thought that only cannabis indica grown in the far east was active, although the German hemp is inert, the American specimen, mariahuana, is equal in potency to the best weed of India.

*Read before the Louisiana State Medical Society, New Orleans, April 14-16, 1931.

Whilst the intoxicating and narcotic properties of Indian hemp have ben known and hashish has been in common use for time immemorial in the Orient, it was not until recently that this menace has assumed a formidable aspect in our southland. The facility with which it can be cultivated, because of the fertility of the soil, our semi-tropical climate and the ease with which seeds may be procured, make its prohibition practically impossible. The muggles habit once firmly established in this community will never be eradicated, and will quickly spread over the length and breath of this country. This weed has already been found in some of the back yards of this city, and we can only imagine the extent of its cultivation. Despite all the police regulations and the state laws concerning its cultivation, use and possession, the traffic in muggles seems to be thriving here. It is impossible to make even an approximate appraisement of the extent of its use in this community, but we can readily surmise the magnitude of this danger when we consider that it is estimated that over two hundred million people constantly indulge in it in some form or other. In fact it has been said that what alcohol is to the Europeans, hashish and ganja is to the Indians and Egyptians.

This intoxicating weed can be taken in many ways, its preparation most commonly used is "ganja," an indian name for a mixture of the stems, leaves and flowering tops of the cultivated female plant. Ganja is smoked in the form of cigarettes or with the pipe; its smell is typically offensive, and easily recognized by the initiated. It corresponds to what is locally known as muggles. Bhang or Siddhi, are also Indian names for the mixture of these dry leaves and capsules without stems, whether female or male, cultivated or in its wild state. It is the cheapest and the weakest of all the preparations of hashish, and it is taken as tea. The resinous substance which exudes from the flowering head of the female plant is called "choras." It is either smoked or is taken in pills or in confections, or mixed with sugar or honey.

Locally its addiction is in the form of smoking. When it is snuffed it is readily absorbed by the nasal mucosa and has a more profound effect than when it is smoked.

In many respects the action of cannabis sativa is similar to that of alcohol and morphine. Its toxic effects are, ecstacy, merriment, uncontrollable laughter, self-satisfaction, bizare ideas lacking in continuity, and its results are extreme hyperacidity with occasionally attacks of nausea and vomiting. It has also been described as producing, in moderate doses, from mild intoxication to a dead drunk, drowsy and semi-comotose condition, lapsing in a dreamy state with a rapid flow of ideas of a sexual nature, and ending in a deep sleep interrupted by dreams. On awakening there is a feeling of great dejection and prostration. Large doses produce excitement, delusions, halucinations, rapid flow of ideas, a high state of ecstasy, psychomotor activity with a tendency to willful damage and violence, and a temporary amnesia of all that has transpired. In cases of prolonged addiction especially in the Malays, the somnolent action of cannabis indica is replaced with complete loss of judgment and of restraint, the same effect so frequently observed in alcoholic intoxication.

Captain Dhunjibhoy, Superintendent of the Indian Mental Hospital in Ranchi, says: "I shall not hesitate to believe any one who commits acts of violence under the influence of the drug and pleads complete amnesia of the crime on recovery."

From the same authoritative source the following is quoted: "I put this drug above alcohol, opium and cocaine, with regards to injurious tendencies in the causation of insanity in India." He states that hemp is a direct cerebral poison which causes the following types of insanity: 1, acute delirious mania; 2, chronic mania; 3, dementia.

He claims that the prognosis in these forms of insanity is as a rule hopeful, for in the acute state 90 per cent and in the chronic cases 40 per cent recover.

The underworld was quick to realize that mariahuana was an ideal drug to quickly cut off the inhibition, especially in the type of inadequate personality. Under the influence of cannabis indica, these human derelicts are quickly subjugated by the will of the master mind. The moral principles or training inculcated in the mind from infancy deter from committing willful theft, murder or rape, but this inhibition for crime may be destroyed by the addiction to mariahuana. Kingman says that in the suggestibility resulting from hashish intoxication, the last vestige of man's artificially acquired restraint is swept away. Thus it can be readily seen how many of these unfortunates with inadequate personalities, laggards in the struggle for existence, the majority of whom are the victim of pyschesthenia, become engulfed in the abyss of drug addiction, and end their miserable existence either on the gallows, or in penal institutions and insane asylums. The moral and physical resistence to narcotics and alcohol is not only weakened but often destroyed in persons of stabilized personality, who are addicted, even to a moderate degree, to mariahuana.

I am indebted to Dr. George Roeling, coroner of the Parish of Orleans, for the following survey recently made in the parish prison of this city. The histories of four hundred and fifty prisoners show one hundred and twenty-five confirmed mariahuana addicts, from 18 to 31 years of age. Addiction was not found in any one beyond that age. It is twice more frequent in the whites than in the negroes.

The records of the district attorney during the past year reveal that 17 out of 37 murderers, 13 out of 145 forgers, 36 out of 195 imprisoned for grand larceny, and 21 out of 115 detained for assault and robbery were addicts of muggles, and that 68 arrests were made for the sale and possession of mariahuana.

This survey shows that approximately one out of every four persons arrested in this city is addicted to mariahuana. The sixty-eight arrests made last year for the violation of Act 41, 1924, relative to possession and sale of mariahuana, which is doubtless only a small percentage of those engaged in the traffic, attest quite a large consumption of the drug.

As far as it can be ascertained this addiction has assumed formidable proportions since the advent of that "noble experiment" that fiasco, prohibition. In fact it is the offspring which bids fair to surpass its dissembling parent in destroying moral inhibition. The lesser of the two evil is alcohol. Whilst both induce a feeling of pleasure and contentment, moral degradation is the most salient feature of mariahuana, for the concomitant loss of social position because of a loose, irregular and frequently criminal existence, make these unfortunates a curse to their families and to their communities.

The debasing and baneful influence of hashish and opium is not restricted to individuals but has manifested itself in nations and races as well. The dominant race and most enlightened countries are alcoholic, whilst the races and nations addicted to hemp and opium, some of which once attained to heights of culture and civilization have deteriorated both mentally and physically.

Whilst it is most unfortunate for humanity to be subjugated by intoxicants and narcotics of any kind, which at this stage of our civilization seems to be a necessary evil, the possible substitution of alcohol for a greater evil should be considered the greatest possible calamity that can befall a nation. It is not confined to the criminal class.

Mariahuana is a real menace to this community. Despite every precaution school

children of tender age, have been detected smoking muggles. Dhunjibhoy states that indulgence in hashish is usally confined to males between the age of twenty and forty. And here in our city jails, it was not found in any prisoner over thirty-one years of age.

Our city authorities are thoroughly aroused to the seriousness of the situation and are doing everything within their power to cope with this growing menace. It is rapidly reaching beyond the city and state and now demands national control. It behoves this society to give this matter its careful attention, and use every means in its power to induce the national government to include mariahuana in the Harrison Narcotic Act.

England has recognized the seriousness of the problem and in the year 1925 has included cannabis indica in its dangerous drug act.

The commissioner of public safety, Dr. Frank Gomila, has taken a deep interest in this subject and directed a great deal of time to its study. I feel much indebted to him and to Miss M. Gomila, assistant city chemist, for their valuable assistance.

DISCUSSION.

Dr. G. F. Roeling (New Orleans): I deem it a pleasure and privilege to be called upon to open discussion on so important a paper, and so timely and so ably presented as Dr. Fossier has presented here today.

Dr. Fossier has outlined to you the amount of menace mariahuana constitutes. It may be well that I relate to you briefly my experience, and I think it will forcibly impress upon you the importance of the mariahuana situation in this section here which I deem largely due to the fact of our seaport facilities for getting the drug.

When I was elected Cornor of tthe Parish of Orleans and during the period of awaiting my induction into office, I surrounded myself with medico-legal problems and studied them from various angles and various standpoints. I went into the study of every form imaginable that we would have to combat in safeguarding our people from crime producing individuals. I went into the study of drug addiction, and into the study of mental diseases from the criminal aspect, but at no time did the subject of mariahuana come into my consideration.

Hardly had a few hours passed after my induction into office when specimen was sent to me for identification of the drug. Individuals were sent to me for examination to determine whether they were mariahuana addicts or not. Attorneys began to use this type of drug addiction as a means of defense for their clients in criminal court procedures. This act was only originated in 1924 which made it a penalty to possess or sell mariahuana in the state of Louisiana. My induction into office was in May, 1925, so you can readily see what a short period of time existed between the origination of the law and my induction into office.

I immediately made a survey of the literature on the subject and found it to be nil. The nearest I could get to a subject of any satisfactory point was that of the United States Dispensary, and that was obsolete in its formation. I immediately called upon my old professor, Dr. A. L. Metz, who was about as limited in literature as I was but who had quite a bit of knowledge and experience because of his position in chemistry and otherwise in making a study of the drug. But neither of us knew very much of the physiological action of the drug until we combined our efforts in studying the actual physiological effect of the drug.

Dr. Fossier, in his paper, brought out a few interesting points in regard to the physiological action of the drug. We can consider the action of this drug upon the human mechanism as we would consider the acceleration of an automobile with the clutch out. We feel that this mariahuana drug stimulates the cortical cerebral centers and inhibits the controlling sub-cortical centers of our mechanism which is responsible for this rapid flow of ideas, the immense visualization of these individuals, the bolstering up of their courage, and the various phenomena which will eventually give them courage and lead them into the most crime producing individuals that we have.

Dr. Fossier gives you a memorandum of 200,000,000 people in the world using mariahuana. Dr. Fossier has brought out the striking statement that between the two evils, alcohol or mariahuana, the mariahuana is by far the greater menace. I agree heartily with Dr. Fossier.

I readily realize—I believe we all do—that we have certain types of individuals who live in our communities who are of such mechanism that they need some form of stimulation in order that they

may properly cope with their situation. Whether that be alcohol or whether that be mariahuana, they are going to consume the one that is the easies to be had and the cheapest and most accessible to their command.

Between the two, I would certainly much prefer having an alcoholic individual to contend with than I would a mariahuana individual. Yet in handling the mariahuana addict you can confine him to the Parish prison and take him off the use of the drug without any ill effects except a certain amount of craving, but there is no physiological disturbance in his mechanism after he has been taken off the drug.

I certainly want to compliment Dr. Fossier for the thoroughness with which he has presented his paper, and the interest he has given to this subject because I feel that we as medical men, and particularly myself in the position I hold, are confronted with this very important factor in our daily lives. I want to thank Dr. Fossier for presenting the subject.

Dr. F. R. Gomila (New Orleans): Mariahuana in our section is certainly beginning to give us a great deal of trouble. I have instructed the Police Department to pick up all of the vendors of the drug and to go further into details in attempting to find the location of the existence of mariahuana in our city. As you know, the Police Department is on edge attempting to destroy the sellers of the drug in the city.

Mariahuana, to my mind, should be put in the same class as heroin. It serves very little medical purpose and should be removed from the market. Before the conclusion of this session of the State Society I would like to have some definite action taken whereby the Society would go on record asking the Government to take cognizance of the situation as it is today.

Just outside of New Orleans on both the lower section and the upper section are vast fields of this weed that is growing, and unless something is done along the lines of gigantic enforcement (and I believe that could only be accomplished by the Government) mariahuana is going to continue to be a severe menace to our community and to these United States.

I want to say in conclusion that I will appreciate it if the Society will recognize the fact that mariahuana is in the same class with heroin and that an attempt should be made to remove it from the market.

Dr. F. F. Young (Covington): As the President has said, we are already over our time, I shall be brief. I would not have made any remarks had I not been requested to do so, by my friend, Dr. Fossier. It is not known apparently where the word marijuana or marihuana (both terms are correct) originated or its definition—a letter from the botanical division of the Department of Agriculture of the U. S. Government states that they have been unable to find anything on the subject, in the literature, in their possession. We must recognize that marijuana as grown in Mexico or Louisiana is in reality Cannabis sativa —Cannabis indica and the others are also Cannabis sativa. This plant grows from Africa to Russia and from the Alps to Kentucky, from Kentucky to Louisiana, from Louisiana to Mexico—if there is a plant indigenous to every part of the world, I suppose this one comes as near filling it as any. The lay term is hemp. In Russia the plant grows very vigorous and ordinary hemp rope is made from it—the products from Cannabis sativa grown in India, are those used entirely, almost, in medicine. There, as we know, it is called Cannabis-Indica. Fifty one years ago Dr. H. C. Wood, the author on a work on Materia Medica and Therapeutics, was invited from Philadelphia to Columbia University, New York, to describe his experiences upon himself, in the study of Cannabis Indica—I refer you to this work, if you wish to read something interesting and charmingly descriptive. Major S. A. Billings, who was in the Medical Corps, with Pershing's Army, on the border of Mexico, when an attempt was made to arrest Villa, has stated to me, that certain individual types of soldiers took to smoking Marijuana like ducks take to water. After smoking it, they would become hilarious and dangerous and had to be locked in cells until sobered up. In the last thirty eight years, we have treated approximately seven thousand drug addicts and my classifications of this disease today would be quite different from then. Thirty five years ago classifying addicts numerically, morphine would have gone down first, cocaine second, chloral third, bromide fourth, with a small number from other drugs. Today, I would be disposed to place at the head of the list, the barbatal group, marijuana second, etc. Regarding marijuana addicts, from what we have seen and from what we have gathered from authorative sources, it is exclusively used by smoking. All that such addicts we have seen were in young persons, under twenty five, who were defective in the brain and nervous structure before they began smoking this weed—they belong a type commonly called "moral imbaciles"—they give a history of being incorrigable at home and at school and as they grow into manhood become criminally inclined—the marijuana addiction aggravates this very much. From what we have seen, these smokers are criminals before they become addicted to the weed. There is a peculiar

laugh, of these addicts, that when once heard, can never be forgotten, I mean when they are on a drunk from its effects. In conclusion I want to state that the flowers of the female plant once pollenized by the male pollen has no longer any medicinal virtue. I enjoyed Dr. Fossier's paper very much—it is food for serious thought. I thank you.

Dr. Fossier (closing): I want to thank very much those who have discussed my paper.

If over night, after the advent of prpohibition, this nation became so adept in the brewing of beer, the making of wine and the distilling of alcohol, so much so that even children are adept in their manufacture, what will happen in the near future, with such a dangerous plant that may grow in our very back yards.

Dr. Roeling is correct when he said that marihuana is the accelerator to a criminal nature, especially when the inhibition of that individual is low.

I feel, gentlemen, that the Society should take an active part to eradicate this growing evil and it is for this reason that I am presenting a resolution to the House of Delegates, and I hope they will give this matter their kind attention.

FEDERAL LEGISLATION

THE REASON FOR UNIFORM STATE NARCOTIC LEGISLATION

HARRY J. ANSLINGER*

THE states which first legislated against the use of narcotic drugs prior to the enactment of any Federal Statute, were impelled to do so in order to secure their citizens against injury to their health, morals and general welfare. The earlier laws were designed to eradicate the evils of opium smoking and the maintenance of opium dens. Later, some of the states enacted laws covering other narcotic drugs and providing various penalties for their violation; but so little knowledge of the traffic was possessed by the drafters of the various acts, that a comparison reveals such a varied expression of ideas on a single subject as to create a situation which may only be classed as absurd.

Nevertheless, up to 1914, when the Harrison Act[1] became effective, there was a real effort, on the part of states which had enacted such legislation, however ill-advised, to enforce the provisions of their laws to the fullest extent.

The primary purpose of the Harrison Act, of course, was to create and protect revenues for the United States, and that Act has been so construed by the Supreme Court of the United States, with the added statement, however, that the law has a moral purpose also.[2] It was contemplated that the authorities of the various states and of the political subdivisions thereof would accept and discharge the responsibility of investigating, detecting and preventing or punishing the local retail illicit traffic conducted by the ordinary peddler, and the institutional care and treatment of drug addicts within their respective jurisdictions.

---

*Commissioner, Bureau of Narcotics, U. S. Treasury Dept.

[1] 38 STAT. 785 (1914), as amended 26 U. S. C. § 211-691-707 (1926).

[2] United States v. Jin Fuey Moy, 241 U. S. 394, 402, 60 L. Ed. 1061 (1916).

United States v. Doremus, 249 U. S. 86, 63 L. Ed. 493 (1919).

This, however, did not prove to be the case. Notwithstanding the limited power of the Federal Government, state officers immediately became imbued with the erroneous impression that the problem of preventing the abuse of narcotic drugs was one now exclusively cognizable by the National Government, and that the Federal law alone, enforced, of course, by Federal agencies only, should represent all the control necessary over the illicit narcotic drug traffic. In very few states was any attempt made to accept a just part of the burden of enacting and enforcing laws to control the traffic.

This attitude on the part of the states has resulted in an anomalous situation. The public prints from day to day bring news of a number of banks that have been robbed by an organized gang; details of kidnappings and of gambling rackets; and articles concerning the operations of a lone bandit who has held up a number of stores and citizens. What is the result? Editorials criticise the police and clamorous demands are made calling upon them to apprehend these menaces to the community well-being. The police, ever active, are stirred to greater activity. The man-hunt is on. The offenders who have unlawfully taken the property of fellow citizens must be caught, prosecuted and punished. No one suggests that this is anything but a state problem. The person who would suggest that the Federal authorities be called upon to come into the state and catch this hold-up man would be ridiculed. But in this same community, the insidious, despicable drug peddler, carrying on his nefarious work of unlawfully taking away not only the property, but the peace of mind, the morals, the health of the citizens and undermining the general welfare of the community—what of him? Ah, that is different. In spite of the fact that the sole right to punish such criminals, under certain circumstances, lies only within the police power of the state, despite the fact that the founders of our country never contemplated that such activities should be dealt with by the National Government, enforcement officers as well as legislators in a number of states have decided that "Uncle Sam" is the proper person to cope with this particular menace to the community. This illogical attitude has not only prevented the passage of adequate laws which would be of inesti-

CONTINUED

8 OF 33

mable benefit to the state's own citizens, but has resulted, in a number of the states, in an almost complete failure to enforce the laws already on their statute books, even in those aspects of the crime with which only the state itself may deal.

The dockets of the Federal courts have necessarily become flooded with cases of a minor character which should have been handled in the state courts, but which were not thus handled, either from lack of adequate laws, or for reasons put forth solely because the duties and responsibilities appear burdensome, expensive, or distasteful, resulting in a slowing-up of the prompt and orderly process of justice in major cases. And what is the result of this delaying of trials in the Federal courts? In many instances, if a plea of not guilty is entered, the case is continued from term to term because of the congestion, and is finally dismissed on account of the unavailability of witnesses or the unknown whereabouts of the defendant. If the defendant does plead guilty, he is often accorded so much consideration that a fine or a short sentence is imposed, and he immediately resumes his illegal activities. Yet in the states where the laws are adequate and where enforcement is reasonably rigid, the defendants in such cases would have been tried within a few days of the commission of the offense and, where guilt was established, immediately sentenced to the state's prison. Some of the reasons advanced by many state and municipal prosecutors, for their reluctance or open refusal to prosecute such cases, may be catalogued as follows:

> *First.* That sentences imposed in Federal courts are more severe than those imposed in state courts.

The sentences referred to are those given major violators. It is obvious that it does not lie within the power of state and municipal courts, where the state law has made the offense a misdemeanor, to impose sentences equal to those which are imposed in Federal courts in cases of greater magnitude, and where the offense is a felony.

> *Second.* That it is difficult to find a jury which will convict, because in the smaller communities the menace of narcotic drugs is not understood.

This argument is plainly fallacious. The general public is fully aware of the menace of such drugs, and in the smaller communities it is usually found that the violation of such a law is regarded as a graver criminal offense than in the urban districts.

> *Third.* That the accused is a woman and the state has no suitable institution in which to care for such prisoners.

This is but an added argument for the enactment of state legislation for the treatment and care of all addicts, men and women, and the excuse flows only from the desire to place the burden of the necessary financial outlay upon the shoulders of the Federal Government.

> *Fourth.* That voluntary applicants for treatment strenuously object to incarceration in a state prison.

This is but an added reason for the enactment of legislation by the states for the purposes set forth above.

> *Fifth.* In the State of Texas, because of an attack[3] on the validity of the state law, upon which no decision has been handed down, the Police Department throughout the state has disbanded their narcotic squads, leaving to the Federal Government the burden of taking all cases into the Federal Courts.

Examples of what became necessary in two Texas cases are cited. Carrie B., an addict was arrested and found to be in possession of one grain of heroin. Because of the necessity of placing a Federal charge, this woman was arraigned for the purchase and possession of this one grain of heroin. Thus it has become necessary, because of the failure of state enforcement, to invoke the majesty of the law of the Nation to decide what disposition shall be made of the case of this poor unfortunate.[4]

In the case of "Black ———," two narcotic agents and two city detectives arrested this man for the sale of two grains of morphine.[5] Here again the ponderous machinery of the Federal Courts must be resorted to, taking

[3] Texas case No. 7313—O. J. D. Mooneyham.
[4] Texas case No. 7339—Carrie Brown.
[5] Texas case No. 7315—James Blackwell.

up the time of two Federal officers, less than 250 of whom are assigned to guard the welfare of 122,000,000 people.

The proposition cannot be too forcefully expressed that the states, having supreme police power within their own boundaries to enact and enforce all laws necessary to the peace, health, morals and general welfare of their citizens, are not hampered by the narrow limitations that restrict the Federal Government in its fight to control the illicit narcotic traffic.

A few instances will be sufficient to plainly indicate the position occupied by the National Government as compared with that of the states:

The agents of the Federal Government call upon Dr. X, to check his records. The duplicate copies of his order forms show that in a comparatively short time he has ordered 50,000 one-half grain tablets of morphine. His dispensing record shows 4,000 tablets dispensed. He is asked to account for the balance. He replies that he has dispensed it to his patients in the course of his professional practice. The agent asks the doctor how many patients he has. The community is small and the list of patients limited. The Federal officer then calls the doctor's attention to the fact that with such a limited number of patients he surely could not have dispensed the amount unaccounted for and that the average physician in the same amount of time would dispense a very much smaller amount. The doctor finally admits that he is addicted to the use of morphine and has used the amount unaccounted for for the satisfaction of his own addiction. The Federal law, being only a revenue measure, does not prohibit self-administration. The state law either does not prohibit it or the Federal officer is met with an indifferent attitude on the part of the Medical Board of the State, the members of which are, of course, brother physicians. The need for uniform legislation and mandatory enforcement thereof is apparent. In such cases suspension and, for more serious cases, revocation, of the physician's license, should be a part of every state law. So long as the use of narcotics is considered essential to the exercise of a profession, and so long as a physician or other practitioner retains his state license to follow that profession, no matter how illegal his activities may be or how long he

may be imprisoned for violating the law, the Federal Government may not deprive him of his right to purchase narcotic drugs until the state has deprived him of his license to practice his profession.

In New York a known peddler, but one who is so cunning that he evades arrest on a charge of selling, is apprehended in possession of tax-paid codeine. Upon conviction for his unlawful possession in the state court a sentence of three years is imposed,[6] yet it would have been impossible to prosecute this man in the Federal court, such possession being no offense under the Federal law. Had this man been prosecuted in the State of North Carolina, the sale of the narcotic would have been only a misdemeanor and a jail sentence the maximum that could have been imposed.[7]

In Alabama "D" had robbed a drug store of tax-paid narcotic drugs. "B" and "C" were apprehended by Federal officers while in possession of such narcotics. From the foregoing it will be seen that this did not constitute a Federal offense. The state law of Alamaba, however, provides that it shall be unlawful for any person in the state to have in his possession or under his control any such drugs, except such as are procured upon a prescription or by virtue of a lawful occupation.[8] The state police were requested to and did adopt this case. B and C were convicted in the state court. Had this case occurred in the neighboring States of Florida or Georgia, no conviction could have been had in the state court, there being no provision in the laws of these states covering the illegal possession of narcotics.

In Arizona police officers arrested three addicts. A narcotic agent was notified. The agent interviewed the addicts, and they stated they had been purchasing smoking opium from the defendant for two or three weeks. One of them volunteered to introduce the agent to the defendant. His offer was accepted and he and the agent, under the surveillance of a police officer, went to the defendant, to whom the agent was introduced by the informer as an old friend who could be "trusted to the

[6] New York (So.) case No. 2021—Frank Van Bramer.
[7] N. C. CODE ANN. (Michie, 1927) § 6683k.
[8] ALA. CODE (Michie, 1928) § 4800 (16), (d).

limit." The agent ordered $3.00 worth of smoking opium, and the defendant delivered 35 grains direct to him fifteen minutes later. The informer was present during the entire transaction. An attempt was made the following day to make another purchase from the defendant, but when he was finally located by the informer he told the informer that the narcotic agent was a stool pigeon and he would have no more dealings with him. When arrested the defendant denied making the sale of smoking opium to the agent.

It will be noted from the amount sold that this case was not one of a grave character and prosecution in the Federal court would only have added to the overcrowded docket. Prosecution was, therefore, instituted under the state law. When the case came to trial the defendant changed his plea to guilty and was sentenced to 18 months to two years in the state prison.[9]

In certain jurisdictions the National Government is faced with the predicament of having a Judge of the Federal court who will sentence persistent violators to six months, one year on probation, or a year and a day. In such instances, where the state has an adequate law, it has been deemed necessary, in order to curb the traffic, to secure the trial of such cases in the state court. In New Jersey, for instance, sentences in many cases have been imposed running from three to as high as 14 years in state prison.

Another difficulty experienced in the prosecution of cases in the Federal courts is that it is necessary in order to prosecute persons found in possession of narcotic drugs, to charge illegal *purchase* and possession. There immediately arises the defense of venue—place of purchase. The material element of the offense is the venue, and the Government in many cases finds it impossible to prove that the purchase was made within the jurisdiction of the court, resulting in a failure to convict. In some of the states mere possession of narcotic drugs is made a felony and it is only necessary for the state to show that the defendant himself was within the jurisdiction of the court when apprehended, not where the purchase of the drugs

[9] Arizona case No. 287—Lee Roy Tarpley.

was made. This, of course, is a feature that should be covered in every state law.

A situation that has made necessary the prosecution of cases in state courts is the requirement of the Federal Constitution concerning search warrants. Local police officers in many states may, on suspicion of any offense, enter a house and search and seize narcotic drugs and arrest offenders without a search warrant. This procedure would violate the provisions of the Constitution if done either by Federal officers alone or jointly with state officers and such a defense would be sustained upon trial in a Federal court. This is a further argument for more adequate laws and more rigid enforcement by the states.

In the draft of proposed uniform state laws, prepared by the United States Commissioner of Narcotics, there was incorporated a section covering the care and treatment of addicts, which was proposed by the United States Public Health Service, after a thorough study of the situation covering a number of years. This section provides for the compulsory care and treatment of addicts.[10]

It should be apparent to the least uninformed that a

[10] THE FOLLOWING SECTION, WHICH HAS THE APPROVAL OF THE U. S. BUREAU OF NARCOTICS AND THE U. S. PUBLIC HEALTH SERVICE, BUT WHICH WAS NOT INCLUDED IN THE FINAL DRAFT APPROVED BY THE CONFERENCE OF COMMISSIONERS ON UNIFORM STATE LAWS, IS RECOMMENDED FOR PASSAGE BY THE STATES:

Section 17. (Commitment of Addicts for Treatment).

(a) Whenever an affidavit duly verified by a person claiming to have knowledge of the facts and setting forth that any person named or described therein habitually uses any narcotic drug as defined in this Act, so as to endanger the public morals, health, safety, or welfare, or who is or has been so far addicted to the use of such drugs as to have lost the power of self-control with reference to his addiction, shall be filed with the county attorney of any county or the city attorney of any city, in which such alleged habitual user is or may be found, such attorney shall issue a notice requiring the person so named or described to appear before a judge of the ———— court in chambers at a time and place specified in such notice and shall cause a copy thereof to be served, by the sheriff or other court officer duly qualified to serve process in civil or criminal cases, upon the person so named or described. Copy of such notice shall be transmitted by mail to the (State Commissioner of Public Health). The affidavit, and the original notice shall be filed with the clerk of the court at or before the time specified for such appearance, but the same and all other records and

business, legal or illegal, is bound to fail if deprived of customers. So it is with the peddling of narcotic drugs. Deprive the peddler of a market for his illegal wares, cut to a minimum his illgotten gains and the peddler will cease to exist. As long as an addict is at liberty to come and go, the peddler has a steady and trustful customer. Experience has shown, except in some few instances, that treatment looking toward a cure of addiction, without confinement, is uniformly unsuccessful The mails of the United States Public Health Service and of the Bureau of Narcotics are burdened with pleas from frantic relatives of addicts requesting information as to where the latter may enter a public institution for treatment. The cure of such persons is as much the duty of the state as is the care of its insane, yet only one state (California) has made an honest effort to provide a remedy.

The Commissioner of Narcotics, while inspecting the

---

files of the proceedings shall be open for inspection only to the person named or described therein or his counsel or by public officers.

(b) At the time and place specified in the notice, the person named or described in such notice, or his counsel being present, the judge shall hear the evidence presented, and may appoint a commission of two physicians who shall examine such person and certify to the court as to whether such person is an habitual user of habit-forming drugs as contemplated in sub-section (a). Upon being satisfied that the allegations contained in the affidavit are true, the judge shall make and file an order requiring the person named forthwith to take and continue treatment for the cure of such drug addiction at a private institution under medical jurisdiction to be selected by the person committed and approved by the (State Commissioner of Public Health) if such person is able to pay therefor, otherwise at some public hospital or institution under medical jurisdiction, other than a penal institution, selected by the (State Commissioner of Public Health), and at the expense of the (State, county, or city). In the event the judge is not satisfied from the evidence adduced that the person is an habitual user of habit-forming drugs as contemplated in sub-section (a), he may order the commitment of such person for observation for a period not exceeding ( ) days and upon expiration of that time shall consider the testimony of the superintendent or physician in charge together with the evidence theretofore presented in rendering decision on the commitment of such person. The order of commitment shall require reports to be made to the court and to the (State Commissioner of Public Health) at stated intervals therein specified by the physician or superintendent in charge, as to the effect and progress of the treatment. A copy of the order forthwith shall be served upon said person. The care and treatment of persons committed under this

New Orleans District, was approached by the sorrowing mother of two sons, 18 and 20 years of age, addicted to the use of heroin. When informed that the state had made no provision for the treatment of such cases, unable to bear the expense of private treatment, but believing that drastic measures were necessary for their future well being, she requested that they be incarcerated in a Federal penitentiary for treatment. This proposition the Judge and the District Attorney flatly refused to entertain. The only thing the state had to offer her was a 30-day sentence in jail, a proposal worse than useless.

---

section shall be designed to rehabilitate them and restore them to mental and physical health; under regulations prescribed by the (State Commissioner of Public Health) the physician or superintendent in charge of the institution may parole inmates but such persons shall be finally discharged from further treatment and supervision only by the committing magistrate or his successor and only upon the recommendation of the superintendent or physician in charge of the institution to which committed.

(c) Any trial court having jurisdiction of a defendant in a criminal action or proceeding, if it appears that the defendant habitually uses narcotic drugs as contemplated in sub-section (a), may in its discretion likewise commit such person for treatment and rehabilitation to a public hospital or institution under medical supervision designated by the (State Commissioner of Public Health). In any case the court may in its discretion stay further criminal proceedings or defer the imposition of sentence pending the discharge of the patient from treatment in accordance with the procedure outlined in sub-section (b) of this section.

(d) Upon the recommendation of a duly licensed practicing physician or public health official that a person habitually uses narcotic drugs as contemplated in sub-section (a), a judge or magistrate of a ( ) court may commit to a public institution under medical supervision and duly approved by the (State Commissioner of Public Health) a person making voluntary application for treatment for drug addiction. A person so committed shall not be detained under such voluntary agreement more than ten days from and inclusive of the date of notice in writing of his intention or desire to leave such hospital or institution.

(e) Any person who shall fail, refuse, or neglect to comply with the terms and conditions of any order of a court duly issued and served in accordance with this section shall be deemed in contempt of court and shall be proceeded against accordingly.

(f) The ( ) court in each (county or city) may in any case of commitment under this section appoint guardians to such committed persons, following the procedure under which guardians of other persons under legal disability are appointed under the laws of this State.

SHOULD THE GOVERNMENT ESTABLISH A BANKRUPTCY BUREAU?

The bill pending in Congress known as the Hastings Bill, backed by the administration, for the complete revision of the bankruptcy law, seeks to establish a new government bureau. This bureau, if established, will be under the direction of the Attorney General, who will be assisted by ten administrators, ten assistant administrators and approximately three hundred examiners, together with a corps of salaried men and women who will do little more than gather a lot of worthless bankruptcy statistics, hold up a lot of discharges of bankrupts (which merely deny them the privilege of reengaging in business and leave them virtual charges on the communities) and here and there uncover some assets which a crooked bankrupt may have hidden out. The receivers or trustees themselves would probably have made the same recoveries. This constantly increasing army of government examiners will soon equal the prohibition forces of the government and will doubtless be about as popular.

There is no lack of machinery to meet the needs of the times with respect to the enforcement of the rights of creditors. Creditors, seeing around them all kinds of government subsidies, paternalism and the like, have concluded to let Uncle Sam collect their debts for them. They recklessly extend credit in the mad rush to sell more goods at high prices and then, when the poor debtor has to avail himself of the last straw which the constitution of the United States established for his benefit, they want to make it impossible for him to use that last straw.

What does this new bill do to help the poor debtor? What will it do to clear the already muddy stream of business progress? Certainly we cannot hope for business recovery until the deadwood caused by the present crisis has been removed and the channel cleared. Throwing more logs in the stream will not relieve the present unfortunate condition. This is no time to tinker with the machinery of so serious and important a law as the country's commercial code, that is, the bankruptcy law of the United States. At least the country should be given an opportunity to thoroughly analyze and study this far-

reaching measure, introduced during the spring of the present year and now likely to be acted upon by Congress at an early date. Lawyers are criticized for their handling of bankruptcy cases. But upon the shoulders of the lawyer falls the responsibility of seeing that no unjust or unfair law is placed upon the statute books. Business, too, will soon realize that it cannot bear the strain and responsibility of unwise, unjust and expensive bankruptcy legislation at this critical time. And the new bill seeks very materially to increase the cost of bankruptcy administration.

MAX ISAAC.*

THE PROPOSED TWENTIETH CONSTITUTIONAL AMENDMENT

THE acceptance by the United States Senate on March 2, 1932, of the conference report of the proposed Twentieth Amendment to the United States Constitution[1] marks the culmination of repeated efforts to have Congress act favorably on proposals changing the date for the convening of Congress and the inauguration of the President. At least 90 constitutional amendments with either or both of these objects in view have been proposed since 1795. In 1808 an Amendment was proposed which provided that the term of Congress should be limited to one year and that it should expire on the first Tuesday in April. No less than 18 amendments dealing with the length of the Congressional term were proposed in the period from 1876 to 1889. From 1889 to 1928, 93 attempts were made to alter the beginning and ending dates of Congress. That this subject has been one which has occupied the minds of our present legislators is evidenced by the fact that "during the last four Congresses (67th, 68th, 69th, and 70th) four resolutions affecting a change on the beginning date of Congress passed the Senate with

*Secretary-Treasurer, National Association of Federal Practitioners; Editor, AMERICAN BANKRUPTCY REVIEW, New York.

[1] S. J. Res. 14, 72 Cong. 1st Sess.

large majorities. Only one[2] of them came to a vote in the House and it failed of passage."[3]

This proposed Amendment, popularly called the "Lame Duck" Amendment, has for its primary object the abolishment of "lame ducks" and "lame duck" sessions of Congress. As is well known, this expression, "lame duck," is applied to any member of Congress who continues to serve in that body after he has been defeated at the polls or has retired. The "lame duck" session, in which these members serve, begins on the first Monday in December following the Congressional election and continues until the following March, at which time their term of office expires. Thus, the newly elected members of Congress do not assume office until the fourth day of March following their election, and cannot be seated in Congress until that body meets the following December.

The joint resolution proposing this amendment, having passed both Houses, was sent to the Department of State March 2, 1932, for submission to the states for ratification according to Article V of the United States Constitution. Three-fourths of the several states must ratify within the seven-year period provided for in the proposed Amendment. Resolutions proposing amendments to the Constitution are not submitted to the President of the United States,[4] and accordingly the resolution does not bear his signature.

Since the Constitution itself does not designate specifically the date when new members of Congress or when the President and Vice President shall take their oaths of office, the question naturally arises why it is necessary to amend the Constitution in order to bring about the desired change. Such an amendment is absolutely necessary, however, because the silence of the Constitution on the date for officials to take their oaths of office does not mean that the duration of the term has not been clearly defined. Members of the Senate are to serve for six years,[5] members of the House for two years,[6] and the President

[2] S. J. Res. 47, 69th Cong. 1st Sess.
[3] H. R. Doc. No. 551, 70th Cong. 3rd Sess.
[4] Hollingsworth v. Virginia, 3 Dallas 378, 1 L. ed. 644 (1798).
[5] Art. I, Sec. 3.
[6] Art. I, Sec. 2.

and Vice President for four years,[7] and, since the resolution of the Continental Congress provided that the proceedings under the Constitution should take effect the first Wednesday in March in 1789, it is quite apparent that March 4th must be the date of inauguration not only for the President and Vice President but also for the reception of the new members of Congress. The desired change, therefore, could not be effected by legislative enactment but only through a Constitutional Amendment, since its effect will be the shortening of the terms of the members of Congress and of the President and Vice President by exactly two months.

The proposed Amendment will have the following several important results:

1. The "lame duck" session of Congress will be abolished.
2. The new Congress may assemble two months after election.
3. The President and Vice President will be inaugurated approximately two months after election, namely on the 20th day of January.
4. The newly elected members of Congress will assume office two months after their election.
5. The newly elected members of Congress will assist in the counting of the electoral votes, and the House of Representatives and the Senate will choose a President and a Vice President, respectively, in the event of a tie or a majority not having been received.
6. In the event of the death of the President-elect before the time fixed for the beginning of his term, the Vice President-elect would become President.
7. The proposed Amendment gives Congress the power to provide by law what officer should act as President in situation which would arise where the election of a President had been cast upon the House of Representatives and the House had failed to elect a President and the Senate had failed to elect a Vice President before the time for the commencement of the new terms. Since the Twelfth Amendment, which specifies the procedure to be followed in electing a President and Vice President, makes no provision for such a situation, that Amendment would, in effect, be amended.

[7] Art. II, Sec. 1.

That the proposed Amendment will soon be a part of the Constitution of the United States seems most likely, in view of the fact that although only eight months have elapsed since it was submitted to the several states for ratification, the state legislatures of seventeen of them have acted favorably upon it.[8]

THE POST IMPRESSIONIST

BACKYARD DRUG

Are you smoking much hashish these days? Lots of people are.

You thought it was a "dangerous drug," ranking with morphia and cocaine, and consequently forbidden? Well, it is indeed a dangerous drug that "maddens the senses and emaciates the body;" but as far as Federal legislation goes—and much State legislation—it isn't forbidden. Somehow or other, it was omitted from the Harrison Act, while the States——

But we'll talk about them in a minute.

The abuse of the weed—it has few uses save in corn-plasters, certain dyeing processes and as a substitute for linseed oil—is raging up and down these United States. Nor is the District of Columbia exempt.

Very infrequently can even this capable column beat The Post's vigiant news services. Yet here's a hashish beat:

The other day the Narcotics Bureau of the United States Treasury—probably the ablest agency of its kind conducted by any government—got a tip from Denver that a drug peddler had just left there for St. Louis "with a trunkful of dope." The Bureau's St. Louis "operatives" were told to "get" the fellow—and got him, and his trunk, when the two came off the train.

"But you guys can't do nothing," the peddler protested; "this here's just muggles."

He was nearly right, too. Hashish was all he had. Against its possession there was neither National nor State law. The utmost those "guys" could do was to secure his arrest under an ancient city ordinance which banned the carrying of poison without a license. The punishment? A mere $20 fine.

Hashish is made from Indian hemp, which is far from being confined to India. It has more aliases than any other drug. Botanically, it is Cannabis Indica, Cannabis Sativa, Cannabis Mexicans. Cannabis Americana. In India it is bhang, chang and ganja; in Iraq, South Africa, Sierra Leone, Somaliland, Australia and the Near East it is, respectively, charas, dagga, djamba, katta edulis, esur and datra, and in the U.S.A. it is marihuana, loco weed, reefer, mooter and muggles. It grows wild in almost every State." A while ago a luxuriant patch was discovered in the grounds of the Colorado Boys Reformatory, where nobody had dreamed of its pernicious character—except the boys.

The flowering top is the damagemaker, chewed or smoked in cigarette form, and "the female of the species is more deadly than the male." What she will do to you depends on your idiosyncrasies. Some she will stimulate, some depress. To many she brings homicidal mania: not long ago a boy smoked his first marihuana cigarette in a Florida school grounds—these cigarettes are frequently peddled in school neighborhoods—and went home and killed the only six members of his family of whom he could get hold. To nearly all users the drug extends time and distance; there are frequent cases of muggles-smoking automobile drivers who think they are a mile from a cliff or a red light—until the accident happens.

Eugene Stanley, district attorney of New Orleans, made a study of the habit as a developer of criminals. He writes:

"The underworld has been quick to realize the value of this drug in subjugating the will. . . . Its uses sweeps away all restraint."

Philadelphia and Pittsburgh authorities have said the same thing lately. It has been said in Maryland. Complaints come from New Mexico and the West, New York and the North.

According to one dryly condemnatory Federal report, "the drug is used . . . by the younger element in some of the larger cities, especially by high school youths. . . . (It) is most commonly used in the form of cigarettes, selling generally from 15 to 25 cents each, or from three for 25 cents to three for 50 cents, but it is also mixed with beer or other alcoholic beverages for its stimulating purposes."

Yet only 13 States have legislation controlling the growth of marihuana. Only 31 control production:

Alabama	Louisiana	Oklahoma
Arizona	Maine	Oregon
Arkansas	Michigan	Pennsylvania
California	Mississippi	Rhode Island
Colorado	Montana	Texas
Florida	Nebraska	Utah
Idaho	Nevada	Washington
Illinois	New Jersey	Wisconsin
Indiana	New York	Wyoming
Iowa	North Dakota	
Kansas	Ohio	

All these also have State laws to control the sale, and Massachusetts, New Mexico and Vermont also have sales-control laws, but no production-control.

"Moreover," Commissioner Anslinger told us the other day, "these States' laws aren't uniform, and now and again there will be a city ordinance—sometimes a very effective ordinance—in the chief city of a State which, in this respect, is lawless. The confusion is unbelievable—until you try to rationalize it."

"And what," we ventured, "is the cure?"

The Commissioner's answer wasn't delayed. "The confusion among the States' narcotic laws is today one of the greatest aids of the illicit traffic in every dangerous drug. It clogs all the machinery of detection, impedes all the processes of prevention and punishment. Put a uniform State Narcotic Act through every Legislature. That will not only cure the worst of the hashish evil; it will help to reduce the whole drug evil to a minimum."

Chairman DODD. I take it from that statement there must be some law enforcement people, and I guess you think so too, who feel that you can't really dry up the sources of a drug like LSD or heroin unless you punish both the peddler and the user because if the peddler, who is only a peddler, has a diminishing market, certainly that is to some extent drying it up. Wouldn't you agree?

Dr. GODDARD. Well——

Chairman DODD. Don't you also think a youngster who also knew he was going to be hauled into court would be somewhat more reluctant to buy such a drug than one who felt he wouldn't be punished?

Dr. GODDARD. Maybe somewhat, but, Senator, I only have to point to the marihuana experience in this country, to say that this does not seem to be the case.

Chairman DODD. Well, I think——

Dr. GODDARD. Very heavy penalties, as you pointed out yourself, for possession are not effective deterrents.

Chairman DODD. My own judgment is that the marihuana situation is not comparable to the LSD or heroin situation.

Dr. GODDARD. Well, leaving the heroin aside because of its addictive properties and because it involves a different class of our society, a different group of people, I would say of the marihuana and LSD, that we quite commonly find these two drugs together in our activities.

Chairman DODD. Do you?

Dr. GODDARD. In about 94 percent of the instances we find that marihuana and LSD are being pushed together by the peddler.

Chairman DODD. Do you find that the marihuana user develops with the LSD user?

Dr. GODDARD. We find it is not uncommon that these drugs are abused by the same people.

Chairman DODD. What I meant was do you find they break in on marihuana and then move on to LSD?

Dr. GODDARD. No necessary correlation there has been demonstrated by our figures or anyone else's, that I know of, so far. It could exist, but I have no knowledge of data to substantiate that.

Chairman DODD. I don't know that you covered it, you may have in your statement, I don't recall, what is your view about the penalties with respect to marihuana?

Dr. GODDARD. Well, Senator, that is under the jurisdiction at the present time, as you know, of the Department of the Treasury, Bureau of Narcotics.

Chairman DODD. I know that.

Dr. GODDARD. I know you are aware of it. I think I have made my position clear on that.

Chairman DODD. Well, you left me hanging a little bit. You brought it up and I thought perhaps that I should ask you what your view was.

Dr. GODDARD. My view there isn't any different than on LSD.

Chairman DODD. From what you have said about the use of marihuana, is it more typical to find marihuana in connection with one of the hallucinogenic or stimulant and depressant drugs than it is to find it with heroin or other narcotic drugs?

Dr. GODDARD. This has been our experience, Senator. In 90 percent of the cases we investigate—LSD, marihuana, Speed—we find several drugs. Since they apparently are used by the same clientele, the pusher or peddler has both or several available.

Chairman DODD. You spoke about Speed. Are there any other such drugs?

Dr. GODDARD. Well, of course, Speed is one of the amphetamine drugs. The more common amphetamines, which are often prescribed for weight control or for mood elevation are better known, dextro amphetamine sulfate being the most common. There are many other amphetamine or stimulant kind of drugs now being seen. DMA or methylenedioxy-amphetamine; TMA, tri-methyloxy-amphetamine, STP (DOM) 2.5 diemethyloxy-4-methyl amphetamine. Now then, there are many hallucinogenic drugs too—DMT, dimethyl-tryptamine, DET diethyl-tryptamine, ibogaine, bufotenine, mescaline, psilocybin, psilocyn, peyote. These and many, many others, Senator, are found from time to time. The list is almost endless.

Chairman DODD. And being added to all the time?

Dr. GODDARD. And being added to monthly. The ingenuity of those who abuse drugs is a constant source of amazement. They use things such as asthmador, nutmeg, Hawaiian Rosewood seeds.

Chairman DODD. Yes, I have heard of that.

Dr. GODDARD. Even Jimson weed, I am told.

Chairman DODD. Is the source of these drugs generally the same, is that the right way to put it, it is not scientific, but do you know what I mean?

Dr. GODDARD. Yes; I believe I do, Senator.

Chairman DODD. All right.

Dr. GODDARD. Drugs such as LSD, DMT, DET which are not legally manufactured at the present time must be illicitly manufactured, thus there are clandestine laboratories involved in this activity.

Now, we have to date, as I recall, since the beginning of the program, knocked off 41 clandestine laboratories in our enforcement program.

We find, sir, that there is an increasing sophistication in these operations, that they are more knowledgeable of what they are up to. Apparently as they get involved in this illegal activity they learn more subtle ways of getting around the law, and they are also being forced to work with some of the earlier precursories of these drugs, because we, for example, brought lysergic acid under control through drug abuse control amendment authority, too, and this means they must work with some of the precursors.

Now, in connection with this we have been able to work out a program with the major chemical suppliers. There are certain chemicals that more commonly than not would be involved in the synthesis of say, for example, LSD. These companies voluntarily notify us when they have an unusually or suspicious purchase of one of these precursors, and this helps us in our surveillance activities.

But the other drugs that are legally manufactured, such as the amphetamine sulfate, barbiturates, we find are still being diverted from legal sources of supply, and so we have a higher priority on the accountability surveys in wholesalers, manufacturers, and on our work with the States for accountability through the local pharmacies. This has paid off. As I indicated, somewhere around 600 million dosage

So what I am saying, Senator, is that we are often using imperfect tools in evaluation of extent of usage. One must keep in mind also that there is great variability in usage patterns in different parts of the country.

On the west coast, for example, there was one high school surveyed where drugs had been tried by about 12 percent, as I recall.

Senator KENNEDY. Well, you are prepared to make an estimate on that, between 1 and 12 percent yourself?

Dr. GODDARD. Yes, 1 to 8 percent.

Senator KENNEDY. Yes, that is what I asked.

Dr. GODDARD. Yes.

Senator KENNEDY. To try to estimate the extent of this experimentation or usage, there has to be some kind of judgment made. It shows an extraordinary difference, I would think, trying to evaluate, which all of us are interested in doing, the extensiveness of the use or experimentation with these drugs. You have 1 to 8; the subcommittee has a third to 50 percent, and it makes it, it certainly does for me, somewhat confusing as to what the real situation is. I suppose if one technique is somewhat flimsier than another in trying to evaluate this problem, we would be compelled to feel that the better technique ought to be used if we are going to use one.

I would like to ask you why you think there is such a flagrant disregard by the young people of this country on the marihuana laws, by the possession of marihuana? They can receive, under the law, 10 years imprisonment. Why do you believe the young people of this country have shown such a flagrant disdain for that legislation?

Dr. GODDARD. It would be my opinion, Senator, that they do not view this drug as being dangerous; that in using it, perhaps, they are expressing their rebellion against our society and against the establishment, as they put it.

Now, I am not so certain that this is different from the youth of the twenties who expressed their rebellion, using alcohol which was forbidden under the Volstead Act at that time.

It is a different medium of expression, perhaps more significant than the fact that it occurs.

Senator KENNEDY. Well, now, what we are suggesting by the administration's legislation is that we are going to make possession of LSD a misdemeanor, is that correct?

Dr. GODDARD. Yes, sir.

Senator KENNEDY. So what you are really equivocating is the possession of marihuana and the possession of LSD would be misdemeanors and, by your own testimony, by the testimony of others, we find out that the use certainly of LSD, I believe, has been estimated as being anywhere from 100 to 1,000 times more dangerous than the use of marihuana.

Dr. GODDARD. I would say so.

Senator KENNEDY. Do you think that these kinds of laws are going to inspire confidence of young people; are they going to pay any more attention to this legislation than the one that is already on the books?

Dr. GODDARD. I do not believe they will.

I believe the educational approach will have the greater impact. I do not believe this will gain the respect of young people.

It may limit the usage of some people for—let me put it this way: There is always a group of people in our society who, if there is not a law, will carry out a certain act. But when a law does exist they will not engage in that act. So it is with that portion of society that the law may have the greatest impact.

Senator KENNEDY. Of course, what you have, as I understand the legislation itself, LSD will be a misdemeanor; marihuana is 10 years which, of course, is a felony.

Dr. GODDARD. Two to 10, as I understand it, with discretion provided.

Senator KENNEDY. It is a felony.

Dr. GODDARD. It is a felony.

Senator KENNEDY. So you would have marihuana, from your own testimony, marihuana, which is certainly less dangerous, would have the larger penalty than would LSD, which is more dangerous?

Dr. GODDARD. Yes, sir.

Senator KENNEDY. And what we are asking is for the young people to try to comply with this kind of legislative jumble and expect them to show some respect for the law.

Dr. GODDARD. Yes.

Senator KENNEDY. When, as far as your comments and the comments of other trained researchers, clinical analysts, show that really there is quite a contrast and difference certainly between these two elements, and that they should be treated differently.

Chairman DODD. I think it ought to be noted that the marihuana statute was passed in 1937.

Dr. GODDARD. 1937.

Chairman DODD. A long time ago, 30 years ago.

It ought to appear on the record. We have learned a lot about it since.

Dr. GODDARD. Senator, I am a little uneasy about testifying on marihuana. I trust you will also be talking to the Bureau of Narcotics. They have to live with the problem to a greater extent than we do.

Senator DODD. I just wanted to—I did not want to interrupt Senator Kennedy, but I wanted it on the record that it has been the law for 30 years.

I want to point out I have always had a question about the severity of the punishment. I do not know what they were thinking of in those days, but there must have been a lot of people who thought the other way.

Senator KENNEDY. You stated, I believe, in 1966 as well, Dr. Goddard, "We think the drug abuse control law is a good one, and we believe we can control LSD under it."

Do you still feel that way?

Dr. GODDARD. Well, I feel the law needs to be strengthened now by the provision of the felony penalties for manufacture, sale, distribution, possession for sale because our working experience has indicated that the lesser penalty of misdemeanor associated with those activities does not give us the tool that we, as an enforcement agency, need. That is a judgment we have reached from the operational experience of nearly 21 months.

I think the bill is still a good one, Senator; the basic intent of Congress, the basic provisions of the act are still sound, but simply that portion related to penalties needs improvement.

Senator KENNEDY. Yes.

Finally, as I understand from the thrust of your comments and testimony, you place a heavy reliance on the education of the young people of this country and the parents and church leaders and others in this whole field of drugs.

Dr. GODDARD. Let me make clear what I am talking about is a program which is comparable to a stool of three legs or, better still, a tripod. There needs to be a vigorous enforcement program aimed at those who manufacture, sell, and distribute, and I strongly support that effort.

Then, secondly, there needs to be a vigorous program aimed at those who use or abuse drugs, to get at their intellects, to get them to understand that drug abuse is inherently dangerous. This is much broader than just the drugs under control. Third, in order to properly support these activities, one needs to conduct a well-balanced program of research to feed into the enforcement and the educational activities.

Senator KENNEDY. Even with this three-legged stool, where do you really come out on the field, for example, in the use of these drugs? Are you trying to eliminate them from any kind of use in the United States? What are your goals and aims in this field?

Dr. GODDARD. I am trying to aim at a situation in which these drugs which have proper medical uses are restricted to those appropriate uses, and that drugs which are investigational drugs are limited to that field, and that we do not have misuse, self-medication, and abuse, which leads to hospitalization, which leads to psychiatric illnesses.

That, simply stated, is my objective. To do this we have to have a better program of drug information to young people starting as early as the third grade and not limit it to LSD and these kinds of drugs. Rather a proper respect for medicine as being something one only uses to correct an illness must be taught.

Senator KENNEDY. That applies to marihuana as well.

Dr. GODDARD. Yes, sir. It is not a medicine, however, so, perhaps, it is less appropriate there.

Senator KENNEDY. I think that is all.

Chairman DODD. Well, thank you very much, Doctor, and your associates. You have all been very helpful, and we appreciate your coming this morning.

Senator KENNEDY. Thank you very much.

Chairman DODD. Dr. Nowlis.

Dr. Helen H. Nowlis has served as Director of the National Association of Student Personnel Administrators' drug education project since 1966.

This project was a result of a contract with the Food and Drug Administration in which Dr. Nowlis worked with the officials from the National Institutes of Health and the Federal Bureau of Narcotics.

I think you are, Dr. Nowlis, one of the best qualified people in the Nation to outline for the subcommittee not only the extent and nature of drug use or abuse on the campus, but to present to the Congress the attitudes and current thinking of our educational, professional,

If we can remember this as a background, for instance, some of the figures that were mentioned this morning, one of which was based on a Gallup poll, which was reported to be a sampling of 426 colleges in this country, if you look at that Gallup poll, it consists of 520 interviews.

Chairman DODD. I do not remember a question about the Gallup poll.

Dr. NOWLIS. Well, some of the statistics that were mentioned this morning——

Chairman DODD. I see. Came from——

Dr. NOWLIS. Come from that kind of thing.

Another so-called national poll represents a sampling of 100 students, a probability sampling, from 12 institutions, and 12 institutions are a very small sample of the 2,567 or whatever the current figure is—it changes almost month to month—of institutions of higher education.

I think the one other thing that I would like to point out is that because some of us—and I think there are an increasing number of us—as we learn about and become more sophisticated about the whole problem of drugs, feel very strongly that the whole problem has underlying it a number of social issues, and because of controversy over these social issues it is extremely difficult to deal with drug as drug.

For instance, there are many young people in our colleges who do not use drugs, who do not intend to use drugs, who do not approve of drug use, who still defend the right of other young people to use drugs. In other words, they are bringing in many other social problems, and it is very difficult to get them to talk about drugs, what drugs are, how they act, and the dangers in every drug, and I would remind you that even aspirin is a dangerous drug.

Every drug, and I am talking now about alcohol, about nicotine, caffein, about medical drugs, all kinds of drugs, are potentially dangerous drugs, and I think this is the message that we must get to our young people.

Chairman DODD. You are such an intereseting witness I hesitate to tell you that we are told that we cannot sit after approximately 11:30. I am anxious to hear all you want to say, to pack a little more in in the remaining minutes.

Dr. NOWLIS. From my statement, perhaps, I can in a very short time get in a little bit more.

Chairman DODD. If you want to come back later, that is all right. But I would like to hear everything you can get in at this time.

Dr. NOWLIS. All right.

I feel that the Drug Abuse Control Amendments of 1965 represented a real step forward in their emphasis on the control of manufacture and distribution and their provision for a combined enforcement, education, and research bureau because, as Dr. Goddard has already stated, we do need the three-pronged effort.

On the basis of those amendments and its thriving infancy, the Bureau of Drug Abuse Control should continue to grow in strength and effectiveness. I feel very strongly the basic drug problem at the user level is a health and education problem and not primarily one of law enforcement. To put criminal sanctions on the user in order to

obviate the necessity for proving intent to sell and to force cooperation with the police is a serious infringement on the rights of the individual. It is police power which can be used to persecute, to gain vengeance, to gain political advantage, to silence opposition. The claim that criminal sanctions are a deterrent encounters much contrary evidence, as in the current increase in marihuana use. Marihuana arrests in California alone were 16,000 in the first 6 months of 1967, compared to 7,500 in the same period in 1966. The large majority of these arrests were for possession.

It must be obvious that I recommend drastic changes in the laws pertaining to marihuana. I feel strongly that all criminal sanctions for possession should be removed. The assumptions on which the laws were based have one by one been proved incorrect. They are not enforceable in the sense that any large portion of users can be arrested. There is little worse than a bad law which is widely ignored. I would think that our enforcement agencies and our courts have far more important concerns than marihuana possession. I am, however, against legalizing marihuana at this time, and endorse heartily the recommendation of the President's Commission of Crime and the Administration of Justice that the Government support, stimulate, and if necessary, do the research that is long overdue.

If you have time for questions I will be glad to answer them, and if you would like me to come back, I would be glad to come back.

Chairman DODD. I have a couple of questions I want to ask. I do not know how many Senator Kennedy will have. We will ask what we can.

First, is it possible for you to give us an estimate on the number of marihuana users; and, secondly, on the number of LSD users among the Nation's six and a half million college students?

Dr. NOWLIS. I have in my statement a very qualified estimate.

Chairman DODD. I noticed that.

Dr. NOWLIS. And this is based on a very inadequate national sampling. If we take the data that we have available, and recognize that it is not good data, I think we can state, taking the lowest figures, that there are at least 600,000 college students——

Chairman DODD. How many?

Dr. NOWLIS. 600,000 college students in this country using marihuana.

Now, some people would place that much higher and, as I say, I do not think the national polls that we have are adequate, but this would certainly be a minimum.

Chairman DODD. What would be the maximum, what would be the upper limit?

Dr. NOWLIS. I could not in all conscience answer that.

Chairman DODD. Why do you take the minimum?

Dr. NOWLIS. Because that is based on the only figures I have available, which I judge to be minimal figures. I have no figures for maximum.

Chairman DODD. I see.

Dr. NOWLIS. But I would like also to point out that if you think that the use of marihuana is purely a phenomenon of the college students, I think you are making a very great mistake.

Chairman DODD. I do not think that, and I do not think the members of the committee do.

Dr. NOWLIS. Pardon?

Chairman DODD. I do not think you should describe yourself that way, with the older generation.

Dr. NOWLIS. Oh, sir, I am a grandmother. I think that labels me, and I cannot get out of it no matter what.

Then, I think we turn to a second group of drug users, and those are the occasional users, who I think are using drugs primarily as an escape from boredom. I would like to come back to this a little later because I think when we talk about reasons, that we may have a little better understanding of what is going on.

Chairman DODD. Well, for example, we are told that some students use amphetamines so they can stay awake to prepare for an examination.

Dr. NOWLIS. We had student panels at some of our meetings and I have had them say, "You do not seem to realize if I walk into a group and say, 'Boy, I have got an exam tomorrow and I am going to be up all night,' I can almost predict 100 percent that somebody will reach in his pocket and say, 'Want a bennie?'." And strictly this, under the contemplated new legislation, if someone gives it to him, will be a misdemeanor.

But to get back to the casual or the occasional user, I think particularly in this group the social factors are very important and we make a mistake if we read more into it than the usual reasons for which people use alcohol, go to cocktail parties.

Now, alcohol is legal; marihuana is not. And I think a lot of these young people feel in their own minds—whether they are right or wrong—that the casual use of small amounts of marihuana is probably less dangerous than the use of alcohol.

Now, whether this is right or wrong I am not judging, but I think we have to accept what they feel as a beginning point, not as the answer.

Chairman DODD. Well, what do you feel?

Dr. NOWLIS. I am very uneasy about marihuana, even though with the possible exception of alcohol it is the most widely used drug throughout the ages and throughout the world. I think we probably know less about the effects of long-term very low dosage use than we do of any other drug. And, I really am more interested in the total impact on the student, with the relationship of the student to the law, than I am with what I see predominantly as minor drug use. I think this is one of the most serious problems we face.

Chairman DODD. Would you favor a reduction in the penalty?

Dr. NOWLIS. Definitely. This involves both my own personal social philosophy and my great concern for what seems to me the building up of a disrespect for law. To put criminal penalties on a law which even the President's Crime Commission has suggested may need looking at and to have the minority report of the President's Crime Commission suggest very strongly that we need to relook at the whole problem in this area. It is almost impossible in a confrontation with students to justify the fact that in many States, the penalties for the possession of five marihuana cigarettes are greater than those for second degree murder and that in many other States there are mandatory sentences with no opportunity for parole. This does not hold for what most of us consider crimes against society. It is this kind of

thing and its impact on the young person's respect for law that I think are far more important.

Chairman DODD. As you may know, there are bills pending before Congress now which propose to make unauthorized possession of LSD and other controlled drugs a misdemeanor.

Dr. NOWLIS. Oh, I think if this were passed it would be absolutely tragic.

Chairman DODD. You do?

Dr. NOWLIS. For one thing, I think that we have not quite been fair in the mass media and in most of the discourses that I have heard on the subject of penalties against LSD and other dangerous drugs.

The real drug problem in this country is not a very small minority of students who are misusing drugs. The real problem is a total society which is misusing drugs. I do not think many people realize that if this legislation goes through, it will have the effect of labeling as criminals a huge proportion of our society.

Now, let me give you an example. I was in Los Angeles last weekend. My plans changed and I had to fly overnight in order to make a 9 o'clock commitment in New York City. Now, when I am on a trip like that and know I am going to have to fly overnight I usually take one Seconal, prescribed by my physician. I had no intention of flying overnight. I do not carry these regularly. But I would have preferred to have one Seconal flying across the country between 11 p.m. and 6 a.m. If I had asked someone if he had a Seconal for me and he had given it to me, he would have been guilty of a felony and I would have been guilty of a misdemeanor.

Now, I think we make a great mistake when the only thing we think about is the number who are put in jail. I think we need to think carefully about merely labeling, whether they ever get caught or not, large portions of our population as guilty of misdemeanors or felonies. If you do this enough, you produce a disrespect for all laws because in a case like this, they do not really think it is that important a law, they do not really think it applies to them. But you run the risk of alienating large portions of the population. This is particularly true of the college student, and heavens knows, there is enough alienation now.

Chairman DODD. Well, do you think that as an expert—you certainly are an expert on this subject, certainly on the subject of the drug abuse problem—you would say that the consensus of scientific opinion in this country would support the proposals to increase drug penalties?

Dr. NOWLIS. The consensus of scientific opinion—do you know of any large group where you can get consensus?

One of the things we must realize is that just because one has doctor after his name, in this day of great specialization, he does not necessarily have any extra wisdom about all areas. I think that those people who know and understand drugs and know and understand young people would tend to agree with me. A large body of psychiatrists, a large body of psychopharmacologists——

Chairman DODD. Maybe I made the question too broad. That is really what I meant. Those researchers and scientists in your field.

Dr. NOWLIS. Yes, but I think it is important because there are many scientists not in the field who are expressing opinions and really if it

is not in your areas of expertise, it is more an expression of your personal opinion, your lay opinion, than it is of expertise.

Chairman DODD. This is not limited, I might say, to the field of drug abuse, is it?

Dr. NOWLIS. That is right. That is right. I think one of the great defaults of the scientific community is not to make it clear when they are speaking as scientists and as experts in a given area and when they are merely reflecting their lay personal opinion.

Chairman DODD. Well, what do you think about the academic community? Do you think it would support further penalties or not?

Dr. NOWLIS. I think we need to define support. I think the academic community is committed to supporting the law of the land, although it gets very, very, very difficult.

Chairman DODD. Well, I know. I am using words as I think most people use them. Would they approve of it?

Dr. NOWLIS. I think—again, you cannot speak for the whole academic community because we have all kinds of colleges.

Chairman DODD. Well, I do not expect you to, but you are in the field and you know a great many educators. What is their judgment?

Dr. NOWLIS. I think the majority of them who have studied the problem or have faced the problem would regret very much further penalties. I think that they have felt unanimously that the approach of the Drug Abuse Control Amendments of 1965 were a great step forward and gave us the framework within which we could work at an educational level, at a counseling level, even at an academic level, that we cannot do under these other penalties.

Chairman DODD. Now, you have worked with a great many law enforcement authorities across the country. Do you think they would agree with your position?

Dr. NOWLIS. No. I can state with great firmness that they do not agree. I have spent many hundreds of hours in dialogue with these people. They are honest people. They are sincere people. They believe in what they are doing and the place at which we differ is at a basic philosophy of social control.

Chairman DODD. Do you think the law enforcement position has any validity at all for increasing the penalties or preserving strong punishment in the case of marihuana?

Dr. NOWLIS. Well, one of the points on which we basically differ is the effect of strong penalties as a deterrent. I think if we look back on our social history, we can see that more often than not, it has not served, at least to the extent that they believe, as a deterrent. Again I have to mention marihuana which at a Federal level has stiff penalties and in many more States, as I have already mentioned, has even stiffer penalties. In the face of this, we see a rapid increase in use.

Chairman DODD. I get the impression that you agree that campus drug users are not what I would call criminal types.

Dr. NOWLIS. I think on a few large campuses in urban areas you may find people who become students or take advantage of being students for what I would consider criminal purposes.

Chairman DODD. I am speaking of the general group.

Dr. NOWLIS. I feel very strongly that unless one defines criminal in terms of the way in which you set up the law, in terms of the concept of criminal, that the overwhelming majority of them are not. If there

Mr. GIORDANO. A somewhat new and significant feature of the traffic is the appearance of increasing amounts of hashish. This is a very potent form of marihuana, and in the past was seldom available in this country. Today, however, we are making many hashish cases in some parts of the country. The extent of the hashish trade is not yet determined, but it is unquestionably growing. As more people use marihuana, the demand for the stronger substances will increase.

As I previously mentioned, most of the increases in marihuana abuse have been among young people, principally dropouts from work or school. By and large, these people come from middle- and upper-income families living in the suburbs, and I think we must realistically look at the problem in terms of several hundred thousand young marihuana users. But, in spite of these increases, I think it necessary to keep the problem in proper prospective. The best reports we have show that only a small percentage of our young people are currently abusing marihuana. A Gallup poll conducted in the fall of 1967 on some 426 college campuses found that only 6 percent of the students had ever used marihuana and 1 percent had used LSD. Many of these cases apparently involved mere experimentation and the number of chronic users is much smaller. The other study we consider authoritative was done by the New York County Medical Society in early 1966. It found a similar incidence of drug abuse in the colleges, gradually tapering off down through the high school levels.

In searching for the causes of this problem, I think it is clear that advocates who encourage others to experiment with the drugs are a major factor.

Chairman DODD. Who are these people? Can you define these people more accurately?

Mr. GIORDANO. Yes. I think I can, Mr. Chairman. I think this involves individuals such as Dr. Timothy Leary, Mr. Ginsburg, the poet, Dr. Fiedler from Buffalo, who has experimented, and, unfortunately, other people, professionals and educators, who should know better. They are encouraging young people by indicating there is nothing really wrong with finding out for yourself what this is all about. It reminds me a little bit of somebody pushing you into a fight with someone else and when you are lying on the ground and turn around to find your friend is long gone. I think that this is what we are finding today with a lot of people who are saying there is nothing wrong with marihuana, or that marihuana is not as bad as alcohol, or this drug is no more than that drug, and if you do not believe it, try it for yourself. A lot of these people who do not use it themselves are busy equating marihuana with alcohol or with something else. I am positive this has caused an upsurge in the use of marihuana. I think you can trace this upsurge in the use of marihuana to the time that Dr. Leary began speaking out on LSD and marihuana. Very soon there was another group; then the next thing we had the LeMar organization, which is a group dedicated to legalizing marihuana, and we had other organizations spreading around the country. As these people became more articulate, and as the newspapers, magazines, television picked this up, we had a concidental rise in the use of marihuana traffic.

Chairman DODD. Very well. Go right ahead.

Mr. GIORDANO. These persons have sought to associate marihuana abuse with all manner of personal and social virtues. Moreover, their

efforts have been aimed primarily at youth, and particularly at college students, who are, by and large, drawn from the middle-class suburbs. Therefore, they are not only responsible for increasing the problem, but also for helping to create it among socioeconomic groups where it did not formerly exist.

We are, in a sense, facing a new type of opposition. The people who are doing the "advertising" for marihuana and LSD peddlers usually are not criminals. They are often well educated and intelligent. They are talented in debate and in deception. All too often, their only vocal opposition is from police officers who do not possess their expertise in debate, or appeal to youth. However, we are undertaking to combat this propaganda with a suitable educational approach. We have participated in the production of an excellent film designed for young people. We have produced new educational booklets and speeches for distribution, and we are beginning a program to enlist the aid of major national organizations. Additionally, four of our most capable agents have been assigned to public educational work on a full-time basis.

The Bureau of Narcotics is seriously concerned over the increases in marihuana abuse on the Nation's campuses. Our principal mission is to concentrate our enforcement efforts on the major national and international traffickers and sources of supply. In this way, we are able to operate most effectively in reducing supplies and curtailing distribution to users. Since few major traffickers are actually operating on college campuses or in high schools, we are seldom involved at that level. However, we always try to assist local police agencies and school administrators in dealing with their problems. While we have read editorials in university papers opposing "snoopers" who come on the campuses to investigate law violators, we have found that most school authorities will not knowingly tolerate a drug problem and offer their full cooperation to our agents.

The current Federal marihuana laws provide penalties for the unlawful sale and possession of marihuana. A person found guilty of the illegal sale or transfer of marihuana may be sentenced to not less than 5 nor more than 20 years' imprisonment for the first offense. A person found guilty of illegal possession of marihuana may be sentenced to a term of not less than 2 nor more than 10 years for the first offense, or he may receive a suspended sentence and probation.

There has been some criticism of this penalty structure, particularly with regard to the penalty for possession. Some persons feel that this sentence is unduly harsh as applied to mere users of marihuana or youthful experimenters. However, this is not the manner in which the law is applied. Our thrust is aimed at the trafficking element and our conviction statistics bear this out. In 1967 about 60 percent of all our marihuana defendants had previous criminal records, usually for serious crimes. Their average age was 28 years. Nearly 70 percent of all of the cases were for sales violations. The remaining violations were for possession, but this does not mean that the individuals involved were not traffickers. We frequently apprehend violators in possession of large quantities of marihuana, clearly destined for the market. If there were no possession penalties, these persons would escape justice.

As you know, the functions of drug law enforcement are presently split between the Bureau of Narcotics in the Treasury Department and

the Bureau of Drug Abuse Control in the Department of Health, Education, and Welfare. At this point, I would like to deal briefly with the President's plan for the reorganization of these two agencies. Presently, the Bureau of Narcotics has jurisdiction over the narcotic drugs and marihuana, while the Bureau of Drug Abuse Control has jurisdiction over the barbiturates, amphetamines, tranquilizers, and hallucinogenic drugs. Under the President's plan, both agencies will be combined in a single agency under the Justice Department, to be known as the Bureau of Narcotics and Dangerous Drugs. This plan will have a great impact on the enforcement of the Nation's drug laws. It will combine the talents and efforts of both agencies in a unified attack on the traffic.

There are many important benefits to the Nation in this plan. In the first place, we must recognize the practical need for it. Patterns of drug abuse frequently involve the use of several drugs. We find that marihuana and LSD are often used by the same persons. The link between marihuana and heroin has been firmly established, but many authorities also agree that using marihuana frequently leads to LSD abuse. Even heroin addicts, in the early stages, use other drugs, such as barbiturates, tranquilizers, or amphetamines. Many traffickers, therefore, deal in a range of drugs. Some, of course, are exclusive dealers, such as the high-level heroin trafficker. Nevertheless, it is clear that patterns in the drug traffic often do not respect the division which we have made in our drug laws and enforcement agencies.

Another important area is the benefit we will gain by unifying our educational efforts. We will be able to undertake larger, more effective programs. It is necessary to present the whole spectrum of drug abuse to young people in the way that they find it in the streets. In short, our educational programs must reflect the broad perspective which only a unified approach can develop.

There are two final points with which I would like to deal.

Chairman DODD. Before you go to those final points, I want to interrupt you. Let me make an observation, first. I think this subcommittee is faced with a confusing situation. We are going to have more witnesses, and you are certainly one of the outstanding experts. Yesterday, Dr. Goddard was here, and he is an outstanding expert in his field. I asked him yesterday if he was against punishment for the possession of heroin and he said he was. He did not think the possessor of heroin should be punished.

Mr. GIORDANO. Should not be?

Chairman DODD. Should not be. I think his attitude is that he is a sick person who needs help rather than punishment. Dr. Nowlis, who was here this morning, feels generally of the same opinion. Now, you have a contrary view.

Mr. GIORDANO. Yes, I do.

Chairman DODD. Will you tell us a little more clearly why?

MR. GIORDANO. Yes, I will, Mr. Chairman, and I think there has to be a little bit of explanation. For the user of heroin or the user of marihuana, there is no State violation, there is no Federal violation. But there are penalties for possession. As I indicated earlier, I am in favor of a possession penalty for heroin. I am in favor of a possession penalty for marihuana. We have many, many cases involving an indi-

vidual in possession of quantities of marihuana. If we had no possession penalty, this individual who is a trafficker would go free.

I believe, Mr. Chairman, the last time I appeared before you was in connection with the Narcotic Addict Rehabilitation Act of 1966, which as I recall, you sponsored on the Senate side.

Chairman DODD. Yes.

Mr. GIORDANO. I supported that. I support treatment for addicts but, at the same time, we have to have a possession penalty for heroin and narcotics. We have to have a possession penalty for marihuana or we are not going to be able to control the traffickers and the sources.

Chairman DODD. I assume you include LSD and other similar dangerous drugs?

Mr. GIORDANO. I include LSD and I include dangerous drugs.

I think the congressional studies alone that have been made, starting with Congressman Boggs' committee and your study over the years in this area, have indicated that this dangerous drug problem is not going away. At the time of the drug amendments—I believe this was 1965—there was a lot of discussion that maybe there should be just a misdemeanor for the seller and no penalty for possession.

Well, these amendments have not improved the situation. At least California figures so indicate. The public does not want drugs used and abused. They want to keep them away from people, but you cannot reduce the availability without a penalty for someone who is in possession of large quantities.

Now to get back to the administration's bill—and just recently on this—it is my understanding that the bill that is before Congress is aimed at the trafficker and the large distributors.

Chairman DODD. Yes. I think that is accurate. We will be introducing our own subcommittee bill.

Mr. GIORDANO. That will be on LSD and dangerous drugs?

Chairman DODD. Yes.

Mr. GIORDANO. Mr. Chairman, there are two final points with which I would like to deal. They both involve legislation which will be proposed to the Congress in the near future. First is the matter of synthetic tetrahydrocannabinol, which is not covered by any of the existing laws. This is a new compound which has only recently been synthesized. It has not been found in the illicit traffic and, in fact, only a few scientists can make it, utilizing very sophisticated equipment. Nevertheless, it is a powerful and dangerous hallucinogenic drug which should be controlled now, in advance of potential abuse problems. The administration will soon offer an amendment to the Marihuana Tax Act for the purpose of including the substance within present controls.

The President has already offered new legislation to rectify the presently inadequate controls over LSD and other dangerous drugs. Under his proposal, unlawful sale or manufacture of these drugs will be made a felony and possession will be made a misdemeanor. At present, unlawful sale is usually a misdemeanor, and possession may carry no penalty at all. As a consequence, the sentences which have been meted out to traffickers and manufacturers are of no deterrent value. They have taken none of the incentives out of the business and do not even take the violators out of the business for long. Much of the effort of a fine team of investigators, therefore, has served little purpose. This piece of legislation is, in my opinion, of utmost importance.

In conclusion, I think that the existing laws, with the measures which are now being proposed, deserve the support of those who are concerned with effective law enforcement. It is a plan of positive action. Other changes may be needed later as we gain experience and knowledge from the consolidation of the whole drug problem in the new agency. But, at this time, I do not feel that any further changes in present laws are required.

Thank you, Mr. Chairman.

Chairman DODD. Thank you very much, Commissioner. We heard testimony yesterday and today from witnesses who seem to be very interested in comparing the use of alcohol with the use of marihuana. How do you equate the use of marihuana with the use of alcohol?

Mr. GIORDANO. Well, I think this is a most unfortunate comparison because, as far as I am concerned, they are totally different substances, pharmacologically. I think that one of the things that even the people who try to make a comparison will acknowledge is that a person drinking alcohol does not necessarily drink it to get intoxicated, but, for the majority of the individuals using marihuana, this is precisely the purpose: to become intoxicated. I would like to submit for the record here a report which I am sure the committee would be interested in reviewing. It is "Drug Dependence: Its Significance and Characteristics," prepared by Dr. Eddy, Dr. Halbach, Dr. Isbell, and Dr. Seevers. They were connected with the World Health Organization Expert Committee. Dr. Eddy and Dr. Isbell were on the Expert Committee at the time of the drafting of the Single Convention on Narcotic Drugs, 1961, when it was determined that marihuana was dangerous enough to be completely controlled by international controls and, in fact, even placed in a special category and, I think they explain here the effects of marihuana better than I could:

> The harm to society derived from abuse of cannabis rests in the economic consequences of the impairment of the individual's social functions and his enhanced proneness to social and antisocial behavior.

The report talks about the psychotic episodes that can be developed by cannabis. It talks about the distortion of space and time, and impairment of judgment and memory, distortion of emotional responsibility, irritability, and confusion.

Mr. GIORDANO. Also, Mr. Chairman, it describes drug dependence of the amphetamine type and barbiturate type.

Chairman DODD. Let me ask you a question. Do you think the penalties for possession of marihuana are reasonable?

Mr. GIORDANO. Yes, I do.

Chairman DODD. They are quite severe, are they not?

Mr. GIORDANO. They are severe, but marihuana has no medical use at this time. It has no commercial use. It has absolutely no use whatsoever. It is a dangerous drug; and in my opinion—and I am talking now of the Federal penalties—I do not think they are overly harsh. I may point out that some of the witnesses forget that, under the Federal statute, up to 18 years old, an individual is treated as a juvenile delinquent and there is no criminal record that would interfere with his future, so I think this must be taken into consideration.

Chairman DODD. What bothers me, and I expect other members of the subcommittee and staff, is that it is a matter of penalty. If you feel, as you say you do, that the penalty for possession of marihuana is not too severe, how would you feel about the penalty for possession of LSD, which is a much more dangerous drug?

Mr. GIORDANO. If we are talking about the marihuana that is available in the United States, most of it comes from Mexico. I think we have to consider that this is a very diluted substance as compared to hashish. It can be harvested in such a way that just the flowering tops are used and it is a much stronger substance. Or the active ingredient tetrahydrocannabinol can be produced, which is just as dangerous as LSD.

Chairman DODD. Well, I use the term LSD as it is commonly used.

Mr. GIORDANO. The question is why not stronger penalties for LSD. First of all, we have no possession penalties. I think the administration's bill is a step forward at least.

Chairman DODD. I do not think you get my point. Accepting your reasoning that marihuana is a dangerous drug and that penalties are not too severe for possession and sale, do you grade the danger of drugs with respect to the penalties imposed? If LSD is a much more dangerous drug, should not there be a much more severe penalty attached to practicing in it or possession of it?

Mr. GIORDANO. Well, I will have to answer it this way: I think myself that the penalties for LSD should be equivalent to marihuana, because the active ingredient in marihuana is somewhat less potent than LSD. As I indicated, the proposed penalties are a move up, a sort of a compromise from nothing to midway in the sentencing structure.

Chairman DODD. I wanted to get your view on the record. Can you tell us, in your judgment, what are the main reasons for the apparently increasing rate of marihuana use throughout the country?

Mr. GIORDANO. Well, I think again the main reason, as I indicated, is the growing permissive attitude.

Chairman DODD. You gave us some reason but I thought you might want to add to that.

Mr. GIORDANO. No. I think I pretty well covered it. I feel that the main reason for the increase is because of the views expressed by certain influential individuals as to the fact that marihuana is not a very dangerous drug and that every person should determine for himself whether he should use it.

Chairman DODD. You can see what a problem we have. Here is a man like Dr. Goddard who just takes a completely opposite view, and Dr. Nowlis, and I am sure there are others. Do you consider these two critics qualified to make judgments on this subject?

Mr. GIORDANO. Well, I certainly feel that they are qualified but, just like anything else, I do not necessarily agree with their conclusions.

Chairman DODD. Well, I did not mean to ask a question which would lead you to give the appearance of criticism. That was not my intention. But you are an expert, they are experts, and you come to entirely conflicting opinions. It is awfully hard for us to know what view to take.

Mr. GIORDANO. Well, all I can do, Mr. Chairman, is give you my views and my experience and what I believe is needed, and try to answer the questions to the best of my ability.

Chairman DODD. Do not misunderstand me. I highly value your opinion. As you know, we have worked with you and consider you an outstanding expert.

Is there any credible evidence that the Federal marihuana laws should be revised, that you know of; either be made more severe or less severe?

Mr. GIORDANO. No. I will say this, which is in the whole range of drug laws. The President in his message mentioned the reorganization and increasing the penalties on LSD and other drugs. He has also referred this whole problem to the National Commission on Reform of the Federal Criminal Laws which I believe is chaired by Governor Brown, and so this whole area is going to be evaluated again. In fact, as I think the chairman knows, these laws are constantly being reviewed, penalties and everything, and committees have been taking a second look every few years. Our last look at the marihuana law was in connection with your bill, Mr. Chairman, at which time the parole provision was restored for violation of the Marihuana Tax Act. Prior to 1966, for a seller or a second or a third offender, parole was not available. So, there was a modification at that time.

Chairman DODD. I have observed, and I am sure you have, too, that the State laws with respect to marihuana are being challenged in a number of instances in a way which I do not recall in the past. I am told that this is true in some 30 States.

Mr. GIORDANO. I think the main reason they are being challenged, although the defense attorneys are making other points in connection with it, I think the main reason for the challenge is because marihuana under the State laws is usually in the Uniform Narcotics Act and marihuana is defined as a "narcotic." It is not so under the Federal law.

Now, under the State laws, it is being challenged on the basis that it should not be classified as a narcotic. This is actually a legal definition, not necessarily a medical one, but they are still challenging it. I think the committee should have available a ruling in connection with a case in Boston involving two individuals named Leis and Weiss. The law was challenged as being unconstitutional. It was challenged on the fact that marihuana was called a narcotic. Judge Tauro gave his ruling, in which he went through all the challenges, and dismissed their motions. In this case, experts on both sides testified.

Chairman DODD. Getting back to the question of how severe the penalty should be for use and sale of marihuana, we have heard testimony here that, despite the severe penalties attached by law, there is an ever-increasing amount of abuse of this drug. That would suggest that the penalty is not very much of a deterrent. What about that?

Mr. GIORDANO. Well, I attempted to explain why I felt there was an increase and I suppose I should have added that this is in spite of the penalties. I think that if we did not have the penalties the problem would be 10 times worse than it is today.

Chairman DODD. And, do you think that if we made the penalty stronger it would be 10 times less?

Mr. GIORDANO. No. I am not saying that.

Chairman DODD. No, I am not saying you are saying it.

Mr. GIORDANO. No. What I said is this: that we have had this change. I think that the proper story will finally reach the young people and I am saying we should hold the line with what we now have.

Chairman DODD. You talked about, and others have talked about the traffic over the Mexican border. I think a great amount of this marihuana comes from there, does it not?

Mr. GIORDANO. Yes, sir.

Chairman DODD. I think you said that the border seizures grew from 6,000 pounds to something like 25,000 pounds in the course of 2 or 3 years. Does that indicate that there is a greater increase in the traffic or better enforcement of the laws?

Mr. GIORDANO. I think it is a combination, Mr. Chairman. There has been good enforcement and marihuana is available in Mexico. It is not very difficult to grow. The Mexican officials are attempting to eradicate it, but I think they are beset with problems of insufficient manpower.

We have increased our effort in working across the border. We have made large seizures there. The Bureau of Customs has increased its efforts. So, I think it is a combination of both.

Chairman DODD. I notice that you said that you are principally concerned with the bigtime operator, not the occasional user or the casual user. I am right about my understanding, am I not?

Mr. GIORDANO. Yes, sir.

Chairman DODD. Yet, the penalties are the same for the casual possessor or trafficker as they are for the bigtime operator. Do you think there is any sense or any validity in the idea that there might be a difference of penalty?

Mr. GIORDANO. I think, as I explained earlier, that our direction here was aimed at the trafficker and the sources of supply and not aimed at the user. None of the cases we made were cases made against the user. But I must say here again, this is something that will certainly be under study.

Chairman DODD. Do you think the possession laws are a deterrent to marihuana traffic and abuse?

Mr. GIORDANO. I think they are.

Chairman DODD. Your reason is that, if you did not have it, the traffic and abuse and possession would be much greater.

Mr. GIORDANO. I think the traffic, the possession, and abuse would be greater. Certain individuals recognize that there is a penalty, and I think this is a deterrent to them.

Chairman DODD. Well, this is an old problem of deterrents, of course. I wish you could tell us specifically how this provision of the law has acted as a deterrent when the abuse is on the increase. That is, something more than just your reasoning that it would be greater if there was no penalty. Do you have any more concrete information about that?

Mr. GIORDANO. I said I felt it would be greater if there were no penalty. I think one example of the fact that the penalties are a deterrent is the figures in relation to second and third offenders. At one time in the narcotic traffic, prior to the stronger penalties on narcotics, two-thirds of the violators were second and third and fourth offenders. That has been altered to where today the figure is 85 percent first offenders. So, we have discouraged these people from continuing to engage in the traffic. In the case of marihuana, in 1967, of the marihuana cases that we had, almost 96 percent were first offenders. Some of them have to be caught before they learn a lesson, but they spread the word, and I think this acts as a deterrent.

Chairman DODD. You do considerable work in the educational field in your Bureau, do you not?

Mr. GIORDANO. Yes, we do.

Chairman DODD. Do you think you ought to be doing more of it?

Mr. GIORDANO. We hope to do more. We have been increasing our activity in this, Mr. Chairman. In the past year, I think, as I mentioned, in cooperation with the International Chiefs of Police Association, we developed a film. We have a marihuana booklet that we just recently developed that I think the committee would like to have. And so we have been moving ahead in that area of education.

(The booklet referred to was marked "Exhibit No. 10" and is as follows:)

EXHIBIT No. 10

The Dangers of Marihuana... Facts You Should Know

An Educational Message on Marihuana Abuse and Control

from Henry L. Giordano
U.S. Commissioner of Narcotics

Recently, within the United States, we have witnessed an increasing abuse of marihuana as well as other hallucinogenic or "mind-changing" drugs. Regrettably this trend has been encouraged by a small number of misguided but highly articulate spokesmen, who have attempted either to justify or to excuse the use of such drugs. As a consequence of promotional activities by these spokesmen, many impressionable young persons have been led to experiment with marihuana. It is therefore wise for every citizen to acquaint himself with the basic medical and sociological facts concerning marihuana.

what is Marihuana?

The technical name of the plant from which all marihuana preparations are derived is *cannabis sativa* (L.), sometimes called cannabis indica, Indian hemp, or simply hemp. The cannabis plant is native to large areas of the world and its fibers have been used for the manufacture of twine, rope, bags, clothing, and paper. The sterilized seeds are occasionally used in various feed mixtures and particularly for bird seed. Marihuana has also been used in the treatment of a variety of clinical disorders as an analgesic, a poultice for corns and in other ways. All of these medical uses were found to be either unsound, inefficient, or without predictable effect. Hence, the drug has been removed from the U. S. Pharmacopeia as well as the official drug lists of nearly all other countries. However, legitimate medical

research into marihuana's possible utilization in a range of useful therapeutic functions continues. Such research has never been prohibited by Federal laws.

Under the Federal law, "marihuana" is defined to mean all parts of the cannabis plant except for the stalks and sterilized seeds. All other preparations of the plant, whether of leaves, flowers, resins, or chemical extracts, are various forms of marihuana. The best known of these is hashish, a concentrated preparation of marihuana. In this country, the term "marihuana" usually refers to a preparation of pulverized leaves, resins, flowers, or combination of these, also called "pot," or "grass," for smoking in pipes or homemade cigarettes (called "reefers," "sticks," or "joints"). We now know that marihuana contains a number of potent compounds called tetrahydrocannabinols which affect the mind and body in various ways.

The strength of any given preparation of marihuana depends upon the amount of tetrahydrocannabinol which is contained in it. The strongest preparations, such as hashish, are made in certain areas of the world, particularly India and the Near East. A substantial quantity of hashish finds its way into this country's illicit traffic; however, most marihuana users customarily must settle for more adulterated forms. This is primarily due to state and Federal policing activity plus the general air of social condemnation, all of which results in making it difficult, expensive, and dangerous to acquire and possess marihuana. Thus, American users accept whatever grade of marihuana they can get at whatever price it is offered and whenever it is available.

effects on the Mind & Body

The consumption of marihuana produces a variety of immediate mental and physical effects which become more pronounced with chronic use. The 1965 report on Drug Dependence for the World Health Organization describes the nature of the intoxication as follows:

> "Among the more prominent subjective effects of cannabis . . . are: hilarity . . . carelessness; loquacious euphoria . . . distortion of sensation and perception . . . impairment of judgement and memory; distortion of emotional responsiveness; irritability; and confusion. Other effects, which appear after repeated administration . . . include: lowering of the sensory threshold, especially for optical and acoustical stimuli . . . illusions, and delusions that predispose to antisocial behavior; anxiety and aggressiveness as a possible result of various intellectual and sensory derangements; and sleep disturbances."[1]

The effects of the drug on the nervous system and brain are undoubtedly the most profound and constitute the greatest problem for the user and the persons around him. These include the precipitation of psychotic episodes during which the user becomes mentally unbalanced for varying periods of time. A recent study which described the effect of the most active of the tetrahydrocannabinols (abbreviated as THC) reports the following:

> "It has long been known that marihuana and hashish can cause psychotic reactions, but usually such reactions are ascribed to individual idiosyncrasies rather than being usual or common reactions to the drug. The data in these experiments, however, definitely indicate that the psychotomimetic effects of Δ^1–THC are dependent on dosage and

1. Eddy, N. B.; Halbach, H.; Isbell, H., and Seevers, M. H.: Drug Dependence: Its Significance and Characteristics, Bull. World Health Organ. 32:721, 1965.

> that sufficiently high doses can cause psychotic reactions in almost any individual. Psychotic reactions after smoking marihuana under the usual conditions in the United States appear to be rare but the low incidence of such psychotic breaks may reflect nothing more than the low tetrahydrocannabinol content of most of the marihuana available in the United States."[2]

Those who have studied users of marihuana have found that:

> "Excessive indulgence in cannabis is apt to produce in healthy individuals and more so in susceptible individuals, mental confusion which may lead to delusions with restlessness and disordered movements. Intellectual impairment as well as disorientation may show itself in various ways."[3]

Prior to the studies showing that tetrahydrocannabinols in appropriate concentration cause psychotic reactions, there had been considerable controversy over the connections between marihuana use and criminality.

A recent report of the New York County Medical Society noted that habitual use of hashish is definitely associated with criminality, violence, and insanity.[4]

A sufficient dose of marihuana is capable of producing all of the effects of hashish and even of LSD,[5] which is conceded to be one of the most powerful drugs known to man. To resolve the dispute, it is enough to say that for certain individuals, a small dose, and for all individuals, a large dose of marihuana's active ingredients causes temporary insanity. What each individual does while in a psychotic state will vary with the individual and his circumstances at the time of the psychosis. The important question for society is no longer in what manner marihuana use causes crime, but rather how many crimes would not be committed but for the addition of this drug to the social environment.

Marihuana vs. Alcohol

Some marihuana users have tried to excuse their indulgence by claiming that it is no worse than consuming alcohol. While alcoholism constitutes a major social problem, surely it is not valid to justify the adoption of a new abuse by trying to show that it is no worse than a presently existing one. The result could only be *added* social damage from a new source. Moreover, marihuana, unlike alcohol, is nearly always consumed by its users for the express purpose of attaining a "high," a disorientating intoxication. Evidence of studies of chronic marihuana users also indicates that a more dangerous psychosis may result.

Another significant difference between alcohol and marihuana which has been given considerable attention is that alcohol more rapidly impairs motor coordination, thus disabling the inebriate. Marihuana intoxication, on the other hand, does not result in such rapid motor incoordination. This difference becomes very important when the marihuana user operates a car, for cannabinol distorts time and space concepts very radically.[6]

6. Maurer, D. W., and Vogel, V. H.: *Narcotics and Narcotic Addiction*, p. 243, 1962.

Marihuana & Addiction

The question regarding the addiction liability of marihuana has been the subject of considerable debate among scientists, and research in the area still continues. Chopra found that, "Repetition of the dose developed into craving for the drug, and gradually there developed in such individuals habitual use and increasing tolerance which led to increase of dosage." However, he pointed out that this was in no way as significant as in the case of morphine-type drugs. Recent studies in England also uncovered a suggestion of tolerance and progressive dosage. Nevertheless, all agree that marihuana does not produce a dependence of the morphine type, and abstention does not result in the classic withdrawal symptoms which invariably accompany abstention from narcotic drugs. The World Health Organization has recently chosen to discontinue the use of the terms "addiction" and "habituation" and substitute the single term "dependence." Thus, one may speak of "marihuana dependence" or "morphine-type dependence" without confusion.

From a medical standpoint, this distinction cannot be overlooked, but it assumes less importance when considering the practical social dangers of the drug. Dr. David P. Ausubel, in his book, *Drug Addiction*, noted that chronic users of marihuana will go to great lengths to insure that they will not be without the drug. Deprivation, he says, may result in "anxiety, restlessness, irritability, or even a state of depression with suicidal fantasies, sometimes self-mutilating actions, or actual suicidal attempts." Other researchers have also observed that, from a psychiatric point of view, marihuana dependence is but little different from narcotic addiction.[7]

Another dangerous aspect of habitual marihuana use is the pattern of graduation to narcotic addiction. Of course, not all persons who use marihuana go on to use heroin, but actual experience leaves little doubt that a large majority of narcotic addicts began their drug-taking with marihuana. Intensive research conducted at the Public Health Service Hospital in Lexington, reported in 1967 by Dr. John C. Ball, disclosed that of 2,213 addicts examined, 70.4 percent had used marihuana prior to their addiction. This sample included addicts from all classes and professions, representing 46 states. Moreover, in those states classified as areas in which marihuana is often available, it was found that of 1,759 addicts, 80 percent had first used marihuana.

As a result of intensive psychiatric evaluation of 80 subjects, Dr. P. A. L. Chapple concluded that the connection between marihuana abuse and heroin addiction could not be accounted for simply on the basis that both drugs are often available from the same illicit source. The evidence is strong that the use of marihuana develops a taste for drug intoxication which, in turn, leads many people to the use of more potent drugs —even heroin.

7. Chapple, P. A. L.: Cannabis, a Toxic and Dangerous Substance—A Study of 80 Takers, Brit. J. of Addiction 61:269, 1966.

Control & Abuse in the United States Today

Marihuana is the subject of worldwide prohibition as expressed in the 1961 Single Convention on Narcotic Drugs. On the advice of the Expert Committee on Dependence-Producing Drugs of the World Health Organization, it was placed in a special category with heroin as being a drug "particularly liable to abuse and to produce ill effects." The United States, which acceded to the Single Convention in the spring of 1967, has controlled marihuana since the passage of the Marihuana Tax Act of 1937. Under this Act, the use of marihuana preparations is confined to bona fide medical research and industrial needs and all other uses are prohibited. A person found guilty of the illegal sale or transfer of marihuana may be sentenced to not less than 5 nor more than 20 years imprisonment for the first offense. A person found guilty of illegal possession of marihuana may be sentenced to a probationary term or not less than 2 nor more than 10 years imprisonment for the first offense.

The efficiency of Federal, state and local law enforcement agencies in coping with the illicit marihuana traffic has succeeded in preventing this abuse from becoming the major problem it is in some other countries.

This success has also, unfortunately, resulted in concealing from many observers the full dangers involved. The low potency of the marihuana which is available and the arrest of those who traffic in it have resulted in partially disguising its consumption as a causative factor in crime and psychosis; a connection which is more apparent in those countries where use has been widespread and has been effectively deterred.

In contrast to the social and scientific realities, the prophets of the drug experience make fantastic claims for the virtues of marihuana. They would have it regarded as a "benevolent herb" which may lead its users to profound philosophic truths, greater social intimacy and keener artistic expression. These claims are often accompanied by otherwise valid criticisms of society's ills and hypocrisies. Such observations are designed to enlist the individual's sympathies and thus to convince him that the claims are as justified as the criticisms. However, it takes little philosophic sophistication to recognize that such virtues do not reside in drugs but in men. They are the products of conscious labor, and cannot be attained on the peddler's prescription. At best, drugs provide only mechanisms to escape from problems and hence to escape from the character development which would ultimately permit their solution. The spread of marihuana abuse can only add to the difficulties which already plague our society, not solve them.

The Committee on Alcoholism and Drug Dependence of the Council on Mental Health of the American Medical Association in a recent article on dependence on cannabis stated: "Only an aroused and concerned public can create, mobilize and implement resources to deal adequately with as serious a problem as drug dependence in all its forms. . . . Frank and forceful public discussions, focusing on the futility and inherent dangers in experimentation with drugs such as marihuana and the consequences of any subsequent psychological dependence, can act as deterrents," and finally: "Marihuana is centuries old, but it represents a constant danger. The responsibilities of the citizen, including the physician, are clearly defined. The time to begin is now."[8]

8. J.A.M.A. 201: 368, August 7, 1967.

(The following documents, marked "Exhibits Nos. 11 through 20," were offered by Mr. Giordano as appendixes to his statement:)

EXHIBIT No. 11

Marihuana violators reported to the U.S. attorneys by the U.S. Bureau of Narcotics during calendar year 1966

POSSESSIONS OFFENDERS

Total violators reported	114
Age:	
Under 18	-----
18 years old	4
19 years old	3
20 years old	7
21 to 25 years old	35
26 to 30 years old	28
Over 30 years old	37
Average age (years)	28.9
Claimed occupation or avocation:	
Skilled workers	38
Clerical-administrative	18
Unskilled laborers	15
Salesmen	11
Job Corps	6
Entertainer	7
Student	8
Military	3
Other (includes unknown)	8
Quantity of marihuana involved per case:	
Average (pounds)	20
Median (ounces)	12
Prior criminal record:	
Yes (54.4 percent)	62
No	52
Prosecution action:	
Pending	42
Dispositions:	
Dismissed	28
Acquitted	4
Convicted	40
Sentenced under FYCA[1]	9
Received suspended sentence and/or probation	17
Reduced from offense calling for mandatory penalty	14
Sentence to be served in prison	14
90 days	1
2 years	4
3 years	2
5 years	6
10 years	1
Average sentence of imprisonment (months)	46.5

[1] Federal Youth Corrections Act prescribes an indeterminate term.

PROFILE OF POSSESSOR

28.9 years of age; resides in a large urban area; claims to be a skilled or administrative worker; is not a student (only 2 students were sentenced to imprisonment); possesses an average of 20 pounds, and a median of 12 ounces of marihuana; receives a prison sentence of 47 months; has a 64% chance of offense being reduced to one not calling for mandatory penalty; has 43% chance of receiving a suspended sentence and/or probation; has a 65% chance of receiving sentence not requiring imprisonment; has only a 15% chance of receiving a 5 year or more minimum mandatory sentence; and is eligible for release on parole.

EXHIBIT NO. 31

COMMISSION ON NARCOTIC DRUGS

Twenty-second session
24 January 1968

THE ABUSE OF CANNABIS AND THE
CONTINUING NEED FOR STRICT CONTROL

Canada, France, Ghana, Jamaica, Japan, Mexico, United Arab Republic, United States of America.

The Commission on Narcotic Drugs recommends the following draft resolution for adoption by the Economic and Social Council:

The Economic and Social Council,

Recalling that the Single Convention on Narcotic Drugs, 1961, obliges Parties to place cannabis under strict controls to prevent its abuse;

Considering that the problem of the traffic and abuse of cannabis remains serious in many areas where it has long been encountered;

Observing that the traffic and abuse of cannabis appears to be spreading to areas where it has not heretofore been encountered;

Noting that considerable publicity has been given to unauthoritative statements minimizing the harmful effects of cannabis and advocating that its use be permitted for non-medical purposes;

Recognizing that cannabis is known inter alia to distort perception of time and space, modify mood and impair judgment, which may result in unpredictable behaviour, violence and adverse effects on health, and that it may be associated with the abuse of other drugs such as LSD, stimulants and heroin;

Convinced that inefficient controls over, apathy towards and lack of public awareness of the dangers of cannabis and its continued abuse contribute to drug dependence, create law enforcement problems, and injure national health, safety and welfare;

1. Recommends that all countries concerned increase their efforts to eradicate the abuse and illicit traffic in cannabis;

2. Further recommends that governments should promote research and advance additional medical and sociological information regarding cannabis, and effectively deal with publicity which advocates legalization or tolerance of the non-medical use of cannabis as a harmless drug.

Chairman DODD. This has been a very interesting testimony, Mr. Giordano, and I am sure all members of the committee will find it informative and helpful. We are grateful to you for coming out so early this morning.

Mr. GIORDANO. Thank you very much, Mr. Chairman. It is always a pleasure to appear before you.

Chairman DODD. Mr. John Steinbeck?

STATEMENT OF JOHN STEINBECK IV, AUTHOR OF ARTICLE ALLEGING MARIHUANA USE AMONG U.S. SERVICE PERSONNEL IN VIETNAM

Chairman DODD. We're glad to have you here this morning. I look forward to hearing your testimony.

You returned in June of 1967, was it not, from Vietnam?

Mr. STEINBECK. Correct.

Chairman DODD. You were in the Army.

Mr. STEINBECK. Yes.

Chairman DODD. You worked then as a newspaperman and broadcast announcer for the Armed Forces radio and TV network. And, after your return in June, you worked as a writer in the Office of the Army's Chief of Information in Washington.

Mr. STEINBECK. Yes.

Chairman DODD. I think I should point out that we asked you to come because your views attracted considerable attention and they are respected by many people, I am sure, by those who are seriously questioning the laws on marihuana and their application. You have written a widely quoted article in the Washingtonian magazine about the use of marihuana by the Armed Forces abroad which certainly adds another dimension to the growing use of marihuana. So, we felt that it would be important to the committee and the Congress to invite you to come and we are pleased that you did.

I said yesterday and I want to reiterate today: this is an investigative hearing. We are trying to get the best information we can. It is not an adversary proceeding. I am not trying to get into an argument with you or Mr. Giordano or anybody else. We want to get the best information we can.

Mr. STEINBECK. I appreciate that.

Chairman DODD. I invite you to go right ahead and tell us what you would like to say.

Mr. STEINBECK. In the interest of time, Mr. Chairman, I am going to waive the vast bulk of my testimony and have it entered into the record. But I would like to read perhaps the major portions of it to get my position clear.

Chairman DODD. Go right ahead. I understand now that we may be allowed to sit. I understood yesterday that we would have to stop at 10 o'clock, but I am told we may be able to continue longer. So, you go right ahead.

Mr. STEINBECK. I have agreed to give testimony today concerning the use of the drug marihuana by service personnel in the Republic of Vietnam because I believe it is the sincere goal of this subcommittee to eventually arrive at a realistic view of the use of marihuana by Americans, a view unclouded by any particular moral opinion, to

couple this view with modern scientific inquiry and then, with this information, to instigate whatever legislation best reflects public morality, civil rights, and the national welfare.

None of this can be achieved, I think, without accurate information as to what marihuana is and especially what marihuana means to the people for whom the Government would be passing any legislation. To begin with, it seems that the prohibition of a substance or the lack of such a prohibition involves the weight of public opinion far more than commonsense or medical evidence either way.

The popular acceptance of cigarettes, while we know them to be a health hazard, is an example. I believe according to the American Cancer Society that it is a medical fact that marihuana is far less harmful than the cancer-feeding tars contained in the everyday cigarette which carries with it the very powerful addictive drug that is nicotine. Cigarette smoking, however, remains in the public domain of overall acceptance despite scientific evidence that the practice of smoking them is deadly. I believe that if marihuana becomes legal, it will probably be the weight of that same public opinion that matters again, far more than any medical or scientific justifications, either way pro or con. I say again, it is interesting that society is now embr ng a chemically dangerous drug in cigarettes and worried about what I believe and the public authorities believe is a relatively safe one. I say again that it is interesting to note how public opinion can change poison to water and water to poison and it really does not seem to make much difference what the chemical makeup is.

I do not completely believe that a Government or official survey into the use of an illegal substance like marihuana could possibly arrive at an accurate index or numerical figure indicating the extent of marihuana use in America or by Americans abroad. With all the extensive official literature and tests that I have heard recently on the subject, it is still almost impossible to get a vague picture of the widespread effects of the drug. This in itself demonstrates some of the haziness of most official publications concerning marihuana use.

In notifying me of the scope of this testimony, the subcommittee submitted a comprehensive list of questions which address themselves to the use of marihuana by American service personnel in Vietnam. I will begin to answer those now.

The result of what I believe to be my sophistication with many aspects of Vietnam tells me that about 60 percent of American soldiers between the ages of 19 and 27 have experienced marihuana by smoking it, and do smoke it whenever they think it is reasonable to do just that, taking into consideration their responsibilities at the moment. However, I think the figure daily approaches 75 percent of the previously mentioned age group as they become more sophisticated about the plant. I believe for the most part, and I understand the military concurs with me on this, that it is a relatively harmless practice both to the military at large and to the individual soldier.

The second question submitted to me refers to the obtainability of marihuana in Vietnam. Marihuana or *Cannabis sativa* flourishes throughout almost every portion of the world. This is true for Omaha, Nebr., not to mention the jungles and plains of Southeast Asia. The easy access of marihuana to American service personnel is mostly due to the American soldier's exposure to the Vietnamese national on all levels of his involvement in Vietnam.

Another question concerns the attitude of service personnel toward the use of marihuana. I assumed by this question you meant the average service personnel, and if they plan to continue its use upon their return to the United States. The attitude of most members of the Armed Forces to marihuana I believe to be a very casual one. A substance that might seem a momentous thing to a suburban family in the United States just is not to a sergeant first class serving in the delta. The younger soldier who probably has friends in the United States who smoke the drug certainly is as offhand about it as the rusty veteran. Soldiers who have started smoking marihuana in Vietnam may or may not continue its use when they return to the United States. However, I believe that it is more likely that they will. Under the articles of the Uniform Code of Military Justice it is illegal to possess marihuana. However, the violation of this code is noteworthy on the command level as an infraction of discipline rather than through any connotations of possessing drugs. There are too many military people for the command to deal with on a personal level, and so it becomes a matter of whether control of marihuana is a convenience or an inconvenience to the legal officer or company commander who has to make out the paperwork if any action is to be taken against any members of his command.

I have been among a great number of military police and legal officers who smoke marihuana, and so another enforcement problem arises right there. Also, if my figures are even nearly correct, then the enforcement of the law in any total measure would mean taking legal actions against tens of thousands of military personnel in a logistical area, Vietnam, where such a thing would be completely impossible.

Another question was, has the use of marihuana by service personnel impaired their effective functioning as combat personnel? I do not believe that marihuana has in any way significantly impaired the effectiveness of American combat personnel and again, I believe the military agrees with me on this point. The Vietcong, whom we know to be excellent fighters and skillful soldiers, have used marihuana almost to a man since early childhood. I have not made it clear, but I will now, that marihuana in Vietnam and by most people who use it is used mostly for relaxation, and a soldier with any respect for his own life would never be likely to endanger that life if he thought it affected his functioning. And, I do not think that there is anyone who is in a better position to judge whether a drug is debilitating or not than the individual himself is as, in the soldier's case, he is asked to continue to perform a series of tasks of a highly physical nature whether he uses the drug or not.

It must be added here that from all evidence at my disposal there is no indication that the effects of marihuana carry on over for any great length of time after smoking. Certainly, far less than the physical effects noticeable in having too many beers the night before or as much as 12 hours after ceasing to use that drug.

So you can get on perhaps with more detailed questions to me, let me just conclude with the recommendations. I would give the subcommittee with regard to the control of marihuana. I have to concur with Dr. Goddard and Dr. Nowlis about penalties being far out of proportion to the nature of the crime when we sentence the users of marihuana to jail. It seems to me to be ultimately ridiculous and

defeating to the philosophy behind any legal system to turn upward of what I believe to be 10 million or more people into criminals because of the provincial and prejudicial nature of our laws governing the use of the substance.

Chairman DODD. Thank you, Mr. Steinbeck.

Based on your personal knowledge, how many servicemen do you know who are smoking marihuana in Vietnam?

Mr. STEINBECK. I would say in my direct experience, from asking questions, and people that I knew by actually meeting them, about 300 American soldiers.

Chairman DODD. What percentage would that be of our total number of men there?

Mr. STEINBECK. Of the men in Vietnam?

It is a very minute percentage, sir, but I got the impression through interviewing these people, and I would only be exposed perhaps to one at a time while traveling throughout the Republic, that the vast majority of their units also smoke the drug.

Chairman DODD. I thought I read somewhere—correct me if I am wrong about this—you were quoted as saying that 75 percent of our servicemen in Vietnam smoke marihuana.

Mr. STEINBECK. I was misquoted, sir. My comments were that 75 percent of a certain age group, that would be that age group between 19 and 27, 75 percent of that group smoke marihuana. The age group of the American service personnel in Vietnam extends quite beyond that.

Now, what percentage that finally comes out to, I do not know exactly. However, whether this figure that I used of 60 percent going to 75 percent is accurate to a 10 percent figure or not is not actually very important to me. I use it mainly as an illustration in morality, that if these soldiers whom we know and continue to call American heroes, these men who are serving their country abroad, smoke the drug, if when they come home we call them criminals, I think there is a basic contradiction in our thinking about our fellow man.

Chairman DODD. I think you have a point there, but I think you would also agree that 60 percent would be alarming to the families and men generally in this country.

Mr. STEINBECK. I agree, sir.

Chairman DODD. If it is not accurate, it would be a disservice.

Mr. STEINBECK. The poll that you quoted yesterday which reported that 85 percent of parents replied "No" when asked whether they would like their children to be using marihuana is probably an accurate one. However, for the purposes of this committee, I think another poll probably should be administered asking how many of those parents would like to have their children put in jail for smoking marihuana. I dare say that the percentage would be equally high, that though they would not like their children smoking marihuana, they would prefer even less that their children go to jail for doing something which is basically very silly.

Chairman DODD. Would it not be better to ask them how they would feel about somebody else's child since they are so emotionally involved with their own children?

Mr. STEINBECK. Exactly, but I think we get to a minor point of hypocrisy if they would not like their own child to go to jail but they would think it was exactly proper for somebody else's to.

Chairman DODD. Well, have you got any suggestion or advice to give us as to why a considerable number of those you came in contact with in Vietnam use marihuana?

Mr. STEINBECK. I believe, sir, that the whole philosophy of this question, whether it be one of civil rights or not, is the fact that we as a government or as citizens are trying to protect our country's youth from any physical disability and the entire position of anybody against marihuana, outside of perhaps violating civil rights with selling and buying, is that we think they are going to hurt themselves by doing this.

In the opinion of most of the Nation's youth today, the major health hazard is the draft and not marihuana. Marihuana you can smoke and you will be awake tomorrow. However, these people see their brothers never coming back from Vietnam.

Now, if we condone a process which ultimately leads to the death, final death of vast numbers of our Nation's youth, then we are very petty and prejudiced about them hurting their health smoking marihuana, a fact that has never been proved. This poses a contradiction to the minds of the youth of America, and from their point of view, they would, I believe, like to know just exactly what the Federal Government means by saying "We want you to grow up and be healthy and psychologically happy" and at the same point exposing them to a violent death from a machinegun.

Also, if what we are worried about is the psychological deterioration of these people by the use of marihuana, I question whether it is better for their health or psychology to spend 10 years in jail. It seems to me there is a contradiction there. If what we really want with this legislation, and our interest in the subject is to protect our people from ill health, psychological disorders, then the penalties certainly do not do it.

Chairman DODD. If I understood you correctly, you said you came in personal contact with something like 300 or 350 who smoked marihuana.

Mr. STEINBECK. Sir, I became exposed to marihuana personally as a very young boy in New York City. In those days I was not particularly involved with obtaining the drug. The places where it was obtainable were particularly sordid and generally a nest of what we would consider to be actual criminal activity.

In the sixties, with the advent of marihuana use by most college students, the criminal element of it had been taken out and as a result, you find college students and most people who smoke marihuana in professional circles not out to make a profit but, as Dr. Nowlis said, merely to distribute the drug among their friends.

Chairman DODD. Well, I would like to stick to this question if we can, to get the answers on the record. Of the 350 whom you personally knew in Vietnam, were all of them in this age group that you spoke of?

Mr. STEINBECK. No, sir. I would say that about 80 percent of those 350 or so people were in this age group. However, there are many professional soldiers in the U.S. Army and the other military who spent great time in occupation duties in the Orient and throughout

the world. When the original buildup in Vietnam occurred, vast numbers of——

Chairman DODD. I know that. What I am trying to get at is what is the basis of your figure, 350? What percentage are in this age group that is most common in the Armed Forces in Vietnam?

Mr. STEINBECK. About 19 to 27, sir. Most common. However, this——

Chairman DODD. Nineteen to 27.

Mr. STEINBECK. Those 19 to 27 years of age represent, I would say, 60 percent of the people that use marihuana.

Chairman DODD. That is how you got at your 60 percent figure?

Mr. STEINBECK. And through investigation, sir. In my capacity as a newsman for Armed Forces radio and television I had the opportunity to travel throughout the Republic of Vietnam. I have come in contact, I believe, with personnel from at least every battalion-sized unit in the Republic. In traveling, and being an enlisted man at the time, I spent a great many hours in hospitals and flight sheds interviewing people about this very subject, and the impression I got——

Chairman DODD. How many of these people had used marihuana before entering the service, do you know?

Mr. STEINBECK. About half, sir. The availability of marihuana in Vietnam and the lack of any realistic controls whatsoever make it an environment where it is a lot easier for a young person to smoke marihuana.

Chairman DODD. I think you misunderstood me. How many of our people who are using marihuana in Vietnam were users before they entered the military?

Mr. STEINBECK. About 50 percent, sir. The other half started using marihuana in Vietnam or at some part of their time in the military. Since I made my statements about the use of marihuana in Vietnam, I received a number of letters, and whatnot, from personnel stationed in other parts of the world, particularly the Panama Canal Zone, Korea, and Japan, and all these people seem to give me the impression that exactly the same thing is going on there. I do not find this surprising because the age group merely reflects the same age group that we know to be smoking marihuana in the United States. So, the fact that they are in the military in no way robs them of their youth and the idea of rebelling with marihuana, and I believe this is a very significant cause as to why marihuana is being used.

In Vietnam marihuana has been used historically for centuries. However, we find in Vietnam the exact opposite trends to what is taking place in the United States today. Because marihuana is used almost 100 percent by the tribal people in the mountains of Vietnam and about 50 percent of the peasants, the youth in the cities, that is to say, the generation gap there, does not use marihuana for the very same reason that American youth uses marihuana, because the use of marihuana to them reminds them of their basically agrarian background and peasant background, and so they would much prefer to drink our scotch than smoke their marihuana.

I believe that at least 50 percent of the time in the United States, on college campuses, today's youth finds that marihuana offers various social and psychological outlets. They realize that marihuana, not being an addictive drug, can perhaps instill their individuality or offer them a relaxing experience. It is a way to channel a good deal of their rebellious feeling.

I say this only perhaps as an idea but if marihuana were widespread today among my generation as it is, it is quite possible that the natural reaction of my children and the generation gap that will follow this will be to not use marihuana because they do not want to seem like their parents. So, I think the problem is not one of the quality of the drug as much as the quality of the person who uses the drug.

Chairman DODD. By the way, what is the attitude of the military command toward the serviceman's using the marihuana?

Mr. STEINBECK. I believe the provost marshal in Saigon, in a very accurate statement said, "It is a damn nuisance."

Chairman DODD. It is what?

Mr. STEINBECK. "It is a damn nuisance," and I believe what he meant, not that it does not get in his way if he does not know about it, but the responsibility of making out paperwork or being asked to appear at Senate subcommittee hearings is to the military, faced with the problem of Vietnam to begin with, a damn nuisance and they would much prefer that it were not brought to the surface since it does not seem to be bothering anybody anyway.

It was my intention in bringing it to the surface not to aggravate them with controlling marihuana but again just paint the obvious paradox that if these people are smoking marihuana, then marihuana itself inherently cannot have anything to do with morality whatsoever.

Chairman DODD. How long were you in Vietnam?

Mr. STEINBECK. One year, sir.

Chairman DODD. One year. And how long were you free to move around the country?

Mr. STEINBECK. The entire year.

Chairman DODD. During the entire period?

Mr. STEINBECK. I was stationed in Saigon for 6 months. In those 6 months I did not completely have my activities in Saigon. I would go out of Saigon throughout the Republic for a day or two. And then, I was stationed in the field for 6 months through the II Corps and III Corps areas, and I believe I have seen just about every square mile of the Republic.

Chairman DODD. Had you made a study of this subject before you went into the Army?

Mr. STEINBECK. No, sir; and I would actually prefer in the future not to make a study. The subject of marihuana to most people that use it, as well as to the people that find themselves controlling it, turns out to be mostly just a bloody bore. The problem is that in controlling the drug we have something to control, and I do not believe that the problem exists.

The only thing that would instigate me to make any investigation is to try and spread a little more information about the drug itself. The widespread use and effects of the drug seem to be very much like the intake of alcohol or cigarettes. I remember when I first started smoking cigarettes that it was very hard to get through one and I became very dizzy. Unfortunately, now I can go through many without any ill effects that are noticeable.

To the novice user, the original effect of marihuana seems to be a distortion of time perception, heightening of different visual, optical and audio things. But after it is used continually for a while, these effects diminish and the user can function as he did before.

Chairman DODD. Do not misunderstand my question. Do you consider yourself an expert on this subject?

Mr. STEINBECK. I do, sir.

Chairman DODD. I would like to ask you another question because I think we are going to have recess at 10:30.

On the first page of your statement you say it seems that the prohibition of a substance involves public opinion far mare than common sense or medical evidence. Well, do you not think that common sense and medical evidence could play some part?

Mr. STEINBECK. I believe, sir, it is the most valuable way to approach the problem. However, the common sense and medical evidence that we use to whitewash cigarettes and alcohol do not seem to have any effect whatsoever, and the common sense that I apply to a situation leaves me in complete paralysis of the fact that there is no common sense being used at all when, as Dr. Nowlis says, the penalties for marihuna in many States exceed those of second degree murder. This does not seem to me to reflect common sense at all and when any doctor would say the consumption of alcohol represents the intake of protoplastic poison and we still use it, this seems to me imbues no evidence of common sense or medical sense, either.

Chairman DODD. On what evidence did you base your statements that I think you said it is more likely that the soldiers returning from Vietnam will continue to smoke marihuana than unlikely?

Mr. STEINBECK. Because in the United States with what controls there are and much of public opinion, it might be quite a gesture in some cases, though statistics show not much at all, for somebody to start smoking marihuna. In Vietnam this is not the case. The soldier is out in the field or in a foxhole. He does not have Federal narcotics agents walking around his foxhole and he will smoke it. After spending a year smoking it he is probably in a pretty good position to judge whether he is suffering any ill effects from doing it.

Chairman DODD. This is a matter of your own judgment, really.

Mr. STEINBECK. I say, "probably." And, when he returns to the United States, he probably will continue to smoke it because he does not believe it is hurting him.

Chairman DODD. Do you advocate the use of marihuna?

Mr. STEINBECK. Sir, I do not believe that any responsible person would be able to say that smoking marihuna is good.

Chairman DODD. Not good? Is not good?

Mr. STEINBECK. I would not say it is not good but I certainly would not use my influence to convince anybody they should do it.

Chairman DODD. I got mixed up in your negatives.

Mr. STEINBECK. I believe that the smoking of marihuana is as silly an affectation of character as smoking cigarettes or drinking alcohol, and if it is as silly, I think it is to be a great crime that we should send these people to jail for doing something basically ridiculous.

Chairman DODD. To answer my question, you do not advocate its use.

Mr. STEINBECK. I am not against it, sir, but I would not use whatever respect I could muster to tell somebody they should use it. The only thing I would like to say on the subject is that if I am a spokesman at all concerning it, I am a spokesman for the people who suffer through the ignorance about it. This is to say the people who might even go to heroin because of the inadequacy of the laws.

I have come across a number of young people who went to heroin paradoxically, not because they smoked marihuana exactly, but because they smoked marihuana, discovered it was harmless as far as they were concerned. They read the statutes further and found that heroin and the other opiates are classed exactly the same way as marihuana was and with this as an example, they then concluded that these drugs as well must be harmless. However, I believe that the President's Commission on Law Enforcement and the Administration of Justice in the spring of 1967 says that the amount of heroin users without a marihuana experience and the amount of marihuana users who never graduated to heroin, can never possibly imply the link that the last witness said was there.

Chairman DODD. Very well, Mr. Steinbeck. We appreciate your appearance. We will have to recess because of the situation in the Senate and we will certainly review your testimony and think about it.

Mr. STEINBECK. Thank you very much.

(Mr. Steinbeck's prepared statement follows:)

STATEMENT OF JOHN STEINBECK IV

Mr. Chairman and Members of the Subcommittee, I have agreed to give testimony today concerning use of the drug marihuana by service personnel in the Republic of Vietnam because I believe it is the sincere goal of this Subcommittee to eventually arrive at a realistic view of the use of marihuana by Americans, a view unclouded by any particular moral opinion, to couple this view with modern scientific inquiry and then, with this information, to instigate whatever legislation best reflects public morality, civil rights and the national welfare.

None of this can be achieved without accurate information as to what marihuana is and especially what marihuana means to the people for whom the government would be passing any legislation. For it seems that the prohibition of a substance or the lack of such a prohibition involves the weight of public opinion far more than common sense or medical evidence.

The popular acceptance of cigarettes, while we know them to be a health hazard, is an example. It is a medical fact that marihuana is far less harmful than the cancer-feeding tars contained in the everyday cigarette, which carries with it the very powerful addictive drug that is nicotine. Cigarette smoking, however, remains in the public domain of overall acceptance despite scientific evidence that the practice of smoking them is deadly. I believe that if marihuana becomes legal, it will probably be the weight of public opinion that matters again, far more than any medical or scientific justifications, either way, pro or con. It is interesting that society is now embracing a chemically dangerous drug and worried about a relatively safe one. I say again that it is interesting to note how public opinion can change poison to water and water to poison and it really doesn't seem to make much difference what the chemical make-up is.

I do not completely believe that a government or official survey into the use of an illegal substance like marihuana could arrive at an accurate index or numerical figure indicating the extent of marihuana use in America or by Americans abroad. With all the extensive official literature on the subject, it is still almost impossible to get a vague picture of the widespread effects of the drug. This in itself demonstrates some of the haziness of most official publications concerning marihuana use. Because I represent no agency, have smoked marihuana, have been exposed to it in a variety of social climates, and because of my personal interest and investigation into the subject, I believe I have access to perhaps more realistic information about marihuana in general than any austere survey could deliver.

In notifying me of the scope of this testimony, the Subcommittee submitted a comprehensive list of questions which address themselves to the use of marihuana by American service personnel in Vietnam. I believe that these questions cover almost all that could be of interest on the subject, so I'll confine the rest of this testimony to reading those questions and answering them as directly and completely as I can.

Included in the first question, "How extensive is the use of marihuana by U.S. servicemen in Vietnam?" was the additional question of how I arrived at the

conclusions that will make up the bulk of this testimony, and how I substantiate my analysis of the situation.

My year in the Republic of Vietnam was in the Army as an enlisted man with Armed Forces Radio and Television, which is an information activity of the Department of Defense. I served as a newsman and a news director of the network throughout the Republic of Vietnam. I spent six months of my year in Saigon and six months in the field. I was stationed for over two months around Pleiku in the II Corps forward area, and Qui Nhon, the large Korean concentration and logistical port on the South China Sea. I drove in a truck with one other man along the breadth of Vietnam from the sea in Qui Nhon, to the Cambodian border near Plei Djeraing. In my field capacity for the Armed Forces network I visited many hospitals and waited long hours in rainy flight sheds with men from other units going in other directions. I believe that I had contact with personnel from practically every battalion-size unit in the Republic at one time or another. In working for an interservice organization my associations covered all branches of the military. I also believe that I saw nearly every part of South Vietnam with the exception of some parts of the Delta. I have a great many Vietnamese friends both in the United States and Vietnam, and when I was last stationed in Saigon, I was teaching English in my off-duty time at the Vietnamese-American Association. All this is to say that I was not an average soldier in Vietnam with an average job.

The result of what I believe to be my sophistication with many aspects of Vietnam tells me that about sixty percent of American soldiers between the ages of nineteen and twenty-seven smoke marihuana when they think it reasonable to do just that, taking into consideration their responsibilities at the moment. However, I think the figure daily approaches seventy-five percent of the previously mentioned group as they become more sophisticated about the plant. I believe for the most part that this is a relatively harmless practice, both to the military at large and to the individual soldier.

The second question refers to the obtainability of marihuana in Vietnam. Marihuana, or *cannabis sativa*, flourishes throughout almost every portion of the world. This is true for Omaha, not to mention the jungles and plains of Southeast Asia. The easy access of marihuana to American service personnel is mostly due to the exposure of the American soldiers to the Vietnamese national at all levels of his involvement in Vietnam.

It would be best to describe the use of marihuana by service personnel in this age group as both chronic and sporadic. By this I mean that their desire or affinity to marihuana is as chronic as a Scotch liker's affinity to Scotch, but the use of marihuana may be sporadic due to the amount of time available to use it. The use of marihuana to a user of the drug is in amounts as normal and intelligent as the use of anything by anyone. Most intelligent people would not get stinking drunk before approaching something important. Neither would it occur to someone who smokes marihuana to get particularly high when he knows that he should not. There is no loss of judgment and the individual is left with his facility to decide for himself when to smoke and when not to.

"What is the attitude of service personnel towards the use of marihuana? Do they plan to continue its use upon their return to the United States?" The attitude of the members of the Armed Forces to marihuana is certainly a casual one. A substance that might seem momentous to a suburban family in the United States, just isn't to a Sergeant First Class in the Delta. The younger soldier who has friends in the States who probably smoke it is certainly as off-hand about it as the rusty veteran. Soldiers who have started smoking marihuana in Vietnam may or may not continue its use when they return to the United States, although it is more likely that they will.

In answer to the question "What is the attitude of the military command with regard to the use of marihuana by service personnel?" I would say that marihuana causes an administrative problem rather than a moral dilemma or health hazard. Under the articles of the Uniform Code of Military Justice, to possess marihuana is illegal; however, this violation of the Code is noteworthy to the command as an infraction of discipline rather than through any connotations of possessing "drugs". There are too many military people for the command to deal with on a personal level, so it becomes a matter of whether control of the use of marihuana is a convenience or an inconvenience to the legal officer or company commander who has to make out the paper work if any action is taken against members of his command.

I have been among a great number of military police and legal officers who use the drug and so another enforcement problem arises there. Also, if my fig-

ures are even nearly correct, then enforcement of the law in any total measure would mean taking legal action against tens of thousands of military personnel in a logistical area where such a thing would be impossible.

"What indications are there that the continued use of marihuana by service personnel has had deleterious effects upon the men, physically or psychologically?" I believe in many cases the use of marihuana has a psychologically beneficial effect on servicemen in a combat situatior This is not to say in combat itself, but rather in the overall mental health of a soldier thousands of miles away from home at war with strangers. Because it is not a depressant like alcohol, which can lead the mind into some pretty emotionally abysmal corridors, marihuana is a euphoriant, which tends to lead to an attitude of serenity, a feeling of well-being and relaxation. It is certainly true that this is not the best psychological state of mind to be in when confronted with combat. Most soldiers who find themselves under the effects of marihuana in combat are either stupid and would be drunk in the same circumstances without marihuana or they are members of a resting element taken under surprise attack. It would not occur to a soldier to wear aftershave lotion on patrol in the jungle, must less to be smoking a cigarette of any kind.

"Has the use of marihuana by service personnel impaired their effective functioning as combat personnel?" I do not believe that marihuana has in any way significantly impaired the effectiveness of American combat personnel. The Viet Cong, who we know to be excellent fighters and skillful soldiers have used marihuana almost to the man since early childhood. I've already made it clear that marihuana is used for the most part for relaxation and a soldier with any respect for his own life would never be likely to endanger that life if he thought marihuana affected his functioning. I don't think that there is anyone who is in a better position to judge whether a drug is debilitating or not than the individual himself, if, as in the soldier's case, he is asked to continue to perform a series of tasks of a highly physical nature whether he uses the drug or not. It must be added here that from all evidence at my disposal there is no indication that the effects of marihuana carry over for any great length of time after smoking. Certainly far less so than the physical effects noticible in having too many beers the night before or as much as twelve hours after ceasing to use the drug.

"Would the use of marihuana in combat units be as prevalant as in noncombat units?" It has been the military philosophy of every army since the Chinese philosopher Sung Tze not to permit combat elements to have a great deal of spare time, either to think or worry. When American combat personnel come off patrol they generally fall asleep. When they wake up, they are generally given details or some other duty under the supervision of their superiors. For this reason support elements undoubtedly do have more spare time and thus more time to smoke the drug; however, because many support elements are in the cities and marihuana is most prevalant in Vietnam throughout the countryside, it could be said that combat elements have more exposure to marihuana than many support groups.

"What is the atttitude of the Vietnamese population and officials towards the use of marihuana? Is there extensive use of marihuana by the Vietnamese?" At present there is, as far as I know, no effective law in the Republic of Vietnam controlling the use or sale of marihuana. Though there may be some clauses in the new Vietnamese legislation involving the revenue received from marihuana, such laws are ignored to the same extent as most other civil controls in Vietnam. About 100% of the tribal people in the central highland region of Vietnam smoke marihuana. This includes men, women and children. Among the Vietnamese peasants throughout the countryside I believe about 50% of their number use marihuana daily. These are mostly the older men and women of the villages.

Though marihuana may be obtained anywhere in the cities of Vietnam, its use is not as prevalant as in the field. There seems to be very much of a reverse trend in Vietnam from that seen in the United States. In revolting against their peasant background, the young Vietnamese of the city and his intellectual counterpart in Vietnamese government and society prefer to drink alcohol than indulge in the pasttimes of the common people. Thus, as marihuana may be used in America as an assertion of individuality, the Vietnamese youth refrain from its use in order to establish their individuality. Geographically, more marihuana is smoked in the mountains than in the countryside, and more in the countryside than in the cities. However, even with this it can easily be said that marihuana is as available in Vietnam, no matter where you are, as cigarettes are in the United States. I also believe that a great number of officials in the Vietnamese govern-

ment probably have access to a majority of the proceeds from the sale of marihuana to American personnel in the cities.

"What other drugs are available to service personnel in Vietnam? What are their sources? Are such drugs abused? To what extent?" Besides marihuana, opium, and amphetamines or pep pills, fill the remainder of the drugs used by American servicemen in Vietnam. When I was serving in Vietnam I came across absolutely no use of the stronger hallucinogens such as LSD, peyote, or psilocybin. However, considering the growing popularity of these drugs in America this is no longer necessarily the case. Opium is not a favorite of American personnel. The intelligence level of young men in the United States military is a great deal higher than is generally thought, and it is common knowledge to these people that opium is a dangerous and tremendously debilitating addictive drug. Though it is readily available, opium is used in this part of the world mostly by the Vietnamese and Chinese equivalent of the American narcotics addict. It's interesting to note, however, that the vast majority of orientals who do use opium are over the age of 40. Amphetamines, however, paint quite a different picture. These pills related to methadrine are distributed by the American government to its personnel through medical officers, corpsmen, and survival kits. The drug is very popular, especially to the combat soldier because it gives him a super-human amount of energy and in this way it could be said that it is beneficial to him but purely as a fighting machine.

"What information do you have relative to the use of marihuana in the United States? College students? Professionals? The so-called 'Hippie Subculture'?" It should be obvious to anyone who so much as reads the New York Times that increasing numbers of youth and adults, from every conceivable class and subculture, including police officials and narcotics agents, are beginning to experiment with the drug. To believe anything else is to display perhaps malicious ignorance to the nature of our increasingly more drug-oriented society. This society includes the sale of tranquilizers, which in America has soared to over $200,000,000 annually.

"What recommendations would you leave with the Subcommittee with regard to the control of marihuana?" I concur with Dr. Goddard about penalties being far out of proportion to the nature of the crime when we sentence a user of marihuana to jail. It seems to me to be ultimately ridiculous and defeating to the philosophy behind any legal system to turn upwards of 10 million or more people into criminals because of the provincial and prejudicial nature of our laws governing the use of this substance.

Chairman DODD. We will recess this hearing now until 10 o'clock tomorrow morning.

(Whereupon, at 10:30 a.m., the hearing was recessed, to reconvene at 10 a.m., Wednesday, March 6, 1968.)

5. *Costs of the Pharmacological and Biochemical Investigations.*—Based upon the costs of studying the biochemistry, toxicology and behavioral effects of other drugs, we estimate that the investigation of marihuana proposed herein would run about $1.5 million. A full investigation of the clinical effectiveness of tetrahydrocannabinol should run an additional $750,000.

II. SOCIAL AND PSYCHOLOGICAL INVESTIGATION OF MARIHUANA USERS

1. *Surveys.*—A national survey of drug use is currently in progress. Preliminary data from a number of college surveys suggests that marihuana use (of one or more times) has reached 15–20 per cent of the college population. The number of student groups (including high school students) will provide some idea of the direction of the problem. Such surveys should be coordinated by a survey research investigator selecting from a random sample of schools that would participate collaboratively in the study.

2. *Epidemiologic Data.*—Known chronic marihuana inebriates should be studied psychiatrically and medically. Such studies will offer clues about the hazards of marihuana usage that can be documented in laboratory populations. Autopsies on known users, with particular reference to liver, brain and respiratory system are essential. Psychological test data and evoked potential EEG studies in known chronic users are also indicated.

Of particular importance would be an in-depth epidemiologic study of cannabis use in the Middle East and/or India. The cultural side effects of endemic drug usage and the hazards to the individual need to be documented in these settings; previous reports were poorly documented. A visiting epidemiologic team (modeled after Public Health Service teams at the Communicable Disease Center) could accomplish this mission effectively. Data obtained here would be compared with user data in the United States and with control population of nonmarihuana using natives in the countries studied.

3. *Social Psychological Studies.*—Social psychological studies of small groups of marihuana users in the United States should be pursued in order to determine the group and individual factors which initiate and maintain substance use patterns. Previous studies by Becker need to be expanded upon in order to understand more recent manifestations of the problem.

4. *Summary and Costs.*—The purpose of these social and psychological studies would be to determine factors leading to and factors associated with marihuana use. The interaction between such use and effective human functioning will be determined by investigating populations of known users. In total this is a more costly operation than the laboratory pharmacology and costs could run as high as $3 million. The costs of effective periodic surveys alone approximates $1.5 million. Priority here should be given to studies which define the public health implications of this problem currently in the United States and of estimating the additional hazards which might result from a change in the law.

Table of cost estimates for the elements of a research program studying marihuana

	Million
Biochemical studies	$0.5
Toxicologic and pharmacologic studies in animals	.5
Toxicologic and pharmacologic studies in man	.5
Studies of the drug as a therapeutic agent	.75
School surveys	1.5
Epidemiologic team studies	.75
Social-psychological studies	.75

Question 6: Does the presently available scientific evidence regarding the characteristics of LSD and marihuana have any implications for any further legislative action with respect to these drugs?

Research as well as educational and treatment efforts conducted by the NIMH are operating satisfactorily under existing legislation.

Chairman DODD. Dr. Yolles, I think I asked each witness who has appeared here in the last two sessions of this hearing about the criminal penalties attaching to the use and possession of marihuana or the sale

and possession both by the peddler and the user. What do you think about it?

Dr. YOLLES. Is the question in relationship to marihuana?

Chairman DODD. Marihuana.

Dr. YOLLES. Well, having worked with the problem of hard narcotics and having seen patients for quite a number of years when I was at Lexington Hospital, I am aware of some of the problems. However, I am here today as a medical scientist and profess no real knowledge, expert knowledge, in the area of law enforcement. I would comment that it has been a repeated observation not only by the medical profession but by law-enforcement officials as well and most recently reported by the President that, to use his words, it is a crazy quilt of inconsistent approaches and widely disparate criminal sanctions in the field of narcotics and drug abuse, and we are quite enthusiastic about the notion that the National Commission to Revise the Criminal Laws, Federal criminal laws, will be taking a look at this to try to bring a more consistent approach to it.

Chairman DODD. For example, you know there have been proposals before Congress to impose a criminal penalty of up to 1 year in jail for possession of LSD. I know you are not an expert and do not pretend to be in the area of law enforcement but based on your studies on LSD use or users, do you think such a penalty would be an effective deterrent?

Dr. YOLLES. Well, again I really do not have any knowledge of the deterrent effect of such penalties.

Chairman DODD. Well, I will not press you on it. I understand your position but we have to ask our witnesses these questions.

That leaves me with another question I do not think we have asked. You are not a scientist, apparently. You do not pretend to be knowledgeable on all subjects. Do you think that the question of deterrent should be left up to the law-enforcement people for effectiveness?

Dr. YOLLES. In large part I suspect this is so. It is a matter of law enforcement and deterrent from use. I can say this, that from a medical point of view, we are as committed to our previous position and it is a consistent position, and I stated this before this committee in 1966 when I appeared. It happens to be the position of the New York County Medical Society, and I think it is worthwhile restating at this point, in terms of the opinion of the National Institute of Mental Health, that:

> No hallucinogen, LSD, mescaline, psilocybin of dimethyltryptamine, et cetera, should be administered except by a physician trained in its use, and that this should apply even if the current studies show LSD to be of value in the treatment of psychoneuroses, sexual perversions, frigidity, alcoholism or other illnesses.
>
> Even use by trained physicians should be limited to carefully controlled experiments until incontrovertible data are available documenting LSD's efficacy and safety.

This is a dangerous drug and should not be administered except under very carefully controlled conditions.

Chairman DODD. I take it that the New York County Medical Society would feel, then, that some punishment should attach to the sale and use of these dangerous drugs other than by prescription or other use under careful medical supervision.

Dr. YOLLES. I think we are all dedicated to the proposition that we have to control the illicit distribution, sale, et cetera, of these dangerous drugs, and this is the intent of the administration at the present time to do so, and there has been in administration bills submitted an increase in the penalties for illicit distribution.

Chairman DODD. The point of my question is whether we should reduce penalties or not and what the reasons are for doing that if we make that decision. I do not think it will do much good to just say that these dangerous drugs should not be available except by prescription, as I would interpret what the New York County Medical Society was saying, and then not attach any penalty for selling or using them without prescription.

Dr. YOLLES. As you will recall, in 1966 it was the administration's position, and a number of us were here and testified to that point, that vigorous enforcement of the drug abuse control amendments together with an effective adequate preventional program would be sufficient to control the problem. It was also stated at that point in time that after some experience with the administration of the laws in this regard, if it was felt that further changes in the law were necessary, that we would come back and request them or at least the appropriate authorities would. But after about a year and a half of experience with these laws, the principal law enforcement authorities of the Federal Government have agreed that such changes are necessary, that there are further sanctions necessary, and so they have come back to the Congress and asked for such changes. This includes a penalty for personal possession.

Now, I have the highest regard and respect for the opinions of the law enforcement agents and in their opinion, if they think this is necessary for the enforcement of the laws to control illicit drug distribution, I am heartily in favor of such measures and I support the administration's position wholeheartedly.

As a physician, however, I am concerned about one factor, that in trying to protect the individual from the dangers of drug abuse, through the operation of the personal penalty for possession, we do not inadvertently do him harm by preventing him from seeking medical help when he feels that it is necessary because of a bad trip, because of the fear of incriminating himself. This is my principal concern as a physician.

Chairman DODD. I think it is a very proper concern myself. I do not know how we will work these things out. That is what we are trying to find out.

Is it too much to ask you this question? There seems to be a major conflict so far between the scientific and research community, in some substantial number anyway, and the law enforcement people on the other side with respect to the control of drug abuse. For example, if you read the testimony of Dr. Goddard, Dr. Nowlis, and Commissioner Giordano, you will see this contrast that I refer to. I think there will be more of it in later hearings. Do you have any opinion about this?

Dr. YOLLES. No. I do not think I could add very much more to what I have already said in this regard.

Chairman DODD. Well, of course, I would like to know who has the better argument.

Dr. YOLLES. Well, there are parallels, not specifically in the area of deterrents or law enforcement, and I think this is a problem that has been going on as you well know for quite a number of years.

Chairman DODD. That is right.

Dr. YOLLES. There is a chronic problem, if you will, or chronic disagreement, for example, in the area of hard narcotics and marihuana. Does marihuana use lead to the use of heroin? The law enforcement authorities generally have taken a position which states simply that a large majority of hard narcotics users have previously used marihuana. The medical authorities and scientific authorities on the other hand, say, yes; this is quite true, but it is an incomplete statement. If you take the obverse of this and look at the universe of marihuana users, relatively few go on to the use of hard narcotics. There is some element of truth in both sides of this.

Now, how you resolve that question is a very difficult one to answer at the present time.

Chairman DODD. I do not know the answer myself. That is why I asked you. I think we ought to get on to the record in the minutes remaining, your views on the known detrimental short-range effects of LSD. What do your studies show?

Dr. YOLLES. Well, LSD use, short range, may cause uncontrolled anxiety, may cause psychotic reactions, and will alter perception, especially time and space perceptions.

Chairman DODD. Would you put that in layman's terms? What does that mean to the average citizen? What does it mean on the street, on the campus?

Dr. YOLLES. It means that an individual who is on LSD will not perceive the reality around him, objects around him as they really are. There is a merging of the various senses so that the individual feels that he can smell what he sees and taste what he hears. It is a complete distortion of reality and it is associated with hallucinations and delusions.

Chairman DODD. We know that. Now, how much do you know about the long-range effects?

Dr. MILLER. There have been no evidence from the electroencephalogram——

Chairman DODD. Make it simple because when this record is printed everyone should be able to understand it and not just the medical society.

Dr. MILLER. OK. In terms of the long range in some few individuals—exact percentage is not known—there is a prolonged psychotic state, that is, the patients remain mentally ill. Some people remain chronically depressed over a long period. There is another phenomenon which is a very unusual one in which some time after having taken LSD, a person will undergo the identical type of experience he had under LSD even without taking the drug.

Chairman DODD. I read and I have heard that in the long run the use of LSD is more likely to lead to deformities or defects in future generations. You have a medical way of putting that.

Dr. MILLER. We have detailed in our responses the research results.

Chairman DODD. Tell me what you think. Is that so?

Dr. MILLER. I think at this point there is inferential evidence that LSD can affect chromosomes. The exact seriousness or significance of this, particularly regarding future generations, I still think is hard to know.

Chairman DODD. You do not exactly know but you are suspicious.

Dr. MILLER. Yes. There certainly is some inferential evidence in that regard.

Chairman DODD. So deterrents in the form of new information might be some explanation for the decrease.

Do you think LSD has any legitimate medical use?

Dr. MILLER. We are conducting research in controlled clinical settings where LSD is being used in the experimental treatment of alcoholics, of severe neurotics and other types of patients who have been unresponsive to other forms of psychiatric therapy. These researchers will continue. I think it is still too early to know really how effective LSD will be as a therapeutic agent.

Chairman DODD. Well, it was just called to my attention that when Dr. Goddard was here, he made another observation. This is what he said: "Research in this field"—that is, with reference to LSD—"is going on and"—and he went on to say at least 90 research projects are being carried out. But I thought these words were rather interesting: "I cannot share their appraisal"—that is, the researchers'—

> Appraisal that this drug is all that important because it has been under investigation now longer than any other investigative drug I have any knowledge of. It has been around since 1942.

Dr. YOLLES. I would like to answer that, Mr. Chairman. It is quite true, and Dr. Goddard is quite correct, that the drug has been around a long time but investigations into its therapeutic uses are very recent, and in terms of the mission of the National Institute of Mental Health, in terms of improving the mental health of the people of the United States, we feel it is our responsibility to investigate every new lead for a new therapeutic agent. At the present time, there is sufficient evidence for us to continue such studies.

Chairman DODD. I see. Well, I want to thank all of you, particularly Dr. Yolles, for being here this morning. I am greatly interested in your testimony—I speak for myself. The last paragraph I think is very good. I found it very impressive.

Dr. YOLLES. Thank you, sir. One last note, Mr. Chairman, if I may. I forgot to mention it. I have brought along this year again, as I did previously for the use of the committee, for whatever use it wishes, a complete set of abstracts of all of the literature on marihuana and LSD, which is available from the National Clearing House on Mental Health Information. This is the most complete file on material on LSD which exists in the world.

Chairman DODD. Well, that ought to keep the staff busy.

Dr. YOLLES. Thank you for the opportunity.

Chairman DODD. Mr. Fitt.

STATEMENT OF ALFRED B. FITT, ASSISTANT SECRETARY OF DEFENSE FOR MANPOWER, ACCOMPANIED BY FRANK A. BARTIMO, ASSISTANT GENERAL COUNSEL

Chairman DODD. Mr. Alfred B. Fitt was appointed Assistant Secretary of Defense for Manpower in 1967. He attended Yale University and received his law degree from the University of Michigan Law School. He was on the staff of the Senate Judiciary Subcommittee

Drugs useful in medicine require different regulations for their control than those without therapeutic value. The latter, if harmful when taken by human beings, should be prohibited and their use, possession, or sale should incur penalty. LSD, marihuana, and similar drugs, commonly known as hallucinogenic drugs, have in my opinion, no recognized place in medicine other than for research purposes and should be strictly controlled. Unfortunately, current penalties for marihuana are more severe than for more harmful drugs, thus making strict and consistent enforcement of laws regulating it very difficult and at the same time encouraging disrespect for law.

Classes of drugs, based on their capacity for harm to the individual or to society, should be devised with heroin and LSD's being in the most serious class and the other drugs being placed in the classification suited to their degree of harmfulness. The classification of harmful drugs is best determined by consultation with competent pharmacologists, physicians including psychiatrists, and specialists in the enforcement of drug laws.

Although "pushing" drugs should always be dealt with severely, I believe that the mere possession for use of hallucinogenic drugs, including marihuana, should be considered a relatively lesser offense punishable by short periods of incarceration and a small fine, but with increasingly severe penalties being imposed for second and subsequent offenses. In other words, at present the laws are so severe they are not being enforced, as I see it.

Chairman DODD. I think you are right.

Dr. FARNSWORTH. Those persons who use these drugs for the first time without full realization of the possible consequences should not have their careers ruined for such offenses unless they persist.

Possession of amphetamines and sedatives (and other drugs useful in medicine) in quantities greater than a specified amount, let us take, for example, 10 times an ordinary therapeutic dose, for example, should also be discouraged by mild penalties at first and increasingly severe penalties for subsequent offenses.

We now need reasonable laws regarding the manufacture, sale and possession of harmful drugs (especially the hallucinogenic drugs), which can be consistently enforced. When the laws are not related to the degree of danger posed by drugs, the overly severe penalties discourage law enforcement and at the same time encourage disrespect for all authority.

A national program of education regarding the abuse and misuse of drugs is urgently needed. And I think it is taking form in many different parts of the country. Many groups in schools, colleges, and universities are urgently seeking help in developing sound programs. Some are carrying out experimental programs. With today's young people, fear tactics do not work. They resent exaggeration. Many distrust the reported experiences of physicians, including psychiatrists, and say that these doctors see only a small percentage of those who use drugs, and that the advantages of taking them outweigh the disadvantages.

Thank you, Mr. Chairman.

Chairman DODD. I want to thank you very much for a very helpful statement. Doctor, do you have some problem about the abuse of marihuana at Harvard University?

Dr. FARNSWORTH. We do, indeed. At our university, and all other universities, particularly those that are located near urban centers or where for one reason or another many students and former students and people who are posing as students collect because of the drug subcultures that are forming.

Chairman DODD. Would you say this is also true about the abuse of depressants and stimulants?

Dr. FARNSWORTH. In the experience that I have had in my own institution and others, there has not been a marked increase in problems connected with them or with the tranquilizers over the 30 years I have been working in college health work. We always had problems with them and we always will, but the drugs that are, as the youngsters say, "in" are the hallucinogenic drugs and substances which they believe might be hallucinogenic.

Chairman DODD. Well, we have had conflicting evidence about some aspects of this problem, as you probably know. Do you think the drug problem on our campuses is increasing, decreasing, or levelling off?

Dr. FARNSWORTH. The problem with respect to LSD is decreasing, I believe, all over the country. For some reason or other, students feel fearful of having their chromosomes disarranged even though they are not fully aware of what this means. It has a powerful propaganda effect.

Chairman DODD. It is a pretty frightening word.

Dr. FARNSWORTH. And the fact that because of LSD abuse many students have become psychotic and quite a number are spending their lives in hospitals and halfway houses and in and out of hospitals has finally become more known. Marihuana, however, is still, I believe, an increasing problem and I think the susceptibility to drugs of any kind is still an increasing problem, because when youngsters get started taking any kind of a drug, they tend to lose their discriminating capacities and, hence, go on to other drugs. In this they are supported quite definitely by many of the influences they encounter in their own peer group cultures and in publicity that occurs concerning the drug problem.

Chairman DODD. We have also had different opinions expressed here about how widespread the use of marihuana is on our college and university campuses. The figures vary according to witnesses. In some cases, not too much. But I wonder if you have any information that you could give us with respect to your university.

Dr. FARNSWORTH. Our university and others in what you customarily call the Ivy League universities, those that have somewhat selective admissions policies, are in general finding a greater willingness to use marihuana with each incoming class because the drug is so frequently used in high schools and secondary schools throughout the country. I should not say in the schools but in people of that age, that it is an increasing problem. However, there are many colleges in the country in which there is very little use of marihuana. Even in any one particular college or university, the colonies that use them are scattered throughout the university but there may be some sections, for example, some parts of dormitories where many students use them. In others, hardly any will use them. The drug phenomenon is a contagious phenomenon. You get a group of people in any particular area, they tend to be very strongly evangelical. They are great proselytizers and this is one of the elements in the loss of judgment. I

think the drug takers have judgment to start with and it becomes exascerbated as they become preoccupied with taking drugs and with maintaining their source of supply.

So, I would say that the range of usage of marihuana ranges from nearly zero in many of the smaller colleges in urban areas to somewhere between 30 and 35 percent in some of the larger universities and colleges near urban centers. But of that 30 to 35 percent, which includes those who have taken marihuana at any time for experimental reasons or otherwise, I would estimate that the number of persons who use it regularly is probably less than one-third the number who have used it at any one time. I would hasten to add, however, that my statistics are not reliable and I feel safe in saying that no one else's statistics are either. We are dealing with a tremendous mixture of a few small studies, many sources of gossip, but of the one thing I am sure, we have a serious problem on our hands.

Chairman DODD. Well, let me ask you another question, if I may, in the few minutes we have remaining. In your opinion, has the chronic use of a drug like marihuana impaired the functional ability or impeded the educational attainment of the student who uses the drug?

Dr. FARNSWORTH. Yes. I would say that I classify marihuana users in three different categories. First, those who use it experimentally and stop, and nothing happens as far as they are concerned. No permanent harm. Another group that gets started, becomes concerned about themselves after using it a few weeks or months. They get help, possibly from friends, possibly from professional sources, and they withdraw and no harm comes to them of a permanent sort that we can demonstrate. Those who remain dependent on the drug or become dependent on it, possibly 10 percent of the total, are the people whose motivation becomes impaired. Their life still changes, their responsibility decreases, their judgment and memory sometimes become impaired. They seem so preoccupied with the drug and maintaining the sources of supply that they can hardly think of anything else. I have had students come to me and say "I am trying to get off these drugs. If you can help get rid of the pushers, then I think I could do it, but when the supply is easily available, it is just too much for me and I cannot do it." So, I am thoroughly convinced from my own clinical experience and from exchange of experiences with my colleagues working in this field that the chronic user of marihuana is in a sense destroying those very things which he came to college to acquire; namely, sensitivity of judgment and perception, the capacity to make decisions in delicate situations, and these are what is first impaired. As I sometimes say to the students who are making it pretty hard for me, if you do not matter, it does not matter whether you take marihuana or not, because it will not be noticed, but if much is expected of you, you have much to lose.

Chairman DODD. Do you think an interest in marihuana would increase or decrease or maybe disappear if possession penalties were removed?

Dr. FARNSWORTH. I certainly do not. I think it would be more of a problem. I would be aghast at the very idea as I am shocked by those who advocate that.

Chairman DODD. If I understand your position, you suggest—very interesting—determination of whether this is one misuse, one abuse,

whether it involved selling or pushing or peddling, and so on. And the hard user and the hard seller is a different matter from the user.

Dr. FARNSWORTH. Yes.

Chairman DODD. The trouble, I suppose, for the legislators, is how we work that out in legislation, that is, by writing it out. It is a matter for a judge or someone in such capacity.

Dr. FARNSWORTH. I think that my comment would have and does have considerable support from quite knowledgeable persons in the legal profession. We feel that the only really effective enforcers of the laws about marihuana are the young people themselves once they become aware of what it does and that then we have to have some additional sanction against their use by society in the form of mild laws so that the laws are used as teaching devices for educational purposes, say in a sense, we disapprove of this but we do not want to ruin your career and so you are on notice now that you are indulging in a very dangerous type of activity. This, then, puts the youngster in a position where he has to go back and talk with his family. He, in a sense, has to do a lot more serious thinking than he has ever done before. And this will then make it possible for people to learn the seriousness of the offense without being so penalized that their careers are going to be ruined in the future. This we must avoid at all costs.

Chairman DODD. I do not speak for any other member, but I think you are right. Would you suggest, say, a short jail sentence for a first offender? Or would you rather put it in the category of traffic offense, a first traffic offense; mild, moderate, not of excessive nature?

Dr. FARNSWORTH. I would prefer, if I may speak as an absolutely uninformed law citizen with respect to the legal aspects of it, I would prefer that there be a small uncomfortable penalty which the judge in a given individual case could suspend or not, depending on what he thought was helpful in the individual situation. In other words, the penalty should be as light as it can possibly be to get the point across that you are starting on something that is very full of potential danger.

Chairman DODD. Very helpful. I want to thank you again for your appearance.

I want to say that we have now concluded the first phase of these hearings, in these three mornings, the purpose of which was to determine the extent and nature of the drug abuse problem, to get more knowledge about it than we had; and it was also our purpose on the past 3 days to look at the drug control policys and procedures of the Federal Government. It has been our purpose to examine the legislative needs with respect to penalties for drug violations and with respect to other aspects of drug control. We wanted to hear as much as we could; and we still want to and we will, I hope, have more hearings, to hear from those best qualified to tell us the latest scientific evidence pertaining to the dangers of drug abuse and the harmful effects of, say, LSD or marihuana or other dangerous drugs. We have heard from the heads of major Federal drug control agencies, those who are charged with enforcing our drug laws, and we have heard from scientists and educators.

So, I am confident the subcommittee feels that the fact that we ran into a conflict or at least a controversy, must be settled if we are to have an intelligent policy for legislation. You were not here, Doctor, but I do not think I exaggerate when I say it is a conflict. I would say it is a serious basic conflict between the law enforcement, the drug

law enforcement people, and some scientists and researchers and educators who are highly respected men in their field. I think, and I think the subcommittee thinks, that this controversy may have hampered drug control in the past and it must be resolved before we pass any new legislation. We ought to be able to learn or settle for ourselves on the basic facts and I think this conflict or controversy has influenced the recent proposals for new dangerous drug laws. But, we will hold further hearings and try to resolve this. I hope it comes to resolution. And then, we can hammer out the best possible kind of legislation which I hope will be satisfactory to both sides. I do not know of any other kind of law that would be made effective. So, I hope these hearings are the beginning of an effort to prevent and reduce the drug problem in this country.

Perhaaps we have been on the wrong track altogether for too long and it has been changing all the time. Knowledge is accumulating. More experience is being gathered. I cannot say I will announce today, without consultation with other members, when we will resume our hearings; but I think there are other people we ought to hear from.

Finally, let me say to you, Dr. Farnsworth, that your testimony is of great value to the subcommittee.

Dr. FARNSWORTH. Thank you very much.

Chairman DODD. I appreciate your presence.

We will recess this hearing until further notice.

(Whereupon, at 10:05 a.m., the hearing was recessed, until further notice.)

(Excerpts from)

NARCOTICS LEGISLATION

Hearings before the

Subcommittee To Investigate Juvenile Delinquency

of the

Committee on the Judiciary

UNITED STATES SENATE

September 15, 17, 18, 24, 25, 26, and 29; and October 20, 1969

Testimony of:
Ingersoll, John E., director, Bureau of Narcotics and Dangerous Drugs, U.S. Dept. of Justice;
Mitchell, John N., Attorney General of the United States;
Yolles, Dr. Stanley F., director, National Institute of Mental Health;
Moss, Hon. Frank E., a U.S. Senator from the State of Utah;
Rossides, Eugene T., Assistant Secretary for Enforcement and Operation, Dept. of the Treasury;
Sonnenreich, Michael, deputy chief counsel, Bureau of Narcotics and Dangerous Drugs, U.S. Dept. of Justice; and
Egeberg, Dr. Roger O., Assistant Secretary for Health and Scientific Affairs, U.S. Dept. of Health, Education, and Welfare.

Mr. INGERSOLL. This chart indicates the number of compliance actions conducted by the Bureau from July 1, 1968, through June 30, 1969. Of the 908 compliance investigations completed during this period, 329 corrective actions of some form had to be taken or in more than one-third of the cases. During this same period, 2,353 thefts of narcotics and 574 thefts of dangerous drugs were reported. The chart indicates that certain portions of the drug industry are maintaining lax security controls against drug diversion and are not complying with the recordkeeping requirements of existing law. We know that large quantities of these legitimately produced drugs are being diverted into the illicit traffic. A study conducted by the Bureau a year ago, for example, showed that 92 percent of the amphetamines and barbiturates on the illicit market were legitimately manufactured, and then diverted. Such diversion can only be attributed to lax security and recordkeeping by those persons responsible for the legitimate traffic in these drugs.

Moving on to the next page of the testimony, there is a rather lengthy discussion of registration and the criteria for revocation, and the Attorney General's authority to deny, revoke, or suspend registration, which I will skip over with your permission at this time.

On page 18, beginning with the second paragraph, is a discussion of production quotas and the procedures that are established under title IV of the act.

Page 19, discusses recordkeeping and the increasing requirements in recordkeeping on the dangerous drugs.

Page 20, then, discusses order form requirements, both present and proposed.

And then moving over to page 21, I would like to briefly comment on title IV which deals with the importation and exportation of controlled dangerous substances.

In order to better insure total information regarding the flow of drugs from this country to other countries and back into the United States, it is imperative that certain drug shipments be given advance clearance by the Attorney General and that there be a notification procedure for the other substances. Vast quantities of drugs are being shipped in and out of this country. Therefore, balancing law enforcement goals against industry's economic requirements, we divided the various substances into two parts—first, those which will require advance authorization, such as schedules I and II substances and the narcotic drugs which are found in schedule III; and, second, those drugs that will require simple notification, which are the drugs in schedules III and IV. Further, provision was made for prohibiting the transshipment of drugs through the United States from one country to another unless prior written approval of the Attorney General has been received which shall be granted or denied within 21 days of the request. I might point out that this provision does not apply to schedule IV drugs. And, as to the schedule II and III drugs, only advanced notice to the Attorney General is necessary.

Title IV now does away with the historic company market share approach presently in existence under the Manufacturing A[illegible] of 1960 and gives the Attorney General greater flexibility in determining those drugs subject to import, and by whom. As the Attorney General mentioned, and as you are all aware, the Attorney General also is respon[illegible]

tions. By giving him flexibility, it is hoped that we can avoid such anticompetitive effects and further protect the consumer who has a legitimate need for these drugs.

The penalty structure in title V closely parallels existing Federal law. With regard to trafficking offenses, minimum mandatory sentences are imposed for the first and subsequent offenses of unlawful distribution, importation, and manufacture of schedules I and II substances. For a first offense the range is 5 to 20 years, and for a subsequent offense the range is 10 to 40 years. Probation and suspended sentences are not permitted.

No minimum mandatory is imposed for first or subsequent offenses involving distribution, importation, or manufacture of schedules III and IV dangerous substances. First offenses involving schedule III substances are punishable by imprisonment up to 5 years and second offenses are punishable by up to 10 years. As to schedule IV substances, first offenses are punishable by up to 1 year imprisonment and second offenses by up to 2 years.

No minimum mandatory sentences are imposed in first offense possession cases, regardless of the drug involved. Possession of schedules I and II substances would draw from 2 to 10 years, but with provisions allowing for probation and suspension of sentences. Possession of schedules III and IV substances is a misdemeanor punishable by imprisonment for up to 1 year. However, second offense possession of schedules I and II substances would draw a minimum mandatory sentence of 5 to 20 years with no provision for probation and suspension of sentence. Second offense possession of schedule III substances is punishable by up to 3 years imprisonment, and second offense possession of schedule IV substances would be punishable by up to 2 years.

The offense of distributing dangerous substances to a minor has been substantially changed from the existing Federal law. A person at least 18 years of age who distributes a dangerous substance to another under the age of 18, who is also at least 3 years his junior, is subject to the harsher penalty provisions. The penalties vary in accordance with the schedule of the substance distributed, but generally they are twice the penalty prescribed for the substantive offenses of distribution of schedules I and II, III, or IV substances. The reason for the 3-year-age difference is to prevent operation of this section in such situations as where a college student, 18 years old, gives a marihuana cigarette to his roommate who happens to be almost 18. Without the 3-year-age difference requirement, such a person would draw a minimum mandatory sentence of 10 to 40 years. Obviously, this was never the intent of Congress when the distribution to minors provision was originally enacted and it is not our intent now.

The new bill also affords first offender treatment in the case of unlawful possession. And this is a significant departure from existing law. Under this provision, a person who pleads guilty or is found guilty of possession of a controlled dangerous substance, and who has no previous conviction for an offense relating to narcotics, marihuana, stimulants, depressants, or hallucinogenic drugs either under Federal or State law, is eligible for a conditional discharge and can be placed on probation. Upon fulfillment of the terms and conditions, the court shall then discharge the individual and dismiss the proceeding against him. No adjudication of guilt is ever entered on record and such a discharge is not deemed a conviction. Such a provision will in no way

hamper our enforcement activities since the type of person it is aimed at is not engaged in large scale narcotic or dangerous drug trafficking or distribution.

As to commercial offenses, we have found it necessary to recognize another dichotomy in the dangerous drug area—this is the difference between technical violations by members of the legitimate industry and violations carried out strictly for illicit purposes. As to purely illicit trafficking, imprisonment and/or fines appear to be a meaningful penalty scheme, but in many violations of a commercial nature, such as recordkeeping and alteration of symbols or just negligence in filling an order, civil and criminal fines appear more efficacious. Such fines can be buttressed by misdemeanor terms or imprisonment when such activities are committed wilfully and knowingly. By separating and establishing this approach apart from the penalty structure for illicit traffickers, I believe the penalty provisions become more credible and realistic.

There is much controversy over the existing penalty structure. This is noted by the Attorney General in his transmittal letter and in his testimony this morning. Recognizing that this is a problem area, I would like to give you my overview of it.

Any criminal penalty structure, to be effective, must be acceptable to the courts, the prosecutors, and the public. It must represent a rational, credible approach to the problem and must further be flexible enough to tailor the penalty to the crime and to the person committing it. In drafting any penalty structure, an effort must be made to identify the types of individuals who are engaged in the traffic and use of narcotic and dangerous drugs. To make a penalty structure more credible and directly applicable to individuals violating the laws, three distinct types of persons involved in the drug syndrome must be identified. These three types are: 1) The professional criminal who is engaged in the business of supplying these drugs to others for profit. This person can be a member of an organized criminal syndicate such as the Mafia or he can be a highly organized regional trafficker dealing in drugs such as LSD or methamphetamine, which are not usually handled by the larger organized criminal elements, or he can be an individual who actively and purposely derives his livelihood from the sale and distribution of these drugs. This type of individual whom we label as a professional criminal must be treated differently and more severely than all other persons caught in violation of the drug laws. He is not engaged in this illicit business because of an ideology or because of mental instability or insecurity. He is fully aware that he is violating the law for profit. For this individual, we must accept the hard and perhaps unappealing fact that we do not know how to rehabilitate him and must, for society's protection, "lock him up;" and get him off the streets.

For this person, there must be built into any general penalty scheme, a separate extended penalty term that will be commensurate with his culpability. This isolation of the professional criminal from the point of view of sentencing is supported to a large degree by the President's Commission on Law Enforcement and Administration of Justice which recognized and approved the separate classification and extension of maximum penalties for the dangerous criminal. Under any proposed penalty structure, such a defendant should be subject to severe terms

of imprisonment so that society is protected. I consider this to be a primary objective of any penalty structure in this area.

2) The casual user or intermittent experimenter of drugs, usually of the nonaddicting variety such as LSD, marihuana, and other hallucinogens, who, for a variety of reasons, starts exploring the drug scene, is the second type of person that must be identified in any penalty structure. This type of person is far different from the professional criminal mentioned before. This is the group that is possessing, or giving away these drugs, usually among its own peer group. For these persons the penalty structure should be more flexible and open-ended as these persons seem most likely to respond to rehabilitative efforts and the court should not have imposed upon it rigid penalty requirements.

The penalties should be flexible enough to deter, and, if deterrence fails, flexible enough to allow the judge, based on his observations of the defendant, to tailor the penalty to the nature of the crime and the person committing that crime. This type of person forms a major segment of the defendant population and for the penalties to be effective and rational, they must be geared to fit the punishment to this person with fairness.

3) The drug addict is the other category of persons that should be isolated and identified for penalty purposes. The addict is usually the consumer of the drugs and when he is arrested for sale, it may be only a sale to facilitate his ability to sustain himself on drugs or to help another addict craving the drug. His commission of other property crimes to sustain his drug habit is well known. There is no question that he is a danger to society and to himself and that he requires removal from the society and intensive rehabilitation so that he can become useful and law abiding. The court must have the opportunity to give this person adequate medical treatment. The Narcotic Addict Rehabilitation Act of 1966 is not changed by the penalty structure of this act and can be used as a treatment modality in the addict situation.

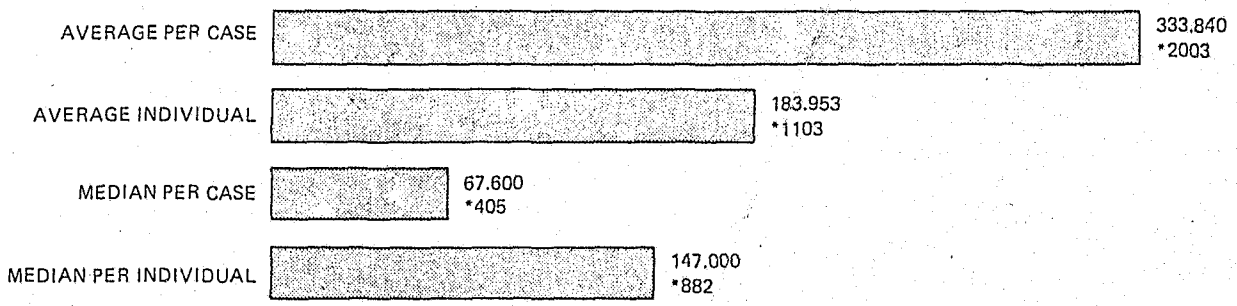
With regard to the crime of possession for one's own use, I feel, from a Federal point of view, that this should not be the major Federal law enforcement effort. The rationale for mere possession offenses within the framework of the Federal penalty structure is for the purpose of indicating a lack of acceptance for indiscriminate and nonmedical use of these drugs and to provide a handhold against the criminal who cannot be arrested for more serious crimes because of his insulation from the street traffic. For the Federal enforcement point of view, some sort of possession provision is considered necessary and must be included. However, the person arrested for simple possession will many times be the narcotic addict or the casual abuser of drugs. In both cases rehabilitation is possible, and, for the casual abuser, probable.

S. 2637 distinguishes mere possession from possession with intent to sell, realizing that the latter is akin to illicit distribution and should be treated more severely. That is why possession with intent to sell is treated the same as sale and simple possession treated as a lesser offense.

Calling your attention to the next three graphs which will be depicting the quantities of the various drugs seized in Federal possession arrests between January 1, 1969, and June 30, 1969, the first illustrates the quantities of narcotics seized.

(The chart was marked "Exhibit No. 13" and is as follows:)

QUANTITY OF NARCOTIC IN POSSESSION CASES (in Grams)



*DOSAGE UNITS
1 DOSAGE UNIT = 333. MGM @ 6% PURITY

Mr. INGERSOLL. The average seizure per case equaled 333 grams, which, when reduced to an amount approximating the average dose taken by a street addict, equals 2,003 dosage units. The average seizure per individual equaled 183 grams or about 1,103 dosage units.

Chiarman DODD. I didn't hear the last figure.

Mr. INGERSOLL. Sir?

Chairman DODD. Would you repeat the last figure?

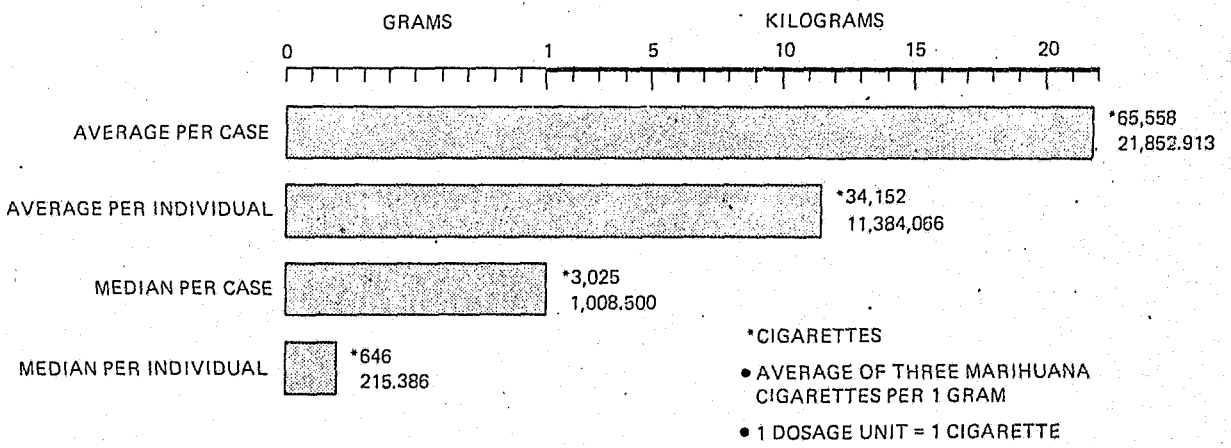
Mr. INGERSOLL. The average seizure per individual equaled 183 grams or about 1,103 dosage units.

The median case produced 67 grams or 405 dosage units, and the median individual was in possession of 147 grams or 882 dosage units. The lowest of these four figures, 405 dosage units, would approximate a 3 month's supply for an average addict requiring three dosage units a day. However, a 3-month supply of narcotics is something which is almost unheard of in the general addict community. In our experience, the average street addict has a difficult time maintaining a single day's supply, let alone a 3-month supply. The only realistic conclusion to be drawn is that the individuals involved in these possession cases were, in fact, engaged in illicit distribution and sale rather than only personal consumption.

The next graph represents the quantity of marihuana seized in reported possession cases.

(The chart was marked "Exhibit No. 14" and is as follows:)

QUANTITY OF MARIHUANA IN POSSESSION CASES (in Grams)



Mr. INGERSOLL. The average quantity of marihuana seized per case equals 21,852 grams, which, when reduced to the number of cigarettes such an amount will produce, equals 65,558 cigarettes. The average quantity seized per individual was 11,334 grams or the equivalent of 34,152 cigarettes. The median case produced 1,008 grams or the equivalent of 3,025 cigarettes; and the median per individual was 215 grams or the equivalent of 646 cigarettes. Logic would dictate that anyone in possession of the equivalent of 646 marihuana cigarettes does not intend to use them all himself. The inference of an intent to sell is inescapable.

Mr. MITCHELL. One additional facet that I would like to mention is that our consideration of this to date discloses that not only is the Mexican border a great source of import of marihuana; it is a troublesome area to police, and it also is a great source of hard narcotics and dangerous drugs that come from all over the world. Thus we find some dangerous drugs that are manufactured under proper circumstances in this country find their way out of the country and into Mexico and back into this country, so that we have all three facets of the problem on the border.

Chairman DODD. I remember that. That was one of the reasons for the writing of the 1965 Drug Control Amendments, to try to stop traffic from this country into Mexico and then out again back into this country. Anyhow, we are all glad to hear we are underway.

The second point I would like to talk about is this. It has become evident to all of us in recent years that the most popular drug of abuse among young people is marihuana. Everybody agrees on that. I wonder what you think, Mr. Attorney General, and Mr. Ingersoll, about the suggestion that I made in my draft bill to make a special effort to study the profits of this drug and to reevaluate the penalty structure. I wonder if either of you have had a chance to think about this idea of having a committee or commission of experts to advise the Attorney General on the properties and penalty structure of marihuana violations. I think you pointed out, Mr. Attorney General, the inconsistencies in the penalties for possession of marihuana and LSD, for example. What, if anything, do you think about this idea? Don't you think it might be helpful if we had such a study made, first, because I find that after the last set of hearings the testimony on marihuana was so conflicting before this subcommittee that it was impossible for me to really make up my own mind about it. I don't know how anyone could legislate in such an atmosphere. The law enforcement people pretty generally took the view that it is dangerous, addictive, very harmful and ought to be dealt with very severely; while the medical, scientific, and educational community pretty generally took the view that this was not quite so. That is the main part of it as I remember it from that record. And I wonder if it would not be a good idea—we have got the top brains in this country—to say to them, now get to work and tell us the facts, give us a definition within a year, say, so that we could better legislate and enforce law.

Mr. MITCHELL. Yes, Mr. Chairman. I was somewhat amazed and surprised upon becoming involved in this subject to find out that there was such little knowledge about the various aspects of marihuana. I would like to point out that the best thing that we have been able to pull together with the cooperation of the HEW and the other participating agencies on the subject is contained in here.

Chairman DODD. In this——

Mr. MITCHELL. And you will find that it is most inconclusive, and I agree with you that definitive information is certainly not available for ultimate disposition of the matter by permanent legislation.

With respect to the concept as contained in your bill regarding the appointment of a commission or another study group, I think that it should be done. I think that it should be adequately funded so that we do get at the bottom of the problem. There are many facets to it. As you

pointed out, the law enforcement people take one approach to it, the medical people another, and that it leaves somewhat of a never-never land in which we are operating.

I do feel, however, that for the purpose of the bill we have under consideration we must proceed with legislation pertaining to marihuana in the category which we are discussing because of the effects that have been established of the substances, but with a review based upon the results of the commission's determination within the period of a year or 2 years or whatever is viable.

Chairman DODD. I would not have any trouble with that. I think you are right. I don't think we should hold up legislation now.

Mr. MITCHELL. And I would be glad, Mr. Chairman—I understand that the people from the Bureau have discussed the concepts with your staff and have been working together.

Chairman DODD. That's right.

Mr. MITCHELL. I would hope that they would provide for such a commission. With respect to the penalties, I think we evidenced our position here this morning to the point where we certainly have to reconsider those as they pertain to this bill vis-a-vis the existing law.

Chairman DODD. Yes. I understand you and I think that is a sensible and a very constructive approach.

Senator KENNEDY. Would the Senator yield at that point?

Chairman DODD. Yes.

Senator KENNEDY. I am just wondering if this is as valuable as Senator Dodd has expressed in the sense of his own legislation. I understand Congressman Pepper has suggested that the Surgeon General do a study; and Congressman Koch of New York has also suggested, I understand, that there be an appointment of a presidential type commission such as the Warren Commission, or the Kerner Commission. Is there any reason why the administration could not go ahead rather than wait for this legislation to be considered and run through the process of the committee and the Senate and House; is there any reason why with the importance of this problem as it exists nationally and with the concern that the administration has expressed, as evidenced in the efforts out in California and Mexico, that there could not be expeditious action by the administration in establishing such a commission rather than waiting for the legislation itself?

Mr. MITCHELL. Senator, I think your point is well taken and I would point out that the President in his message to Congress, in effect, directed this.

We have two problems in my opinion with respect to that process. Number one is we haven't been able to obtain the money.

Senator KENNEDY. Well, are you suggesting from your response that one of the principal limitations in further action in the designation or the appointment of a commission is a lack of congressional responsiveness in providing adequate funding for such a commission?

Mr. MITCHELL. No, I say that the process that we must undertake now and are undertaking—and the initial start is contained in this—is partially inhibited by the lack of money. I would also hasten to add that I think the more important facet is that by the appointment of a commission from whatever source with a national reputation and

representation, I think that we will have better acceptance of the subject matter within all aspects of the community than if we do it as a branch of the Government.

Senator KENNEDY. Well, I couldn't agree with you more in those terms, although I think the Surgeon General obviously would have a very significant standing in all aspects of our Government and as far as public acceptance. I think my point would be is there any reason, realizing the expression of support and the expression of need which you have articulated so well in terms of your response to the chairman's question, that there could not be Presidential action in the naming of such a commission prior to the passage or the consideration of this legislation; given the fact that the administration and you, yourself, as I think so many law enforcement and young people have expressed that there really is a tremendous need for a greater understanding about the dangers of such drugs and their effect in terms of law enforcement, and many other implications of it? Is there any reason that the administration could not go ahead and appoint this commission rather than wait for the legislation?

Mr. MITCHELL. I think in the context of your question in that area, I think that is a good suggestion that should be followed, and we will examine the prospects of funding, the powers and intergovernmental relations as we go along.

Senator KENNEDY. I say this as I am sure you realize, Mr. Attorney General, because there has been so much misinformation, I think, as the distinguished Chairman has pointed out about the drug itself, and it seems to me that such a commission made up as you suggested of a very broad and wide spectrum of public participation within our own society I think would have a very significant impact in furthering the understanding of the public. And I think particularly with the appointment and the mantle of a Presidential commission, with all that that suggests and recommends, I think that we could at last come to grips with this problem which I think all of us feel has escaped us in too many of the studies where they go back to the time of the La Guardia study, many other studies have been done on the local and State level and even some that have been done in various departments of Government. And I think with that Presidential mandate, I think a very important step would be taken forward.

Mr. MITCHELL. Yes, sir.

Senator KENNEDY. Thank you.

Thank you, Mr. Chairman.

Chairman DODD. I would just add, Mr. Attorney General, when I suggested this last March or April, when I introduced this bill, I had more in mind a committee or commission just concerned about marihuana, because I think it is urgent that we get the answers to this specific problem. There are many others. But in any event, I hope we can get something done about it and I know you do, too.

(Testimony of Dr. Yolles, continuing)

I would now like to spend the remainder of my time here in talking about marihuana, Mr. Chairman.

Because of the increase in the use of marihuana and because of the confusion and controversy resulting from that use, it is of the greatest importance to present factual information about the drug itself, the effects of its use and the history of efforts to control its use.

For, unless we separate fact from fable in the public uproar over the use of this drug, our efforts to achieve effective and acceptable controls over marihuana use will indeed be just "more of the same."

The marihuana story for 1969 in the United States goes back to the 1930's.

The "great experiment" was over. The prohibition of the use of alcoholic beverages, under the 18th Amendment, had ended.

For better or worse, American voters had made it clear that they considered alcohol a social beverage, and chose to limit prohibition of its use through state laws which vary to this day, in terms of "wet" and "dry" jurisdictions and the age at which individuals can legally drink beer, wine, and spirits.

The experiment, which we voted to terminate, had produced at least two major results: the social usage of alcohol by adult men and women had increased and the contempt for an unpopular law had spread, bringing other legal restrictions on manners and morals into question.

At approximately the same time, however, enough hue and cry over the reported evils of another intoxicant—marihuana—resulted in the adoption of the Marihuana Tax Act of 1937.

We know that marihuana is not, scientifically, specifically—and I repeat, is not, scientifically—a narcotic drug like heroin or morphine, but is a mild hallucinogen. It should not be associated with narcotics—either medically or legally.

However, "guilt by association" with narcotics occurred for marihuana for the first time in Federal law in 1929, with the passage of Public Law 672 of the 70th Congress authorizing the establishment of the Lexington and Fort Worth Hospitals.

In the statute, the term "habit-forming narcotic drug" or "narcotic" was specifically defined—drug by drug—and on the list was "Indian

hemp, or marihuana and its various derivatives, compounds and preparations."

Nowhere, Mr. Chairman, in the committee hearings or in the Congressional Record was there any discussion of the rationale for this drug classification.

As States adopted the Uniform Narcotic Drug Act which included marihuana, it was more widely classified as a narcotic.

And so the stepping stone concept got its start. Once labeled as a statutory narcotic, marihuana continued to be so labeled in succeeding years.

By 1937, the use of marihuana was reported to present so severe a health danger that Federal controls were represented as necessary. And so the Marihuana Tax Act of 1937 was enacted, even though many of the statements in testimony before the Congress were substantially untrue.

The report to the Senate on the bill quotes the following:

> Under the influence of this drug (marihuana) the will is destroyed and all power of directing and controlling thought is lost. Inhibitions are released. As a result of these effects, many violent crimes have been and are being committed by persons under the influence of this drug. Not only is marihuana used by hardened criminals to steel them to commit violent crimes, but it is also being placed in the hands of high-school children in the form of marihuana cigarettes by unscrupulous peddlers. Its continued use results many times in impotency and insanity.

And elsewhere in the testimony, the witness stated, "I believe in some cases that one marihuana cigarette may develop a homicidal maniac probably to kill his brother." [sic]

At the time of the hearings on this proposal, one of the witnesses was Dr. William C. Woodward, appearing for the American Medical Association.

In speaking about newspaper accounts of abuse of marihuana, Dr. Woodward said:

> It has surprised me that the facts on which these (newspaper) statements have been made have not been brought before this Committee by competent primary evidence. We are referred to newspaper publications concerning the prevalence of marihuana addiction. We are told that the use of marihuana causes crime.
>
> But as yet no one has been produced from the Bureau of Prisons to show the number of prisoners who have been found addicted to the marihuana habit. An informal inquiry shows that the Bureau of Prisons has no evidence on that point.

Dr. Woodward pointed to a series of agencies including the PHS who had not been consulted.

> You have been told that school children are great users of marihuana cigarettes. No one has been summoned from the Children's Bureau to show the nature and extent of the habit, among children.
>
> Inquiry of the Children's Bureau shows that they have had no occasion to investigate it and know nothing particularly of it.
>
> Inquiry of the Office of Education—and they certainly should know something of the prevalence of the habit among the school children of the country, if there is a prevalent habit—indicates that they have had no occasion to investigate it and know nothing particularly of it.
>
> Moreover, there is in the Treasury Department itself, the Public Health Service, with its Division of Mental Hygiene. The Division of Mental Hygiene was, in the first place, the Division of Narcotics. It was converted into the Division of Mental Hygiene, I think, about 1930. That particular Bureau has control at the present time of the narcotic farms that were created about 1929 and 1930 and came into operation a few years later. No one has been summoned from that Bureau to give evidence on that point.

Informal inquiry by me indicates that they have had no record of any marihuana or Cannabis addicts who have ever been committed to those farms.

The indictment by Dr. Woodward, who qualified both as a physician and an attorney, of the acceptance of "indirect hearsay evidence" by the committee brought forth neither questions nor comment at that time.

The legal history of marihuana control measures is a matter of record and I will not pursue it here. The major point I wish to make is that, in the case of marihuana, legal penalties were assigned to its use that are strict enough to ruin the life of the first-time offender, with total disregard for medical and scientific evidence of the properties of the drug or its effects. I know of no clearer instance in which the punishment for an infraction of the law is more harmful than the crime itself.

I would like to make my professional position very clear in this regard, Mr. Chairman.

I do not, at this time, advocate the removal of all restrictions on the use of marihuana. I believe that until we know more than we now do about the long-term effects of marihuana and other forms of cannabis, that use of the drug should continue to be controlled.

Medically speaking, I cannot give it a clean "bill of health." But, penalties for its use should be lowered, in proportion to the danger and risk to the individual and society of this drug.

Chairman Dodd. That is about what I happen to think is right, too. And if you are familiar with the bill I introduced, this is about what I tried to do.

Dr. Volles. Yes, sir.

Chairman Dodd. I think the only thing we can do pending this study is for your office to hold the present controls and iron out this ridiculous penalty situation, and both of these things could be done.

Dr. Volles. You are quite right.

For some marihuana can be a potentially dangerous drug. Generally it is a mild drug in comparison with other hallucinogens such as LSD, or with certain amphetamines and barbiturates. To equate its risk—either to the individual or to society—with the risks inherent in the use of hard narcotics is—on the face of it—merely an effort to defend an indefensible, established position that has no scientific basis.

It is quite understandable that law enforcement officials are concerned with the misuse of marihuana. So are physicians, educators, and scientists. But the degree of concern must now—at long last—be equated with the degree of mental and physical risk. For too long, the fantasies surrounding marihuana, whether fostered deliberately or through ignorance, have clouded the facts. I would like to mention some of them here because fallacy can only give way to fact if each is recognized for what it is.

And I have prepared a chart of fable and fact on marihuana which I would like to read into the record at this point.

Chairman Dodd. Yes; please do.

Dr. Volles. Fable: Marihuana is a narcotic. Fact: Marihuana is not a narcotic except by statute. Narcotics are opium or its derivatives—like heroin, and morphine—and some synthetic chemicals with opium-like activity.

Fable: Marihuana is addictive. Fact: Marihuana does not cause physical addiction, since tolerance to its effects and symptoms on sudden withdrawal does not occur. It can produce habituation, which is psychological dependence.

Fable: Marihuana causes violence and crime. Fact: Persons under the influence of marihuana tend to be passive. It is true that sometimes a crime may be committed by a person while under the influence of marihuana. However, any drug which loosens one's self-control is likely to do the same and relates primarily to the personality of the user.

Fable: Marihuana leads to increase in sexual activity. Fact: Marihuana has no aphrodisiac property.

Fable: Marihuana is harmless. Fact: Instances of acute panic, depression, and psychotic states are known, although they are infrequent. Certain kinds of individuals can also become overinvolved in marihuana use and can lose their drive. We do not know of the effects of long-term use.

Fable: Occasional use of marihuana is less harmful than occasional use of alcohol. Fact: We do not know. Research on the effects of various amounts of each drug for various periods is underway.

Fable: Marihuana use leads to heroin use. Fact: We know of nothing in the nature of marihuana that predisposes to heroin abuse. It is estimated that less than 5 percent of chronic users of marihuana go on to heroin use.

Chairman Dodd. May I interrupt you here, Doctor?

Do you remember the letter that I wrote to you and you wrote back to me?

Dr. Yolles. Yes.

Chairman Dodd. I believe—I don't know whether you have your copy or a copy of your answer with you. Do you have a copy of yours?

Dr. Yolles. No, I don't have it with me, Senator.

Chairman Dodd. Well, I think my facts are straight. You say that, "Habitual marihuana users will invariably try hashish, which is three to four times stronger. They are often attracted to LSD and other hallucinogenic drugs. Pep pills, like the amphetamines, are used by one-third of the 'potheads' and some of these go on to injecting amphetamines."

And then you say, "The escalation of heroin is infrequent, but it certainly occurs."

Now, these drugs are more dangerous than the ones you refer to here, certainly more dangerous than marihuana.

Dr. Yolles. Yes, sir.

Chairman Dodd. What I find difficult to understand—perhaps you could clarify this for me—is what the relationship is. Perhaps you are going to show it. I haven't had a chance to read your testimony over. What, then, is the relationship between marihuana and such other drugs like hashish and heroin? Or is there a relationship? I know what you said before about heroin so far, but I say perhaps you are going to say more than I have had a chance to read. But even so, I think it would be helpful if you could spell it out here.

Dr. Yolles. Well, I could summarize it very briefly. In terms of progression to heroin, there is a very small percentage of frequent

users, chronic users of marihuana, who do go on to heroin but they also go on to all other drugs. The very fact that these individuals, who use marihuana chronically, and are known as potheads, will test the nature of the habituation of these drugs, leads them to try all other types of stimulants, hallucinogens, et cetera. Only a small percentage, however, even of these smorgasbord users of various types of drugs go on to use heroin. So the statement has been made over the years that marihuana use inevitably leads to heroin use, but——

Chairman Dodd. It is said it is a threshold drug.

Dr. Yolles. The large percentage of marihuana users are infrequent users. It is estimated that about 65 percent of them use it once or twice. Another 25 percent of them will use it on occasion socially. These are not the people we are talking about. There is another 10 percent who are frequent users. but of that 10 percent somewhat less than 5 percent go on to using heroin, which is a rather small percentage.

Chairman Dodd. If a higher percentage of these marihuana users were more frequent users—suppose 80 percent were smoking it all the time—then would you have a higher percentage moving to heroin and other dangerous drugs?

Dr. Yolles. There would be a larger number of people moving if the percentage stayed the same. However, I must point out that given an unselected population exposed to marihuana smoking, some 50 percent of them will have no effect the first time at all. What we are talking about basically here, Senator, is the personality of the users.

Chairman Dodd. Some people are more addictive than others, is that it?

Dr. Yolles. They are more addiction prone. Let's put it that way.

This is the basic phenomenon. It is not the drug itself which leads to the use of another drug. It is the personality of the user which leads him to experiment with other drugs.

Chairman Dodd. Very well: That is helpful testimony. Go ahead.

Dr. Yolles. Fable: Marihuana enhances creativity. Fact: Marihuana might bring fantasies of enhanced creativity but they are illusory, as are instant insights reported by marihuana users.

Fable: More severe penalties will solve the marihuana problem. Fact: Marihuana use has increased enormously in spite of the most severely punitive laws.

Fable: It is safe to drive while under the influence of marihuana. Fact: Driving under the influence of any intoxicant is hazardous.

Of all those who have tried marihuana, as I mentioned a moment ago, about 65 percent are experimenting, trying the drug from one to 10 times, and then discontinuing its use. Some 25 percent are social users, smoking marihuana on occasion when it is available, usually in a group context. Ten percent or less can be considered chronic users who devote significant portions of their time to obtaining and using the drug. The effects of marihuana vary with the potency of the agent, the psychological set of the user, or what he expects from the situation, and the setting in which use takes place. Thus, it has been estimated that half of those who use marihuana the first time experience no effects at all.

It is obvious, therefore, that there are some things we already know about marihuana, in spite of the fact that many people are not willing to accept this knowledge.

A youngster who smoked one marihuana cigarette is not a dope fiend, even though misguided individuals in the past have made this association.

There is probably not a single youngster today who believes that smoking one marihuana cigarette will automatically lead him to perdition.

In this situation, it is extremely unfortunate that by the continued, exaggerated emphasis on the supposed dire evils of marihuana smoking, we make it extremely difficult to tell people what the real risks of use of specific kinds of drugs are. And there is no doubt that we have already built up in the new generation some of what people of our age absorbed in the days of the Volstead Act. The prohibition syndrome, as applied to marihuana, has already brought about defiance of these specific laws; additionally, it has created in the new generation a credibility gap concerning other laws and law enforcement.

This committee, Mr. Chairman, is considering various legislative proposals. Other proposals designed to improve control of drug abuse are also before the Congress and have been assigned to other committees.

I would like to discuss the elements of the proposals under consideration by this committee which I would hope to see enacted, and the elements that I think could be improved.

I would not favor adoption of these proposals in their present form, without further consideration of medical and scientific data, as well as further consideration of statements made by judges, probation officers, prison officials and others who oppose mandatory minimum penalties on drug offenders.

Chairman DODD. Now, you are talking about S. 2637, is that the one? So you are not talking about my bill, are you, when you say that you would favor the adoption of either proposal in its present form?

Dr. YOLLES. The two major proposals before the committee are your bill and the bill of the late Senator Dirksen. There are elements in both that I am strongly in favor of and certain elements which I would hope can be altered in both of these bills.

Chairman DODD. I see. All right.

Dr. YOLLES. The principle and the effects of mandatory penalties defeats the whole purpose of treatment and rehabilitation of drug users; it unnecessarily limits the courts and negates the traditional American expectancy that each individual will be heard by a court of law in terms of his intent, the circumstances of his alleged offense, and his potential ability to be rehabilitated.

As a result of my professional experience with drug users sentenced by the courts, I am convinced that the social and psychological damage caused by incarceration is in many cases far greater to the individual and to society than was the offense itself. Each case of drug abuse must be decided separately, from the legal as well as the medical point of view.

From this standpoint, I would favor provisions which would make possible a definite scientifically based determination of the dangers of marihuana use and of the properties of the drug themselves.

Changes in scheduling drugs in any piece of legislation can only have real meaning if they are based on research findings. My second point in this regard, therefore, is that social and psychological research on the use and abuse of drugs should remain a medical and health responsibility so that scientific credibility can be established.

As President Nixon has said:

> In addition to gathering existing data, it is essential that we acquire new knowledge in the field. We must know more about both the short- and long-range effects of the use of drugs being taken in such quantities by so many of our people. We need more study as well as to find the key to releasing men from the bonds of dependency forged by any continued drug use.
>
> The National Institute of Mental Health has primary responsibility in this area, and I am further directing the Secretary of Health, Education, and Welfare to expand existing efforts to acquire new knowledge and a broader understanding in this entire area.

Similarly, drug abuse education in schools and for health professions should continue to be the responsibility of the health professions. We have long been involved in such educational programs and public response to the expanded drug education pamphlets, TV, and radio spots and other visual materials indicates that when youngsters gets facts instead of hysteria they pay attention to this information.

The Department of Justice should, of course, have responsibility for the training and education of enforcement personnel, but today's youth are unlikely to accept information on drugs presented by enforcement officials.

I am hopeful that relevant, factual educational programs will begin to become significantly effective in curbing the indiscriminate abuse of all drugs as it has been in reducing LSD use.

No matter what legal reforms are undertaken, this task will be difficult, because the whole program has gotten out of hand, and the smoking of marihuana has become an accepted fashion among millions of our citizens.

In this situation, the first place in which legal reforms can be made is in the removal of mandatory minimum penalties.

I agree with you, Mr. Chairman, as you stated at the White House Conference on Narcotics and Drug Abuse in 1962, that the time has come to correct the mistake that was made with the passage of the Narcotics Control Act of 1956. That act radically departed from the existing trend in criminal legislation—a trend toward individual treatment of convicted offenders with a view to their eventual rehabilitation.

If mandatory sentences really were deterrents to criminal conduct, then there would be little justification for limiting them only to narcotic and marihuana offenders.

Mandatory sentences bear little or no relationship to the public good, to public health or to mental health.

I think it important that the record of this committee's current hearings include the results of the questionnaire that the chairman of this committee included in the proceedings of the White House Conference on Narcotics and Drug Abuse.

As a joint project of the Senate Subcommittees on Juvenile Delinquency and on National Penitentiaries, the questionnaire was sent to Federal district judges, Federal chief probation officers, Federal prison authorities and U.S. attorneys, inquiring into the effects of the

mandatory minimum sentence provisions, and the elimination of probation and parole in the handling of narcotics offenders.

The results of that survey showed that approximately 75 percent of all those who responded—people who lived with that law from day to day—opposed these two basic provisions of the act.

Chairman Dodd. I appreciate your recognition of the survey of drug abuse which this subcommittee and the Subcommittee on Penitentiaries submitted at the White House Conference. The appropriate parts of it will be included in the record of these hearings. (The documents referred to were marked "Exhibits Nos. 16 and 17," and are as follows:)

EXHIBIT No. 16

STATEMENT OF SENATOR THOMAS J. DODD, BEFORE THE WHITE HOUSE CONFERENCE ON NARCOTICS, SEPTEMBER 28, 1962

The White House Conference on Narcotics is at once an indication of the gravity of the narcotic problem in the United States and a symbol of the determination of the American people and its Government to do something about it. I feel deeply privileged to have been invited to speak before this panel, which is concerned with the legislative aspects of the problem.

In 1956, as a result of widespread national dissatisfaction with the growth of narcotic addiction, especially among juveniles, and because of deep frustration over the apparent failure of existing legislation to deal with the problem, a new Narcotic Control Act was passed into law. This law contained three major innovations that were expected to have a tremendous deterrent effect on narcotic racketeers.

First, it removed from the hands of judges all discretion in the sentencing of convicted narcotic offenders by providing a mandatory minimum sentence of 5 years for the first offense and 10 years for subsequent offenses, with maximum penalties of 20 years for the first offense and 40 years for subsequent offenses.

Second, it removed all possibility of parole for narcotic offenders, thus putting them in a special category in our Nation's Federal prisons.

Third, it emphasized the concern of Congress over juvenile drug use by providing up to life imprisonment or even death for adults convicted of selling narcotics to a juvenile under the age of eighteen.

To demonstrate the severity of this law, it should be pointed out than an illegal narcotic transaction normally involves several violations of the act, each of which could be punishable by a mandatory 5-year sentence. Thus, a first offender could be, and frequently has been, sentenced to 20 or 30 years for a first offense.

When Congress passed the Narcotic Control Act of 1956 it radically departed from the existing trend in State and Federal criminal legislation, a trend toward the individual treatment of convicted offenders with a view to their eventual rehabilitation. Congress made this departure because it felt that the peddling of narcotics was so vicious, dangerous, and contagious a crime that unusually severe and rigid methods were necessary and justified in dealing with it. If the passage of several years under this act had been accompanied by a marked decrease in narcotic crimes, we might say that the law could have justified itself. For after all, the primary purpose of law enforcement is the protection of the public; the care and rehabilitation of criminals, however important, must be subordinate. But has the law been effective?

We have now had several years of experience under it. Its degree of effectiveness is a matter of dispute. The 1956 law has proved helpful in the jailing of several large-scale narcotic racketeers. Yet the growth of drug traffic continues.

The dispute is heightened by the fact that available information on the spread of narcotic addiction is completely contradictory. The Federal Bureau of Narcotics tells us that there are 46,798 drug addicts in the entire country. But testimony before the Senate Subcommittee To Investigate Juvenile Delinquency by responsible city and State officials indicates that there may be as many as 50,000 addicts in the city of New York alone, and from 15,000 to 20,000 addicts in the State of California alone.

Only last week the executive director of the New York City Youth Board told our subcommittee that 25 percent of the children studied by the youth board are

involved in the use of drugs ranging all the way from heroin to marihuana, pep pills, goof balls, and other varieties. He told of entire neighborhoods where children were exposed to narcotic pushing "as part of their daily life." In his opinion and in the opinion of countless people with whom I have talked, who deal with this problem on a day-to-day basis, there are more narcotics illegally available today than ever before.

Therefore, I think it is clear that the severe mandatory sentencing provisions of existing law have not had the deterrent effect that was hoped for.

There is an overwhelming preponderance of opinion on the part of those who deal most closely with this act that these provisions have had a very damaging effect and should be altered.

The Senate Subcommittee on Juvenile Delinquency, in a joint project with the Subcommittee on National Penitentiaries, sent a questionnaire to Federal district judges, Federal chief probation officers, Federal prison authorities, and U.S. attorneys inquiring into the effects of the mandatory minimum sentence provisions, and the elimination of probation and parole in the handling of narcotic offenders. The answers to this questionnaire, digested and broken down, are as follows:

Of Federal prison wardens, 92 percent were opposed to the mandatory minimum sentence provisions; 97 percent were opposed to the prohibition of probation or parole:

Of the Federal district judges responding to the questionnaire, 73 percent opposed the mandatory minimum sentence provisions and 86 percent opposed the prohibition of probation or parole:

Of the probation officers who responded, 83 percent opposed the mandatory minimum sentence provisions and 86 percent opposed the prohibition of probation or parole:

Of the U.S. attorneys who responded, a group which understandably is predisposed toward more rigid punitive statutes, 50 percent opposed the mandatory minimum sentence provisions and 55 percent opposed the prohibition of probation or parole.

The overall figures for our survey showed that approximately 75 percent of all those who responded, people who live with this law from day to day, oppose the two basic provisions of the act and seek their modification.

Why? I will give you representative answers.

From James V. Bennett, Director of the Federal Bureau of Prisons:

"Prisons, both State and Federal, in the years immediately ahead will be faced inevitably with the problems of narcotic offenders, addict and nonaddict alike, who are weighted down by the hopelessness and the bitter futility of sentences which seemingly stretch into infinity. What can the institution offer the man serving 30, 50, or 80 years with no prospect for parole or hope of mitigation of his sentence? There is a real danger that, in the effort to contain the problems which stem from the hopelessness characterizing the attitudes of such men, much of what has been achieved in the development of constructive programs for all types of prisoners may be wiped out."

From U.S. District Judge James M. Carter:

"Several years ago at a Ninth Circuit conference there was a unanimous vote against mandatory sentences. The mandatory sentence can work extreme injustice. I was compelled to impose a 5-year sentence on a Marine veteran of the Korean campaign who was found with three or four marihuana cigarettes. He had been drinking in Tijuana and was arrested at the border. Obviously, three or four cigarettes did not make him a peddler and these were not commercial amounts. He had a spotless civilian record and an excellent military career. He had received a Purple Heart and had been wounded in action and had a wife and children. I held up sentencing 60 days with the defendant's consent, to attempt to get the U.S. Attorney to file a tax consent on a smuggling charge which would not have carried at least 5 years' sentence. I was unsuccessful. I sentenced the man to 5 years in the penitentiary without parole."

From Oliver Gasch, then U.S. attorney for the District of Columbia:

"I am opposed to the philosophy of mandatory minima. Even in narcotic cases some discretion should be allocated to the judge. The answer to the elimination of drug traffic is an ideal difficult of realization. I would recommend long *conditional* sentences with close supervision by parole authorities."

From Eugene P. Dupuy, Chief United States Probation Officer, New Orleans, Louisiana:

"Existing laws emphasize the punitive aspects in dealing with the illegal drug traffic. Presumably, the reason for this approach is that strict penalties are expected to serve as a deterrent and to eliminate or greatly reduce the problem. Were this premise valid, mandatory minimum sentences for all crimes would be the solution. I believe that all persons who have worked with offenders know that such an approach is doomed to failure, for it overlooks the causative factors of crime. Historically, we know that severe penalties for relatively minor offenses, such as theft of a loaf of bread, did not deter the hungry from stealing bread. Similarly, the person with mental or emotional problems who needs support, will seek that support, irrespective of social or legal consequences."

I believe that the experience of the Narcotic Control Act of 1956 demonstrates again the fact that mandatory, inflexible, general punishment statutes can never be a just or even an effective substitute for the individual discretion, within prescribed limits, of judges, prison officials, probation officers and district attorneys who, acting upon personal study of individual cases, can arrive at justice far more readily than can a blind and impersonal article of law.

The principal defect in the present law is that it makes no distinction between major narcotic pushers and narcotic addicts themselves who, in order to pay for their own drugs, become small-time drug peddlers. Under the present law, drug addicts are being imprisoned for terms of twenty, forty and sixty years, and some are being given life imprisonment. This mandatory sentencing, with no hope for parole, thwarts all efforts to deal sensibly and rationally with addicts and completely sweeps under the rug the tragic problem which they represent.

The problem of drug addiction is essentially a medical problem, a psychiatric problem. It cannot be solved by merciless prison sentences. I believe that the law should be amended to repeal mandatory minimum penalties and to restore the possibility of probation and parole for rehabilitated narcotic offenders.

I do not here suggest that the professional criminals at the vortex of narcotic racketeering be given lenient treatment. Their conscious dedication to profiting from the calculated destruction of human beings demonstrates that they are the least likely of all rehabilitative prospects, and must of their very nature be confronted with the full force of the law. But I do propose that we should reform the excessively punitive and inhumane treatment now meted out to those who are essentially the victims of the narcotic racket.

To be sure, the drug addict, while locked up in prison, only to be released at an old age or by death, does not pose a threat to society as a narcotic peddler. But this solution is so demonstrably ineffective as a deterrent to narcotic crimes, wreaks such havoc within the penal system, does such damage to the individual involved, works such violence to the principles of justice and equity which should characterize our legal code, constitutes such an affront to reason, upon which all successful law must be based, involves such an abandonment of the principle of compassion which must be at the heart of all successful social advance, presents such a stark contrast with the enlightened trend toward the rehabilitation of prisoners—that all reasonable observers will eventually agree that the tragic and manysided toll of blind and rigid imprisonment procedures is too great to pay for the fancied and illusory gain.

I believe that the Congress should rewrite the law and give the courts the right to distinguish between professional narcotic criminals and narcotic addicts who are drug peddlers only because of the overwhelming need to finance their own addiction.

This is today an unpopular cause and those who advance it will be subject to ridicule and abuse by unthinking people. Yet I am certain that the American people, in their honest wisdom, in their mercy, and in their plain good sense, will support this cause when once they understand it.

This Conference marks a great step toward that goal and I am very proud and honored to have an opportunity to take part in it and to bring these views to you.

EXHIBIT No. 17

EXCERPTS FROM S. REPORT 1519, 85TH CONGRESS, SECOND SESSION, pp. 4–7

THE EFFECTIVENESS OF THE NARCOTICS CONTROL ACT OF 1956

A study of the effectiveness of the Narcotics Control Act of 1956 is clearly called for. The act is one of the harshest penal laws ever placed on our statute books, utilizing principles of deterrence and punishment as opposed to parole or

CONTINUED

9 OF 33

probation for defendants convicted of narcotic and marihuana violations. The act has now been in effect for more than 6 years. Statistics and other data suggest that it has failed in its deterrent purpose and has been most costly to the Government. It has also produced many injustices and has generally had a destructive effect on prison rehabilitation programs.

There has been no decline in the number of narcotic and marihuana offenders committed to prison each year. This would appear to indicate that the stiff penalties provided for narcotic violations have not succeeded in their objective of frightening potential offenders away from this illicit trade. In 1956, the last fiscal year before the Narcotics Control Act went into effect, 1,189 persons were sentenced to prison for narcotic offenses and 325 for marihuana offenses. In the succeeding years, the commitments of these offenders experienced slight fluctuations. In the 1962 fiscal year, 1,070 defendants went to prison for narcotic violations and 204 for marihuana violations.

The rate of commitments has remained high despite the fact that the average sentence imposed for Narcotics Act convictions has increased. In 1956, the sentences imposed for narcotics violations averaged 3.9 years and for marihuana violations, 3.2 years. By the 1958 fiscal year, the average sentence for narcotic violators increased to 6 years and for marihuana violators to 5 years, and the average have remained at about those levels. Due to the cumulative effect of the longer sentences, the average term being served in prison by this group of offenders also increased, from 5.1 years in 1956 to 7.5 years in 1962 for narcotic offenders and from 4.4 to 5.9 years for marihuana offenders.

Lacking parole eligibility and serving substantially longer terms than other types of violators, the prisoners under sentence for Narcotics Act offenses comprise an ever larger component of our Federal prison population. Under the Boggs Act, the number of drug law violators increased from 2,017 or 11.2 percent of the entire prison population in 1950, to 3,181, or 15.1 percent of the population in fiscal 1956. The trend continued under the 1956 act. By 1962, the number reached 4,368, or 17.7 percent of the prison population.

In 1962, it cost the Federal Government $2,022 to keep one offender in prison for 1 year. The expense for keeping 4,368 drug offenders in prison for a year therefore comes to $8,824,000. And the cost is getting greater every year.

The provisions of the Narcotics Act, which apply indiscriminately to addict, peddler, and racketeer, have vastly complicated the problem of rehabilitating the addict. Approximately one-half of the offenders committed to Federal institutions last year for drug law violations were reported to be addicts, many of them in their late teens and early twenties. Their long terms and nonparole status has militated against their rehabilitation.

Prior to the recent White House Conference on Narcotics Addiction and Drug Abuse, the President appointed an ad hoc panel to review the overall problem, and a report prepared by the committee was used as one of the working documents of the Conference. The Panel's conclusions contained the observation:

The compulsive drug abuser can be rehabilitated to a legal and, in some cases, productive place in society. A decision either to place this offender in prison for long periods, or to maintain his addiction by continued drug dosage, is a tacit denial of this possibility. * * * The most critical component of treatment and rehabilitation appears to be a long, strictly supervised, highly controlled parole period, with legal and practical measures to assure that the parolee remains drug free. Such a parole period is essential for either civil or criminal commitments, and should be just as strict for either one. The cost of such supervision where tried has been $350 per year as compared with $2,000 to maintain a Federal prisoner for an equal time.

Under current Federal legislation, needless to say, the prospects of rehabilitating drug addicts have been greatly diminished.

The severe penalties provided by the Narcotics Control Act have also vastly aggravated the problem of sentence disparities in the Federal courts. Many of the sentences imposed on these defendants have been of truly Draconian proportions and far in excess of the 6-year average term imposed in most Federal courts for narcotic offenses. An addicted epileptic youth was sentenced to life for selling narcotics; a 32-year-old male addict was sentenced to 80 years. A 40-year-old woman, a first offender, was given 40 years for sale of heroin, and a 36-year-old woman, also a first offender, a 20-year term for sale of marihuana. None of these defendants was eligible for parole under the provisions of the Narcotics Act.

President Kennedy reduced the sentences of all four of these prisoners. He cut the sentences of the two men to 20 years each and the sentences of the two

women to 10 years each. He has also taken similar action in a number of other narcotics cases in which the sentences were excessive considering the circumstances of the offenses and the backgrounds of the prisoners.

James V. Bennett, Director of the U.S. Bureau of Prisons, wrote in a recent article for the University of Illinois Law Forum:

"With interminable sentences and no possibility of parole, these offenders [drug law] are accumulating from year to year in the Federal prisons and now compose the second largest group of prisoners, next only to the car thieves. They have utterly no incentive to improve themselves in prison and their very presence, bulking ever larger, is creating a formidable handicap and a discouraging atmosphere for the prison staffs who are doing their best to rehabilitate both the narcotic offenders and the many other types of prisoners in our institutions. The sentences in the narcotics cases, instead of promoting the rehabilitation of the offender and the public safety, are proving to be socially destructive in their effects."

It seems apparent that the Narcotics Control Act of 1956 has not been as effective as originally expected to reduce the dimensions of the drug problem. Its provisions have also made programs of rehabilitation for drug addicts virtually impossible and have had unfortunate and damaging consequences for our system of justice. We have now had more than 6 years of experience with the act, and it is time that it be amended in the light of that experience.

Because of this situation and numerous questions raised by eminent authorities, the subcommittee felt a need for further investigation. In a joint effort with the Subcommittee on National Penitentiaries, a questionnaire was sent to Federal district judges, Federal chief probation officers, Federal prison authorities, and U.S. attorneys. These groups were selected because of their association with the Narcotics Control Act of 1956. The questionnaire explored the effects of the mandatory minimum sentence provision of this act, the prohibition of probation and parole as provided, the severity of the mandatory provisions, the effect, if any, of this law upon the specialized function of those questioned and the advisability of amendments with requests for recommendations.

Federal prison officials.—The wardens or superintendents of the 27 Federal reformatories, correctional institutions, penitentiaries, and prison camps were sent questionnaires. One hundred percent were returned either fully or partially answered. Ninety-two percent were opposed to the mandatory minimum sentence provisions of the Narcotics Control Act of 1956 and 97 percent were opposed to the prohibition of parole as provided in the act. Ninety-seven percent replied that mandatory minimum sentences per se presented special problems in penology.

Federal judges.—Fifty percent of the questionnaires sent to Federal district judges were returned either fully or partially answered. An additional 20 percent disqualified themselves from answering the questionnaire due to lack of experience under the act. Eighty-five percent of the judges answering the questionnaire recommended changes in this Federal law. Eighty-six percent were opposed to the prohibition of probation or parole as provided in the Narcotics Control Act and 73 percent were opposed to the mandatory minimum sentence provisions, many on the grounds that the mandatory provisions were too harsh for first offenders.

Probation officers.—The chief probation officer of every Federal district was sent a questionnaire for a total of 87. Five of these officials disqualified themselves for lack of experience with the Narcotics Control Act of 1956. Of the 82 remaining who answered the questionnaire, 84 percent recommended that changes be made in this Federal law. Eighty-three percent were opposed to the mandatory minimum sentence provisions and 86 percent were opposed to the provisions which provided for the prohibition of probation or parole.

U.S. attorneys.—Questionnaires were sent to all of the U.S. attorneys regarding their opinion of the Narcotics Control Act of 1956. Sixteen percent declined to answer the questionnaire because of insufficient experience. Fifty percent of the respondents recommend changes in the Federal statute. Fifty-five percent were opposed to the provisions which prohibited probation or parole.

Dr. YOLLES. I think it most important.

Mr. James Bennett, former Director of the Federal Bureau of Prisons, has stated:

> There is a real danger that, in the effort to contain the problems which stem from the hopelessness characterizing the attitudes of men with mandatory sentences, much of what has been achieved in the development of constructive programs for all types of prisoners may be wiped out.

I am strongly in favor, Mr. Chairman, of the specific recommendations of the Prettyman Commission, made in 1963, in its report to the President. Any legislation designed to control drug abuse should include in its provisions the concepts and recommendations of that Commission.

Its report stated:

> The Commission makes a flat distinction between the two drugs (narcotics and marihuana) and believes that the unlawful sale or possession of marihuana is a less serious offense than the unlawful sale or possession of an opiate.
>
> The Commission believes that the sentencing of the petty marihuana offender should be left entirely to the discretion of the courts. There should be no mandatory minimum sentences for marihuana offenders and no prohibition of probation or parole.
>
> The courts should have the discretion to impose a fixed sentence (with eligibility for parole), to suspend sentence, or to impose an indeterminate sentence. The Commission is opposed to mandatory minimum sentences even in the case of multiple offenders.

If one considers the actual application of mandatory penalties when, for example, a 21-year-old college junior who gives a freshman, 3 years younger, a marihuana cigarette and then is subject to a mandatory 10 years in jail, the scene becomes absurd in relation to the size of the problem as well as tragic for the individual person.

A conservative estimate, as I said before, of persons in the United States, both juvenile and adult, who have used marihuana at least once is about 8 million and may go as high as 12 million people.

Can you imagine what would happen to the law enforcement and corrections system of this country if each of these 12 million people had been caught by a policeman when smoking his first marihuana cigarette?

It is no wonder that law enforcement officials reportedly stay away from rock festivals and other gatherings where the marihuana smoke hangs heavy in the air and proof of possession is very easily come by.

It is time to change from prosecution to a public health approach in dealing with drug abuse and especially in cooling the marihuana problem, and I can only repeat what I said 18 months ago to this committee, Mr. Chairman. If we are to get to the root of this problem of drug abuse, we must be prepared to identify and investigate the underlying problems which lead people to distort or ward off reality with drugs.

Chairman Dodd. Doctor, not because you are in any conflict but rather because I think it will be helpful if the record is clarified to present your view, let me refer to this figure of 8 to 12 million people who have used marihuana at least once. I asked you about this a few minutes ago, but I would like to do so once more. You say the chronic users of marihuana go on to use other drugs either more harmful or more potent, such as hashish——

Dr. Yolles. Quite correct.

Chairman Dodd (continuing). Than these other drugs, pep pills and so on. These cause psychosis and extreme aggressiveness, and post-brain damage and hepatitis, as you said.

You say there are about 8 or 12 million users. Now, you say that 10 percent of the 8 to 12 million are chronic users?

Dr. Yolles. That is the top limit; yes, sir.

Chairman DODD. Between 800,000 and a million people approximately. Then you say 5 percent of the 800,000 or 1 million go on to use heroin. Well, this would give us somewhere between 40,000, 50,000, 60,000 people. I am sure you agree this is a grave problem.

Dr. YOLLES. Yes, sir.

Chairman DODD. And then it has to be treated very seriously as a grave national problem.

Dr. YOLLES. I agree. I agree wholeheartedly.

Chairman DODD. I am sure you do. I just wanted to be sure that our record made that clear that we were not saying that this was just a trivial amount.

Dr. YOLLES. No, sir.

Chairman DODD. That is helpful.

Dr. YOLLES. Until we are prepared to identify and investigate the underlying problems which lead people to distort or ward off reality with drugs, until this is done, nothing said here today will achieve much more than to begin to solve the problem on paper. And since the problem is far more than a "paper tiger" we are faced with the fact that Americans must make a conscious decision relating to their acceptance or rejection of the use of dangerous drugs.

Even if it is found that there are no dire physiological effects of marihuana smoking, the problem still remains and a decision still has to be made by our society.

To protect the few who are oversensitive to the drug, will society restrict the use of this substance by the many?

Or, in the light of scientific information, our society may choose to remove restrictions and allow the individual to decide.

In my professional judgment, Mr. Chairman, even though marihuana is certainly not the horror it was alleged to be in 1937, it is a drug having a capacity to alter mood, judgment, and functional ability. For these reasons, I believe that in the interests of public health, it is necessary—at least for the present—to maintain restrictions on the availability and use of this drug.

Chairman DODD. I think I should have waited a while until you finished the statement because you answered the question better than I could ask it.

Go ahead.

Dr. YOLLES. Although there are several pathways toward alternative conscious decisions, any valid decision, I am convinced, must involve the scientific fact of the degree of public danger which exists, and the specific range of risk involved in the use of each drug.

If one-half of 1 percent of the population is at risk, the decision could certainly be different from a situation in which from 10 to 20 percent of the population is at risk.

The most obvious pathways to decisions which must be made very soon, if the uproar over drug abuse is to achieve any significant and acceptable results, are through legal reform and through education.

In considering both of these, however, the time has certainly come to substitute a broad and realistic look at our American society for the tunnel vision on which our legal and moral attitudes to drug use have been founded until now.

We all know, for example, that marihuana smoking is more than a fad. It is linked with student contempt for the Establishment.

Marihuana smoking has become a symbol of rejection of things as they are, as well as a sometimes pleasurable experience in itself.

The chairman of the House Interstate and Foreign Commerce Committee, Mr. Staggers, in commenting on the need for new legislation, said:

> Unfortunately, ours seems to be, for many of our citizens, a drug-oriented, drug-taking society. Hourly, television and radio commercials assault our ears extolling the virtues of various drugs. . . . Perhaps this overall orientation contributes to drug abuse among the young.
>
> Perhaps the problem lies deeper. Our national rate of suicide, alcoholism, violent crime and divorce indicates that a substantial number, and perhaps the majority, of Americans find their social and human environment something less than satisfactory.
>
> Whether we call it anomie, alienation, or excessive concentration on material values, this dissatisfaction may lie closer to the surface in many than they would be willing (or perhaps psychologically able) to admit. If so, it seems unlikely that laws alone can accomplish what is needed, although increased research on a very fundamental level may point the way.

Dr. Dana Farnsworth, director of university health services at Harvard University and chairman of the American Medical Association Council on Mental Health, speaking at a meeting of the American Medical Association recently said:

> Until now, the official attitude has been "Stamp out drug use and you will get rid of the problem." But the use of drugs is not the central problem—it is only a symptom, an index of the confusions and uncertainties which affect increasing numbers of young people.
>
> Unenforceable laws and inappropriate penalties make a mockery of the whole principle of legal control and provide one more example of the adult world's misunderstanding of the problem.

And a 22-year-old former drug addict, it seems to me, expressed a rare depth of perception when he said that the problem—

> Is a problem neither of youth nor one of drugs, but a problem of a whole society and an entire life style shared by young and old alike.

Our life style, Mr. Chairman, in the 1970's is characterized by our inability or ability to use the products of our technical ingenuity to help bring about our happiness and well-being.

The current patterns of drug abuse are illustrative of our inability to make the results of our technological skills work for us as servants, rather than as masters.

As science continues to offer an ever widening choice of chemicals designed to modify emotions and behavior and to enable us to cope with our environment, ways are being found to use them detrimentally. Our ingenuity, to date, has outrun our wisdom; we have yet to find the restraint to limit ourselves to constructive uses of these products.

The first place in which legal reforms can be made is in the removal of mandatory minimum penalties in all cases of drug abuse.

If this were done, it is quite possible that this one, major step toward accommodating the law to the realities of drug use might also initiate a steppingstone toward a greater respect for the law generally, if those laws were just and relevant.

Such a legal reform would eliminate one of the major causes of defiance brought on by the violent rejection by youth of what they see as our society's hypocrisies. And certainly such a reform would cap-

ture the attention, and I am sure a large amount of cooperation, among the young people who smoke marihuana, as well as their parents, their teachers, and the courts.

If these millions of young people were convinced that efforts to reform the drug laws were sincere and based on scientific fact and evidence, I feel confident that they would be more receptive and less cynical about information about possible harmful effects of drugs.

There is no doubt that the scare techniques which have been used in the past have now been discredited. And the resultant disbelief in much of the information provided by any persons in authority on many subjects should teach us that the abuse of known information is worse than the lack of any information at all.

In our search for information about man's behavior, many of us at the National Institute of Mental Health are relating the problems of some types of drug abuse to a more general question. What is the best way of handling crimes without victims—those situations in which an individual at most, is harming himself?

Do these belong in the criminal code, or should they be handled in another way?

This is a philosophy, in considering man's conduct, that is worthy of serious research and discussion.

As an initial step toward fundamental changes which must be forthcoming in changing the rules of our way of life, the Members of Congress and others who share the authority to do so have an immediate opportunity to revise the procedures for punishment. Society can then begin to devise procedures for protection, acceptable not only to tradition but also to our restless, rebellious, but thoughtful young people who have had enough of rhetoric and empty promises.

Chairman Dodd. Well, thank you very much. I wish everyone could have heard your testimony. I certainly hope they will read it. You make much sense here, as you have on other occasions when you have appeared here. And you have certainly helped this committee tremendously by way of information and clear thinking about this very problem.

And once again, I will say to you what I have said to you before, that we are very grateful to you.

Dr. Yolles. Thank you, sir.

Chairman Dodd. One more question on this matter of the number of addicts and users and so on. I am most anxious to have the record clear on this subject. I think we agree there are some 65,000 reported addicts in the United States?

Dr. Yolles. Yes, sir.

Chairman Dodd. But you said a more plausible figure of narcotic abusers would range as high as 125,000. I think it would be helpful if you could tell us how you substantiate that figure.

Dr. Yolles. The more plausible figure is arrived at from some studies which we have done where the reporting comes in from not only law enforcement on figures, but also from health sources. For example, in New York City, we have had a study going on for some time which shows a much higher percentage or a much higher number of addicts there than are reported by the law enforcement. And using that same basis of estimation we applied that to the national figure.

This is obvious only an estimate, but we believe and we have for a long time, and I believe the Bureau of Narcotics and Dangerous Drugs believes with us on this point that the figure is much larger.

Chairman Dodd. I think there is no reason why they should not be made public and why everyone should not know what we are talking about when we use the terminology "more plausible figures."

Thank you very much, Doctor.

NARCOTICS LEGISLATION

WEDNESDAY, SEPTEMBER 24, 1969

U.S. SENATE,
SUBCOMMITTEE TO INVESTIGATE JUVENILE DELINQUENCY
OF THE COMMITTEE ON THE JUDICIARY,
Washington, D.C.

The subcommittee (composed of Senators Dodd, Hart, Bayh, Burdick, Tydings, Kennedy, Hruska, Fong, Thurmond, and Cook) met, pursuant to recess, at 9:10 a.m., in room 457, Old Senate Office Building, Hon. Thomas J. Dodd (chairman of the subcommittee) presiding.

Present: Senator Dodd.

Also present: Carl L. Perian, staff director; Eugene W. Gleason, editorial director; William C. Mooney, chief investigator; Peter Freivalds, research director; Elizabeth V. DePaulo, staff member; and Richard C. Sheridan, minority counsel.

Chairman DODD. I will call this hearing to order.

The first witness this morning is Senator Frank E. Moss, of Utah.

Senator Moss is the sponsor and author of S. 2590, a bill to establish a Presidential Commission on Marihuana, that is being considered by this committee.

Mr. Moss has for some time been interested in the problem of the widespread use of marihuana among our young people.

We want to welcome you this morning to our committee, Senator Moss. And we would be happy to hear you.

STATEMENT OF HON. FRANK E. MOSS, A U.S. SENATOR FROM THE STATE OF UTAH

Senator MOSS. Thank you, Mr. Chairman. I am pleased to be here this morning before this subcommittee. I am sorry that my own tight schedule has prevented me from appearing at these hearings at an earlier time. But I have been watching them each day—and I commend the chairman and the subcommittee for devoting as much time as you are to the very urgent problem of drug control. There is no doubt that the alarming increase in drug use—and drug abuse—especially by the Nation's young people is one of the most distressing problems facing the Nation today.

Because of the widespread use of marihuana among our young, I have for a long time been especially interested in determining just what are its effects. I first began asking questions in the U.S. Senate in the fall of 1967 as to how dangerous the use of marihuana is, and as to whether the penalties for its use are realistic. From time to time I have brought my questions up again, and I am delighted to be able

to bring them to the attention of a subcommittee devoted to finding some of the answers.

The questions raised by the use of marihuana are legion, and the authoritative answers nearly nonexistent.

I personally believe that there is only one way to assemble all of the answers we need—firm, incontrovertible answers which will be accepted by the majority of our citizens. And that is to establish a Presidential Commission to study the legal, social, economic and medical aspects of marihuana as proposed in my bill (S. 2590). The Commission would be required to submit to the President and the Congress the results of its study, making at that time specific recommendations for legislative proposals or administrative actions which should be taken. My bill allows 2 years for such a study, but I am willing to amend it to require that the study be made and the proposals be sent to Congress within 1 year, since I now believe that this is possible.

My attention was arrested last week by the testimony before this subcommittee by Dr. Stanley F. Yolles, Director of the National Institute of Mental Health, that marihuana is simply a "mild hallucinogen" that "should not be associated with narcotics either medically or legally;" and his recommendations that milder penalties for its use and possession are called for.

Dr. Yolles furthermore came out in opposition to the formation of any commission to study marihuana and make recommendations on it, on the basis that enough facts are already known, and further study is not necessary.

I have the greatest respect for Dr. Yolles as a physician, psychiatrist and scientist, and I recognize that he has been involved for 20 years in the development of research on narcotics and on the treatment and rehabilitation of the users of narcotics and other drugs. I have sought his opinion on a number of occasions during the period I have been concerned about the galloping increase in the use of marihuana in this country. But his word alone is not enough.

We still have such a thing as public opinion in this country, and even such an expert's testimony as his will not be enough to sway the public's thinking on this subject.

While Dr. Yolles may be fully convinced that smoking marihuana is practically harmless, many other people have not accepted that conclusion. There is even some disagreement among the experts as to the degree to which marihuana is dangerous—or harmless—or somewhere in between. About all that authorities agree upon is the individuality of the marihuana experience—that it has different effects on different individuals.

I suggest the best way to decide what we want to do about marihuana is to have an exhaustive and authoritative report on it, issued by an agency of the Federal Government, which will provide the same sort of "Bible" on marihuana as the 1964 Report of the Surgeon General on Smoking and Health did on cigarettes.

The report must be of the scope which could be prepared by a Presidential Commission because the marihuana problem is not only a medical and health problem, but a legal one, and we will need some guidelines for remodification and unification of our laws.

The American people will not be satisfied with less than an authoritative report of this type. On the one hand, there are many parents who are too deeply worried about their pot-smoking teenagers. On the other hand, there are too many young people who are convinced that pot is both harmless and fun. Neither will be satisfied with anything less than a commanding report on it. The public uproar demands it.

Here are some questions on which I hope the scientific community could reach a high degree of agreement.

Is the use of marihuana dangerous? To most people? To a minority?

Does it, like alcohol, pose primarily a problem of abuse?

Is it addictive, and should it be totally prohibited?

Or can it be used with some degree of safety in moderation?

Does its use, under certain conditions and dosages, lead to hallucinations?

Does its use lead to a faulty sense of time, or a loss of judgment?

Does it damage the brain?

Does the use of marihuana affect the user's ability to operate mechanical contrivances, such as an automobile?

Does it have an impact on artistic creativity?

Is there any medical justification for the widespread opinion that the use of marihuana may lead to the use of other drugs, such as heroin, or morhpine or cocaine, whose serious effects have already been established?

What are the long-term effects of the smoking of marihuana?

Could it induce lung cancer, as does the smoking of cigarettes made of tobacco?

Would its continued use cause chromosonal changes, as is the case in the use of LSD?

Mr. Chairman, we have been speculating about marihuana long enough. Let's have all of the facts, and in one authoritative package.

Because of the drug research program being carried on by the National Institute of Mental Health—a program which I have consistently supported, incidentally—and because more and more facts are emerging every week about marihuana, I am hopeful that we are reaching the point where we can be authoritative about it.

I was glad to note on Monday of last week, the New York Times agreed. In an editorial written in support of the bill introduced by Representative Koch of New York, which is the House counterpart of the Moss Senate bill, the Times called for the establishment of a presidential commission—saying it was "time the American people had the hard facts on a possibly soft drug."

I ask that the Times editorial of September 15, 1969, entitled "The Facts on Pot" be carried in the record of the hearings.

Chairman Dodd. That may be done.

(The document was marked "Exhibit No. 18" and is as follows:)

EXHIBIT 18

THE FACTS ON "POT"

THE NEW YORK TIMES, SEPTEMBER 15, 1969

"The question of whether 'taking pot' is a step toward self-destruction or merely an innocent diversion is being debated as though it could be decided by majority vote. Few young people concede any danger whatever in the practice,

many of their elders are genuinely alarmed, and medical men, predictably, are divided. The argument might be a harmless pastime were it not for two glaring circumstances: If marijuana is indeed harmful, then a staggering percentage of the rising generation is headed for disaster and drastic curbs are in order. If it is not, then hundreds of innocent users, police, school officials and parents, are being put through an ordeal as useless as it is psychologically damaging.

Given these alternative possibilities—both deplorable and both based on ignorance of the facts—Representative Koch of New York makes the sensible suggestion that something be done to diminish that ignorance. He proposes a Presidential commission, comparable to the Kerner and Warren commissions, to establish authoritatively how many Americans, and what kind, smoke marijuana; how effective the laws against it are; its psychological and physiological effects, taking the most exhaustive and reliable testimony; its relationship, if any, to crime; and, not least, its possible encouragement to the use of other drugs.

Other studies have, of course, been made. A committee appointed by Mayor La Guardia, in response to lurid charges about the prevalence of "reefers" in the schools, came up in 1944 with some reassuringly unsensational findings. A British Advisory Committee on Drug Dependence only a year ago found no evidence that marijuana-smoking led to violence or serious dependence. Beyond these studies and others like them a body of literature on "grass," "pot," "Acapulco gold," "weed" and "tea" goes back through the centuries.

Yet the fact remains that none of these studies, putting aside entirely the ancient and the legendary, is entirely applicable to the American situation today. The number of smokers, their degree of indulgence, and the potency of the drug—all these vary greatly from country to country and from time to time. There has been nothing in the United States comparable to the investigation proposed by Mr. Koch, either in scope or in the stature of the investigators. It is time the American people had the hard facts on a possibly soft drug."

Senator Moss. Thank you for the time, Mr. Chairman. I sincerely hope that the subcommittee will give serious consideration to my bill.

Chairman Dodd. Thank you, Senator Moss. We will give careful consideration to your testimony. I thank you for being here this morning.

Do you think that this proposal for a presidential commission should be made part of a bill recodifying and bringing up to date existing narcotics information, or would you really prefer to have a separate bill.

Senator Moss. I would envision that the appointed commission have on it not only medico-sociological experts but legal experts too, so that the recommendations that came out of it would establish what we would be doing as far as legal controls are concerned on marihuana. It seems to me we have come to such a juncture now, with so many of our young people adopting the attitude consistent with Dr. Yolle's testimony, that marihuana is just sort of a harmless bit of fun, that we have to focus the fact with authoritative findings. And I don't think that is going to happen until we get something of the caliber of a presidential commission to do it.

Chairman Dodd. Perhaps I didn't make myself clear. What I was really trying to get at is whether you wanted this as a separate bill, or would it make any difference to you if it was included in the overall narcotics law recodified, brought up to date with the existing law, harmonizing the several existing laws, or whether it ought to be a separate measure.

Senator Moss. I don't have a strong conviction, except that it seems to me that if it does remain separate, and if it focuses right on this commission, and especially if the subcommittee saw fit to shorten the time for reporting—which I have suggested could be 1 year rather

than 2 years—then with all that focus on it except apart from any other modifications in the Drug Control Act, perhaps we would get a really authoritative pronouncement that would have an arresting effect, as I made the comparison, like the Surgeon General's Report on Tobacco.

Chairman Dodd. Would you want the National Institute of Health represented on this?

Senator Moss. Very much so.

Chairman Dodd. Would it be expecting too much to ask you to outline who you think should be on it? I think it would be sufficient to suggest that we would probably want to cover the full spectrum of knowledgeable individuals who are well informed about this problem.

Senator Moss. The sociologists, and especially people concerned with the sociological problems of young folks, because that is where the principal unrest is now.

Chairman Dodd. One other question that I want to get your view on. Is it your view that the penalty structure for marihuana violations should remain the same as it is now under existing law until the commission or until the study is completed, or would you think it should be changed, pending the findings of the commission?

Senator Moss. I think that we would be anticipating the results of the findings a bit if we made the change now. Of course, I know there is a very considerable revolt against the penalties even now. But I think a year's time is not really too lengthy, and perhaps we should leave it as it is until we get the study made.

Chairman Dodd. I think you are right about that.

How do you feel about the penalty provisions in the administration bill, if you have had a chance to study it? The bill changes the penalty structure and eliminates mandatory sentencing. I wish you would look at it.

Of course, I think you are right, the penalty structure is a great problem, and it is pretty hard to reconcile a mandatory sentence for simple possession with other criminal penalties.

Senator Moss. I agree with you on that, Mr. Chairman. We have a tendency, I think, in a time when there is a bit of crisis, to think that we are going to solve the problem, perhaps, by just increasing the penalty. And there ought to be other ways that we could look at this rather than simply jacking up the penalty, and especially a mandatory sentence.

Chairman Dodd. Senator Moss, this has been very helpful testimony, and you can be sure that it will be given careful consideration.

Senator Moss. I thank you very much, Mr. Chairman.

Chairman Dodd (continuing). To give us the benefit of your views.

Mr. Eugene T. Rossides, Assistant Secretary for Enforcement and Operations, Department of the Treasury.

STATEMENT OF EUGENE T. ROSSIDES, ASSISTANT SECRETARY FOR ENFORCEMENT AND OPERATION, DEPARTMENT OF THE TREASURY; ACCOMPANIED BY LAWRENCE FLEISHMAN, G. GORDON LEDDY, AND LEE RITGER

Chairman Dodd. Mr. Rossides, glad to welcome you back again. We are anxious to hear your testimony.

I will say for the record that although it is already in the record, Mr. Rossides has had a distinguished public career. He served as assistant to the Under Secretary of the Treasury from 1958 to 1961. In his present capacity, his present responsibilities include supervision of the Bureau of Customs and Secret Service, Treasury Law Enforcement School, and Bureau of Engraving and Printing, Bureau of the Mint.

Mr. Rossides is now involved in Operation Intercept, the Government's massive campaign against narcotics and drug addiction. If for

no other reason, if you were only in Operation Intercept, we would be very anxious to hear from you.

Go right ahead.

Mr. ROSSIDES. Thank you very much, Mr. Chairman. It is a great pleasure to appear again before your committee.

Mr. Chairman and members of the committee, on behalf of the Treasry Department, I wish to thank you for the opportunity to appear here today to comment upon S. 2637, the administration bill concerning control of drug traffic, and further to discuss other matters of concern to this committee.

Much testimony has been presented describing the features and details of the various provisions of S. 2637, and therefore I shall confine my remarks to a general endorsement of this bill. Additionally, in response to inquiry made by the committee chairman, I shall present certain factual material which serves as an appropriate background supporting enactment of this legislation.

No genuine dispute exists concerning either the dangerous character of the magnitude of drug abuses in the United States. We all recognize the threat this problem poses to the health and welfare of millions of Americans. Enforcement and drug control problems have increased for this Government as illicit drug traffic has proliferated. This bill is designed to increase the effectiveness of control and enforcement generally. Representatives of the Department of Justice have testified concerning the effect of the various titles of this legislation, and I concur in general in the thrust of that testimony.

The principal interest of the Treasury Department in this legislation arises from the primary involvement of Treasury's Bureau of Customs in prevention and suppression of drug smuggling and its exclusive responsibility to enforce the smuggling laws. Section 701(b) of S. 2637 recognizes this.

The Bureau of Customs historically and currently plays a vital role in our overall drug control effort, because foreign-produced and smuggled drugs constitute over 90 percent of illicit U.S. drug traffic and consumption. Drugs are smuggled into the United States by aircraft, boat, car, and by pedestrians at points all along the thousands of miles of the U.S. borders. We estimate that between 15 to 20 percent of narcotics and over 85 percent of high-potency marihuana are smuggled across the United States-Mexican border, facts well known to this committee.

1. The committee has requested the most recent trends in the smuggling of narcotics, marihuana and dangerous drugs into the United States, as indicated by the Bureau of Customs arrest and seizure figures.

Drug seizures and arrests by the Bureau of Customs during the past 3 years reflect startling increases in drug smuggling. For example, Customs seized 78 pounds of heroin during fiscal year 1967, 246 pounds in 1968 and 311 pounds in 1969, and thus seizures quadrupled in a period of but 2 years.

The same trend is reflected regarding seizures of opium, marihuana, hashish, and the various other dangerous drugs. Exhibit A sets forth the details of the quantity of seizures of all drugs.

(The chart was marked "Exhibit No. 28" and is as follows:)

EXHIBIT NO. 28

COMPARATIVE SEIZURES STATISTICS

	Fiscal year 1967		Fiscal year 1968		Fiscal year 1969	
	Number of seizures	Amount	Number of seizures	Amount	Number of seizures	Amount
Heroin:						
Grams	225	$35,323.00	265	$111,741.00	240	$141,269.00
Pounds		77.87		246.00		311.43
Opium:						
Grams	16	4,436.00	21	6,539.00	42	15,347.00
Pounds		9.81		14.20		33.88
Other narcotics:						
Grams	291	18,304.00	259	[1] 44,325.00	253	90,213.00
Pounds		40.37		98.00		198.87
Marihuana:						
Grams	1,081	11,935,431.00	2,450	31,767,457.00	2,673	25,929,683.00
Pounds		26,312.00		70,034.00		57,164.00
Hashish:						
Grams		[2]		86,638.00	186	282,771.00
Pounds				191.00		623.39
Dangerous drugs (5 grain units)		[2]	525	3,936,800.00	630	4,763,361.00

[1] Mostly cocaine.
[2] No records maintained.

Mr. ROSSIDES. It must be noted that very little hashish was seized prior to 1966. In 1966 and 1967, however, approximately 70 pounds of hashish were seized, 191 pounds in 1968, and 623 pounds in fiscal year 1969.

The seriousness and significance of these figures can only be appreciated when it is realized that it takes 625 pounds of raw marihuana to make 1 pound of hashish. Thus, the fiscal 1969 seizure represented the active ingredients in 390,000 pounds of marihuana.

Stepped-up enforcement efforts and tremendous traffic increases both contribute to these impressively enlarged seizure statistics. The statistics show that a firm market for hashish has been established in the United States, and that there is a growing market for other drugs for illicit distribution and use. Arrests by the Bureau of Customs follow the same pattern. Drug smuggling arrests increased from 3,374 in fiscal year 1967 to 6,200 in fiscal year 1969.

2. The committee has further inquired as to the international sources of supply.

Heroin, the most noxious of all the drugs, is derived from the opium poppy plant. Nearly all of the legal cultivation of opium poppies is in Turkey. The raw materials for heroin, in the form of the gum opium and its product, morphine-base, are diverted directly from legitimate channels into illicit production and the smuggling supply line.

The raw material for heroin, morphine-base, is smuggled into the European countries where, in hidden laboratories, it is converted into the heroin and smuggled directly into the United States through various routes.

It should be noted that a significant amount of opium is illegally cultivated in Mexico, and heroin derived from it is smuggled into the United States.

Cocaine flows into the United States from mountainous regions along the West Coast of South America, where the coca plant grows wild and is also cultivated. The finished drug ordinarily is produced in

countries where the coca leaves grow, and then smuggled into the United States, principally through the port of Miami, Fla., and additionally through New Orleans and across the Mexican border.

Hashish traffic has increased markedly during the past 2 years. As I have mentioned, hashish is a marihuana or cannabis derivative.It is six to eight times more powerful than the most potent marihuana. Its popularity apparently results from its high potency and increased availabiilty. Our best informaton, Mr. Chairman, indicates that large quantities of hashish currently are smuggled by caravan through Israel by way of the Sinai Peninsula and Negev Desert. Several seizures of hashish traceable to the Middle East have been made along our Canadian border. Smaller quantities of hashish arrive from original sources in India, Pakistan, and Afghanistan.

Unlawful activities within Mexico figure heavily in the illicit traffic in narcotics, marihuana, and dangerous drugs. The greatest volume of illicit drugs smuggled into the United States crosses the United States-Mexican border. The predominant drug crossing that border is Mexican-grown marihuana that has been pressed into kilo-sized bricks and smuggled in by a variety of methods. As I have noted, some raw opium is produced in Mexico and smuggled in as either crude gum opium, smoking opium or heroin. Heroin of European origin is sometimes channeled through Mexico into the United States. A high percentage of the dangerous drugs for illicit use in United States markets is legally exported from the United States to Mexico, is diverted to unlawful channels and smuggled back.

The bulk of Customs drug seizures and arrests is at the Mexican border, and the Mexican border is clearly the predominant supply route for such traffic. Any program designed successfully to combat the drug traffic problem must provide a method for effective suppression of traffic at the Mexican border.

The current, massive antidrug smuggling campaign at the U.S.-Mexican border is called Operation Intercept. Operation Intercept is a joint effort by various departments of Government, involving principally Treasury and Justice and including the Bureau of Customs, the Immigration and Naturalization Service, the Bureau of Narcotics and Dangerous Drugs, the Federal Aviation Administration, the Coast Guard and the Navy. It stems from President Nixon's direction to curb the flow of drugs across the Mexican border. Early in his administration, President Nixon appointed a special Presidential task force relating to narcotics, marihuana and dangerous drugs. It has been my pleasure to be cochairman of that task force with Deputy Attorney General Richard G. Kleindienst.

The findings and recommendations of the task force were submitted to President Nixon. The President reconstituted the study task force into an action task force and directed that it translate its recommendations into action. Operation Intercept was a direct result. I have submitted to you for inclusion in the hearing record a copy of that task force report.

Chairman DODD. Well, we are glad to have it and it will be included in the record.

(The report referred to was marked "Exhibit No. 29" and is as follows:)

June 6, 1969

The President
The White House
Washington, D. C. 20500

Dear Mr. President:

We submit herewith a report dated June 6, 1969, entitled "Narcotics, Marihuana and Dangerous Drugs Task Force." As you can see, it is the result of the joint efforts over an extended period of time of many persons from not only the Treasury Department and the Justice Department, but also from the Departments of Defense, Health, Education and Welfare, Agriculture, Labor, Commerce and Transportation. The State Department was represented in an advisory capacity. A representative of the Interstate Commerce Commission also participated and a staff assistant to Mr. Ehrlichman was present as an observer at all meetings of the full Task Force.

This report is a direct result of your pledge to the American people on September 16, 1968, at Anaheim, California. At that time you stated that you intended to do several things. Among them was your intention to "move against the source of drugs" and to "accelerate the development of tools and weapons to detect narcotics in transit".

In the immediate future, the combined enforcement resources of the United States Government will be utilized in order to make a concerted frontal attack on the illegal importation into and the subsequent illegal sale and use of marihuana, narcotics and dangerous drugs in the United States.

We will keep you advised on a continuing basis of specific programs that will be initiated to implement the recommendations of the report. We will also advise you of the results of such programs.

In this regard, you should also be advised that representatives of our respective departments will be meeting in Mexico City on June 9th, 10th and 11th, with officials of the Government of Mexico to consider all aspects of the illegal traffic between our two countries in narcotics, marihuana, stimulants and hallucinogenic drugs.

The Department of State, which will assume the major burden of obtaining Mexican cooperation on a continuing basis, will participate in these meetings and will coordinate our follow-through efforts with the Mexican authorities. Under Secretary Richardson has assured us of that Department's whole-hearted support for the report.

Because the report concerns itself not only with recommendations as to enforcement matters but also with the dangers and effects which result from the use of marihuana in particular, representatives from the Department of Health, Education and Welfare made valuable contributions to the efforts of the Task Force. We have been authorized by Secretary Finch to inform you that he fully concurs in the report, its conclusions, and recommendations.

Respectfully,

/s/David M. Kennedy
Secretary of the Treasury

/s/John N. Mitchell
Attorney General

INTRODUCTION

One of the most serious problems facing the United States today is the marked increase in the use of narcotics, marihuana and other hallucenogenic or "mind-changing" drugs. This problem is especially prevalent among the youth of our nation, who have experimented with these drugs.

Most of the marihuana in the United States today comes from Mexico and is smuggled across the border by various means. Mexico has become by far our largest supplier of marihuana and it is also the source of a substantial amount of other drugs. As the primary sources of supply, free-lance smugglers and organized traffickers are largely responsible for the marihuana and drug abuse problem.

In an effort to find a solution to this problem, the Attorney General requested the formation of an inter-departmental Task Force to conduct a comprehensive study of marihuana with specific emphasis on the Mexican border problem. The objective of the Task Force has been to formulate a plan for positive and effective action to control the illicit trafficking of drugs across the Mexican border. The Task Force has also reviewed the best scientific information now available on the health dangers inherent in the use of marihuana and has endeavored to communicate unequivocally in this report the facts concerning the social implications of marihuana use.

It was considered advisable to involve in this study all Government agencies dealing with one or more phases of the problem.

The following individuals represented their departments and agencies on the Task Force and actively participated in its deliberations:

Co-Chairman	Mr. Richard G. Kleindienst Deputy Attorney General Department of Justice
Co-Chairman	Mr. Eugene T. Rossides Assistant Secretary Department of the Treasury

Executive Secretary:	Mr. R. Richards Rolapp Special Assistant to the Deputy Attorney General Department of Justice
Member:	Mr. John J. Caulfield Staff Assistant to Counsel The White House
Member:	Mr. Paul Eggers General Counsel Department of the Treasury
Member:	Mr. G. Gordon Liddy Special Assistant to the Secretary Department of the Treasury
Member:	Mr. Lester D. Johnson Commissioner - Bureau of Customs Department of the Treasury
Member:	Mr. John E. Ingersoll Director, Bureau of Narcotics & Dangerous Drugs Department of Justice
Member:	Mr. George H. Revercomb Associate Deputy Attorney General Department of Justice
Member:	Mr. Cartha D. DeLoach Assistant to the Director Federal Bureau of Investigation Department of Justice
Member:	Mr. Raymond F. Farrell Commissioner, Immigration & Naturalization Service Department of Justice
Member:	Mr. William E. Ryan Chief, Narcotics & Dangerous Drugs Section Criminal Division Department of Justice

61-801 O - 77 - 56

Member:	Mr. Henry E. Petersen Acting Deputy Assistant Attorney General Criminal Division Department of Justice
Member:	Mr. Robert E. Jordan, III Chief Counsel Department of the Army
Member:	Mr. Frank A. Bartimo Assistant General Counsel Manpower and Reserve Affairs Department of Defense
Member:	Dr. Theodore C. Byerly Assistant Director, Science & Education Department of Agriculture
Member:	Mr. Rocco C. Siciliano Under Secretary Department of Commerce
Member:	Mr. John Gentry Executive Assistant to the Under Secretary Department of Labor
Member:	Dr. Mark Novitch Special Assistant for Pharmaceutical Affairs Office of the Secretary Department of Health, Education and Welfare
Member:	Dr. Stanley F. Yolles Director, National Institute of Mental Health Department of Health, Education and Welfare
Member:	Mr. James M. Yohe Deputy Director of Compliance and Security Federal Aviation Agency Department of Transportation

Member: Commander Frederick J. Lessing
U. S. Coast Guard
Department of Transportation

Member: Mr. Fritz Kahn
Deputy General Counsel
Interstate Commerce Commission

The Task Force convened its initital meeting on March 26, 1969. In that first meeting the general scope of the proposed study was discussed, objectives formulated and Subcommittees formed for more specific and detailed research on the various aspects of the overall study. The Subcommittees were:

Health Subcommittee -- Dr. Stanley F. Yolles, Director of the National Institute of Mental Health, Chairman.

Resources Subcommittee -- Mr. Cartha D. DeLoach, Assistant to the Director of the Federal Bureau of Investigation, Chairman.

Enforcement Subcommittee -- Mr. John E. Ingersoll, Director of the Bureau of Narcotics and Dangerous Drugs, Chairman.

Each Subcommittee was given direction on the scope and nature of its study and assigned certain questions by the Task Force. The Task Force requested the Health Subcommittee to prepare a comprehensive report on the medical implications of marihuana use. The Task Force was particularly interested in learning by whom and to what extent marihuana is used and the health dangers involved, if any. This Subcommittee was also requested to report on present efforts to educate the public about drug abuse and to recommend particular areas where educational efforts can be increased and concentrated.

The Resources Subcommittee was asked to survey and report on the manpower and facilities available to aid in the control of trafficking in marihuana. This Subcommittee undertook an analysis and comparison of the resource needs of existing law enforcement agencies to enable such agencies to participate effectively in a long-range program for marihuana control.

The Enforcement Subcommittee developed a recommended plan of action, for immediate and long-term implementation, designed to have a significant impact on unlawful marihuana trafficking across the Mexican border. Its study included an examination of existing programs of law enforcement agencies with a view to the improvement of coordination and efficiency. The Enforcement Subcommittee defined the various aspects of the enforcement problem, reached certain conclusions and made appropriate recommendations for implementation.

These Subcommittees devoted considerable time to careful study of the assigned subject matter. As an example of the effort expended, the Enforcement Subcommittee devoted over 25 hours for discussion meetings within a three-week period of time.

The Task Force considered the Subcommittee reports during its second meeting on April 28, 1969. The reports were discussed in detail and Task Force members made suggestions for changes and additions. The final report in draft was submitted to each member of the Task Force for discussion and approval at a concluding meeting on May 19, 1969.

This final comprehensive report is a product of the extensive research and study by the Task Force of an extremely complex problem.

I. THE DANGERS OF MARIHUANA

WHAT IS MARIHUANA?

Marihuana (pot, grass, weed, etc.) is a product of the Indian hemp plant known to botanists as cannabis sativa (L.). It is derived from the leaves and flowering tops of the female plant which are the source of the psychoactive material. Under federal law, marihuana is defined to mean all parts of the cannabis plant except for the stalks and sterilized seeds.

Marihuana contains a number of potent compounds called tetrahydrocannabinols (THC) which affect the mind and body in various ways. Potency of the drug varies greatly depending on growing conditions such as temperature, humidity, soil conditions, and methods of cultivation. Generally, plants grown in sunny, dry climates are most likely to contain the highest proportion of THC. The pharmacologic potency of any preparation of marihuana depends upon the amount of THC which it contains.

The drug is most commonly smoked in hand-made cigarettes (reefers, sticks or joints.) The butt is called a "roach." Marihuana is also smoked in ordinary pipes or water pipes. The effects of the drug are decreased three or four times if it is swallowed rather than smoked.

Various forms of marihuana are prepared from extracts of the plant. Hashish (hash, charas) is the purest and most concentrated of the natural cannabis products. It consists of the concentrated resin of the plant and is usually eight times as concentrated as the typical marihuana available in North America. Once rare in the United States, hashish is reported to be increasingly obtainable in response to a rising demand. Relating foreign studies of cannabis use to the American scene is difficult because of the generally higher potency of the cannabis products used abroad. Marihuana grown in this country is typically of lower potency and is often weakened further by additives such as oregano. However, Mexican grown marihuana has a high potency and is regularly sold in the United States. It should be noted that all marihuana products lose strength over time.

While marihuana contains many ingredients, THC is believed to be the principle psychoactive substance. With the synthesis of THC in 1966, 1/ and the demonstration of its psychopharmacological effects in 1967, 2/ a basis was finally established for more precise, systematic pharmacological investigation of the drug. At present, THC is being synthesized in research quantities. Along with other natural marihuana constituents, THC is being made available under appropriate precautions to qualified researchers through the National Institute of Mental Health's Center for Studies of Narcotics and Drug Abuse.

Since marihuana products produce effects similar to other hallucinogens like LSD, and their reactions are often indistinguishable from those produced by other psychedelics, they are pharmacologically classified in that category.

PRESENT EVIDENCE OF EXTENT OF USE

Marihuana use has been rapidly increasing in the past five years. Although originally restricted to certain jazz musicians, artists and ghetto dwellers, it has now appeared amoung the middle and upper class. A conservative estimate of persons, both juvenile and adult, who have used marihuana at least once is about five million.

One of the most alarming aspects of the current drug crisis is the involvement of young people. In California alone juvenile arrests for drug offenses increased from 1,271 in 1961 to 14,112 in 1967. Of the 14,112 juvenile arrests in California during 1967, 10,987 were arrested for marihuana violations. To understand the full significance of this figure it must be compared with the year 1961 in which there were 401 arrests. In 1967 alone there were over 2,000 more arrests for marihuana violations than in the previous six years combined.

Two years ago, surveys in parts of the country where marihuana use is known to be high suggested that twenty percent of the college students in those areas had experience with marihuana. Present evidence, although spotty, suggests that as many as sixty percent of the students on some campuses have used it. Some students feel that official estimates are low, and that the true extent of drug abuse

1/ Mechoulam, R. et al. A total synthesis of a 1-Δ^1 tetrahydrocannabinol, the active constituent of hashish. Journal of the American Chemical Society 1965, pp. 3273-3275.

2/ Isbell, H. et al., Effects of Δ^9 Tetrahydrocannabinol in Man, Psychopharmacologia, 1967, pp. 184-188.

among college students is even higher. There are also many reports of increasing use of marihuana in high schools although there is not sufficient data to establish a countrywide pattern. Significantly, most recent college data indicated that many college users were first exposed to marihuana in high school. However, the bulk of users are more aptly characterized as "triers" rather than habitual "potheads." Two out of three who have tried the drug have used it not more than one to ten times. In the most recent (Fall, 1968) survey based on a geographic area of high use, about one person in ten reported using marihuana regularly for as much as a year's duration. Finally, there is growing evidence that the number of pre-teenagers who are using marihuana is increasing.3/

EFFECTS

The use of marihuana produces a variety of mental and physical effects. If active marihuana is smoked effectively (inhaled and kept in the lungs as long as possible) symptoms may appear after one or two puffs and the effect may last from several minutes to several hours.

Dr. Stanley F. Yolles, Director, National Institute of Mental Health, has stated:

> "Little can be added to previous reports on the toxicity of marihuana. It is considered to be a mild hallucinogen, taken by the usual route of smoking, occasionally by ingestion. It may induce a mild euphoria and lead to heightened suggestibility and faulty perception, really an exaggerated notion of thinking more clearly, profoundly and creatively. In addition, it is known to cause reddening of the membranes of the eyes, rapid heartbeat, muscular incoordination, unsteadiness, drowsiness, and distortion of time and space perception.
>
> "In acute intoxication, especially when ingested, it may also produce visual hallucinations, pronounced anxiety, paranoid reactions, and transient psychoses lasting four to six hours. It generally tends to lessen inhibitions and creates for the user a false reality based on his wants, his motivations, or the situation. In this respect it is similar to LSD, but its effects are not as potent.

3/ Blum, R. H. et al., Students and Drugs, Vol. II, 1969, pp. 31-47.

"The muscular incoordination and the distortion of space and time perception commonly associated with marihuana use are potentially hazardous, since the drug adversely affects one's ability to drive an automobile or perform other skilled tasks.

"We still do not know enough about the long-term effects of marihuana use. As in the case of tobacco, it is possible that there are serious consequences of chronic use which will only become apparent through careful, longtime studies." 4/

A 1965 report on drug dependence for the World Health Organization describes the nature of marihuana intoxication in the following terms:

"Among the more prominent subjective effects ... are: hilarity ... carelessness; loquacious euphoria ... distortion of sensation and perception ... impairment of judgment and memory; distortion of emotional responsiveness; irritability; and confusion. Other effects, which appear after repeated administration ... include: lowering of the sensory threshold, especially for optical and acoustical stimuli ... and aggressiveness as a possible result of various intellectual and sensory derangements; and sleep disturbances." 5/

In small, low potency quantities marihuana may act as a mild euphoriant and sedative somewhat similar to alcohol. In relatively high doses pyschotic-like phenomena, quite similar to those associated with LSD use, have been reported. Recurrences of the marihuana state (flashbacks) without actually taking the drug again have been reported. These recurrences can be anxiety provoking. Unlike the stronger hallucinogens, such as LSD, which produce wakefulness, marihuana tends to be more sedative in its properties. THC in sufficiently high doses can induce psychotic reactions in almost any individual.

Despite marihuana's long history -- spanning thousands of years and many cultures -- there has been comparatively little sound research on this drug. Only four laboratory studies investigating marihuana's immediate effects on humans have been reported in the American scientific

4/ Hearings before the Subcommittee to Investigate Juvenile Delinquency of the Senate Committee on the Judiciary, Mar. 4-6, p. 4658, 1968.

5/ Eddy, N. B. et al. Drug Dependence: Its Significance and Characteristics. Bull. World Health Organization. 32:721, 1965.

literature. The first of these was done with a group of 34 soldiers in the Canal Zone. A second study, reported in the 1944 LaGuardia Report, is based on 72 prisoners' responses to marihuana extract. In 1946, a small number of chronic using prisoners were studied. A more carefully controlled study recently produced a report on some laboratory work with marihuana in humans done partially with NIMH support.6/

All of these studies generally found loss of inhibitions, and feelings of relaxation and self-confidence together with some mild impairment of thinking and coordinated performance. It has also been demonstrated that THC, when administered in sufficiently high dosage, will cause a psychotic-like state, similar to that induced by LSD.

While no long-term physical effects of marihuana use have been adequately demonstrated in this country, the American experience has been extremely brief and additional studies are needed to resolve this and other issues. Although there is no firm evidence that marihuana use in humans has either teratogenic or genetic implications, this possibility should be explored -- particularly in view of some evidence on this point with respect to LSD. It is possible that there are serious consequences of chronic use which will only become apparent after careful, long-term studies. In foreign countries where heavy use of the stronger cannabis preparations is common, a variety of physical ailments supposedly related to marihuana use have been reported -- notable conjunctivitis, chronic bronchitis and certain digestive ailments.

There have also been reports of adverse psychological effects of marihuana both in this country and abroad. Recently a group of some 1500 psychiatrists, psychiatric residents, internists, general practitioners and psychologists in the Los Angeles area reported that they had seen almost nineteen hundred "adverse reactions" to marihuana. 7/ It is difficult to interpret this finding since "adverse reaction" was poorly defined, and there has been no follow-up to define just what the reactions to the drug were. However, there have been reports of increased number of hospitalizations following the usage of marihuana.

6/ Weil, A. T. et al., A Controlled Study of Cannabis in Humans, Science, pp. 1234-1242, 1968.

7/ Ungerleider, J. T. et al., A Statistical Survey of Adverse Reactions to LSD in Los Angeles County, American Journal of Psychiatry, Sept., 1968, p. 355.

Considerable concern has been expressed in the United States over the possibility of personality changes and a loss of motivation among youthful marihuana users. The potential effects of a reality distorting agent on the future psychological development and maturation of the adolescent user are of special concern. Normal adolescence is a time of considerable psychological turmoil. Patterns of coping with reality developed in the teen years help determine later adult behavior. Persistent use of an agent which serves to ward off reality during this critical period of development is likely to effect adversely the future ability of the individual to cope with the demands of a complex society. While systematic studies of large numbers of American chronic users are not yet available, a number of clinicians have observed that at least some users show evidence of a loss of convential motivation. They seem to prefer instead a non-goal oriented life style, which emphasizes immediate satisfactions to the exclusion of ambition and future planning. The "pothead", then, may well retard his own chances for emotional growth by not learning how to deal with life stress. Characteristic personality changes among impressionable young persons from the regular use of marihuana include apathy, loss of effectiveness, and diminished capacity or willingness to carry out complex long-term plans, endure frustration, concentrate for long periods, follow routines, or successfully master new material. It has also been observed that verbal facility is often impaired, both in speaking and writing.

The British cannabis report by the Advisory Committee on Drug Dependence (1968) concluded:

> There have been reports, particularly from experienced observers in the Middle and Far East, which suggest that very heavy long-term (italics, theirs) consumption may produce a syndrome of increasing mental and physical deterioration to the point where the subject is tremulous, ailing and socially incompetent. This syndrome may be punctuated on occasions with outbursts of violent behavior. It is fair to say, however, that no reliable observations of such a syndrome have been made in the Western World, and that from the Eastern reports available to us, it is not possible to form a judgment on whether such behavior is directly attributable to cannabis-taking. 8/

8/ Cannabis, Report by the Advisory Committee on Drug Dependence, 1968, pp. 14-34.

PROGRESSION TO OTHER DRUGS

A basic question that frequently arises is the extent to which marihuana use in some sense predisposes users to escalate to stronger and more dangerous drugs. There is little question that most heroin and LSD users have had experience with marihuana. Indeed, 85 to 90 percent of heroin addicts reported that they started their use of drugs with marihuana. There is also a question whether any but a small percentage of marihuana users progress to other drugs, the evidence tending to show that only five percent of the habitual marihuana users progress to heroin addiction.

In discussing the question of progression, it is vital to distinguish between the casual experimenter with marihuana, and the regular and continuous user, and between physical addiction and psychological dependency.

A casual experimenter by definition is not dependent upon the drug. A regular and continuous user, on the other hand, may very well be dependent upon it.

Once he has become psychologically dependent upon one drug as a "crutch" to cope with life stress, the user is substantially more susceptible to the acquisition of a larger crutch through the medium of a stronger drug.

An example of the importance of this distinction is the heroin addict. The most desperately "hooked" of junkies with a "habit" costing hundreds of dollars per day can be "detoxified" in under 8 days, and brought to a point where absence of the drug will produce no physical reaction or withdrawal symptoms. Yet, let that individual be imprisoned for 5 years without access to the drug, and without effective psychiatric treatment, upon release he will seek a pusher. He will do so because he is still psychologically dependent upon heroin. Recognition of the fact is basic to the New York State rehabilitation program which spends years, rather than weeks, treating addicts. Their physical craving is terminated in days -- their psychological dependency is the subject of years of treatment.

In view of the foregoing, it must be concluded that regular and continuous use of cannabis can and does produce psychological dependency and marked susceptibility to progression to stronger reality concealing drugs.

The progression is, however, probably not a consequence of the pharmacological properties of marihuana, but rather is due to sociological and psychological factors present in a vulnerable minority of users. For example, in ghetto situations where both drugs are freely available, sometimes from the same supplier, a progression based on availability may be likely. Similarly, heavy drug using subcultures may encourage widespread experimentation with a wide variety of drugs. It is generally true that a heavy marihuana user is more likely to be a multiple drug user. In one study, half of the heavy users of marihuana had tried LSD. One in seven had used LSD more than 25 times or had tried heroin. Two out of five heavy users in this same study had abused amphetamines. This trend to multiple drug experimentation may increase in the future. In this connection it is important to point out that use of a combination of dangerous drugs may have a synergistic effect and may result in the death of the user.

There is reason to believe that heavy marihuana users are likely to have considerable interest in the use of the stronger forms of cannabis such as hashish. If hashish is available, many would probably use it in preference to low-potency marihuana. The history of mind-altering drugs invariably reveals that excessive indulgence increases sharply as more potent preparations of a given drug become available. 9/

MARIHUANA VS. ALCOHOL

Some marihuana users have tried to justify their behavior by claiming that it is no worse than consuming alcohol. It is estimated that the consumption of alcohol is a major problem for some five to six million Americans who are unable to control their drinking. In most cases, excessive drinking of alcoholic beverages causes serious physical, psychological, social and vocational problems for these people and their families. It is well known that one-half of the fatal traffic accidents in the United States are related to excessive drinking. 10/

While alcoholism constitutes a major social problem, surely it is not valid to justify the adoption of a new abuse on the basis that it is no worse than a presently existing one. The result could only be added social damage

9/ McGlothlen, W. et al., American Journal of Psychiatry, Sept., 1968, p. 373.

10/ 1968 Alcohol and Highway Safety Report, U. S. Government Printing Office, 1968, pp. 11-21.

from a new source. It would not solve our alcohol problem and would only lead to additional numbers of marihuana intoxicated individuals. Moreover, marihuana, unlike alcohol, is nearly always consumed by its users for the express purpose of obtaining a "high", a disorientating intoxication.

Allegations have been made and attributed to government officials that marihuana is no more dangerous than alcohol. When these stories appear in the mass media they often do considerable harm, even when subsequently retracted. Dr. James Goddard, former Commissioner of the Food and Drug Administration, was extensively quoted as saying that marihuana is no more dangerous than alcohol. Dr. Goddard was, in fact, misquoted and never made such a statement. Although the wire service issued a written apology, the retraction has never caught up with the misquote.

THE POSITION OF THE AMA AND WHO

The American Medical Association has stated that marihuana is a dangerous drug and, as such, is a public health problem. 11/ They reiterate that while no physical dependence develops this does not mean that it is an innocuous drug. Further research is considered essential, and educational programs should be directed to all segments of the population.

The World Health Organization recently reaffirmed its previous opinions that cannabis is a drug of dependence, produces public health and social problems, and that its control must be continued. 12/ More basic data are needed on acute and chronic effects on the individual and society to permit accurate assessment of the degree of hazard to public health.

MARIHUANA USE AND CRIME

Aside from the fact that marihuana use and possession is in itself a crime, it has not been proven that its use is a direct cause of other types of criminal behavior. Generally, assertions that marihuana plays a casual role in the commission of crime are based on reports from other than scientific agencies. The validity of these impressions is, however, questionable because of the unscientific basis

11/ Marihuana and Society, Journal of the American Medical Association, June 24, 1968, pp. 1181-1182.

12/ World Health Expert Committee on Drug Dependence, WHO Technical Report Series 407, 1969, p. 19.

on which such data has been collected. The New York Mayor's Committee (1944) reported that many criminals might use marihuana, but the Committee did not feel marihuana played a causal role in crime. In the United Kingdom, the use of cannabis has not been generally regarded as a direct cause of crime.

The President's Commission on Law Enforcement and Administration of Justice has observed:

> One likely hypothesis is that, given the accepted tendency of marihuana to release inhibitions, the effect of the drug will depend on the individual and the circumstances. It might, but certainly will not necessarily or inevitably lead to aggressive behavior or crime. The response will depend more on the individual than the drugs. 13/

While perhaps it cannot be statistically proven that marihuana or other dangerous drugs may be the cause of originating crime, nevertheless the use of marihuana or dangerous drugs is related to increased criminal activity.

According to the President's Crime Commission Task Force Report on Narcotics and Dangerous Drugs, page 11, the FBI submitted criminal histories on 7,920 narcotics offenders. These criminal histories, when examined as to marihuana users and heroin users, indicated that the criminal careers of narcotics users, both marihuana and heroin, were longer, and resulted in more frequent arrest activities than the average non-narcotic criminal offender. For the marihuana offender this comparison demonstrated that during the course of his criminal career he was proportionately more frequently involved in violent crimes than the normal non-narcotic criminal offender.

CONCLUSION

There is no question that the widespread use of marihuana represents a significant mental health problem.

There is no known beneficial result from the use of marihuana; there are, on the other hand, definite detrimental effects.

13/ Task Force Report: Narcotics and Drug Abuse. President's Commission on Law Enforcement and Administration of Justice, 1967, p. 13.

More research is needed to further our understanding of the effects of marihuana use. However, it is clear that, depending on the dose, the active ingredient found in marihuana may have substantial detrimental effects on both the mental and physical well-being of the user. In this connection it is important to point out that use of a combination of dangerous drugs may have a synergistic effect and may result in the death of the user.

Medical evidence neither proves nor disproves that marihuana is a cause of crime. Criminal records do establish clearly an accelerating rate of association between crime and the use of marihuana.

The Task Force recommends:

Continued and expanded research to further our understanding of the causes and effects of marihuana use.

Prevention by wide distribution, among other means, of scientifically accurate information and materials about the dangers of drug abuse.

Provision of resources to treat and rehabilitate marihuana users in need of mental health care.

II. THE MEXICAN BORDER PROBLEM

Among the nations of the Western Hemisphere, Mexico occupies a unique position insofar as traffic in narcotics, marihuana and dangerous drugs is concerned. Large quantities of narcotics, marihuana and dangerous drugs are smuggled into the United States across the Mexican border. Based on our study of the problem, the Task Force enters these findings:

1. Mexico is the primary source of nearly all of the high potency marihuana seized in the United States. Seizures of marihuana at the Mexican border have increased tremendously in the past five years. For example, in 1966 there were 10,416 pounds of marihuana seized at the Mexican border: whereas, in 1968 almost seven times this much, or 70,210 pounds were seized.

Most of the marihuana sold and consumed in the United States is grown in Mexico. Mexican marihuana is highly preferred by users and is of more potent content than the U. S. variety. It enters this country at scores of border crossing points and is quickly delivered to the more populous cities where demand is greatest. In recent years, the California border has been a particularly active smuggling point for extremely large shipments of marihuana. San Diego and Los Angeles, California, are the major distribution points for the rest of the country.

Control of marihuana traffic is in the hands of small groups that generally operate independently. Some marihuana is smuggled by individuals for self-consumption or small-scale sales.

2. A significant percentage of the heroin consumed by addicts in the United States is produced surreptitiously in Mexico. Mexican heroin is produced from opium grown in small opium fields hidden in normally inaccessible valleys in remote areas of the Mexican interior. The distribution of the Mexican heroin is accomplished by scores of peddlers handling small shipments with great frequency.

Most of this heroin is distributed in states bordering Mexico. Once in the United States, most of the Mexican heroin is moved quickly from border cities to population centers such as San Diego, Los Angeles, Denver, Phoenix, Albuquerque, Houston, Fort Worth, and Dallas. Some of the heroin produced in Mexico has appeared in St. Louis, Chicago, Detroit, and other northern cities. The addict population in the border area is relatively low. However, many addicts living in border cities journey daily to nearby Mexican towns to obtain heroin and some risk smuggling small quantities into the United States for future use or for friends and associates.

3. Significant quantities of European heroin, produced principally in France, are smuggled from time to time into the United States via Mexico. Most of the heroin in the United States (approximately 80%) is produced in France from Turkish opium. Some of this European heroin is smuggled into the United States through Mexico. The largest individual heroin shipments seized at the Mexican border were of French origin and were under the control of individuals associated with "organized crime" in New York. The French heroin which passes through Mexico is usually destined for New York City and from this point is distributed to the large metropolitan areas on the Eastern Seaboard and the Middle West.

4. Mexico occasionally serves as an intransit point for cocaine destined for the United States from the source countries in South America, principally Bolivia and Peru. No fixed pattern has been detected with regard to cocaine smuggling from Mexico, although there is indication the California border is involved to a greater degree than other areas.

5. Considerable quantities of dangerous drugs in the amphetamine and barbiturate category are smuggled into the United States across the Mexican border. This traffic occurs in various ways. These drugs may have been produced legally or illegally in Mexico and smuggled into the United States, or may have been legally produced in the United States for export to Mexico and then smuggled back into the United States or diverted at border cities prior to actual exportation.

SMUGGLING METHODS

Smuggling methods are varied. In the case of French heroin, it is sometimes hidden in specially constructed traps

61-801 O - 77 - 57

in automobiles shipped to Mexico from Europe. In other cases, it may be sent from Europe to Mexico City concealed on aircraft, or by couriers carrying luggage with false compartments. It is then passed northward to the United States.

Mexican heroin is usually carried in relatively small quantities across the border on the persons of individual smugglers or in large quantities hidden in traps or panels of small trucks or automobiles. This same pattern is followed in shipments of Mexican marihuana and other dangerous drugs.

There is increasing use of general aviation aircraft and small boats in the smuggling of heroin and marihuana.

THE MEXICAN PROGRAM TO CONTROL ILLICIT TRAFFIC

The Mexican Government has participated in three bilateral meetings with the U. S. Government concerning the problems of illicit traffic in narcotics and other dangerous drugs. A fourth such meeting is scheduled for June 9, 10 and 11, 1969.

The atmosphere at these meetings has been friendly and cooperative. Mexican efforts to eliminate illicit opium and marihuana cultivation have been encouraged through these meetings. In the past, the United States has provided the Mexicans with aircraft for use in locating marihuana and opium fields and for transporting agents to destroy these fields.

Despite this country's encouragement, and the efforts of Mexican authorities to aid in the effective control of illegal trafficking in marihuana and dangerous drugs, Mexican resources and efforts continue to be inadequate in the face of the increasing magnitude of the problem. The control of illicit drugs in Mexico is based on federal statutes which are enforced by the Federal Judicial Police under the Attorney General. Their individual states, unlike our own, do not have narcotic and drug laws. At the present time the Federal Judicial Police, headquartered in Mexico City, is staffed by 264 agents, only a fraction of whom are assigned to drug enforcement activities.

The Task Force was formed to study the acute problem of marihuana drug traffic from Mexico and to develop a plan to bring this situation under control. It is clear that the

problem is becoming more serious and of greater magnitude. Smuggling activity at the Mexican border is increasing at an alarming rate.

The problem of illicit trafficking across the Mexican border is bilateral in nature. Neither country can solve it alone. There is need for a concerted, continual and coordinated effort on the part of both countries and at all levels of Government to become more deeply involved in controlling the flow of illicit drugs across the border.

It is reasonable to conclude that the ready availability of marihuana and other drugs from Mexico has significantly affected the increase in drug abuse in this country. It is also certain that more can be done toward solving the entire spectrum of drug abuse problems in the United States by attacking this problem at its source.

For the above reasons, the Task Force is prepared to recommend a plan for immediate action to substantially reduce on a short time basis the illicit trafficking in marihuana and dangerous drugs across the Mexican border.

In addition, the Task Force has considered in depth various methods to be used in the suppression of Mexican drug traffic on a more long-term basis. The problem has been divided, for study, into three main phases: (1) the prevention and control of drug smuggling at the Mexican border; (2) the location and destruction by the Mexican Government of drugs at their source in Mexico and the apprehension of the traffickers involved by the Mexican Government; and (3) the detection and swift prosecution of drug violators in the United States and Mexico. Accordingly, the findings and recommendations of this Committee will be based on analysis of each of these areas. It is anticipated that many of the recommendations of the Task Force may be put into effect, with Mexican Government cooperation, in the future in order to deter the flow of illicit drugs.

III. PREVENTION AND CONTROL OF DRUG SMUGGLING AT THE MEXICAN BORDER

BORDER CROSSING RESTRICTIONS

The suppression of drug smuggling along the border is directly related to the physical and regulatory control of individuals and conveyances. The huge volume of vehicle and pedestrian traffic crossing at border points creates serious enforcement problems for Customs officials. The limited manpower available and the enormous volume of traffic make it impossible to inspect adequately each vehicle to determine if it is transporting contraband. Inspectors detain and carefully search only those cars or individuals whose likelihood of possessing contraband merits secondary inspection. Since it is impossible under this method to detect all persons who may have contraband items, many smugglers successfully traverse the border. Any information that could lead to some common denominator as to the kind of person who smuggles contraband articles, should be analyzed. This would aid border inspectors in their discretionary authority to search persons and vehicles.

The Task Force recommends:

> Case histories of past and future smuggling operations should be analyzed to determine identifiable characteristic patterns of smugglers to facilitate primary inspection at the border.

One way to decrease the flow of vehicular traffic would be to encourage those traveling to Mexican border cities for brief visits to leave their cars and enter Mexico by foot. This procedure could be encouraged by providing additional parking facilities at border crossing points. Because of the advantages of parking a vehicle on the U. S. side, many temporary visitors would probably desire to use such parking facilities.

The Task Force recommends:

> The United States Government should acquire property at border crossings for the construction of parking facilities.

The Immigration and Naturalization Service has stressed the effectiveness of fences currently installed near authorized points and is convinced that their extension would enhance efforts to restrict unauthorized crossings.

The Task Force recommends:

> Existing fences along the United States-Mexican Border should be extended after careful determinations are made of those areas where such extensions are most needed and would have the most beneficial effect.

The lack of sufficient easements at the border, particularly at metropolitan points, compounds the problem of choking off traffic at unauthorized entry points. In such areas, an easement of at least thirty feet would be necessary to effectively control these areas.

The Task Force recommends:

> Easements up to thirty feet wide at metropolitan border points should be granted to the United States Government to enhance its efforts to restrict unauthorized crossings.

The large number of military personnel in San Diego produces an economic boost for Tijuana. It also creates many problems with respect to the safety and welfare of these men. Although a relatively small percentage of the military element is involved in the smuggling of narcotics, the social and commercial atmosphere produced by the drug trade in Tijuana greatly affects their activities. Should Tijuana be placed off limits to all military personnel, the effect on the local economy would be substantial. Such action could be considered as an inducement for better drug control along the border.

The Task Force recommends:

> A study should be made by the Department of Defense to consider the feasibility of imposing an off-limits restriction on military personnel at Tijuana.

Aliens are inadmissible to the United States under the Immigration and Nationality Act if they are narcotic drug addicts or if they have been convicted of a violation or conspiracy to violate any law or regulation relating to the

illicit possession of, or traffic in, narcotic drugs or marihuana. They are also inadmissible if the Immigration Officer knows or has reason to believe such aliens have been illicit traffickers in narcotic drugs. Furthermore, alien narcotic drug addicts convicted of offenses involving narcotic drugs or marihuana trafficking or possession, are subject to deportation. There is a program whereby the Bureau of Narcotics and Dangerous Drugs and the Bureau of Customs furnish the Immigration and Naturalization Service information concerning aliens who are arrested for criminal offenses involving narcotic drugs or marihuana.

DRUG DETECTION METHODS AND DEVICES

The Task Force discussed many technical devices presently available and in the experimental state that would aid in the detection of drugs at the border.

Because further study is necessary of the many scientific considerations that are necessary in determining the feasibility of a potential border detection device, a committee should be established to review the devices which may become available for future utilization. The White House Office of Science and Technology should be consulted for assistance in this endeavor.

Dogs, German shepherds particularly, have been trained to detect marihuana, and one such animal is being used by Customs at San Ysidro, California. It has been under test for approximately one year, not only at San Ysidro border points, but also at air cargo sections, mail sections and at other points along the border. Results have not been conclusive but tend to indicate that the dog requires considerable time, manpower and effort to sustain. The dog has assisted in the detection of some marihuana and definitely has a psychological effect on smugglers amounting to a limited deterrent. However, the limited work time of the dog is approximately four hours per day. It requires a trainer-handler who might otherwise be engaged in regular searching activities.

The Army has trained a number of dogs for these purposes. However, there is a problem of Army involvement on the Mexican border because of posse comitatus statutes.

There are numerous perimeter detection devices that could be utilized to cover the border area These would be used

primarily by the Border Patrol to cover border areas outside of designated crossing points. The Border Patrol is presently using a sensor device, which when activated, indicates to a centralized unit that an object has crossed the border at the point. Regardless of what devices are implemented, there must be sufficient manpower to back them up. The intrusion device presently used at the border enables the Border Patrol to detect more intruders than could possibly be done with the human eye at night, but its effectiveness in stopping intruders can only be measured in terms of available personnel to follow up each border-crossing detection.

The Task Force recommends:

> A committee should be established to study existing means of detection to evaluate their relative effectiveness. The Office of Science and Technology should participate in this study and render technical advice and assistance to the committee.
>
> The United States Government should obtain perimeter detection devices that are economically feasible and practical for use on the border.

BORDER SURVEILLANCE OF AIRCRAFT AND VESSELS

Based on reports submitted to the Task Force, it would appear the use of aircraft in the smuggling of drugs from Mexico is on the increase and it poses a problem requiring more attention. Air smuggling usually involves small rented or leased planes which proceed to obscure airports or makeshift landing fields in Mexico. Upon returning to the United States they either discard their contraband by air drops at secluded locations or they land at small private fields or on roads where their presence is unlikely to be observed. Present efforts to detect these illegal flights must be considered inadequate.

The Immigration and Naturalization Service currently employs 20 planes along the Mexican border. They are primarily used for observation purposes and are not considered to have pursuit capability. In addition, they maintain an Air Intelligence Center at Yuma, Arizona, where data on 73,000 private aircraft and pilots, including pilots suspected of alien smuggling, is catalogued.

The Bureau of Customs has only one aircraft at the present time. It has pursuit capability and is used primarily in the investigation of smuggling at the Mexican border.

The pilots of these government planes have gathered, in the normal course of their contact within the flying fraternity, considerable information of value relating to smuggling activity. Wider dissemination and exchange of such intelligence is clearly desirable.

In examining the role of the Federal Aviation Administration in relation to illicit flights and the licensing of pilots, it is apparent that existing regulations and sanctions should be reviewed at an early date. For example, at the present time, private pilots of non-commercial aircraft are not required to file a flight plan on a non-instrument flight prior to departure for Mexico. Precedence exists for the promulgation of such requirements. Conviction for smuggling or other felonies is not grounds for the revocation of an airman's license. Only the airman's skill and physical fitness is an issue in such action.

There is some recent evidence to indicate that small pleasure boats are sometimes used in drug smuggling. Smuggling by boat is potentially a very serious problem. It represents a means of smuggling that is very difficult to control. Effective surveillance of the thousands of pleasure crafts operating in the waters off southern California and in the Gulf of Mexico would represent a Herculean task and would not, at this time, justify the expenditure of manpower and equipment necessary to implement a meaningful program. Better coverage might be achieved at various Mexican ports of call and investigative procedures relating to small vessels should concentrate on gathering intelligence on their illegal use.

The Task Force recommends:

FAA regulations should be amended to require the filing of a flight plan prior to departure of all aircraft on international flights between Mexico and the United States.

FAA statutes and regulations should be revised to permit license revocation in the case of pilots convicted of smuggling, or possession of contraband drugs.

Existing radar facilities along the Mexican border should be expanded and improved to conduct greater surveillance of low altitude aircraft and canyon air corridors.

Pursuit-type aircraft should be utilized on an increased basis to combat smuggling by air.

UTILIZATION OF ENFORCEMENT PERSONNEL

The Bureau of Customs, the Bureau of Narcotics and Dangerous Drugs, and the Immigration and Naturalization Service need greatly increased manpower to carry out the duties and responsibilities of their respective agencies. Should a manpower increase be granted, the agencies would utilize these additional personnel as follows:

1. Customs would significantly increase its agent personnel, a substantial portion of whom would be assigned to augment the anti-smuggling drive by increasing information gathering facilities and emphasizing smuggling conspiracy investigations.

2. The Border Patrol would utilize new personnel at border areas other than designated crossing points. This would augment the Border Patrol's current effort to make it more difficult to avoid the ports of entry and to discourage potential smugglers from using unauthorized entry areas.

3. The Bureau of Narcotics and Dangerous Drugs would utilize its additional manpower to develop intelligence data, form specialized mobile units, and expand undercover operations and conspiracy-type investigations.

IV. THE CONTROL OF MARIHUANA AT ITS SOURCE

There is considerable opium poppy cultivation in Mexico, usually in remote and inaccessible areas in the interior. Generally, it is grown on relatively small plots by individual farmers as a supplemental money crop, primarily in the states of Sinaloa, Sonora, Jalisco and Morelos and to a lesser degree in Durango and Nuevo Leon.

Marihuana presents an even greater problem due to the fact that its prolific growth is both wild and cultivated. It can be found in practically every state in Mexico, although Guerrero, Jalisco, Sinaloa and Tamaulipas are the major sources.

REMOTE SENSING

In the absence of specific information from informants, the only practical method of locating these crops is through the use of remote sensing devices. For a number of years, the Mexican Government has employed light observation planes and helicopters on spotting missions, but it would appear that these operations to date have not been of sufficient scope to cover adequately the vast land area where these crops can be found. The use of broad remote sensing techniques in states involved, with subsequent crop identification by agricultural experts, would appear to be more efficient and effective. If the Mexican Government has such a capability at the present time, it is not being used for this purpose. On the other hand, there is no question that the United States is capable of undertaking such missions.

Airborne remote sensing of marihuana may be feasible with a minimum of investment and technical assistance with systems already developed. NASA and the Government of Mexico have already initiated an agreement to develop a Mexican remote sensing capability. As far as we know, remote sensing has not yet been tested specifically for marihuana and poppy detection. This should be done by interested United States agencies. If the results are positive, we should make them available to the Mexican Government and urge it to acquire whatever equipment is required. The question arises as to what extent NASA can commit its resources to this program.

The Task Force recommends:

With the participation of the State Department, there should be early discussion between appropriate officials of the Mexican and United States Governments concerning efforts to implement effective remote sensing surveys.

The Attorney General should be requested to direct an inquiry to the Director of NASA concerning the participation of NASA in helping to develop a remote sensing capability for marihuana control in Mexico.

The Attorney General should be requested to direct an inquiry to the Secretary of Agriculture concerning the participation of the latter's manpower and resources in development of a Mexican remote sensing capability. Remote sensing priority should be placed on known regions of opium poppy and marihuana cultivation.

CROP ERADICATION

For the most part, the Mexican authorities have relied on manual eradication of opium poppies. This simple but tedious process consists of breaking the stems with a wooden switch or cane, causing the plant to wither and die. As an added measure, the crude irrigation devices and protective fences are destroyed. Marihuana crops are usually burned, sometimes after being uprooted.

There are considerable difficulties associated with crop destruction. These crops are often grown in extremely difficult terrain in some of the most remote areas of Mexico, creating severe problems in transporting men and equipment to the scene. The local growers have, on occasion, resorted to armed resistance against the eradication teams resulting in death and injuries to the personnel involved. This particular problem is serious enough to require escorts of squads of heavily armed soldiers. In view of the foregoing, the Task Force is impressed with the potential effectiveness of chemical crop destruction utilizing aircraft.

The use of chemicals would undoubtedly involve considerable funding, but until the actual crop acreage is known,

a realistic cost estimate cannot be made. Before embarking on such a program, it would be necessary to obtain the agreement of the Mexican Government. It is not known whether the Mexican Government would be willing to authorize and finance such programs. Alternative sources of funding might be available, such as grants from U. S. agencies or international organizations, i.e., Pan American Union, the World Bank, or even private foundations in the United States.

The Task Force examined the possibility of crop substitution programs which would encourage the small farmer to abandon the cultivation of opium poppies and marihuana. It would appear for the present at least, that such a program would not be feasible or practical.

The Task Force recommends:

> The appropriate Departments should be requested to broaden their current research and experimentation to determine the most effective and practical methods for the destruction of opium poppy and marihuana crops.
>
> The Mexican Government should be consulted by the State Department concerning broad programs for marihuana and poppy crop destruction.
>
> A survey should be conducted of funding sources to support crop eradication programs, said survey to include other than U. S. or Mexican Government agencies.

FLOW OF TRAFFIC IN MEXICO

Interdiction of the flow of drugs in Mexico presents several unique problems. Elements of the traffic are located in remote areas, removed from adequate transportation and communication facilities. Heroin laboratories are operating in scattered locations, including some in desolate mountain regions and isolated villages. European heroin passing through Mexico enters by ship in the eastern part of Vera Cruz and by air at Mexico City. The capital city is also a transfer point for significant quantities of cocaine en route to the United States from South American sources. Marihuana is gathered at rural points and large consolidated shipments are prepared for movement north to the border.

With the recent increase in dangerous drug abuse in the United States, metropolitan areas in Mexico have emerged as souces of this material, both in clandestine production and diversion from legitimate industry. All of these drugs eventually move northward to the border in vehicles ranging from automobiles with sophisticated traps to tractor trailers.

An analysis of drug seizures clearly indicates that the bulk of this traffic moves to the California and Arizona border points via Mexican Highway #15 to Santa Ana in the state of Sonora. Here it either continues on Highway #15 to Nogales and other Arizona points of entry or moves westward on Highway #2 to western Arizona and California. Alternative routes simply do not exist in that region. Although there are checkpoints on these highways, they are only used for the control of southward traffic. If adequately staffed facilities were established south of Santa Ana on Highway #15 and on Highway #2 west of that city, it would impede the flow of these drugs to the border.

The violator in Mexico can be typed on the basis of his individual role in the traffic. He may be the grower, the laboratory operator, the courier who transports the drugs to the border, or the recipient who employs the actual smuggler. The Mexican authorities should give appropriate attention to each phase of the smuggling operation so that meaningful results can be achieved.

The Task Force recommends:

> The Mexican Government should be urged to establish adequate northbound inspection points along Highways #15 and #2.
>
> They should also be urged to tighten control over the legitimate production and distribution of dangerous drugs, and to monitor the sales and distribution of chemicals essential in the manufacture of heroin, particularly acetic anhydride.

STEPS TO ENCOURAGE MEXICAN COOPERATION

The United States Government can assist the Mexican Government in establishing better enforcement techniques, especially with regard to narcotics and dangerous drugs. Seminars on this problem should be held, attended by BNDD,

Customs, and Mexican Judicial Police to cover all aspects of drug trafficking. This could later be expanded into a school similar to what is available in the United States, with an equal number of students from both countries.

The Mexican Government should be urged to establish a bureau solely for the enforcement of narcotic laws. United States technical and financial assistance could be used to enhance this endeavor.

More specific intelligence information should be made available to the Mexican police. If substantive evidence concerning specific individuals would be presented to the Mexicans for their exploitation, the probability of arrest and prosecution of these violators would be greatly enhanced. Similar efforts with Italian officials concerning the Mafia families produced immensely successful results. The same technique may be effective in Mexico.

The Task Force recommends:

The Mexican Government should be encouraged to establish a Bureau of Narcotics with initial technological and financial assistance from the United States, where necessary and appropriate.

The United States authorities should provide more specific information to the Mexican Government describing the scope of the traffic along with names of drug traffickers known to be operating in Mexico.

Joint seminars should be established between The United States and Mexico for the interchange of information relating to enforcement techniques with regard to narcotics and dangerous drugs.

V. PROCEEDINGS AGAINST VIOLATIONS

PROSECUTION OF VIOLATORS IN THE UNITED STATES

The prosecution of drug traffickers in this country is based on a multitude of statutes. The laws regulating the smuggling of narcotic drugs and marihuana are generally inflexible in terms of minimum mandatory penalties. These penalties are applicable, not only to major violators but also to a broad range of offenders, some of whom are relatively minor offenders. As a result, it has been necessary to bring technical prosecutions under other statutes to avoid the imposition of mandatory sentences and in other cases, a program of deferred prosecution has been used to the same end. As a last resort, it has been necessary to decline prosecution, all in the interest of the fair administration of justice and in consideration of the nature of the offense.

In recent years, we have witnessed a dramatic increase in the number of drug prosecutions. The Administrative Office of the United States Courts reported that there was a 31.9% increase in narcotic prosecutions during the first half of fiscal year 1969 as compared to comparable period in the previous fiscal year. Approximately one-half were commenced in the judicial districts abutting the Mexican border. These courts are severely overburdened with a disproportionate number of criminal cases of all types. During fiscal year 1968, over twice as many criminal cases were filed and terminated in these districts than in the five judicial districts located between Connecticut and eastern Pennsylvania, one of the most densely populated regions in the United States. In fact, there were six times as many narcotic cases filed in the border districts compared with those in the eastern districts.

This inordinate situation is also reflected in the heavy case loads assigned to the Assistant U.S. Attorneys in the border districts. The problem is further compounded by the relatively few federal judges available in these districts.

Because of the congestion, there has been a parallel problem regarding bail for drug offenders, which has necessitated the release, pending trial, of violators who might otherwise be held on high bond for early prosecution. The result has been a high incidence of new offenses by persons awaiting trial and bail jumping. In the case of Mexican nationals, the defendants often seek sanctuary across the border.

The Task Force recommends:

> Federal statutes relating to the smuggling of narcotic drugs and marihuana should be revised to permit greater flexibility in the prosecution of such violators.
>
> Serious consideration should be given to increasing the number of federal judgeships in border districts.
>
> The staff of U.S. Attorneys in border districts should be enlarged to handle the heavy criminal caseload.
>
> As an interim measure, consideration should be given to the use of visiting and retired judges and Special Assistant U.S. Attorneys from other districts.
>
> There should be an appropriate increase in the staff of the Criminal Division of the Department of Justice to complement any increase in U.S. Attorney staffing and, specifically, to provide assistance in highly complex drug cases involving major violators.

PROSECUTIONS IN MEXICO

The federal laws of Mexico relating to narcotic drugs and marihuana, in a general sense, are similar to those of the United States. We are informed, however, that Mexico has not enacted laws similar to our laws regulating stimulant, depressant and hallucinogenic drugs.

With regard to narcotic drugs and marihuana, the Mexican Government has assured us that it is within their power to prosecute their nationals in Mexico for violations of the Mexican laws, even though such violations occur in the United States. A recent ruling by the Supreme Court of Justice for Mexico has upheld such a prosecution. The ruling was handed down on January 13, 1969, under Mexican appeal number 4032/968-2a, by the First Cabinet of the Court, in the case of Mario Aguilera-Smith, a fugitive from American justice.

Aguilera, a Mexican national, had been arrested on January 3, 1966, at Tijuana, B.C., Mexico, based upon evidence presented by the United States. On August 5, 1967, Aguilera was convicted of exporting, trafficking and furnishing heroin. He was sentenced to six years' imprisonment and a fine of 1000 pesos. An intermediate appeal to the 4th Circuit Tribunal at Guadalajara had resulted in the affirmance of Aguilera's conviction.

Existing extradition treaties with Mexico, although listing narcotic violations as extraditable offenses, grant discretion to the parties in respect of requests for their own nationals.[14/] The Government of Mexico will prosecute locally persons who are fugitives from justice in the United States. Its present policy is to deny requests for the Extradition of Mexican nationals. The United States Government generally grants extradition requests for its nationals.

The Task Force recommends:

> The United States should take immediate steps to present to the Republic of Mexico for prosecution selected cases involving narcotic and marihuana violations by fugitive Mexican nationals.

14/ Treaty of Extradition with Mexico, Feb. 22, 1899, 31 Stat. 1818, T.S. No.242 (effective April 22, 1899); Supplementary Extradition Convention with Mexico, December 23, 1925, 44 Stat. 2409, T.S. No. 741 (effective July 11, 1926); Supplementary Extradition Convention with Mexico, August 16, 1969, 55 Stat. 1133, T.S. No. 967 (effective April 14, 1941).

61-801 O - 77 - 58

VI. ROLE AND RESPONSIBILITY OF STATE DEPARTMENT IN SECURING MEXICAN COOPERATION

The Department of State is the primary representative for communicating to foreign governments the vital interests of the United States and for doing everything necessary to advance those interests through diplomacy. The consumption in the United States of drugs and narcotics produced abroad and illegally imported into this country has reached such proportion as to be in the highest rank of those matters affecting the vital interests of the nation.

Accordingly, the Department of State, in its dealings with the highest officials of Mexico and in the setting of agenda therefore, should give no subject higher priority or greater emphasis than the desire of the United States to realize an eradication of the production and refinement in Mexico of opium poppies and marihuana in violation of Mexican laws. The basic responsibility for effecting such control lies with the Government of Mexico and its law enforcement agencies. Nothing should be done which would weaken or shift that burden of responsibility. Only a massive, continuous effort, directed by the highest officials of Mexico, will significantly curtail the production and refinement of marihuana and other dangerous drugs.

The Task Force recommends:

> The Department of State must devote its efforts to persuading Mexico to place a program for eradication and control of marihuana and dangerous drugs among the highest of its national priorities.
>
> The United States Ambassador in Mexico should have this problem on his highest priority list on a continuing basis.

Mr. ROSSIDES. Your committee has also asked what problems the Bureau of Customs faces in its antismuggling efforts directed to illicit drug traffic.

The basic need of the Bureau of Customs today is for more manpower and facilities.

President Nixon consistently has asserted his personal concern and desire to increase the number of agents and the resources of the Bureau of Customs in order that it can better meet its responsibility for enforcement of the Nation's antismuggling laws.

On September 16, 1968, Richard M. Nixon, presidential nominee, recommended greatly increasing the number of Customs agents. In the President's message to the Congress dated July 14, 1969, concerning the drug menace, he pledged increased efforts to eliminate drugs illegally entering this country, and stated:

> The Department of the Treasury, through the Bureau of Customs, is charged with enforcing the Nation's smuggling laws. I have directed the Secretary of the Treasury to initiate a major new effort to guard the Nation's borders and ports against the growing volume of narcotics from abroad. There is a recognized need for more men and facilities in the Bureau of Customs to carry out this directive. At my request, the Secretary of the Treasury has submitted a substantial program for increased manpower and facilities in the Bureau of Customs for this purpose which is under intensive review.

In accordance with the President's message, there will be transmitted to the Congress shortly a supplemental request for appropriations recommending substantial supplemental appropriations to increase Customs manpower and facilities.

During 1968, 213 million persons entered the United States by foot and in 61 million motor vehicles, 96,000 vessels and 313,000 aircraft. This represents a tremendous increase in border traffic. In spite of vast increases in business and traffic, the number of personnel of the Bureau of Customs has not materially increased over the force in being many years ago, impairing the effectiveness of the antismuggling effort. Much of the drug traffic intercepted is found on the person of arriving passengers.

Traffic volumes are such that personal and vehicular searches must be made on a random basis. In order to intercept drug traffic, Customs inspectors must rely to a great extent on information developed by agents and informants and on shrewd observations of arriving traffic.

Smuggling by light aircraft across the Mexican border is becoming an increasingly difficult problem. A number of successful interceptions of such traffic recently have been made along the Texas-Mexican border and along the southwest Arizona to southern California-Mexican borders.

Customs has been operating with only one recently acquired aircraft, but during its first 6-month period of operation in Southern California it was used to further 26 separate smuggling investigations, 14 of which have not yet been concluded. As a consequence of the 12 finished cases in the period, 23 arrests were made, 10 motor vehicles and 3 aircraft were seized, and the Bureau of Customs confiscated 4,100 pounds of marihuana, 12 pounds of heroin and 2 pounds of cocaine. This demonstrates conclusively, I believe, that the effectiveness of Customs antismuggling efforts would be greatly enhanced by employing additional aircraft which are effective for surveillance and pursuit of both air and surface traffic.

4. At best, the Bureau of Customs can only guess. Mr. Chairman, as to the amount of narcotics, marihuana and dangerous drugs smuggled into the United States. One indication to unknown traffic is the amount seized. Our rough estimates are that seizures approximate only 10 to 15 percent of the total amount of drugs smuggled into the United States. It must be noted, however, as is apparent, that estimates are highly unreliable, and that total drug smuggling volumes could be greater than this estimate.

5. This committee has asked for an appraisal of the ability of the Customs Service to cope with the narcotic traffic across our borders in terms of its manpower, equipment and operating funds. As I have indicated in response to your inquiry concerning the problems of Customs, this is our greatest need.

With the same number of personnel, seizures and arrests constantly escalate. However, increases in seizures and arrests correspondingly increase time and work requirements of our manpower because of the need for time-consuming investigations, case reports, appearances, consultations, and other matters attendant to preparation for and appearance at trials and various other preliminary proceedings.

Additionally, the demand for related correspondence and statistical reporting is accordingly increased. Thus, it is clear that the effectiveness of Customs in dealing with vastly increased volumes of international traffic is directly related to those available resources of manpower, equipment and operating funds.

The forthcoming supplemental appropriations request is significant. Appropriation increases will help rectify a longstanding manpower shortage of the enforcement arm of the Customs Service. The President and the Secretary have manifested their support in this regard, and with the continuing support of the Congress, the Bureau of Customs can and will meet its responsibilities in suppression and control of illicit drug smuggling.

Thank you, Mr. Chairman. I would be pleased to answer any questions the committee might have.

Chairman Dodd. Thank you very much, Mr. Rossides. We have a few questions, mostly for clarification.

What would you say was the major goal of Operation Intercept?

Mr. Rossides. The major goal of Operation Intercept is to prevent heroin, marihuana and other dangerous drugs, from coming into the United States. The main purpose is not seizures because obviously once we started the intensive full-time inspection, the organized smuggler would try to wait us out. He is not coming across as he had been before. That is our key aim.

Now, secondly, and part of that aim, we are most hopeful that we will be having effective cases against the major organized bands who are involved in smuggling these drugs across the border. We hope for, and I confidently expect, that we will be having full cooperation from the Mexican Government in this regard.

Chairman Dodd. The operation is still on, is it?

Mr. Rossides. It is still on, Senator, and it will go on indefinitely.

Chairman Dodd. I am not going to ask you, unless you want to volunteer, how many of the smugglers were caught. I would rather put it another way. Are you satisfied that your program is making progress?

Mr. ROSSIDES. We are satisfied, very much so, Senator, and the fact that there have been very few seizures is indicative to us that the actual smuggling attempts have been very, very few. This is proof of the success of the program thus far.

There is additional proof in that we have had fine cooperation with most of the people involved, and frankly I had expected a great deal more comment and criticism regarding the economic dislocations that are occurring, but it is most gratifying to have the various persons at the border areas say, yes, it is inconvenient, we hope we can work out procedures to reduce the inconvenience, but your goals we are all for.

Chairman DODD. How many agents did the operation involve?

Mr. ROSSIDES. That, Senator, I would prefer not to get into.

Chairman DODD. All right. I will ask it another way. I am not trying to pry.

Mr. ROSSIDES. Let me suggest this——

Chairman DODD. Let me help you. Obviously the Operation Intercept differs very considerably from the normal border operation and a lot of people are wondering can this be continued for very long?

Mr. ROSSIDES. I think it can, Senator, because I think the hallmark, as Deputy Attorney General Kleindienst in our briefings that we have given, as he pointed out, and I think it is the hallmark of this program, this is the first time that we have brought together the various enforcement arms of the Federal Government in a coordinated effort. We have the Bureau of Customs and the Immigration Service along the border. We have the Coast Guard and the Navy in the water. We have the Federal Aviation Agency helping significantly with regard to regulations and its expertise. We have the Bureau of Narcotics and Dangerous Drugs working internally and supplying intelligence information.

This will continue after the period of the full intensive inspection ends and that period, as I say, at the moment is indefinite.

Additionally what has occurred, Senator, and this is the part that is difficult to keep up without the additional manpower, particularly the Bureau of Customs and Immigration and Naturalization Service have brought in manpower from other parts of the country to beef up the personnel on the border. As I say, we hope to keep that going indefinitely but I do want to stress that everybody must understand that Customs will continue permanently an increased level of inspection along the border.

Tied in with our supplemental appropriation, which will be forthcoming shortly, we will be able to have a much more effective inspection along the Mexican border.

Chairman DODD. I take it, then, as a result you expect that the smuggling operations such as they were, when this Operation Intercept started, now are greatly reduced or substantially reduced.

Mr. ROSSIDES. Yes, sir.

Chairman DODD. I am glad you said that you notified the Mexican Government officials. They knew all about this going into operation, I take it?

Mr. ROSSIDES. Yes, sir, and if I may add to that, Deputy Attorney General Kleindienst and I visited with our counterparts in Mexico

City in June of this year. It was the fourth such informal talk which had started back in—I believe the first conference was 1960. They were called informal consultations to see what could be done about the drug traffic.

In June of this year, following months of work that we had been undertaking in view of this task force, I would suggest that our delegation was as fully prepared as could possibly be. We had most fruitful discussions with the Mexican officials and the Mexican Government.

I might add that a joint communique was issued June 11, I believe, Mr. Chairman, and it is most significant because there is some criticism in the papers regarding our efforts, but we feel that we will have the cooperation of the Mexican Government.

In the joint communique, and I quote regarding border intensification, Mr. Chairman, the intensification of the inspection at the border:

> The question of smuggling narcotics along the long common border between the two countries was examined since despite intense enforcement efforts this presents a growing problem for the authorities charged with its control. It was agreed that the respective officials of each government recommend that enforcement activity along the border be increased.

Mr. Chairman, we are looking forward to further discussions with the Mexican Government, particularly in the area where we want to be as helpful as we can to them, namely, the eradication of the crops, the poppy and hemp fields and with regard to suppressing the entire smuggling pipeline.

Chairman Dodd. To be destructive of the poppy and marihuana fields?

Mr. Rossides. This a major goal of our joint efforts with the Mexican Government.

Chairman Dodd. That sounds very sensible and I hope you succeed. As I understand, you are telling us that this operation will continue and in fact gradually evolve into a stronger, more heavily managed operation, with border patrols on both sides of the border.

Mr. Rossides. We are hopeful on the other side. We can only control our side, Mr. Chairman.

Chairman Dodd. I know.

Mr. Rossides. And we have already had indications. I received word over the weekend, for instance, that the mayor of Tiajuana, and this was secondhand, so I have not had a chance this morning to confirm it, had asked the Mexican Government to have checkpoints on the traffic coming north on Routes 15 and 2, which are two of the main passage points from Mexico into the United States in the southern California area.

Chairman Dodd. Since you have brought up that question, that moves me to ask you what about that. I have heard that some Mexican officials have been greatly concerned about the impact of this program on the economy of these border communities. Can you tell us anything about that?

Mr. Rossides. Yes, sir. There is an impact. There has been great concern voiced on—maybe the word "great" is a little overstating it. There has been concern voiced on both sides of the border of the business community that tourism has been hurt, for instance. The traffic has

dropped enormously, the tourist traffic, maybe up to 75 percent. We are gratified that even with the businessmen I have spoken to and others that are in the border areas, they all recognize the problem. They want us to try and alleviate the question of movement through, if we can speed up the procedures, but this would be a very, very small price, indeed, to pay, Mr. Chairman, if we are successful in this program.

Chairman Dodd. It would seem to me the destruction or the doing away of these poppy fields and marihuana fields in Mexico—I think the Mexican Government could very easily do this if it wanted to.

Mr. Rossides. Well, I would only qualify one word, Mr. Chairman, the word "easy." A lot of these fields, as was pointed out to us, are in the dense mountainous areas of Mexico. Mexico is a poor country. Its resources are limited. We are hoping that they will make a much greater allocation of these resources to the eradication program. We stand ready to assist them with technical assistance.

Chairman Dodd. That is important.

Mr. Rossides. Of planes and materials and sensor devices. The Department of Defense has been developing these sensor devices from the air, from the aroma it picks up, the location of various poppy and hemp fields. The word "easy" would be a little bit strong, but a greater effort, there is no question, and we feel we can be successful.

And also, Senator, I think a much greater effort must be made by the Mexican Government in following the smuggling pipeline, because the smuggling pipeline starts when you put the seed in.

Then there is the growth and production of the plants. That is part of the smuggling pipeline. And then where there is the refinement and the traffic north, each stage gets easier to stop.

There is no doubt in my mind that a much greater effort by the Mexican authorities on the entire smuggling pipeline will cut down the volume drastically.

Chairman Dodd. Are you aware of the fact that this subcommittee had pictures taken of some of those fields back in 1962?

Mr. Rossides. I was not aware, Senator.

Chairman Dodd. We have those photographs, and at that time we did quite a bit of work trying to get the cooperation of the Government of Mexico. I personally talked with many people down there. Nothing ever happened. I am sure you are going to do much better. That is what we hope.

Mr. Rossides. Mr. Chairman, let me suggest at least one reason why we feel we will do better. Two reasons.

One, at first you have to put your own house in order and this is what we feel we are doing with our intensified program of inspection along the border where we control the border.

Additionally, and most significantly, at this conference in June with the Mexican Government, they stated that for the first time they now have the problem of marihuana use by their youth. In the last year or 2, call it spillover or whatever term, but the Mexican youth of the average family is now using marihuana, not to the degree that we are but to a degree which alarms their officials.

So I think that factor has had an important effect and it was in our communique, our joint communique.

Chairman Dodd. Yes. That is significant. I had always understood they had a very low rate of users.

Mr. ROSSIDES. Up until the last few years there were only a very few of them.

Chairman DODD. Well, now, a couple of more questions. Some of them I want to get on the record so it will be complete.

Can you tell us, or give us your opinion, as to why smuggling of narcotics from Mexico has quadrupled in the last 2 years?

Mr. ROSSIDES. I believe I referred to it in regard to hashish.

Chairman DODD. You said it had quadrupled. I wondered if you would care to tell us why you think this happened.

Mr. ROSSIDES. One, frankly, prior to this effort, the Mexican border was such a sieve that the feeling was that it is so easy to get it in; this helps stimulate it through that border.

Also, there became the growing popularity of hashish. I think it is the ease with which it has been able in the past to come in, which is a great factor. Other than that, I cannot tell.

That is one of the reasons why you have the hard narcotics from Turkey through the refinement process in France, Italy, and Spain. A fair proportion of that goes into Mexico and is shipped on up as being a safer route than directly along the eastern coast or through Canada. We have a fair amount coming into Canada and down from Montreal and we plan to make a greater effort on that.

Chairman DODD. I won't go into that situation in Turkey. We will be hearing more about that later. My own impression is you have got good people working on that. I have talked to them, as you probably know.

Mr. ROSSIDES. Yes, I do, Senator.

Chairman DODD. Principally Mexico and Turkey, as far as heroin is concerned.

Mr. ROSSIDES. Correct, sir.

Chairman DODD. Let me finally ask you this question. If most of the marihuana in this country comes from Mexico, and I take it from your testimony that it does, and your plans for more men and airplanes and surveillance people and surveillance devices all along the Mexican-United States border. I suppose we have got reason to look forward to a greatly improved situation in the not too distant future and outwardly pretty near total eradication of the traffic from Mexico. Ultimately I know there will always be some illegal traffic, but I am talking about this massive traffic we have now. Would you agree to that?

Mr. ROSSIDES. I would agree to this extent, Senator, and we are putting ourselves right on the spot and are pleased to do so because of the importance of the program. We feel, Mr. Kleindienst and I, and I am sure the task force members do, but I can talk for Mr. Kleindienst because we have had this question asked of us at various conferences, we feel there will be a significant, a substantial reduction in the marihuana and narcotics traffic from Mexico within a year.

Chairman DODD. Well, thank you very much, Mr. Rossides.

Mr. ROSSIDES. Mr. Chairman, may I make one other reference for the record? We received, and again this is regarding part of the total picture, a lot of the things we have read in the paper have been about criticism of persons, about our operation, from Mexico—I received a Mexican editorial digest and I will supply for the record the name

of the paper, but this was a cable that came through to us over the weekend, and this was on Thursday, September 25, and I would like to quote, Mr. Chairman. It just said "Mexican Editorial Digest."

We shouldn't be offended by the United States effort to stop drug traffic. Let us not complain that it hurts our tourist industry; nor should we defend ourselves with the questionable argument that all of us aren't marihuana smugglers or that there is a greater consumption of drugs north of the border than there is south of it.

We should let our neighbors solve their internal problems as they see fit and start putting our own house in order, not for them nor for tourism but for ourselves, our health and dignity. If there is an excessive proliferation of vice in our border cities, we should cure these sores instead of shouting protests and let us not forget that there is where the Latin American world begins. This remembrance should imbue us with a sense of responsibility.

The National Border Program, long languishing in the throes of bureaucracy, should now be vigorously implemented. This would change our border into a cultural, artistic, commercial and industrial showcase. This would be better than trying to defend racetracks, bullfight arenas, and centers that traffic in vice.

Thank you, Mr. Chairman.

Chairman DODD. Thank you. I am glad you read that editorial into the record. That sounds very sensible. It will help everyone better understand the attitude below the border. Thank you again.

Mr. ROSSIDES. Thank you, Mr. Chairman. It was a great pleasure. If I may just introduce—and I apologize for not having done this earlier—some of the gentlemen that have been most active in the campaign.

First, Assistant Commissioner Lawrence Fleishman, of the Bureau of Customs, who is in overall charge under the direct supervision of Commissioner Ambrose, of Operation Intercept.

Chairman DODD. Glad to have you.

Mr. ROSSIDES. Special Assistant to the Secretary for Organized Crime, Mr. G. Gordon Liddy, who has been most helpful in this program; and

Mr. Lee Ritger, Assistant General Counsel of the Treasury Department.

Chairman DODD. We are very pleased to have you here, and appreciate your help and cooperation.

Mr. ROSSIDES. Thank you, sir.

Chairman DODD. Senator Birch Bayh, a member of the subcommittee, is here. We welcome you here this morning.

Senator BAYH. Mr. Chairman, I regret that other committee responsibilities prohibited me from following your present investigation as closely as I would like. I am sure that no one knows better than you the difficulty of touching all bases as we must.

I listened with a great deal of interest to Secretary Rossides' discussion of this problem.

Mr. INGERSOLL. I should like to point out that the American Bar Association, the Model Penal Code, and the Model Sentencing Act all favor special treatment for professional criminals. The Department agrees that such a provision is worthwhile and rational as it allows, within the sentencing structure, the ability to identify and discriminate between offenders, treating the exceptional case exceptionally, and the routine case flexibly.

4. MARIHUANA AND HALLUCINOGENIC PENALTIES

The next requirement that runs throughout the suggested alternatives is the legal and medical recognition that marihuana is not a narcotic drug but it rather an hallucinogen and should be treated, in terms of regulation and sentencing, as an hallucinogenic drug.

It is our conclusion, after consulting with the scientific community and with members of the legal profession, that the hallucinogenic substances should not be subject to the same penalty scheme as the narcotic substances in schedules I and II. Therefore, while the proposed act properly reflects the regulatory and penal structures according to the schedule designation, the hallucinogenic substances in schedule I shall be treated the same as the amphetamine, barbiturates, and other dangerous drugs listed in schedule III.

Under present law the hallucinogens are treated in this manner and we see no reason to disturb the present structure.

One point, however, has become clear as a result of the testimony before the subcommittee and that is the need for more knowledge about the effects of marihuana. Although it is termed an hallucinogen, we need to know more about this particular drug, especially its long-term effects.

Therefore, the Department supports a provision that will allow for a study into the causes and effects of marihuana use. Such a study is

part of S. 1895, introduced by Senator Dodd. The Department is reparing some language on the organization and scope of such study ld will be happy to submit it to this subcommittee for its nsideration.

Chairman Dodd. I am glad to hear you say that. I am glad we are oing to get it. That is in the bill I have introduced, as you pointed it, and of course that is the right way to go about it. There have en a lot of suggestions about Presidential commissions since that ll was introduced, but the best thing to do would be to do just what ou say you are going to do here, find out and let us know.

Mr. Ingersoll. By recognizing the proper classification for marihuana and adjusting the penalties to that classification, the Department feels that this is a rational and credible approach to sentencing. oupled with the proposed study on marihuana we hope to have more formed answers and a better understanding of this drug in the near uture.

5. SPECIAL PAROLE TERM

Another requirement that has been included in the alternative enalty schemes is a special parole term that is a part of the illicit trafficking sentence structure. Just as incarceration is not always a meaningful answer to effective rehabilitation, certainly incarceration without an adequate supervisory followup after release is not in the best nterest of society.

Therefore, we have required a special parole term so that persons entenced for trafficking violations would be placed under supervision or a period of time regardless of whether they are incarcerated or heir sentence probated or suspended. The intent here is to give the udges another tool for sentencing and another means of protecting ociety when dealing with the drug violator.

6. SIMPLE POSSESSION OR POSSESSION FOR DISTRIBUTION

With regard to possession offenses, we have identified two types of possession and treated each type differently. On one hand, there is the violator who is merely possessing for his own personal use. He is on he lowest rung of the distribution ladder and represents the widest segment of the drug culture.

On the other hand, we have the possessor who intends to sell and has large quantities of the drug in his possession.

The only distinction between this person and the trafficker is that he is normally caught before he sells the drugs. Since the intent to sell is present in both instances, this person is logically no different from the actual trafficker and he should be treated the same.

With this dichotomy in mind, all alternatives make possession with intent to sell a felony and possession for one's own use, regardless of the drug involved, a misdemeanor.

We believe that, by having such a flexible range of penalties for the illicit possessor, prosecutors will be more willing to initiate cases and the courts less reluctant to handle possession cases because of the potential high penalties involved.

By allowing, the court to prosecute the possessor who intends to sell as a felon and the possessor for one's own use as a misdemeanant, I believe we will have better law enforcement and better respect for the law.

Senator HRUSKA. Mr. Ingersoll, you refer to the possessor who intends to sell and has large quantities of the drug in his possession. Now, an offender who has that particular material in his possession for his own personal use may possibly have this material with others.

This material would not be for his personal use. It is for the use of someone else, and yet it is not the possessor who intends to sell and has large quantities of the drug in his possession. Now is there any special consideration given to that half-way in between point?

Mr. INGERSOLL. Yes; the term "trafficking" includes distribution without the exchange of money, and also the choice between prosecuting for simple possession or possession with intent to sell would be a prosecutive decision based upon the information that is provided by the investigative agency.

Senator HRUSKA. A malevolently inclined prosecutor could make out of that kind of a simple process I have just described a trafficking thing and a very serious proposition. Is there any inhibition in the statute that you propose in the bill that you propose, guarding against that sort of thing?

Mr. INGERSOLL. Yes. Can Mr. Sonnenreich comment on that, Senator?

Mr. SONNENREICH. Senator, we have a similar existing law with the Drug Abuse Control Amendments as it was amended on October 24, 1968, which also has the possession with intent to sell and the simple possession. Normally the burden when we talk about possession with intent to sell, the burden is on the Government to show that there was in fact an intent to distribute, and the burden would be on he Government to do this.

Of course, the jury then makes its decision as to whether or the Government's burden was carried forward. If the jury determines that it was, of course, they will convict with a felony. This is a matter that has always been, when you are talking about the gray area a very difficult area to pinpoint. It is normally left to the discretion of the prosecution to prosecute. The normal case is that, as Mr. Ingersoll has pointed out, our cases where we have had possession would normally involve very large quantities. This would probably be true still under this coming law, and we do not anticipate having this kind of a problem. Most of those cases would be broken down to simple possession.

Senator HRUSKA. Does this bill still make a distinction between the offense of giving marihuana to someone under 18 and a person over that age?

Mr. SONNENREICH. Yes, sir.

Senator HRUSKA. In this same topic we are discussing?

Mr. INGERSOLL. Yes; that same provision is included in these alternatives.

Senator HRUSKA. Are you satisfied that by leaving this matter to the discretion of the prosecutor we are on safe and fair ground?

Mr. INGERSOLL. I think as a practical matter, Senator Hruska, a nmative transfer or a simple giving would be prosecuted as a simple ossession type of case.

Senator HRUSKA. It would?

Mr. INGERSOLL. As I indicated in my testimony in September, the ast majority of our cases involve very large amounts of substances hich makes it very apparent that the material was in the individual's ossession not for his own personal use.

Senator HRUSKA. Thank you very much.

Mr. INGERSOLL. Yes, sir.

Chairman DODD. Let me see if I understand this clearly. You have old us now about the possession situation; you are recommending that andatory minimum sentences for possession of marihuana and other rugs as well are out. I think that is a good thing: this is what really as got the country upset.

The meat of this thing is the problem of young people found in he possession of marihuana or some other drug. People, judges, and rosecutors felt that the law was not to the point where we were getting nywhere. You are taking a good intelligent step here and this will elp us.

My own judgment is that this is what the Congress will want to do.

Mr. INGERSOLL. That is certainly in line with our thinking.

Chairman DODD. I do not want to rub it in but this is about what I ecommended in my own bill.

Mr. INGERSOLL. Yes: it is.

Chairman DODD. Last March.

Mr. INGERSOLL. Very close to it.

Chairman DODD. I am glad this is what you are recommending. I hink it will help us.

Mr. INGERSOLL. I might point out, Mr. Chairman, that the Department of Justice has favored this approach for some time. Senator Iruska may recall that in January of this year I testified before the National Committee to Reform the Federal Penal Law in favor of a nodification on the marihuana penalty.

Chairman DODD. Yes.

Mr. INGERSOLL. And consistently throughout the intervening period we have attempted to work in that direction.

Chairman DODD. I recall your testimony when you were here and I hink you were thinking that way then?

Mr. INGERSOLL. Yes, sir.

FIRST OFFENDER TREATMENT

I might add that we have carried over from our present proposal the first offender treatment that will allow those persons possessing drugs for their own use, who are first offenders, to have their records expunged if the court thinks this a useful procedure. The Congress enacted just such a provision on October 24, 1968, in Public Law 90-639, which Mr. Sonnenreich referred to just a moment ago, and applied it to all hallucinogenic, depressant, and stimulant drugs. We feel that this is an extremely useful tool and will allow many young persons, who have learned their lesson and satisfied the court with their sincerity to stop illicit drug use, to avoid the stigma of a lifelong criminal record.

ALTERNATIVE PENALTY SCHEMES

At this time, I would like to briefly outline the alternative sentencing structures so that this subcommittee will have a better idea of our proposals. All alternatives contain a professional criminal penalty of not less than 5 years nor more than 20 years for first offenders, and not less than 10 years nor more than 40 years for second offenders. All alternatives provide for up to 5 years and/or $15,000 for traffickers in hallucinogenic, depressant, and stimulant drugs in schedules I, II, and III, with second offenses allowing for imprisonment of up to 10 years, a fine of $30,000, or both for alternatives A and B, and not less than 2 nor more than 10 years for alternative C.

All include a special parole term of 2 years for first offenders and 4 years for second offenders. All schedule IV violations carry a penalty of up to 1 year, a fine of $5,000, or both. Both imprisonment and fine double for second offenders.

Alternatives A, B, and C, all treat possession for one's own use the same, allowing for first offender treatment at the court's discretion and imprisonment of up to 1 year, a fine of $5,000, or both. Second offenses are a felony of up to 2 years, a fine of $10,000, or both. Possession with intent to sell is treated in all alternatives as a sale offense and sentenced accordingly as a felony.

As to first offense sales of narcotic drugs in schedules I and II, alternative A imposes a sentence of up to 12 years imprisonment, a fine of $25,000, or both, as well as a special parole term of 3 years. Second offenders are subject of up to 24 years, a fine of $50,000, or both, as well as a special parole term of 6 years.

Under alternative B, first offender sales of narcotic drugs carry a penalty of up to 12 years, and, in addition, a discretionary fine of $25,000. The special parole term is 3 years. Probation, suspension of sentence, and parole are permitted. Second offenses carry a penalty of not less than 5 or more than 20 years, and, in addition, a discretionary fine of $50,000. The special parole term is 6 years. No probation or suspension of sentence is permitted but parole is available.

Alternative C first offender sellers of narcotic drugs are subject to imprisonment for up to 20 years, a fine of $25,000, or both. The special parole term is 3 years. Second offenders are subject to not less than 5 nor more than 20 years, with a discretionary fine of $50,000. The special parole term is 6 years. No probation or suspension of sentence is permitted, but parole is available.

These, then, are the general requirements of our penalty structure alternatives. We have created a range of flexible sentencing alternatives for the courts to administer that we believe will more adequately fit the crime and the person who committed that crime. Where severity is needed, as in the case of the professional criminal, minimum mandatory sentences are retained.

As to other traffickers, more judicial flexibility is permitted. As to possessors, the penalties range from first offender treatment, to misdemeanor, to felony, depending on the Government's proof and whether or not the person is a first offender.

I trust you will find this approach useful and meaningful. There is a great need for swift passage of this law both in terms of effective law enforcement operations and in terms of public acceptance of governmental activity in the drug abuse area.

We need stronger laws to protect against diversion from legitimate industry sources and we must, at the same time, respond more effectively against the illicit drug traffic. We believe that S. 2637 with the penalty concepts outlined above, will effectively meet both challenges.

Thank you, Mr. Chairman.

Chairman DODD. Thank you, Mr. Ingersoll. I am glad you came back. Your testimony was helpful when you first appeared here, and it is very helpful today. You have a very good understanding of this problem, and I like the way you go about it. I wish you would tell us which one of these penalty structures you are in favor of.

Mr. INGERSOLL. I, Mr. Chairman, am personally in favor of alternative B.

Chairman DODD. B?

Mr. INGERSOLL. Yes, sir.

Chairman DODD. Why?

Mr. INGERSOLL. The main reason is that it makes a distinction in first and second sale offenses for narcotic substances, and I think provides again a floor for the second trafficking offense in narcotic substances, which I think will be useful in the sentencing procedure.

Chairman DODD. Am I right now that B is a mandatory sentence for a second offender?

Mr. INGERSOLL. It is only for hard narcotic traffickers.

Chairman DODD. Is this something about the professional criminal?

Mr. INGERSOLL. It has a relationship to the professional criminal. I think that when a man or a defendant comes around for the second time for a hard narcotic sales or distribution offense, that he is professionally engaged in this kind of activity.

Chairman DODD. That is another question, is it not? This is something in addition to the determination that he is a professional criminal?

Mr. INGERSOLL. The professional criminal on second offense would call for a higher sentencing structure than we have provided for here. There is a distinction.

Chairman DODD. Under plan B the maximum fine would be $50,000, and the sentence mandatory 5 to 20 years.

Mr. INGERSOLL. Excuse me, sir?

Chairman DODD. I want to be sure I understand it.

Chairman HRUSKA. For second offenders.

Chairman DODD. For second offenders, yes. I said a $50,000 maximum fine and a mandatory sentence of from 5 to 20 years for a second offense, and then the same under alternate plan B. The professional criminal which is another class of case or offense, maximum fine of $100,000 and a mandatory sentence of from 10 to 40 years.

Mr. INGERSOLL. That sentence provision for a professional criminal is true of all of the alternatives, Mr. Chairman.

Chairman DODD. I know.

Mr. INGERSOLL. Let me say that I have expressed by own personal preference.

Chairman DODD. I know.

Mr. INGERSOLL. I think we can live with all or any of the alternatives.

Chairman DODD. I understand that. I am not suggesting if you do not get everything you want that everything is going to drop dead. As a law enforcement officer my reason for asking you is why you think this is true. Very likely that is the way we should be thinking about it. I do not want to belabor this. I find it so hard to understand this 5- to 20-year mandatory sentence.

Mr. INGERSOLL. May I point out to the chairman that even this provision does provide for parole, which is different from existing penalty structure.

Chairman DODD. Yes.

Mr. INGERSOLL. And it is a minimum sentence which a person could qualify for parole under.

Chairman DODD. Do you think any second offender should be considered as being professionally involved as a criminal?

Mr. INGERSOLL. I think that the burden still should remain upon us to prove the status of professionalism as far as the defendant is concerned.

Chairman DODD. What is he, a semipro? This is what bothers me. I know the popular view of it is throw him in jail and lock the doors. There is not any logic to it in my judgment.

Mr. INGERSOLL. It seems to me that when an individual is convicted a second time for the sale of narcotics, after having had a first opportunity for rehabilitation, that we then have to consider the welfare of society.

Chairman DODD. And you can give him up to 20 years, but you do not say you have got to do it just because he has twice made a mistake and committed this offense. That is my case. Why do you say in all such cases, regardless of the circumstances, the judge has just got to lock him up? You do not allow any leeway for all the sociologists to learn anything, psychiatrists, psychologists, penologists. Every second offender is not a hardened criminal or a professional criminal, even a semiprofessional criminal. You must know that as a law enforcement officer.

Mr. INGERSOLL. I appreciate that, and I think that those other disciplines will have their opportunity to work with this individual.

Chairman DODD. Yes, but in this very section you have got plenty of machinery to get him if he is a professional. You can give him forty years, if he is a professional. This is, providing that he is determined to be a professional. If you are fooling around with words, you do not want to say he is a professional, or semiprofessional. It seems to me you have got all the power you need in the case of that hardened individual who needs most severe confinement for a long period of time. Anyway, we will be talking about it more. I am grateful for your testimony, to both of you.

You have been very helpful before this subcommittee. I agree with you that we ought to hurry along and I am sure Senator Hruska agrees as we all agree. We want to get this reported to the full committee as quickly as we can, and I commend you and your associates for the help they have given the subcommittee. It has been very substantial. Without it we could not have proceeded this far. Mr. Sonnenreich has been extremely helpful.

Mr. INGERSOLL. Thank you very much, Mr. Chairman. I am sure r. Sonnenreich shares my appreciation for your kind remarks.

Senator HRUSKA. Mr. Ingersoll, I want to agree with our Chairman re that your statement reflects a good deal of talk, study and research this particular aspect of this legislation. With all due respect to your d your colleagues' prowess in the field I have an idea that you arched for wisdom and for suggestions far beyond the four walls your respective offices. Let me ask this question in regard to any search that might have been made in that direction, particularly in gard to first offenders. What progress has been made in State legisla- on on this subject? Are you informed on that, Mr. Sonnenreich?

Mr. SONNENREICH. Yes, Senator. We have been as you know, work- g on a model State act, and as a result of that, we have been looking to the State legislative processes in the drug area. We have found that there is a tendency among at least 11 States to opt toward the rst offender treatment and to opt toward lesser penalties as to the pos- ssion, your State happens to be one in particular.

There have been I believe three States, maybe four, that have opted the other direction for stiffer penalties. The biggest problem we have the State area is we really do not have any way of determining hether or not stiffer penalties are more effective or less effective.

The only thing we do know about it is the fact of course that the use increasing and it has been taking up a tremendous amount of law nforcement efforts for possession offenses, but this seems to be the end at the present time toward making a very clear distinction be- ween the first offender possessor and others. I might point out as I elieve Mr. Ingersoll pointed out in his testimony that a great majority f these people that are caught for the first time in possession, I be- eve it was either 98 or 99 percent, were first offenders for possessing ese drugs, especially marihuana.

Senator HRUSKA. Is the reason for your inability to form a conclu- ion about the need for greater or lesser penalties the lack of statistics. r is it the lack of followup in the State penalties; or is it the model ct and the State laws on the subject are of recent origin?

Mr. SONNENREICH. Well, they are of fairly recent origin, Senator, ut I believe it is also a question of statistics. I just do not think that here are adequate statistics at this point to really evaluate what the mpact is.

Senator HRUSKA. It would be difficult in minor offenses of that kind o maintain any followup, would it not?

Mr. SONNENREICH. That is correct, sir. It would be very difficult, nd you are dealing, as I believe the statistic was of some 162,000 cases. great many of them, the great majority being possession cases in he United States since last year as reported by the Uniform Crime Reports.

Senator HRUSKA. I think this illustrates once again the services which the States perform for the entire Nation in this particular field.

Mr. SONNENREICH. Absolutely.

Senator HRUSKA. Where many approaches and many efforts are made we get a little experience. Based on that experience we can mod- fy either the Federal laws or the other State laws accordingly.

Mr. SONNENREICH. It is clearly a two-way street, Senator. We do get lot of suggestions and we get a lot of experience from what the

States are doing with their own laws. By the same token we can give input to the States. That is why we are trying to work closely with them.

Senator HRUSKA. Some 10 or 12 years ago, the matter of any offense was considered by the Senate. I remember Senator Hennings of Missouri was very active in those hearings which were held when the fever and the emotion of the public was at a high pitch. The demands did not stop at 40 years for a penalty. Some even demanded the death sentence for second and third offenders. Of course, better judgment prevailed.

Not that the final product is much better. Under the law, the original sentence as I remember it was 5 years; the second offense was 10, and the third 20, with no parole. We have found that approach to be a little barbaric and insufficient, did we not? It is not flexible enough to suit all facets of the crime.

Chairman DODD. You asked about State laws, Senator. I know in my own State we reduced possession of marihuana to a misdemeanor.

Senator HRUSKA. My State did, too. We are under this model plan. In fact this seems to be the trend, is it not?

MR. SONNENREICH. For the most part, yes, Senator.

Senator HRUSKA. Thank you very much, and I join the chairman in commending you for your contribution.

Chairman DODD. Thank you, gentlemen.

MR. INGERSOLL. Thank you.

Chairman DODD. Dr. Roger Egeberg is the Assistant Secretary for Health and Scientific Affairs of the U.S. Department of Health, Education, and Welfare. He served as Assistant Secretary since July 1969, and has had a very distinguished career in the field of medicine. He has been the medical director of Los Angeles County General Hospital, dean of the University of Southern California Medical School, and professor of medicine at the University of Southern California.

Dr. Egeberg has served as a member of the President's Study of Narcotics in 1962, and on the President's Advisory Committee on Narcotics and Drug Abuse in 1963. I am sure that there is much more to his distinguished background, but I wanted to properly identify Dr. Egeberg for the subcommittee.

I am glad you are here and look forward to hearing your testimony.

STATEMENT OF ROGER O. EGEBERG, M.D., ASSISTANT SECRETARY FOR HEALTH AND SCIENTIFIC AFFAIRS, U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE; ACCOMPANIED BY DR. MORTON G. MILLER, ASSOCIATE DIRECTOR, NIMH; DR. MARK NOVITCH, SPECIAL ASSISTANT TO DR. EGEBERG; AND THEODORE ELLENBOGEN, ASSISTANT GENERAL COUNSEL, DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Dr. EGEBERG. Thank you, Mr. Chairman and members of the subcommittee.

May I first introduce on my left Dr. Morton G. Miller who is the Associate Director of the National Institute of Mental Health, and on my right Mr. Theodore Ellenbogen, who is Assistant General Coun-

for Legislation in our department, and Dr. Mark Novitch who is a ecial Assistant on my staff.

Chairman Dodd. We are glad to have you here and we will be ased to hear from them.

Dr. Egeberg. Thank you.

I very much welcome this opportunity to appear before you in nection with the important drug abuse legislation under considera- n by this subcommittee.

The similar bills introduced by the late Senator Dirksen and by the airman, Senator Dodd, as well as the related bill introduced by nator Moss, deal with a subject of very deep concern to me person- y and of immense importance to this Nation. The increasingly seri- s problem of drug abuse, a problem that encompasses health issues, ial issues, and legal issues at one and the same time, clearly requires ective action predicated on the best informed judgments of those o make law, those who enforce law, and those others, such as myself, o must look at drug abuse in a context broader than the law.

In recent weeks I have felt it appropriate to make several public tements concerning drug abuse—I may say that none of them have en volunteered, they have all been sought, specifically on the subject the use of marihuana by our young people. Because this subject is imately related to the legislation now before this committee, I ould like, Mr. Chairman, to make my views as clear as possible so at there need be no misunderstanding of what I believe, either in the blic mind or on the part of the Congress.

I neither recommend nor condone the use of marihuana by anyone, ung or old. This drug has no recognized medical value and, as a llucinogen and intoxicant, it constitutes a clear and demonstrated k to the user and thus to those with whom he comes in contact. It is entifically invalid, however, to associate marihuana with more dan- rous substances, such as heroin and other addicting drugs.

Its use under ordinary circumstances does not lead to physiological pendence, as do narcotics, nor is there any scientifically sound evi- nce to demonstrate that the use of marihuana in itself predisposes individual to go on to more potent and more dangerous drugs. I nt to emphasize that I am talking here about the relatively short- m effects of marihuana, not its potential long-term effects.

We simply do not know the effects of this drug over relatively long riods of use. We do not know, for example, to what if any extent the equent use of marihuana by young people, let us say under the age 18, may impair emotional and intellectual maturation.

It is because of its known short-term effects and the gaps in our owledge about its long-term effects that I cannot condone the use marihuana. And it is for the same reasons that I am very concerned out the marked increase in experimentation with marihuana by the uth of this country. Millions of Americans, most of them under 25 ars of age, are tampering with a drug whose long-term effects neither ey nor anyone else fully understand, and this is a situation I regard extremely serious, medically and socially.

But I want also to make as clear as possible my views concerning e treatment of these people before the law. As a physician, as a rson who served on the President's Advisory Commission on Nar-

cotic and Drug Abuse in 1962 and 1963, and as a former dean of a medical school, I cannot in good conscience accept a system of punishment that fails to recognize the major and important differences between the use of marihuana and of the so-called "hard" narcotics.

It is my strong belief that laws that threaten the user of marihuana, even when convicted of a first offense, with lengthy prison terms are unjustified, unnecessary, and very probably unenforceable. Such laws have the effect of making a large part of our population criminals by definition. They deny to the courts the opportunity to fix sentences consistent with the dual requirement of protecting society and rehabilitating the offender. And they impose on the marihuana user a degree of punishment that, in my view, can be more damaging to him and to society than is his use of this drug.

Chairman Dodd. I want you to go on and finish your statement but do you mind if I ask you a question?

Do I understand you correctly that you would not be in favor of mandatory sentences in these cases?

Dr. Egeberg. For users? Yes, I am not in favor of mandatory minimum sentences for users.

I think it is imperative:

(1) That we make a clear legal distinction between marihuana and the hard narcotics with which it has erroneously been associated in law and in the public mind, and

(2) That we make a further distinction between the individual who chooses to use marihuana and the person who is involved in the distribution of the drug.

To equate these two kinds of people in terms of the punishment given them for their contact with marihuana is, I believe, an egregious legal and social error. Speaking not as an expert on legal matters but as the ranking health official of the Federal Government, I am deeply troubled by our present ill-founded and inappropriate system of classifying dangerous drugs and punishing those who abuse them.

I think I hold a view shared by the overwhelming majority of scientists and physicians when I say we need to replace the present patchwork of Federal drug laws with a new legal structure that is consistent with society's needs and with the scientific information at hand. The legislative proposals before this committee are an important step in that direction, and I should like to comment on them.

In the opinion of this Department, the bill sponsored by Senator Dodd (S. 1895) and the administration bill, S. 2637, introduced by the late Senator Dirksen, represent a sound approach toward recodification of existing Federal law for the control of narcotics and other dangerous drugs. By providing for logical classification of drugs based on scientific knowledge, both bills represent a needed forward step toward orderly and effective drug control.

By providing a system of regulatory control that is related to the proposed classification system, the bills aim toward controls that are based on a realistic appraisal of our various kinds of drug abuse problem, rather than on emotion or unsupported opinion.

By assuring continued efforts in the all important areas of drug research and education, the bills recognize the need for a balanced approach to the control of drug abuse.

We recommend enactment of S. 2637, which is the administration oposal, with the modifications that have been suggested to your mmittee by the Department of Justice. It rationalizes and categorizes e regulatory scheme for controlling dangerous substances.

S. 2637 would give the Attorney General responsibility for specifilly those research and education activities necessary to carry out s enforcement functions, thus avoiding needless duplication of the search and education activities of this Department.

The National Institute of Mental Health of this Department, as you ow is directing a comprehensive program of drug abuse research nd education, an area in which it has no peer in the Federal Governent. The duplication of these activities in the Department of Justice, proposed in S. 1895, seems unwarranted.

As the Attorney General said in testifying before this committee on eptember 15:

> The Department of Health, Education, and Welfare has the primary function providing for research education and treatment in the field of drug abuse.

We feel very strongly that these major responsibilities must remain ith this Department.

S. 2637 would retain with the Attorney General the authority he ow has to determine when a dangerous drug should be brought under ederal control. The bill would improve this procedure by establishing our categories, or schedules of controlled substances on the basis of ie liability for abuse and legitimate medical value of each substance. s I have indicated, we believe that this provision represents a major nd necessary step toward orderly and effective control of dangerous rugs.

The decision to place a potentially dangerous substance under ederal control involves both legal and scientific considerations. There re those in the Congress and elsewhere who advocate giving to the ecretary of Health, Education, and Welfare the ultimate responsiility for deciding which substances are to be brought under Federal rug abuse control.

I would be less than candid if I did not acknowledge that there is nerit in this suggestion. The hazard to society and to an individual osed by abuse of a drug must be assessed in the light of sound scienific information on the nature of a given drug, its physiological and sychological effects, trends in its use among various segments of he population, and other factors that are largely the province of the ealth sciences.

But we must recognize that determination as to which drugs are o be brought under Federal control and in what manner are an ssential element of the regulatory process and thus should logically e made by the agency responsible for such control.

We think it is highly appropriate, indeed essential, that the Atorney General, in the exercise of his control authority, be guided y the best available scientific information, and we fully support the provision of S. 2637 requiring him to seek in writing the advice of his Department and a committee of scientists.

I would remind the committee that Attorney General Mitchell, in his testimony before you on September 15 stated that he would exercise his authority to schedule controlled substance only "upon ad-

vice in writing of a Scientific Advisory Committee and of the Secretary of the Department of Health, Education, and Welfare."

You have my assurance, Mr. Chairman, that this Department will promptly and fully meet its responsibility in this critically important area of control, so that the Attorney General will be able to base his determinations on the best possible scientific information that can be provided him.

Mr. Chairman, I would like to turn briefly to the subject of penalties for drug abuse.

As you know, officials of the Department of Justice, at the committee's request, have developed and presented alternative penalty structures for that now included in S. 2637.

Let me just indicate at this time some of my thinking with regard to penalties for drug abuse.

First: because marihuana and similar hallucinogenic drugs are fundamentally different from addictive narcotics and in our present state of knowledge, cannot be considered as hazardous as the "hard" drugs, penalties for possession and distribution of these drugs should be of a substantially lesser order.

Secondly: the courts should have greater flexibility when imposing sentence on persons convicted of drug abuse. Except in the case of the professional criminal whose traffic in drugs poses a real threat to society, minimum mandatory sentences for drug abuse are inappropriate.

The penalty alternatives that have been outlined by Mr. Ingersoll incorporate these concepts and deserve the committee's very careful consideration.

Chairman DODD. Doctor, were you consulted about these alternatives that Mr. Ingersoll testified about this morning?

Dr. EGEBERG. The Department of Justice evolved these, and we had a very cooperative discussion with them, but I would like to be sure that they get the credit for evolving the structure of penalties.

Chairman DODD. (Laughing.) Or the blame?

Dr. EGEBERG. (Laughing.) Pardon me. All right, if it is blame I suppose I will share it with them.

Chairman DODD. I take it from what you have said already, or should I take it that you would be in favor of alternative A?

Dr. EGEBERG. Yes. Personally I think I would prefer A.

Chairman DODD. I thought you would.

Dr. EGEBERG. But I would go along with A, B, or C because I think they are a great step forward.

Chairman DODD. Don't say that. I think you did very well when you stopped at A. I am glad to know your view anyhow, go right ahead.

Dr. EGEBERG. Thank you.

Mr. Chairman, you asked that we comment on the bill introduced by Senator Moss, S. 2590, calling for the creation of a Presidential Commission to conduct a 2-year study of marihuana and to report its findings and recommendations to the President and the Congress.

We are in favor of the creation of a study group, either by legislative or executive action. Such a group could perform a useful service by assembling existing information on marihuana use for the benefit of

e scientific community, law-enforcement officials, legislators, and .e public.

Such a study, whose objective would be the marshaling of existing formation on marihuana as the basis for specific recommendations, ould in no way conflict with the work of this Department pertaining basic and applied research on marihuana and the dissemination of formation about the drug.

We believe that a review of the marihuana situation could be of nsiderable value to all concerned. We are exploring with the Justice epartment the possibility of recommending that provision for such study be included in S. 2637.

Mr. Chairman, in your letter of October 1 inviting us to testify day, you asked that we answer some specific questions concerning ie administration of several statutes relating to drug abuse. We shall rovide detailed answers in writing. At this time, however, I should 'e to make a few general comments on one of your questions.

You asked for an evaluation of the need for research, educational, nd rehabilitation efforts in the drug field. I simply want to tell you at the need in all three of these areas is great. These three elements e, in effect, the other side of the coin we have been discussing today.

Without the knowledge gained through research and the applica-on of that knowledge through educational and rehabilitation pro-rams, even the best designed enforcement programs will be severely eakened, and perhaps rendered ultimately ineffective.

Mr. Chairman, in our written reply to the questions in your letter e will provide detailed comments on our rehabilitation programs, nd I would like to confine my remarks today to the remaining two ements of your question, research and education.

(The reply subsequently received was marked "Exhibit No. 34" nd will be found on p. 1166.)

Chairman Dodd. Before you do that, I would like to indicate for ie record that this 2-year study you suggest be included n S. 2637 already included in my bill S. 1895. I had in mind at the time that our Department would unquestionably do this work for the Attorney ieneral.

It is the only place I know of in government where it could be prop-rly done. I am conscious of the fact that you may not be able to answer his question at all but it will be helpful if you can. Do you have any dea how long you would want in time for such a study, 1 year, 2 years, r could you do it in less time?

Dr. Egeberg. I have a pretty good idea, but I think Dr. Miller might nswer these.

Dr. Miller. In terms of the study referred to in your bill, Senator Dodd, that is the research that needs to be done. We have also testified previously before this committee that within 2 years, given appro-riate budgetary support, we would have some initial answer and con-lusion regarding the scientific determined effects of marihuana.

Chairman Dodd. I hope we do this, and that we get this in the bill efore it comes to the floor or before the full committee.

Go ahead, Doctor.

Dr. Egeberg. I have suggested in my remarks this morning that nowledge is the foundation upon which progress in the control of

drug abuse must be based, knowledge of the nature of drugs, of their immediate and long-term effects on physical and mental health and on human behavior, knowledge of the hazard that drug abuse poses for individuals and for society—in short, a sound understanding of the drug abuse problem in all its aspects.

I believe that the Department of Health, Education, and Welfare, through the National Institute of Mental Health, is conducting a well planned and well designated program that will give us this kind of knowledge, that is in fact beginning to provide it now.

NIMH studies cover such varied aspects of the drug problem as: the addiction potential of new drugs; basic biochemical and neurophysiological aspects of drugs of abuse; the nature and extent of drug abuse in the United States; and the biological, psychological, and sociological consequences of drug abuse.

These studies range from examination of the basic neurophysiology of drug action on the brain, the nervous system, and the genetic material; to studies of the psychosocial consequences of drug abuse. These studies range from examination of the basic neurophysiology of drug action on the brain, the nervous system, and the genetic material; the studies of the psychosocial characteristics of drug users and to the care and cure of the drug addict.

These kinds of research are providing not only valuable new scientific insights into the drug problems, they also serve as the source of materials and methods needed by others in their investigations of drug abuse. NIMH, for example, sponsored the developmental work leading to the identification and production of tetrahydrocannibinol (THC), the active constituent of marihuana.

This accomplishment has provided the scientific community a standardized substance for use in controlled studies of marihuana and has done away with the need to rely on the natural product which as you know has a highly variable potency.

It is, admittedly, difficult to assess precisely the value of a program of basic research. But experience in this and other health-related fields of endeavor leave no doubt in my mind that such studies are not only urgently needed but will be increasingly effective in this Nation's efforts to deal with the problem of drug abuse.

As a physician, I feel very strongly that the best approach to virtually any health problem, certainly including drug abuse, is prevention. The educational efforts of NIMH are, in our view, appropriately and effectively aimed in this direction.

There are several aspects of the NIMH information and education program, including a public service announcement series presented in cooperation with the mass media; programs for the educational community, including curriculum development and workshops; a program to disseminate the authoritative information to parents, youngsters, and the general public; and a professional communication program aimed at providing scientific information to physicians and researchers.

Strong emphasis is being placed on "educating the educators" to make them more effective agents of prevention, as well as on reaching the general public to alert them to the hazards posed by drug abuse.

I have no intention of claiming that NIMH, through its educational activities, has achieved dramatic results, nor do I think dramatic

sults can be expected overnight. Nevertheless, there is evidence in the decline of LSD use following wide dissemination of information about its adverse and often unpredictable effects, that public understanding of drug hazards can have a real impact on patterns of drug abuse. This Department feels a genuine necessity to continue its drug abuse education activities because of the important contribution they can and will make toward effective control.

Mr. Chairman, this concludes my statement. I will be pleased to answer any questions you and the members of the committee may care to ask.

Chairman Dodd. That statement of yours will be very helpful to us. The mere fact you have made it this morning will be helpful because it will lay at rest some misinformation that is abroad about this problem.

What evidence, if any, is there that the long-term use of marihuana predisposes a person to the use of other more dangerous drugs or more potent drugs? Or is there any evidence to this effect?

Dr. Egeberg. I know of no evidence that this is true. I would like to ask Dr. Miller if he would care to comment.

Dr. Miller. There is indeed no evidence, Senator Dodd.

Chairman Dodd. What?

Dr. Miller. There is no evidence that the drug itself has any properties which will lead someone to use other drugs. I think it is generally recognized that the use of drugs, particularly by very heavy users, tends to become a multiple use phenomenon, so that probably a certain percentage of marihuana users will also use other drugs, amphetamines, barbiturates, perhaps even heroin.

There is nothing within the characteristics of marihuana per se which leads people to use other drugs.

Chairman Dodd. That is what I wanted to know. We will have to know these things. Of course, Senator Hruska is aware we will have to know when we get into the full committee and certainly when we get before the Senate.

There will be a lot of debate on this question. There are a lot of people who do believe that the use of marihuana leads to the use of other more dangerous drugs. I know you are right about it in my own mind, but the task will be to make this so clear that there can be no doubt about it in the minds of others.

Senator Hruska. Would the chairman yield at this point?

Chairman Dodd. I will be glad to yield.

Senator Hruska. Dr. Miller, could there be evidence to the contrary or the converse? Could it be imagined and would there be any evidence obtainable on the proposition that use of marihuana would deter people, in view of their experience and the affection from going into any other fields of drugs or of the narcotics?

Dr. Miller. I do not think there is specific evidence in that regard. I am sure that people, for instance who had an unpleasant experience from the use of marihuana or other such drugs might be thereby convinced not to try something else but there is no scientific data, Senator Hruska.

Senator Hruska. In both fields we lack evidence, do we not?

Dr. Miller. Yes.

Dr. Egeberg. Could I suggest one thing here. It occurs to me that when I was on the Presidential Commission on Narcotic and Drug

Abuse, the number of marihuana users in this country was probably one-twentieth or less of what it is now, that the hard narcotics users have probably not gone up anywhere near in proportion. I admit that finding statistics that are valid on hard narcotics users is difficult, and one has to use estimates, but the estimates would indicate that in spite of the great rise, and even the creation of a marihuana culture, the use of the hard narcotics has not gone up at all in this proportion.

Senator HRUSKA. Might not the element of time enter in there? It would take a little while to record and to gather information on the progression for marihuana to harder drugs. You would have to allow a little more time than 6 or 7 years, item 1 for the event to happen, item 2, to gather the information thereon?

Dr. EGEBERG. Yes, I think that is a logical question, but so far——

Senator HRUSKA. No results?

Dr. EGEBERG. Yes.

Senator HRUSKA. That is no appreciable results?

Dr. EGEBERG. That is right.

Senator HRUSKA. In a commensurate fashion?

Dr. EGEBERG. That is correct.

Senator HRUSKA. I wish there were something to encourage us to believe that once the urge to try something new and daring and the thing that is being done by the use of marihuana, maybe the experience is so disagreeable on the morning after that maybe they would not want to venture into new fields of experimentation. But be on the lookout. It might be an optimistic hope, anyhow, maybe not very realistic, but try to find it.

Chairman DODD. I do not think a hangover has ever helped too much, or that a hangover has been a very good remedy for drinking.

Senator HRUSKA. But drinking cannot equate with marihuana, can it?

Chairman DODD. I do not know. I thought your treatment was somewhat similar.

Dr. EGEBERG. If personal experience is worth anything I think a hangover is a good deterrent.

Chairman DODD. I have been told that is true. I know what you are saying but I do not want any doubts about it on the record. You were just telling us that the incidence and use of marihuana has grown enormously while the increased rate of the use of hard narcotics is much less. Is that about what you are telling us? It has increased in other words, but not as much?

Dr. EGEBERG. That is our impression. These statistics are difficult to get.

Chairman DODD. That is what I wanted to make clear. Now, let me ask you this question. What, if any, definite information do you have relative to marihuana that can be made available to this subcommittee in the next couple of weeks?

Dr. EGEBERG. For that I think I would have to refer you to Dr. Miller.

Have you got anything?

Dr. MILLER. Again, to cite Dr. Yolles's testimony here previously, he has submitted a list of some 10 so-called facts and fables which details generally what we do and do not know about marihuana.

Marihuana, for instance, is not a narcotic drug scientifically. It does not cause physical addiction. In terms of relationship between marihuana and crime, we know that persons under the influence of marihuana tend to be passive. Marihuana does not lead to our knowledge to any increase in sexual activity. We do believe that contrary to many people's feelings, that marihuana is not a harmless drug. We know instances of acute panic, depression and psychotic states which have been associated with marihuana use.

We know that marihuana does not lead inexorably to the use of heroin, as Dr. Egeberg has pointed out. We believe we have information to indicate that marihuana does not enhance creativity.

We do not know specifically as to how one could compare scientifically the short- and long-term effects of alcohol and marihuana, but we are currently supporting and conducting research which hopefully will differentiate some of this.

I think we know that more severe penalties will not solve the marihuana problem, based on the increase, the enormous increase in marihuana, in the face of very severe penalties, and I think we also know that it is unsafe to drive while under the influence of marihuana as under the influence of any intoxicant.

Chairman DODD. As you know, Dr. Yolles was here and testified. He said he was not representing anybody. Are you familiar with his testimony?

Dr. MILLER. Yes, sir; I am.

Chairman DODD. I suppose you are. Maybe you could validate it for us this morning. Do you think he was right? Maybe he could name you his agent here today?

Dr. MILLER. Insofar as I am in Dr. Yolles' employ that is perfectly appropriate, sir. I am with the National Institute of Mental Health.

Dr. EGEBERG. I think you know Dr. Yolles was speaking specifically for himself.

Chairman DODD. He made that very clear. It was a unique appearance here for a Government official to come from his agency and say that he was speaking only for himself. I thought it might be helpful if we could clarify that point.

Would you now like to say he can speak for the agency as well?

Dr. EGEBERG. Well, I think that Dr. Miller is here, and if Dr. Yolles had been here today he or both of them would be speaking for the agency.

Chairman DODD. That is all right. That does it just about as well as we could expect you to do it. This may be off the subject a little bit, Dr. Egeberg, but would you care to tell us what is your view with regard to including in the current proposals such tranquilizers as Miltown, Librium, and Valium?

Dr. EGEBERG. My own feelings, and I would say I can speak for the Department, are that these should be included along with the barbiturates, and others as they develop.

Chairman DODD. Thank you very much for that. That is very valuable. I think it will be very persuasive I am sure. I thank you and commend you for your appearance here this morning.

MISCELLANY.

Limiting or Prohibiting the Possession of Intoxicating Liquors for Personal Use.—"Alas, poor Yorick, I knew him well." This feeling sentiment appeared recently under a cartoon depicting a thirsty faced individual holding in his arms an empty beer keg through the bung holes of which, pictured as the eye holes of a skull, the last drop of amber liquid had long since run. Many is the man, and hush! speak it low, and woman too, who will gaze with fond recollections and intense longing on the empty receptacles which in bygone days were filled with the spirit that cheers. And their inability to replace the dear lost ones will cause exceeding hurt. But they will get over it, for they say that time heals all things, and in days to come they will cease to mourn the lost one and their regrets will be softened by the pictures they can conjure up of the good times that flowed from the associations with the long departed. To them the adage that there are as good fish in the sea as ever came out, will no longer give comfort and they must be content to dwell in the pleasant memories of the past. A kind of spiritualistic seance, as it were. But how about him who has tenderly nursed and preserved his loved one to soothe and calm his declining years, housing her within impregnable walls (cellars rather) and surrounding and protecting her against inquisitive and covetous eyes? What will be his feelings when the ruthless hands of the law break down his stronghold and seize and bear away his mistress to destruction? It is one thing to say, No more shall you flirt with and wed the nymphs of Bacchus, but quite another to seize the nymph whom you have lawfully wedded and forcefully tear her from your loving embrace. And this brings us to the serious side of the question.

How far, in the exercise of its police power, may the state go in prohibiting the possession and personal use of intoxicating liquors which have been lawfully acquired? In many states laws have been passed limiting the amount that may be possessed at any one time, and in some the possession of any amount whatsoever, even one teeny weeny drop of the awful stuff, has been prohibited. And these laws have been declared to be a proper and lawful exercise of the police power by the highest court in the land. It is interesting to note the gradual change in judicial opinion on this question in keeping with the growth of the prohibition movement. At first the legislatures were content to prohibit its manufacture and sale and in most instances they were particularly careful to insert a provision that the law did not apply to the possession of liquor for personal use. But later they began to place a limit on the amount that might be possessed, and finally in some instances prohibited the possession of any quantity whatsoever. If the press reports of the bills introduced in Congress to enforce the prohibition laws are correct the

latter provision is embodied therein. That the acquisition of liquor for personal use may be prohibited seems to be conceded, but whether the state can by law deprive one of the possession of liquor lawfully acquired, is another question, though the trend of the more recent decisions is strongly in favor of the view that it can.

One of the earliest cases passing on the power of the state to forbid the possession of intoxicating liquors for personal use was Preston *v.* Drew, 33 Me. 558, 54 Am. Dec. 639, decided in 1851. Here a statute providing that no action could be maintained for the recovery of the possession of intoxicating liquor or the value thereof was held to be unconstitutional as a deprivation of property without due process of law. The court, recognizing that the state might legally forbid the future acquisition of intoxicating liquors, said: "The State, by its legislative enactments, operating prospectively, may determine that articles injurious to the public health or morals shall not constitute property, within its jurisdiction. It may come to the conclusion that spirituous liquors, when used as beverage, are productive of a great variety of ills and evils to the people, both in their individual and in their associate relations. * * * Such conclusions would be justified by the experience and history of man. If a legislature should declare that no person should acquire any property in them, for such a purpose, there would be no occasion for complaint that it had violated any provision of the constitution." And hearken to this from Kentucky (Com. *v.* Campbell, 133 Ky. 50), 117 S. W. 383, 19 Ann. Cas. 159, 24 L. R. A. (N. S.) 172. It sounds like a voice from the tomb: "The right to use liquor for one's own comfort, if the use is without direct injury to the public, is one of the citizen's natural and inalienable rights, guaranteed to him by the Constitution, and cannot be abridged as long as the absolute power of a majority is limited by our present Constitution. The theory of our government is to allow the largest liberty to the individual commensurate with the public safety, or as it has been otherwise expressed, that government is best which governs the least. Under our institutions there is no room for that inquisitorial and protective spirit which seeks to regulate the conduct of men in matters in themselves indifferent and to make them conform to a standard not of their own choosing, but the choosing of the lawgiver; that inquisitorial and protective spirit which seeks to prescribe what a man shall eat and wear, or drink or think, thus crushing out individuality and insuring Chinese inertia by the enforcement of the use of the Chinese shoe in the matter of private conduct of mankind. We hold that the police power—vague and wide and undefined as it is—has limits, and in matters such as that we have in hand its utmost frontier is marked by the maxim 'Sic utere tuo ut alienum non ledas.'" Among the many cases supporting the sound constitutional doctrines announced in the cases just quoted from, see Luera's Application,

28 Cal. App. 185, 152 Pac. 738; Cortland *v.* Larson, 273 Ill. 602, 113 N. E. 51, Ann. Cas. 1916E, 775, L. R. A. 1917A, 314; Shreveport *v.* Hill, 134 La. 352, 64 So. 137, Ann. Cas. 1916A, 283; Flowers *v.* State, 8 Okla. Crim. 502, 129 Pac. 81; State *v.* Rookard, 87 S. C. 442, 69 S. E. 1076. The theory of these cases is that there being a property right in intoxicating liquors, lawfully acquired, it is beyond the power of the state in the exercise of its police power to destroy it.

But as the cohorts of prohibition have advanced, the constitutional barriers have fallen one by one, until we come to the decision in Crane *v.* Campbell, 245 U. S. 304, 38 S. Ct. 98, 62 U. S. (L. ed.) 304. This case arose in Idaho and involved the construction of a statute making it unlawful for any person to have in his possession any intoxicating liquors of any kind for any use or purpose except for scientific, medical or sacramental purpose, as provided by the act. The Idaho Supreme Court held the statute to be constitutional and on appeal to the Supreme Court of the United States the Idaho case was affirmed. After stating that it is well settled that a state may prohibit the manufacture, sale, gift, purchase or transportation of intoxicating liquors, the Supreme Court goes on to say: "As the State has the power above indicated to prohibit, it may adopt such measures as are reasonably appropriate or needful to render exercise of that power effective. * * * And, considering the notorious difficulties always attendant upon efforts to suppress traffic in liquors, we are unable to say that the challenged inhibition of their possession was arbitrary and unreasonable or without proper relation to the legitimate legislative purpose. We further think it clearly follows from our numerous decisions upholding prohibition legislation that the right to hold intoxicating liquors for personal use is not one of those fundamental privileges of a citizen of the United States which no State may abridge. A contrary view would be incompatible with the undoubted power to prevent manufacture, gift, sale, purchase or transportation of such articles—the only feasible ways of getting them. An assured right of possession would necessarily imply some adequate method to obtain not subject to destruction at the will of the State." Apparently this decision gave the death blow to John Barleycorn, at least in so far as Idaho was concerned. But unfortunately the court in this case did not take notice of the time when the liquor was acquired and the language used is seemingly broad enough to cover the possession of liquor no matter when acquired or whether its acquisition was lawful or unlawful. At any rate it was so interpreted by the Utah court in State *v.* Certain Intoxicating Liquors, 172 Pac. 1050, L. R. A. 1918E, 943, wherein it was held on authority of the Crane case, supra, that a statute prohibiting the possession of intoxicating liquor for personal use was constitutional, and that it was immaterial when, how or where it had been acquired. It appeared from the facts in this case that the

liquor was lawfully acquired before the statute went into effect and the lower court held the statute to be unconstitutional basing its ruling on the ground that property rights in liquor lawfully acquired could not be destroyed by the state. In reversing the case on that point, the Supreme Court said: "If we correctly interpret the meaning of the opinion of the very able and learned trial judge, he holds that the acts does not undertake to prohibit the use or drinking of intoxicating liquors within the state except as in the act expressly mentioned, and that the state may not, in the lawful exercise of its police powers, confiscate and destroy intoxicating liquors within the state, when acquired for personal use and recognized as property before the act became effective. * * * We have heretofore pointed out that in our judgment it was the intent of the legislature, and that the plain provision of the act abolishes, aside from the exceptions expressly made, all property rights in alcoholic liquors on and after August 1, 1917, no matter where or how acquired, for what use intended, or how possessed. It necessarily follows that the very purpose and intent of the act was to preclude the right to use intoxicating liquor within the state except for the specific purposes in the act expressly mentioned and reserved." And now we come to the case of Barbour *v.* Georgia, 39 S. Ct. 316. Here the Georgia court like that of Utah held that it was within the police power of the state to prohibit the possession of intoxicating liquor for personal use, and the fact that it incidentally destroyed the property rights lawfully acquired therein before the law became effective did not render it void as contrary to the Fourteenth Amendment of the Federal Constitution, and the Supreme Court of the United States sustained the decision. Among the recent decisions adopting this construction, see the following: Frazier *v.* State (Ala.), 73 So. 764; Southern Express Co. *v.* Whittle, 194 Ala. 406, 69 So. 652; O'Rear *v.* State (Ala.), 72 So. 505; State *v.* Carpenter (S. C.), 92 S. E. 373. As may be seen from these cases the tendency of the more recent legislation with respect to alcoholic liquors is directly against the consumption on the theory that it is in consumption always that the evil lies.

But in the Barbour case we see the first glimmer of hope for the man with the well stocked cellar—a small, very small one it is true, but nevertheless it is there. The court sustains the decision of the Georgia court, but is very careful to point out that in that case, although the liquor was acquired before the law became effective, it was acquired after the passage of the act, and though lawfully acquired, the possessor was put on notice by the passage of the law of the inherent evil qualities of his property. It also points out that in the Crane case it only decided that liquor acquired after the passage of an act forbidding its possession, though lawfully acquired, could be outlawed by the statute; and particularly states that in

neither the Crane case nor the Barbour case did it decide that liquor acquired before the passage of an act making its possession unlawful could be divested of its property rights by the statute. So here we find the one possible oasis in the coming desert. The court also states that the particular question as to whether a state can legally prohibit the possession of liquor acquired before the passage of the act has never been passed on by it, although the two cases cited as touching on the question give a very clear indication of what would have been decided by the court as then constituted. In Boston Beer Co. *v.* Massachusetts, 97 U. S. 25, 24 U. S. (L. ed.) 989, the court while holding that a state might enact a law prohibiting the manufacture and sale of intoxicating liquor said: "We do not mean to say that property actually in existence, and in which the right of the owner has become vested, may be taken for the public good without due compensation. But we infer that the liquor in this case, as in the case of Bartemeyer *v.* Iowa (18 Wall. 129), 21 U. S. (L. ed.) 929, was not in existence when the liquor law of Massachusetts was passed." And in Bartemeyer *v.* Iowa, 18 Wall. 129, 21 U. S. (L. ed.) 929, it was said: "The weight of authority is overwhelming that no such immunity has heretofore existed as would prevent State legislatures from regulating and even prohibiting the traffic in intoxicating drinks, with a solitary exception. That exception is the case of a law operating so rigidly on property in existence at the time of its passage, absolutely prohibiting its sale, as to amount to depriving the owner of his property."

The reasoning on which the decision in the Barbour case is based is somewhat difficult for the ordinary mind to grasp. The court says: "Does the Fourteenth Amendment, by its guaranty to property, prevent a state from protecting its citizens from liquor so acquired? A state, having the power to forbid the manufacture, sale, and possession of liquor within its borders, may, if it concludes to exercise the power, obviously postpone the date when the prohibition shall become effective, in order that those engaged in the business and others may adjust themselves to the new conditions. Whoever acquires, after the enactment of the statute, property thus declared noxious, takes it with full notice of its infirmity and that after a day certain its possession will, by mere lapse of time, become a crime." Now if property rights existed in liquor acquired after the passage of the act but before it went into effect how could it be divested by the law becoming operative? In other words how did the law going into effect affect the inherent evil nature of the liquor? Was it innocent of evil during the period between the passage of the act and the time set for it to go into effect, and then suddenly by the magic touch of legislative legerdemain did it become invested with all the qualities of the evil one? And could it be said that liquor purchased before the passage of an act declar-

ing its possession to be unlawful retained its innocent and law abiding qualities, while liquor purchased after the passage but before the law became effective lost its innocent character and assumed the livery of the evil one on the happening of the latter event? It would seem that the wish to uphold the statute was stronger than the reasoning on which the decision was based.

What does this opinion presage as to the court's action, should it be called on to construe a law of Congress, enforcing the prohibition amendment, containing provisions prohibiting the possession of intoxicating liquors for personal use? Does not the amendment put all on notice of the evil qualities of liquor and in the language of the court "whoever acquires, after the enactment of the statute, property, thus declared noxious, takes it with full notice of its infirmity, and that after a day certain its possession will, by mere lapse of time, become a crime?" The cases are certainly parallel, and if a legislative enactment can warn the possessor of the evil qualities about to inhabit his property surely an amendment to the Constitution adopted by forty-five states is a trumpeting announcement that that which to-day is innocent of evil in the eyes of the law shall in the near future be looked upon by the same law as invested with noxious qualities. In one other recent case the Supreme Court has shown some signs of relenting in its strict construction of the liquor laws. In U. S. *v.* Gudger, 39 S. Ct. 323, the court held that the Reed Amendment prohibiting the transportation of intoxicating liquor into any state which had prohibited its manufacture, sale, etc., did not apply to liquor being transported through the state. In this case it appears that a passenger bound from Baltimore to Asheville, North Carolina, was arrested in Lynchburg, Virginia, where his train was temporarily stopped and his baggage searched.

But the state legislatures and courts are still revelling in extreme and rigorous laws. As an instance to what extremes a law-making body may go in its zeal to deal a death blow to intoxicating liquors, take the recent statute passed by the legislature of Georgia. By this statute it is made illegal to manufacture, sell, etc., all liquors and beverages or drinks made in imitation of or intended as a substitute for beer, wine, whisky or other alcoholic or spirituous, vinous or malt liquors (Acts 1915, p. 77). And the Supreme Court of Georgia, holding this act to be constitutional even when applied to beverages admitted to be non-intoxicating, said: "On the basis of protecting health, morals, and the public safety, the provisions of the act making it illegal to manufacture, sell, etc., intoxicating liquors have been held to be a valid exercise of the police power. Delaney *v.* Plunkett, 146 Ga. 547, 91 S. E. 561, Ann. Cas. 1917E, 685, L. R. A. 1917D, 926. The manufacture and sale of drinks made in imitation of or intended as a substitute for intoxicating drinks as specified in the act, although not intoxicating themselves, afford a cloak for

61-801 O - 77 - 60

clandestine manufacture, sale, etc., of intoxicants—the evil which the legislation was designed to prevent. Under such circumstances, the power to prohibit the manufacture, sale, etc., of the beverages will include the power also to prohibit the manufacture and sale of substitutes and imitations." Purity Extract, etc., Co. *v.* Lynch, 226 U. S. 192, 33 S. Ct. 44, 57 U. S. (L. ed.) 184. Under this view, it is within the police power of the state to enact a law prohibiting the manufacture and sale of liquors and beverages not intoxicating in character, but made in imitation of or intended as a substitute for beer, ale, wine, whisky, or other alcoholic or vinous or malt liquors." Kunsberg *v.* State, 147 Ga. 95 S. E. 12. Luckily for the Salvation Army the twenty-five or more saloons in New York city on which it has obtained options are not located in Georgia. It is the announced purpose to conduct these saloons in all particulars, i. e., with bars, mirrors, fixtures, brass rail and all, just as they are now conducted, except that in the place of alcoholic beverages there will be served over the bar as a substitute, soda water, buttermilk, ice cream, etc.

There is another phase of this question which deserves careful and unprejudiced consideration. For years the right of property in intoxicating liquors was recognized by the law-making bodies and the courts. Only in comparatively recent times has this been denied. If such a right of property exists it is setting a dangerous precedent to deprive the owner of it by legislative ukase. Where will such a precedent lead us? The right of property, always so jealousy guarded by civilized governments, was never before in the history of the world so jeopardized. One big country has repudiated it in a large measure and the leaders of that doctrine are endeavoring with all their might to fasten it upon others and with some degree of success in its neighboring states. Even here in our own great land of the free these destroyers of human liberty in the name of liberty are organizing and their insidious propaganda is being industriously spread. The professional reformer, whether he be prohibitionist, advocate of blue laws, or what not, is prone to say of such arguments as the above that they display "prejudice, blind prejudice, born of interest and not of reason." But is it not time for all of us to cease imputing prejudice and to realize that an honest difference of opinion can exist without prejudice and without ulterior motive? When one looks at the question from the standpoint of the lover of constitutional government and not that of a partisan or follower of any particular fad or ism, can it be said that the precedent set by such decisions does not lead logically and directly to the doctrine advocated by the Bolsheviki? To them all property possessed by the individual is against the health, morals, and general welfare of the public, so they take it away. In the present case it is prop-

erty in liquor lawfully acquired that is taken, but for the same reasons as announced for the action of the Bolsheviki. The tendency of such decisions is well expressed by Chief Justice Browne in his dissenting opinion in Morasso *v.* Van Pelt recently decided by the Florida Supreme Court. The majority, following the decision of the Crane case, upheld the Florida law limiting the amount of intoxicating liquor that might be possessed for personal use. But in an exceptionally well-reasoned dissenting opinion Justice Browne said: "The right to abolish private ownership of property for the public welfare is predicated on the doctrine that whatever a strong and preponderant public opinion regards as against the prevailing morality and inimical to the public welfare constitutional guarantees are impotent to secure. This is the apotheosis of the police power, at whose feet all constitutional guarantees must humbly kneel, petitioning but not demanding observance. Before it, the right of free speech, a free press, freedom of conscience and religious worship, must yield. The attention of the civilized globe is now centered in one of the great nations of the world whose government, conducted upon this doctrine, is ruthlessly destroying life, liberty and property. There the 'prevailing morality' and the 'strong and preponderant opinion' is that private ownership in lands and manufacturing capital, and private wealth, are inimical to the public welfare; that they produce idleness, pauperism, suffering and crime, and consequently must be abolished. These people feel as deeply on these subjects as our people feel on the liquor question. Their doctrine is not a new one. It was proclaimed by Karl Marx more than half a century ago, but it has recently become more insistent, and its spread threatens our own institutions. He taught that 'the proletariat will use its political supremacy to wrest by degrees all capital from the bourgeoise,' and his followers advocate that 'the institution of private property, that is, the right of private ownership in things tangible or intangible, is to be abolished—by indirect and peaceful means as far as convenient, but by violence so far as conducive to speed and thoroughness of the change.' It is a short step—one that will be essayed much sooner than many anticipate—from abolishing private property in intoxicating liquors, to abolishing without compensation private property in lands, manufacturing capital, railroads or other public utilities, whenever a 'strong and preponderant public opinion' shall consider the public welfare demands it. When that time comes, the decision of the majority of the court in this case, and those in line with it, will be authority for legislation along these lines, and they will plague those who too late seek to check further inroads upon the rights of property. Not the least of the evils that the traffic in liquor is responsible for, is this line of decisions sustaining laws destructive of property and

property rights, enacted in response to 'strong and preponderant opinion.'"

Do not let the possessors of well-stocked wine cellars delude themselves with the idea that Congress or the states will not go to such extreme lengths as to take away from them the liquor which they have lawfully acquired for their own personal use. Such laws already exist in not a few states and a similar provision is incorporated in one of the bills introduced in Congress, and one of our most prominent business men and capitalists, Mr. Schwab, according to the press, advocates such a law. In his opinion if we are to have nationwide prohibition we should be consistent about it and make it apply to all alike. If we are to deprive the poor man of his beer, then make the rich man empty his wine cellars. And there are many who agree with him. A law prohibiting the possession of any intoxicating liquors, no matter when, where or how acquired, would do this, and the Supreme Court has said that it is a lawful exercise of the police power, certainly to the extent of liquor acquired after the enactment of laws prohibiting their possession although acquired before the law becomes operative.—Minor Bronaugh in Law Notes.

Illicit Drug Traffic

IN a recent address delivered before a luncheon gathering of the Association, Commissioner Anslinger of the Bureau of Narcotics enumerated some of the difficulties confronted by those in charge of the suppresion of the illicit traffic in narcotic drugs, and especially in the District of Columbia, where, owing to the inadequacy of the District Code effective enforcement is rendered extremely difficult. He emphasized the fact that the Bureau of Narcotics regards with grave concern the accumulating reports of the increased use in certain of the states and in the District of Columbia of marihuana, which is the Mexican name for the drug designated in the United States Pharmacopoeia as cannabis. It consists of the dried flowering tops of the pistillate plants of cannabis sativa Linne (Fam. Moraceae). One of the chief reasons for this apprehension is the wide-spread use of this drug in the form of cigarettes. This noxious plant is cultivated and also grows wild by the roadside, in ditches and in open meadows. Its accessibility makes it easy to obtain as it is indigenous to every State. It has been cultivated in the United States for its commercial use and it is also used to a limited extent in medicine as a mild counter irritant.

The active narcotic principles of cannabis sativa seem to affect the higher nerve centers, producing first an exaltation, then later an increased feeling of physical strength, followed by a stimulation of the imagination in a more or less delirious state, which lasts until it gradually merges into frenzy. Those who are habituated to the drug develop an uncontrollable rage after its use and during the stimulation are liable to, and often do, commit violent crimes.

The Federal Government has no control over the sale and distribution of marihuana under the Harrison Narcotic Act, but the uniform Narcotic Drug Act drafted and approved by the National Conference of Commissioners on Uniform State Laws and recommended for enactment in all of the States at its 42d annual conference in Washington, D. C., October 1932, includes can-

nabis or marihuana and expressly prohibits its production, preparation, etc., without a license from the proper official.

Twenty-nine States have adopted the Uniform Narcotic Drug Act; eleven States are operating under State legislation. In the District of Columbia and in the following eight states the sale and possession of cannabis is not a criminal offense: New Hampshire, Maryland, Virginia, North Carolina, South Carolina, Kentucky, Tennessee and Minnesota. The uniform law presents many advantages over the state legislation as found in a number of the states. It prohibits street, or retail peddling and also prohibits improper possession, the enforcement of which prohibitions is of the utmost importance as a supplement to Federal activity, as the facilities of the Bureau of Narcotics are not designed for such work, but are intended rather for operations in the detection and elimination of the larger wholesale sources of illicit supply within the states. The uniform law also inclusively defines the dangerous habit forming drugs and makes provision for simple additional amendment to the act to include any other dangerous drug which may need to be brought under control. The duties and responsibilities of the dispensing professions with respect to the sale and administration of narcotics are quite clearly defined. An adequate set of records is required to be kept. The false or fraudulent execution of narcotic prescriptions is condemned as an offense. It has many other indispensable advantages essential to the proper control of the illicit traffic in narcotic drugs. In fact the Bureau of Narcotics reports that is seems to fill every need and to meet all emergencies for investigation, detection and judgment.

In those states where the uniform law is not in effect efforts are being made by the Bureau to have it adopted, since strong legislation presents the best means of control over all narcotic drugs. The citizens of those st tes in which the unlawful sale or possession of marihuana is not a criminal offense may well be apprehensive of the evil consequences of marihuana cigarettes. The facility of communication from one commonwealth to another requires that something in the way of reciprocal legislation should be enacted to safeguard such communities from encroachment by criminals who have been driven out of states where appropriate legislation operates. No state or community should fall below the level of the adequate law of other states.

The Police Department of the District of Columbia is obliged, owing to the inadequacy of the District Code, to prosecute marihuana violators under the Pharmacy Act, which provision is entirely inadequate to meet the present needs for infraction of the Narcotic Drug Law. With a view to securing for the District of Columbia adequate laws to cope with the illicit drug traffic the Association only recently sponsored a resolution pledging its cooperation with the office of the Corporation Counsel of the District of Columbia in drafting appropriate legislation, which should conform, as nearly as may be practicable, to the Uniform Narcotic Act, and in urging upon the Congress the speedy enactment of such legislation.

MORAL PASSAGE: THE SYMBOLIC PROCESS IN PUBLIC DESIGNATIONS OF DEVIANCE

JOSEPH R. GUSFIELD
University of Illinois

The fact of public affirmation of a norm through law and government action expresses the public worth of one sub-culture vis-à-vis others. Because different forms of deviance affect that normative status in different ways, they incur different responses from the designators. Three forms of deviance are disinguished: repentant, sick, and enemy. One form threatens the public affirmation of the norm more than another. The public definition of deviance undergoes changes from one form to another, as illustrated in issues of drinking control. Where consensus on the norm is lacking and deviants become enemies, movements for legal restrictions are most likely. It is not the frequency of deviant acts but the symbolic import of deviance for the status of the norm which is determinative of these reactions.

Recent perspectives on deviant behavior have focused attention away from the actor and his acts and placed it on the analysis of public reactions in labelling deviants as "outsiders."[1] This

[1] Howard S. Becker, *Outsiders: Studies*

perspective forms the background for the present paper. In it I will analyze the implications which defining behavior as deviant has for the public designators. Several forms of deviance will be distinguished, each of which has a different kind of significance for the designators. The symbolic import of each type, I argue, leads to different public responses toward the deviant and helps account for the historical changes often found in treatment of such delinquents as alcoholics, drug addicts, and other "criminals," changes which involve a passage from one moral status to another.

INSTRUMENTAL AND SYMBOLIC FUNCTIONS OF LAW[2]

Agents of government are the only persons in modern societies who can legitimately claim to represent the total society. In support of their acts, limited and specific group interests are denied while a public and societal interest is claimed.[3] Acts of government "commit the group to action or to perform coordinated acts for general welfare."[4] This representational character of governmental officials and their acts makes it possible for them not only to influence the allocation of resources but also to define the public norms of morality and to designate which acts violate them. In a pluralistic society these defining and designating acts can become matters of political issue because they support or reject one or another of the competing and conflicting cultural groups in the society.

Let us begin with a distinction between *instrumental* and *symbolic* functions of legal and governmental acts. We readily perceive that acts of officials, legislative enactments, and court decisions often affect behavior in an instrumental manner through a direct influence on the actions of people. The Wagner Labor Relations Act and the Taft-Hartley Act have had considerable impact on the conditions of collective bargaining in the United States. Tariff legislation directly affects the prices of import commodities. The instrumental function of such laws lies in their enforcement; unenforced they have little effect.

Symbolic aspects of law and government do not depend on enforcement for their effect. They are symbolic in a sense close to that used in literary analysis. The symbolic act "invites consideration rather than overt reaction."[5] There is a dimension of meaning in symbolic behavior which is not given in its immediate and manifest signifi-

in the Sociology of Deviance, Glencoe: The Free Press, 1963, Chap. 1. A similar view is presented in John Kitsuse, "Societal Reaction to Deviant Behavior," *Social Problems*, 9 (Winter, 1962), pp. 247-56; Kai Erikson, "Sociology of Deviance," in E. McDonagh and J. Simpson, editors, *Social Problems*, New York: Holt, Rinehart and Winston, Inc., 1965, pp. 457-464, p. 458.

[2] The material of this section is more fully discussed in my book *Symbolic Crusade: Status Politics and the American Temperance Movement*, Urbana: University of Illinois Press, 1963, esp. Chap. 7.

[3] See the analysis of power as infused with collective goals in Parsons' criticism of C. Wright Mills, *The Power Elite:* Talcott Parsons, "The Distribution of Power in American Society," *World Politics*, 10 (October, 1957), p. 123, 144. [See his book, *Structure and Process*, Glencoe, Illinois: Free Press, 1960.]

[4] Francis X. Sutton, "Representation and the Nature of Political Systems," *Comparative Studies in Society and History*, 2 (October, 1959), pp. 1-10. In this paper Sutton shows that in some primitive societies, political officials function chiefly as representatives to other tribes rather than as law enforcers or policy-makers.

[5] Phillip Wheelwright, *The Burning Fountain*, Bloomington: Indiana University Press, 1964, p. 23.

cance but in what the action connotes for the audience that views it. The symbol "has acquired a meaning which is added to its immediate intrinsic significance."[6] The use of the wine and wafer in the Mass or the importance of the national flag cannot be appreciated without knowing their symbolic meaning for the users. In analyzing law as symbolic we are oriented less to behavioral consequences as a means to a fixed end; more to meaning as an act, a decision, a gesture important in itself.

An action of a governmental agent takes on symbolic import as it affects the designation of public norms. A courtroom decision or a legislative act is a gesture which often glorifies the values of one group and demeans those of another. In their representational character, governmental actions can be seen as ceremonial and ritual performances, designating the content of public morality. They are the statement of what is acceptable in the public interest. Law can thus be seen as symbolizing the public affirmation of social ideals and norms as well as a means of direct social control. This symbolic dimension is given in the statement, promulgation, or announcement of law unrelated to its function in influencing behavior through enforcement.

It has long been evident to students of government and law that these two functions, instrumental and symbolic, may often be separated in more than an analytical sense. Many laws are honored as much in the breach as in performance.[7] Robin Williams has labelled such institutionalized yet illegal and deviant behavior the "patterned evasion of norms." Such evasion occurs when law proscribes behavior which nevertheless occurs in a recurrent socially organized manner and is seldom punished.[8] The kinds of crimes we are concerned with here quite clearly fall into this category. Gambling, prostitution, abortion, and public drunkenness are all common modes of behavior although laws exist designating them as prohibited. It is possible to see such systematic evasion as functioning to minimize conflicts between cultures by utilizing law to proclaim one set of norms as public morality and to use another set of norms in actually controlling that behavior.

While patterned evasion may perform such harmonizing functions, the passage of legislation, the acts of officials, and decisions of judges nevertheless have a significance as gestures of public affirmation. First, the act of public affirmation of a norm often persuades listeners that behavior and norm are consistent. The existence of law quiets and comforts those whose interests and sentiments are embodied in it.[9] Second, public affirmation of a

[7] Murray Edelman has shown this in his analysis of the discrepancy between legislative action and administrative agency operation. Murray Edelman, *The Symbolic Uses of Politics*, Urbana: University of Illinois Press, 1964.

[8] Robin Williams, *American Society*, New York: A. A. Knopf, 1960, pp. 372-96. Hyman Rodman's analysis of "lower-class value stretch" suggests yet another ambiguity in the concept of norm. He found that in Trinidad among lower-class respondents that *both* marriage and non-legal marital union are normatively accepted, although marriage is preferred. Hyman Rodman, "Illegitimacy in the Caribbean Social Structure," *American Sociological Review*, 31 (October, 1966), pp. 673-683.

[9] Edelman, *op. cit.*, Chap. 2. The author refers to this as a process of political quiescence. While Edelman's symbolic analysis is close to mine, his emphasis is on the reassurance function of symbols in relation to presumed instrumental affects. My analysis stresses the conflict over symbols as a

moral norm directs the major institutions of the society to its support. Despite patterned practices of abortion in the United States, obtaining abortions does require access to a subterranean social structure and is much more difficult than obtaining an appendectomy. There are instrumental functions to law even where there is patterned evasion.

A third impact of public affirmation is the one that most interests us here. The fact of affirmation through acts of law and government expresses the public worth of one set of norms, of one sub-culture vis-à-vis those of others. It demonstrates which cultures have legitimacy and public domination, and which do not. Accordingly it enenhances the social status of groups carrying the affirmed culture and degrades groups carrying that which is condemned as deviant. We have argued elsewhere that the significance of Prohibition in the United States lay less in its enforcement than in the fact that it occurred.[10] Analysis of the enforcement of Prohibition law indicates that it was often limited by the unwillingness of Dry forces to utilize all their political strength for fear of stirring intensive opposition. Great satisfaction was gained from the passage and maintenance of the legislation itself.[11]

Irrespective of its instrumental effects, public designation of morality is itself an issue generative of deep conflict. The designating gestures are dramatjstic events, "since it invites one to consider the matter of motives in a perspective that, being developed in the analysis of drama, treats language and thought primarily as modes of action."[12] For this reason the designation of a way of behavior as violating public norms confers status and honor on those groups whose cultures are followed as the standard of conventionality, and derogates those whose cultures are considered deviant. My analysis of the American Temperance movement has shown how the issue of drinking and abstinence became a politically significant focus for the conflicts between Protestant and Catholic, rural and urban, native and immigrant, middle class and lower class in American society. The political conflict lay in the efforts of an abstinent Protestant middle class to control the public affirmation of morality in drinking. Victory or defeat were consequently symbolic of the status and power of the cultures opposing each other.[13] Legal affirmation or rejection is thus important in what it symbolizes as well or instead of what it controls. Even if the law was broken, it was clear whose law it was.

DEVIANT NONCONFORMITY AND DESIGNATOR REACTION

In Durkheim's analysis of the indignant and hostile response to norm-violation, all proscribed actions are

process of importance apart from instrumental effects.

[12] Kenneth Burke, *A Grammar of Motives*, New York: Prentice-Hall, 1945, p. 393. Burke's writings have been the strongest influence on the mode of analysis presented here. Two other writers, whose works have been influential, themselves influenced by Burke, are Erving Goffman and Hugh D. Duncan.

[13] Gusfield, *Symbolic Crusade*, *op. cit.*, Chap. 5.

threats to the existence of the norm.[14] Once we separate the instrumental from the symbolic functions of legal and governmental designation of deviants, however, we can question this assumption. We can look at norm-violation from the standpoint of its effects on the symbolic rather than the instrumental character of the norm. Our analysis of patterned evasion of norms has suggested that a law weak in its instrumental functions may nevertheless perform significant symbolic functions. Unlike human limbs, norms do not necessarily atrophy through disuse. Standards of charity, mercy, and justice may be dishonored every day yet remain important statements of what is publicly approved as virtue. The sexual behavior of the human male and the human female need not be a copy of the socially sanctioned rules. Those rules remain as important affirmations of an acceptable code, even though they are regularly breached. Their roles as ideals are not threatened by daily behavior. In analyzing the violation of norms we will look at the implications of different forms of deviance on the symbolic character of the norm itself. *The point here is that the designators of deviant behavior react differently to different norm-sustaining implications of an act.* We can classify deviant behavior from this standpoint.

The Repentant Deviant

The reckless motorist often admits the legitimacy of traffic laws, even though he has broken them. The chronic alcoholic may well agree that both he and his society would be better if he could stay sober. In both cases the norm they have violated is itself unquestioned. Their deviation is a moral lapse, a fall from a grace to which they aspire. The homosexual who seeks a psychiatrist to rid himself of his habit has defined his actions similarly to those who have designated him as a deviant. There is a consensus between the designator and the deviant; his repentance confirms the norm.

Repentance and redemption seem to go hand-in-hand in court and church. Sykes and Matza have described techniques of neutralization which juvenile delinquents often use with enforcement agencies.

> The juvenile delinquent would appear to be at least partially committed to the dominant social order in that he frequently exhibits guilt or shame when he violates its proscriptions, accords approval to certain conforming figures and distinguishes between appropriate and inappropriate targets for his deviance.[15]

A show of repentance is also used, say Sykes and Matza, to soften the indignation of law enforcement agents. A recent study of police behavior lends support to this. Juveniles apprehended by the police received more lenient treatment, including dismissal, if they appeared contrite and remorseful about their violations than if they did not. This difference in the posture of the deviant accounted for much of the differential treatment favoring middle-class "youngsters" as against lower-class "delinquents."[16]

The Sick Deviant

Acts which represent an attack upon a norm are neutralized by repentance. The open admission of repentance confirms the sinner's belief in the sin. His threat to the norm is removed and his violation has left the norm intact. Acts which we can perceive as those of sick and diseased people are irrelevant to the norm; they neither attack nor defend it. The use of morphine by hospital patients in severe pain is not designated as deviant behavior. Sentiments of public hostility and the apparatus of enforcement agencies are not mobilized toward the morphine-user. His use is not perceived as a violation of the norm against drug use, but as an uncontrolled act, not likely to be recurrent.[17]

While designations of action resulting from sickness do not threaten the norm, significant consequences flow from such definitions. Talcott Parsons has pointed out that the designation of a person as ill changes the obligations which others have toward the person and his obligations toward them.[18] Parsons' description sensitizes us to the way in which the sick person is a different social object than the healthy one. He has now become an object of welfare, a person to be helped rather than punished. Hostile sentiments toward sick people are not legitimate. The sick person is not responsible for his acts. He is excused from the consequences which attend the healthy who act the same way.[19]

Deviance designations, as we shall show below, are not fixed. They may shift from one form to another over time. Defining a behavior pattern as one caused by illness makes a hostile response toward the actor illegitimate and inappropriate. "Illness" is a social designation, by no means given in the nature of medical fact. Even left-handedness is still seen as morally deviant in many countries. Hence the effort to define a practice as a consequence of illness is itself a matter of conflict and a political issue.

The Enemy Deviant

Writing about a Boston slum in the 1930's, William F. Whyte remarks:

> The policeman is subject to sharply conflicting pressures. On one side are the "good people" of Eastern City, who have written their moral judgments into law and demand through their newspapers that the law be enforced. On the other side are the people of Cornerville, who have different standards and have built up an organization whose perpetuation depends upon the freedom to violate the law.[20]

Whyte's is one of several studies that have pointed out the discrepancies between middle-class moralities embodied in law and lower-class moralities which differ sharply from them.[21] In Cornerville, gambling was

19 A somewhat similar distinction as that presented here can be found in Vilhelm Aubert and Sheldon Messinger, "The Criminal and the Sick," in V. Aubert, *The Hidden Society*, New York: The Bedminister Press, 1965, pp. 25-54.

20 William F. Whyte, *Street-Corner Society*, Chicago: University of Chicago Press, 2nd edition, 1955, p. 138.

21 See William Westley's analysis of the differences between the morality shared by

seen as a "respectable" crime, just as antitrust behavior may be in other levels of the social structure. In American society, conflicts between social classes are often also cultural conflicts reflecting moral differences. Coincidence of ethnic and religious distinctions with class differences accentuates such conflicts between group values.

In these cases, the validity of the public designation is itself at issue. The publicly-defined deviant is neither repentant nor sick, but is instead an upholder of an opposite norm. He accepts his behavior as proper and derogates the public norm as illegitimate. He refuses to internalize the public norm into his self-definition. This is especially likely to occur in instances of "business crimes." The buyer sees his action as legitimate economic behavior and resists a definition of it as immoral and thus prohibitable. The issue of "off-track" betting illustrates one area in which clashes of culture have been salient.

The designation of culturally legitimate behavior as deviant depends upon the superior power and organization of the designators. The concept of convention in this area, as Thrasymachus defined Justice for Socrates, is the will of the stronger. If the deviant is the politically weaker group, then the designation is open to the changes and contingencies of political fortunes. It becomes an issue of political conflict, ranging group against group and culture against culture, in the effort to determine whose morals are to be designated as deserving of public affirmation.

It is when the deviant is also an enemy and his deviance is an aspect of group culture that the conventional norm is most explicitly and energetically attacked. When those once designated as deviant have achieved enough political power they may shift from disobedience to an effort to change the designation itself. This has certainly happened in the civil rights movement. Behavior viewed as deviant in the segregationist society has in many instances been moved into the realm of the problematic, now subject to political processes of conflict and compromise.

When the deviant and the designator perceive each other as enemies, and the designator's power is superior to that of the deviant, we have domination without a corresponding legitimacy. Anything which increases the power of the deviant to organize and attack the norm is thus a threat to the social dominance symbolized in the affirmation of the norm. Under such conditions the need of the designators to strengthen and enforce the norms is great. The struggle over the symbol of social power and status is focused on the question of the maintenance or change of the legal norm. The threat to the middle class in the increased political power of Cornerville is not that the Cornerville resident will gamble more; he already does gamble with great frequency. The threat is that the law will come to accept the morality of gambling and treat it as a legitimate business. If this happens, Boston is no longer a city dominated by middle-class Yankees but becomes one dominated

---

the lower class and the police in contrast to that of the courts over such matters as gambling, prostitution, and sexual perversion. The courts take a stemer view of gamblers and prostitutes than do the police, who take a stemer view of the sexual offender. William Westley, "Violence and the Police," *American Journal of Sociology*, 59 (July, 1953), pp. 34-42.

by lower-class immigrants, as many think has actually happened in Boston. The maintenance of a norm which defines gambling as deviant behavior thus symbolizes the maintenance of Yankee social and political superiority. Its disappearance as a public commitment would symbolize the loss of that superiority.

The Cynical Deviant

The professional criminal commits acts whose designation as deviant is supported by wide social consensus. The burglar, the hired murderer, the arsonist, the kidnapper all prey on victims. While they may use repentance or illness as strategies to manage the impressions of enforcers, their basic orientation is self-seeking, to get around the rules. It is for this reason that their behavior is not a great threat to the norms although it calls for social management and repression. It does not threaten the legitimacy of the normative order.

DRINKING AS A CHANGING FORM OF DEVIANCE

Analysis of efforts to define drinking as deviant in the United States will illustrate the process by which designations shift. The legal embodiment of attitudes toward drinking shows how cultural conflicts find their expression in the symbolic functions of law. In the 160 years since 1800, we see all our suggested types of non-conforming behavior and all the forms of reaction among the conventional segments of the society.

The movement to limit and control personal consumption of alcohol began in the early nineteenth century, although some scattered attempts were made earlier.[22] Colonial legislation was aimed mainly at controlling the inn through licensing systems. While drunkenness occurred, and drinking was frequent, the rigid nature of the Colonial society, in both North and South, kept drinking from becoming an important social issue.[23]

The Repentant Drinker

The definition of the drinker as an object of social shame begins in the early nineteenth century and reaches full development in the late 1820's and early 1830's. A wave of growth in Temperance organizations in this period was sparked by the conversion of drinking men to abstinence under the stimulus of evangelical revivalism.[24] Through drinking men joining together to take the pledge, a norm of abstinence and sobriety emerged as a definition of conventional respectability. They sought to control themselves and their neighbors.

The norm of abstinence and sobriety replaced the accepted patterns of heavy drinking countenanced in the late eighteenth and early nineteenth century. By the 1870's rural and small-town America had defined middle-class morals to include the Dry attitude. This definition had little need for legal embodiment. It could be enunciated in attacks on the drunkard which assumed that he shared the normative pattern of those who exhorted him to be better

[22] The best single account of Temperance activities before the Civil War is that of John Krout, *The Origins of Prohibition*, New York: A. A. Knopf, 1925.

[24] Gusfield, *Symbolic Crusade*, *op. cit.*, pp. 44-51.

and to do better. He was a repentant deviant, someone to be brought back into the fold by moral persuasion and the techniques of religious revivalism.[26] His error was the sin of lapse from a shared standard of virtue. "The Holy Spirit will not visit, much less will He dwell within he who is under the polluting, debasing effects of intoxicating drink. The state of heart and mind which this occasions to him is loathsome and an abomination."[26]

Moral persuasion thus rests on the conviction of a consensus between the deviant and the designators. As long as the object of attack and conversion is isolated in individual terms, rather than perceived as a group, there is no sense of his deviant act as part of a shared culture. What is shared is the norm of conventionality; the appeal to the drinker and the chronic alcoholic is to repent. When the Woman's Anti-Whiskey Crusade of 1873-1874 broke out in Ohio, church women placed their attention on the taverns. In many Ohio towns these respectable ladies set up vigils in front of the tavern and attempted to prevent men from entering just by the fear that they would be observed.[27] In keeping with the evangelical motif in the Temperance movement, the Washingtonians, founded in 1848, appealed to drinkers and chronic alcoholics with the emotional trappings and oratory of religious meetings, even though devoid of pastors.[28]

Moral persuasion, rather than legislation, has been one persistent theme in the designation of the drinker as deviant and the alcoholic as depraved. Even in the depictions of the miseries and poverty of the chronic alcoholic, there is a decided moral condemnation which has been the hallmark of the American Temperance movement. Moral persuasion was ineffective as a device to wipe out drinking and drunkenness. Heavy drinking persisted through the nineteenth century and the organized attempts to convert the drunkard experienced much backsliding.[29] Nevertheless, defections from the standard did not threaten the standard. The public definition of respectability matched the ideals of the sober and abstaining people who dominated those parts of the society where moral suasion was effective. In the late nineteenth century those areas in which temperance sentiment was strongest were also those in which legislation was most easily enforceable.[30]

The Enemy Drinker

The demand for laws to limit alcoholic consumption appears to arise from situations in which the drinkers

[30] Joseph Rowntree and Arthur Sherwell, *State Prohibition and Local Option*, London: Hodden and Stoughton, 1900, using both systematic observation and analysis of Federal tax payments, concluded (p. 253) that ". . . local veto in America has only been found operative outside the larger towns and cities."

possess power as a definitive social and political group and, in their customary habits and beliefs, deny the validity of abstinence norms. The persistence of areas in which Temperance norms were least controlling led to the emergence of attempts to embody control in legal measures. The drinker as enemy seems to be the greatest stimulus to efforts to designate his act as publicly defined deviance.

In its early phase the American Temperance movement was committed chiefly to moral persuasion. Efforts to achieve legislation governing the sale and use of alcohol do not appear until the 1840's. This legislative movement had a close relationship to the immigration of Irish Catholics and German Lutherans into the United States in this period. These non-evangelical and/or non-Protestant peoples made up a large proportion of the urban poor in the 1840's and 1850's. They brought with them a far more accepting evaluation of drinking than had yet existed in the United States. The tavern and the beer parlor had a distinct place in the leisure of the Germans and the Irish. The prominence of this place was intensified by the stark character of the developing American slum.[81] These immigrant cultures did not contain a strong tradition of Temperance norms which might have made an effective appeal to a sense of sin. To be sure, excessive drunkenness was scorned, but neither abstinence nor constant sobriety were supported by the cultural codes.

Between these two groups—the native American, middle-class evangelical Protestant and the immigrant European Catholic or Lutheran occupying the urban lower class—there was little room for repentance. By the 1850's the issue of drinking reflected a general clash over cultural values. The Temperance movement found allies in its political efforts among the nativist movements.[82] The force and power of the anti-alcohol movements, however, were limited greatly by the political composition of the urban electorate, with its high proportion of immigrants. Thus the movement to develop legislation emerged in reaction to the appearance of cultural groups least responsive to the norms of abstinence and sobriety. The very effort to turn such informal norms into legal standards polarized the opposing forces and accentuated the symbolic import of the movement. Now that the issue had been joined, defeat or victory was a clear-cut statement of public dominance.

It is a paradox that the most successful move to eradicate alcohol emerged in a period when America was shifting from a heavy-drinking society, in which whiskey was the leading form of alcohol, to a moderate one, in which beer was replacing whiskey. Prohibition came as the culmination of the movement to reform the immigrant cultures and at the height of the immigrant influx into the United States.

Following the Civil War, moral persuasion and legislative goals were both parts of the movement against alcohol. By the 1880's an appeal was made to the urban, immigrant lower classes to repent and to imitate the habits of the

[81] See the accounts of drinking habits among Irish and German immigrants in Oscar Handlin, *Boston's Immigrants*, Cambridge, Massachusetts: Harvard University Press, 1941, pp. 191-192, 201-209; Marcus Hansen, *The Immigrant in American History*, Cambridge, Massachusetts: Harvard University Press, 1940.

[82] Ray Billington, *The Protestant Crusade, 1800-1860*, New York: Macmillan, 1938, Chap. 15; Gusfield, *Symbolic Crusade*, *op. cit.*, pp. 55-57.

American middle class as a route to economic and social mobility. Norms of abstinence were presented to the non-abstainer both as virtue and as expedience.[83] This effort failed. The new, and larger, immigration of 1890-1915 increased still further the threat of the urban lower class to the native American.

The symbolic effect of Prohibition legislation must be kept analytically separate from its instrumental, enforcement side. While the urban middle class did provide much of the organizational leadership to the Temperance and Prohibition movements, the political strength of the movement in its legislative drives was in the rural areas of the United States. Here, where the problems of drinking were most under control, where the norm was relatively intact, the appeal to a struggle against foreign invasion was the most potent. In these areas, passage of legislation was likely to make small difference in behavior. The continuing polarization of political forces into those of cultural opposition and cultural acceptance during the Prohibition campaigns (1906-1919), and during the drive for Repeal (1926-1933), greatly intensified the symbolic significance of victory and defeat.[84] Even if the Prohibition measures were limited in their enforceability in the metropolis there was no doubt about whose law was public and what way of life was being labelled as opprobrious.

After Repeal, as Dry power in American politics subsided, the designation of the drinker as deviant also receded. Public affirmation of the temperance norm had changed and with it the definition of the deviant had changed. Abstinence was itself less acceptable. In the 1950's the Temperance movement, faced with this change in public norms, even introduced a series of placards with the slogan, "It's Smart *Not* to Drink."

Despite this normative change in the public designation of drinking deviance, there has not been much change in American drinking patterns. Following the Prohibition period the consumption of alcohol has not returned to its pre-1915 high. Beer has continued to occupy a more important place as a source of alcohol consumption. "Hard drinkers" are not as common in America today as they were in the nineteenth century. While there has been some increase in moderate drinking, the percentage of adults who are abstainers has remained approximately the same (one-third) for the past 30 years. Similarly, Dry sentiment has remained stable, as measured by local opinion results.[85] In short, the argument over deviance designation has been largely one of normative dominance, not of instrumental social control. The process of deviance designation in drinking needs to be understood in terms of symbols of cultural dominance rather than in the activities of social control.

[83] William F. Whyte, *op. cit.*, p. 99. Whyte has shown this as a major attitude of social work and the settlement house toward slum-dwellers he studied in the 1930's. "The community was expected to adapt itself to the standards of the settlement house." The rationale for adaptation lay in its effects in promoting social mobility.

[84] Although a well-organized Temperance movement existed among Catholics, it was weakened by the Protestant drive for Prohibition: See Joan Bland, *Hibernian Crusade*, Washington, D.C.: Catholic University Press, 1951.

[85] See my analysis of American drinking in the post-Repeal era. Gusfield, "Prohibition: The Impact of Political Utopianism," *op. cit.*

The Sick Drinker

For most of the nineteenth century, the chronic alcoholic as well as the less compulsive drinker was viewed as a sinner. It was not until after Repeal (1933) that chronic alcoholism became defined as illness in the United States. Earlier actions taken toward promotion of the welfare of drinkers and alcoholics through Temperance measures rested on the moral supremacy of abstinence and the demand for repentance. The user of alcohol could be an object of sympathy, but his social salvation depended on a willingness to embrace the norm of his exhorters. The designation of alcoholism as sickness has a different bearing on the question of normative superiority. It renders the behavior of the deviant indifferent to the status of norms enforcing abstinence.

This realization appears to have made supporters of Temperance and Prohibition hostile to efforts to redefine the deviant character of alcoholism. They deeply opposed the reports of the Committee of Fifty in the late nineteenth century.[86] These volumes of reports by scholars and prominent men took a less moralistic and a more sociological and functional view of the saloon and drinking than did the Temperance movement.

The soundness of these fears is shown by what did happen to the Temperance movement with the rise of the view that alcoholism is illness. It led to new agencies concerned with drinking problems. These excluded Temperance people from the circle of those who now define what is deviant in drinking habits. The National Commission on Alcoholism was formed in 1941 and the Yale School of Alcoholic Studies formed in 1940. They were manned by medical personnel, social workers, and social scientists, people now alien to the spirit of the abstainer. Problems of drinking were removed from the church and placed in the hands of the universities and the medical clinics. The tendency to handle drinkers through protective and welfare agencies rather than through police or clergy has become more frequent.

"The bare statement that 'alcoholism is a disease' is most misleading since . . . it conceals what is essential—that a step in public policy is being recommended, not a scientific discovery announced."[87] John Seeley's remark is an apt one. Replacement of the norm of sin and repentance by that of illness and therapy removes the onus of guilt and immorality from the act of drinking and the state of chronic alcoholism. It replaces the image of the sinner with that of a patient, a person to be helped

[86] The Committee of Fifty, a group of prominent educators, scientists, and clergymen sponsored and directed several studies of drinking and the saloon. Their position as men unaffiliated to temperance organizations was intended to introduce unbiased investigation, often critical of Temperance doctrine. For two of the leading volumes see John Shaw Billing's, *The Physiological Aspects of the Liquor Problem*, Boston and New York: Houghton, Mifflin and Co., 1903; Raymond Calkins, *Substitutes for the Saloon*, Boston and New York: Houghton, Mifflin and Co., 1903.

[87] John Seeley, "Alcoholism Is a Disease: Implications for Social Policy," in D. Pittman and C. Snyder, editors, *Society, Culture and Drinking Patterns*, New York: John Wiley and Sons, 1962, pp. 586-593, at p. 593. For a description of the variety of definitions of alcoholism and drunkenness, as deviant and non-deviant, see the papers by Edwin Lemert, "Alcohol, Values and Social Control" and by Archer Tongue, "What the State Does About Alcohol and Alcoholism," both in the same volume.

rather than to be exhorted. No wonder that the Temperance movement has found the work of the Yale School, and often even the work of Alcoholics Anonymous, a threat to its own movement. It has been most limited in its cooperation with these organizations and has attempted to set up other organizations which might provide the face of Science in league with the tone of the movement.[88]

The redefinition of the alcoholic as sick thus brought into power both ideas and organizations antithetical to the Temperance movement. The norm protected by law and government was no longer the one held by the people who had supported Temperance and Prohibition. The hostility of Temperance people is readily understandable; their relative political unimportance is crucial to their present inability to make that hostility effective.

Movements of Moral Passage

In this paper we have called attention to the fact that deviance designations have histories; the public definition of behavior as deviant is itself changeable. It is open to reversals of political power, twists of public opinion, and the development of social movements and moral crusades. What is attacked as criminal today may be seen as sick next year and fought over as possibly legitimate by the next generation.

Movements to redefine behavior may eventuate in a moral passage, a transition of the behavior from one moral status to another. In analyzing movements toward the redefinition of alcohol use, we have dealt with moral crusades which were restrictive and others which were permissive toward drinking and toward "drunkards." (We might have also used the word "alcoholics," suggesting a less disapproving and more medical perspective.) In both cases, however, the movements sought to change the public designation. While we are familiar with the restrictive or enforcing movements, the permissive or legitimizing movement must also be seen as a prevalent way in which deviants throw off the onus of their actions and avoid the sanctions associated with immoral activities.

Even where the deviants are a small and politically powerless group they may nevertheless attempt to protect themselves by influence over the process of designation. The effort to define themselves as ill is one plausible means to this end. Drug addiction as well as drunkenness is partially undergoing a change toward such redefinition.[89] This occurs in league with powerful groups in society, such as social workers, medical professionals, or university professors. The moral passage achieved here reduces the sanctions imposed by

[88] The WCTU during the 1930's persistently avoided support to Alcoholics Anonymous. The Yale School of Alcohol Studies was attacked and derogated in Temperance literature. A counter-organization, with several prominent pro-Dry scientists, developed, held seminars, and issued statements in opposition to Yale School publications.

[89] Many of the writings of sociologists interested in drug addiction have contained explicit demands for such redefinitions. See Becker, *op. cit.*; Alfred Lindesmith, *The Addict and the Law*, Bloomington: Indiana University Press, 1965, and David Ausubel, *Drug Addiction*, New York: Random House, 1958. The recent movement to redefine marijuana and LSD as legitimate is partially supported by such writings but is more saliently a movement of enemy deviants. The activities of Timothy Leary, Allen Ginsberg, and the "hipsters" is the most vocal expression of this movement.

criminal law and the public acceptance of the deviant designation.

The "lifting" of a deviant activity to the level of a political, public issue is thus a sign that its moral status is at stake, that legitimacy is a possibility. Today the moral acceptance of drinking, marijuana and LSD use, homosexuality, abortion, and other "vices" is being publicly discussed, and movements championing them have emerged. Such movements draw into them far more than the deviants themselves. Because they become symbols of general cultural attitudes they call out partisans for both repression and permission. The present debate over drug addiction laws in the United States, for example, is carried out between defenders and opposers of the norm rather than between users and nonusers of the drugs involved.

As the movement for redefinition of the addict as sick has grown, the movement to strengthen the definition of addiction as criminal has responded with increased legal severity. To classify drug users as sick and the victims or clients as suffering from "disease" would mean a change in the agencies responsible for reaction from police enforcement to medical authorities. Further, it might diminish the moral disapproval with which drug use, and the reputed euphoric effects connected with it, are viewed by supporters of present legislation. Commenting on the clinic plan to permit medical dispensing of narcotics to licensed addicts, U.S. Commissioner of Narcotics Anslinger wrote:

> This plan would elevate a most despicable trade to the avowed status of an honorable business, nay, to the status of practice of a time-honored profession; and drug addicts would multiply unrestrained, to the irrevocable impairment of the moral fiber and physical welfare of the American people.[40]

In this paper we have seen that redefining moral crusades tends to generate strong counter-movements. The deviant as a cultural opponent is a more potent threat to the norm than is the repentant, or even the sick deviant. The threat to the legitimacy of the norm is a spur to the need for symbolic restatement in legal terms. In these instances of "crimes without victims" the legal norm is *not* the enunciator of a consensus within the community. On the contrary, it is when consensus is least attainable that the pressure to establish legal norms appears to be greatest.

CLARIFICATION OF DR. GODDARD'S VIEWS ON MARIHUANA

WEDNESDAY, NOVEMBER 8, 1967

HOUSE OF REPRESENTATIVES,
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D.C.

The committee met at 11 a.m., pursuant to notice, in room 2123, Rayburn House Office Building, Hon. Harley O. Staggers (chairman) presiding.

The CHAIRMAN. The committee will come to order.

The purpose of the hearing today is to obtain clarification from Dr. James L. Goddard, Commissioner of the Food and Drug Administration, concerning statements he is reported to have made with respect to marihuana.

Dispatches carried by a major news service on October 16 and 17 stated "Food and Drug Administration Commissioner Dr. James Goddard says he would not object to his daughter smoking marihuana any more than if she drank a cocktail."

This dispatch received wide publicity throughout the United States and, although its accuracy has been denied, the denial has not caught up with the statement as originally reported, as is often the case.

Ever since the original statement was reported, I have been requested by Members of the House to hold a hearing to provide for clarification of this matter. I have refused up until now, because I wanted enough time to pass for the facts to be developed. I think we are now in a position to discuss the subject in perspective, and therefore have called this hearing to obtain from Dr. Goddard a clarification of his remarks concerning marihuana, both as reported, and as actually delivered.

Dr. Goddard, we are pleased to have you with us again, and you may proceed with your statement.

STATEMENT OF DR. JAMES L. GODDARD, COMMISSIONER OF FOOD AND DRUG ADMINISTRATION, DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE; ACCOMPANIED BY WILLIAM W. GOODRICH, ASSISTANT GENERAL COUNSEL

Dr. GODDARD. Mr. Chairman, we appreciate the opportunity to appear before this committee today to clear the atmosphere about our position with respect to marihuana.

As evidenced by the attention given by representatives of Government, the press, and the professions, it is plain that the increasing use of marihuana is a matter of national concern.

I am aware, Mr. Chairman, that statements attributed to me, but which I did not make, have caused additional concern. Let me clarify the record in this regard at the very outset.

I did not say that I would not object to my daughter smoking marihuana.

I did not, and I do not, condone the use of marihuana.

I did not, and I do not, advocate the abolition of controls over marihuana.

I did not, and I do not propose "legalizing" the drug.

With your permission, Mr. Chairman, I would like to call your attention to one point which arose as the result of an erroneous news dispatch from Minneapolis on October 17. I was reported to have stated that I would not object any more to my daughter smoking marihuana than if she drank a cocktail.

The news dispatch was not correct, and Mr. Julius Frandsen, vice president and Washington manager of United Press International, has written me a letter on the subject. With your permission, I would like to insert a copy for the record and quote just this brief portion:

So it has become clear to me that UPI erred in attributing to you unqualified statements which in fact were considerably qualified.

I am sorry if UPI has compounded your problems. We are prepared to carry a dispatch acknowledging our error.

(The letter referred to above follows:)

UNITED PRESS INTERNATIONAL,
Washington, D.C., November 2, 1967.

DR. JAMES L. GODDARD,
Commissioner, Food and Drug Administration,
Washington, D.C.

DEAR DR. GODDARD: Following my return from a trip, I have been belatedly looking into the circumstances of our dispatches from Minneapolis on October 17 and 18. I find we owe you an apology.

I refer to the UPI dispatch which began, without qualification:

"Food and Drug Administration Commissioner Dr. James Goddard says he would not object to his daughter smoking marijuana any more than if she drank a cocktail."

Unfortunately, no complete tape exists of your exchanges with reporters. The questioning began in an informal session in the front of the auditorium after your speech and no recording equipment was there. Equipment was set up in another room and only the ensuing proceedings at that place were taped.

UPI was represented by Miss Judy Vick of the University of Minnesota News Service. She says her notes show that in the Q. & A. with reporters in the auditorium Victor Cohn of the Minneapolis Tribune asked whether marijuana is more dangerous than alcohol. And that you replied "Whether or not marijuana is more dangerous than alcohol is debatable. I don't happen to think it is."

Miss Vick says that Mr. Cohn then asked whether you would mind if your daughter smoked marijuana any more than if she drank a cocktail, and that you replied "No, except in the context of the present law." I take that to be a reference to the fact that marijuana is illegal and alcohol is legal.

Mr. Cohn's recollection is that his question was to the effect "Would you mind if your daughter took marijuana?" His notes have you responding: "We have talked about it at home. I would (that is, would object) in terms of the law today" and "we really don't know what the long-term effects (of marijuana) are." Followed by some comments about distortion of perception following use of marijuana.

So it has become clear to me that UPI erred in attributing to you unqualified statements which in fact were considerably qualified.

I am sorry if UPI has compounded your problems. We are prepared to carry a dispatch acknowledging our error.

In view of the public uncertainty that now exists as to what you do and do not believe, I hope you will sit down with our Louis Cassels so that he can prepare

a definitive dispatch. I believe you know Mr. Cassels and his outstanding record for accuracy and fairness. Please let me know.

Several members of Congress have inquired about our original story, and I am taking the liberty of sending them copies of this letter.

Sincerely,

JULIUS FRANDSEN,
Vice President and Washington Manager.

Dr. GODDARD. Mr. Chairman, I think Mr. Frandsen—and other members of the press—recognize the complexities of the issue of marihuana and wish to serve the public in the best possible manner. I think the press does sense the importance of the problem and makes every effort to provide the Nation with the best information available.

My remarks at Minneapolis and elsewhere concerning marihuana have always been in response to questions from the press. In every instance, I have made it abundantly clear that marihuana has been and still remains under the jurisdiction of the Bureau of Narcotics of the U.S. Department of the Treasury.

It is often erroneously assumed that the Food and Drug Administration, which administers the drug abuse control amendments, has jurisdiction over not only the controlled drugs—the amphetamines, barbiturates, and hallucinogens—but marihuana, as well. Our agency has made every effort to clarify the differences wherever possible.

Now let me make several points about marihuana. First, the shocking growth and use of marihuana has been so rapid that none of us in Government, in medicine, or the legal profession has been able to counter it effectively.

For example, the Department of Justice of the State of California has reported a total of 28,319 adult drug arrests for 1966, the highest figure to date, fully 32.1 percent above the 1965 figure. Some of this increase comes from the enforcement last year, for the first time, of the drug abuse control amendments, which became effective on February 1, 1966.

However, to quote from the California report, "Marihuana offenses accounted for approximately one-half of the 1966 arrests and showed a 71-percent increase over those reported during 1965." Arrests for "heroin and other narcotics" rose by about 11 percent. "Dangerous drug arrests showed a 4-percent gain," the report also adds.

California's adult marihuana arrests in 1966 were triple that for 1960. Among juveniles, the rise was even more dramatic: Drug arrests in general increased 87 percent between 1965 and 1966, but juvenile marihuana arrests increased 140 percent, from 1,623 to 3,869.

The marihuana arrests, plus the 898 dangerous drug arrests, accounted for 95 percent of the juvenile drug arrests in California during 1966.

We could pursue this further, Mr. Chairman, but I hope that this illustration will show that, as we have talked about the problem in professional circles and have done our studies and exchanged our memorandums, the agencies of law enforcement have encountered a grim situation that is developing with great momentum—with a momentum that seems to exceed our own ability, thus far, to explore the problem and come up with sound solutions that are in the public interest and that can be put into effect.

This is only part of the broad picture of drug abuse. As you know, Mr. Chairman, the drug abuse control amendments, which we carry

out, include a class of drugs called the hallucinogens. Among these drugs are lysergic acid diethylamide—or LSD—peyote, mescaline, psylocibin, and others, such as DMT and STP, which have recently come upon the scene.

Since the establishment of our Bureau of Drug Abuse Control, in February of 1966, we have conducted over 2,000 criminal investigations. A third of these have involved the hallucinogens. Marihuana has been offered for sale or seized in nine out of every 10 investigations by our BDAC men following the hallucinogen leads.

Our agents, Mr. Chairman, have moved in on these cases swiftly, but with a good sense of who has jurisdiction. BDAC agents in Dallas recently seized 1,000 doses of LSD. At the same time, they seized approximately 100 pounds of marihuana, which they turned over to Bureau of Narcotics agents.

At New York's Kennedy International Airport, BDAC agents, again working on an LSD case, seized not only a quantity of that drug, but about 230 pounds of marihuana as well, which was turned over to local police and agents of the U.S. Customs Service.

There are countless instances of marihuana appearing together with the hallucinogens under our jurisdiction. Our agents, working in close cooperation with other Federal agencies and with the excellent cooperation of State and local law enforcement agencies, can account for 931 arrests to date. Sixty per cent of these arrests involved the hallucinogens. And, as I have indicated—in both the investigational as well as the arrest stages—marihuana is usually present.

The Food and Drug Administration and the Treasury Department's Bureau of Narcotics have been cooperating in dealing with this problem. There is a formal working agreement between the Bureau of Narcotics and our Bureau of Drug Abuse Control which provides for a close working relationship between our agents in the field as well as our staffs in Washington.

The use of marihuana in this country and the rest of the world has a long history, of course. In the United States, "marihuana" refers to any part of the plant, or an extract such as the resin, which induces changes in physical perception and in psychological reactions. These physical and mental effects will vary in the individual marihuana smoker, depending on four major factors:

The circumstances in which the drug is used;
The amount consumed, usually by smoking;
The personality of the user; and
The user's previous experience with marihuana.

The most common reaction to marihuana is development of a state of mind in which ideas seem disconnected, uncontrolled, and freely flowing. Perception is disturbed, minutes seem to be hours, and seconds seem to be minutes. Space may be broadened, and near objects may appear far away.

When large doses are used—doses generally heavier than normally used in this country—extremely vivid hallucinations may occur. With such large doses, panic and a fear of death may make the experience highly unpleasant.

Gentlemen, what I have just told you about marihuana is a résumé from one of the most respected textbooks on drugs in this country. It is the third edition of the "Pharmacological Basis of Therapeutics"

by Louis S. Goodman and Alfred Gilman. I refer you to pages 299 and 300 of this volume.

It should be made clear, however, that no one in the scientific or medical communities is satisfied with the level of knowledge we have concerning marihuana and similar drugs. As I have stated on several occasions, there is still much research to be done.

For example, the chemical composition of marihuana has not been fully determined, although what seems to be the plant's most active ingredients have been isolated and synthesized.

Scientifically controlled marihuana studies of varying lengths have not been conducted on animals or humans to determine effects on body tissue and metabolism, or neuromuscular response, and on psychological, and cultural reasons for marihuana use, especially among our young people. The number and characteristics of marihuana users in the United States are virtually unknown, and paths to such use are unexplored.

Mr. Chairman, there are a number of studies that are being conducted under the auspices of the National Institute of Mental Health. I would like to deposit with the committee at this time a recent listing by the NIMH of their marihuana research and related grant activities.

(The document referred to follows:)

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE, PUBLIC HEALTH SERVICE, NATIONAL INSTITUTE OF MENTAL HEALTH

(For release Thursday, October 26, 1967)

The National Institute of Mental Health today issued a summary of Institute-supported research related to marijuana and its components. The summary follows:

Eugene S. Boyd, University of Rochester, N.Y.—Investigation of the effects of marijuana components on the central nervous system of human subjects. Start September 1, 1960; $167,773.

Hine Laboratories, San Francisco—Development and investigation of tests to determine the presence of marijuana in blood and urine. Start March 1, 1967; $70,700.

Raphael Mechoulam, Hebrew University, Jerusalem—Synthesis of marijuana constituents and a study of their physiological and psychological effects. Start March 1, 1967; $26,500.

Constandinos J. Miras, University of Athens—Use of radio-active tagged marijuana to determine absorption, distribution, site of action and excretion of marijuana in the body of experimental animals. Start March 1, 1967; $14,000.

Lloyd J. Dolby, University of Oregon—A study of the chemical nature of selected marijuana components. Start September 1, 1965; $13,699.

Dean I. Manheimer, Longley-Porter Neuropsychiatric Institute; San Francisco—Research on patterns of drug acquisition, drug use and attitudes toward drugs by adults. (West Coast). Start June 1, 1966; $285,931.

Ira Cisin, George Washington University, Washington, D.C.—Research on patterns of drug acquisition, drug use and attitudes toward drugs by adults, (East Coast). Start June 1, 1966; $107,337.

Martin Hoffman, Mount Zion Hospital and Medical Center—San Francisco—Psychological and psychiatric studies of marijuana smokers. Start September 1, 1965; $64,751.

Richard Blum, Stanford University—An investigation of the incidence and patterns of use of marijuana and other mind-altering drugs by college students. Start March 1, 1966; $78,524.

Ross Speck, Hahnemann Medical College, Philadelphia—Investigation of adolescent drug users and of the spread of drug use among adolescents. Start June 1, 1966; $49,734.

National Student Association, Washington, D.C.—Exchange of information on the motives for, and extent and consequences of, drug use by college students

as a basis for developing means to discourage campus drug abuse. Start June 15, 1967; $50,600.

Samuel Pearlman, Brooklyn College of City College of New York—Investigation of patterns of drug use and abuse in five New York City universities. Start May 1, 1967; $4,200.

Christopher D. Stone, University of Southern California Law Center—A survey of laws concerning marijuana use, with special attention to problems of marijuana use in research. Start June 1, 1967; $3,248.

Harris Isbell, University of Kentucky, Lexington—Studies of psychological, emotional and behavioral effects of marijuana in humans, Addiction Research Center. (Intramural).

Dr. GODDARD. You will notice that underway are several projects on the sociology of marihuana usage, the metabolism of marihuana in man and animals, and patterns of acquisition of the drug.

Gradually, we will be able to construct a clearer picture—based upon hard, scientific facts—of this drug, its short- and long-term effects, its fully identity, and the ways it can and cannot be used by man.

Clearly, while the answers to these questions are being formulated by the scientific community, by the work of many hundreds of physicians and researchers, our enforcement efforts in the Food and Drug Administration as well as in the Bureau of Narcotics must continue.

I am reminded, Mr. Chairman, of the experience the FDA went through when it first became involved in the control of abused drugs. The agency discovered, for example, that as many as 25,000 barbiturate dosages could be purchased at a truck stop.

The enforcement strategy for an agency with limited manpower seemed to be clear enough: concentrate on those who engage in the illicit manufacture, distribution, and sale of large quantities of those drugs which are abused by some members of our society. This was the position advocated by the Department of Health, Education, and Welfare during the hearing before this committee on the Drug Abuse Control Amendments of 1965. This was the position adopted by the Congress.

After the amendments were passed by a unanimous vote of the Congress, this strategy of enforcement continued to be FDA's approach. In my opinion, it has worked well. In fact, last year, when we were questioned by three congressional committees as to the need for more stringent penalties—particularly penalties for personal possession and use of the amphetamines, barbiturates, and hallucinogens—I responded that we saw no need for a change in the law. We believed then and still believe today that no useful purpose would be served by making a felon of the individual who abuses these drugs.

I did state, however, that we would evaluate the effectiveness of the misdemeanor penalties for the illicit manufacture, sale, and distribution of the controlled drugs. If we find these penalties to be ineffective, I promised to come back to the Congress and seek a tougher set of penalties in that area. I repeat that promise now.

From this brief bit of history, you can see how the FDA, while administering the drug abuse control amendments and coming upon both LSD and marihuana in the course of our enforcement work, finds that there is a rather significant anomaly in the penalties with respect to these two hallucinogens.

During the past year and a half, I have become personally aware of the problem, as the agency's Commissioner. For example, our agents may find two individuals in the same room, one possessing LSD—an extremely dangerous drug, and one of the most dangerous drugs I have ever studied—and the other possessing marihuana. Our BDAC agents would seize the LSD under the executive seizure provisions of the drug abuse control amendments, but the person possessing the drug would not be subject to prosecution under the Federal statute. His companion, however, would be taken into custody and be liable to a felony conviction under the laws governing the possession of marihuana, a drug which is less potent that LSD.

This is why I consider the penalties to be inconsistent and why I believe that this inconsistency prevents full and effective protection of the public interest in the matter of abused drugs of any kind.

Let me emphasize again that I have never advocated the legalization of marihuana. Rather, I have raised the question of the severity of the penalties attached to possession of marihuana and I suggest that the Congress might also wish to review these penalties in the light of enforcement experience throughout local, State, and Federal Government and as the results of drug research may dictate.

In closing, I would like to summarize some of the tasks we are performing and the goals toward which we are striving in dealing with the problem of drug abuse in a comprehensive manner. Among these, I would include—

(1) a continuing concentration of enforcement activities against the illicit manufacturers and distributors of dangerous drugs;

(2) an increased exchange of information with State and local police and health agencies, as well as with similar international agencies, to strengthen enforcement programs and to broaden the total understanding of the scientific and social data upon which these programs must be based;

(3) the continuation and expansion of the research effort to fill the gaps in our knowledge that I noted a moment ago; and

(4) effective assistance to educators and journalists to support their effort to bring factual drug knowledge to the public, who ultimately must determine the nature and direction of our control programs.

The cooperation of many agencies, at all levels of government, is required in carrying out these broad assignments. The Food and Drug Administration will give its best efforts in this cause, I assure you.

Thank you.

I will be happy, Mr. Chairman, to answer any questions you or other members of the committee may have.

The CHAIRMAN. Thank you, Dr. Goddard.

I do have one or two questions, and I would like to say for the benefit of the committee that I hope that after questions have been asked, they will not be repeated by the members of the committee. I hope that we get the questions asked and answered by noon, in the hopes that we can finish this morning.

Dr. Goddard, to clarify some of your statements, do you favor eliminating any of the penalties presently prescribed by law for the

sale of marihuana or any other drugs whose sale is prohibited by law?

Dr. GODDARD. No, sir.

The CHAIRMAN. Well, based upon the studies that you have conducted, does it appear that a person can become addicted to any of the following drugs: the amphetamines, barbiturates, LSD and the like, marihuana, and the hard narcotics?

Dr. GODDARD. Yes. There is no question that persons can become addicted to the hard narcotics, the opiate derivatives of which heroin is one. Addiction implies that the individuals are taking increasing dosages and that they have physical withdrawal symptoms from the drug.

With respect to the amphetamines, the other drugs we have mentioned, LSD and the other hallucinogens, we do not see addiction, as such. We do see psychic dependence; we do see development of tolorence.

For example, people rapidly go to tolerance in the amphetamines. They may take heavy dosages at one time, for example, several hundred milligrams instead of the usual dosage of 5 milligrams, dosages so large that they could be fatal in any of us who have not taken the drug.

We now talk more in terms of drug dependence than getting caught in the argument of addicting, nonaddicting, and get into the semantic problems that existed in the past. Alcohol is still another drug that one can develop physical dependence upon and have withdrawal symptoms occur. Barbiturates also can cause physical dependence.

The CHAIRMAN. Now, that was my next question. Does alcohol cause addiction?

Dr. GODDARD. I would rather call it physical dependence, rather than addiction. This is measured by the increasing dosage that is required by the person to obtain the same effect; in other words, what we commonly call tolerance and the withdrawal symptoms that occur when the drug alcohol is withdrawn.

What we commonly refer to as the "DT's" are the physical manifestations of withdrawal sysmptoms in the individual who has developed a physical dependence to alcohol. As I have tried to point out, alcohol does represent a serious problem to our society. Many times I have also mentioned that marihuana and other drugs are abused.

These problems of drug abuse and the problem of alcohol are very much alike; they are manifestations of problems in society that we have to approach realistically; we have to recognize their presence and we have to begin to develop programs which will help solve these problems.

The CHAIRMAN. Excuse me. Is there a study now being made in your Department on alcohol?

Dr. GODDARD. Yes.

The CHAIRMAN. Who is making it?

Dr. GODDARD. Both through the support of research, and recently we have published what represents a comprehensive summary of our present knowledge about alcohol and alcoholism from the NIMH national clearinghouse for mental health information.

I could provide you, if you wish, Mr. Chairman, for the record, the scope of the studies that are being carried out, the activities that are underway.

(The information supplied is contained in Public Health Service publication No. 1640 (1967), "Alcohol and Alcoholism".)

Dr. GODDARD. We are talking about a very serious health problem, and I consider drug abuse to be a very serious health problem of our Nation as well, and marihuana is one drug that is being abused. The extent of the magnitude of that portion of the problem is known, and estimates range between 400,000 to 3 million people currently using marihuana.

The CHAIRMAN. One further question and then I will stop.

In 1963, the Prettyman commission recommended transfer of jurisdiction over the hard narcotics and over the amphetamines, barbiturates, and LSD to the Justice Department. Do you know if the administration ever took a position on that recommendation and, if so, what it was?

Dr. GODDARD. I do not believe they have ever taken a position on that recommendation. I am familiar with the Prettyman report, but they have not taken a position.

The CHAIRMAN. Mr. Friedel.

Mr. BROWN. Mr. Chairman——

Mr. FRIEDEL. I don't have any questions, but I am very glad we invited Dr. Goddard to this meeting to clear the air. I am glad that you were here to deny that. I think you have been done a lot of injustice.

Dr. GODDARD. Thank you.

Mr. FRIEDEL. Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Keith.

Mr. KEITH. Thank you, Mr. Chairman.

It is good to see you here to clarify this confusing situation, but I am not surprised that it is confused. It seems to me that you could have given a frank statement of one word to each of the questions contained in this UPI letter and saved yourself a lot of embarrassment, this committee a lot of concern, and reassure the public as to what the true facts were instead of hedging a bit. It seems to me as though you asked for what you got.

The letter you presented here does not give a simple, straightforward answer to a question that could have been answered simply and straightforward. Is that not so?

Dr. GODDARD. I don't believe it is so because I obviously answered the questions that were asked me by the press on this and other occasions, and these are complicated matters. Many of these things cannot be answered by a direct "Yes" or "No."

I would like to offer for the record, Mr. Chairman, a copy of the transcript of the press conference at Minneapolis as well as other press conferences where the question has arisen.

(The document referred to follows:)

TRANSCRIPTION OF WCCO TAPE OF GODDARD PRESS CONFERENCE, OCTOBER 17, 1967, UNIVERSITY OF MINNESOTA, MINNEAPOLIS, MINN.

Dr. GODDARD. First of all, marijuana is under the jurisdiction of the Bureau of Narcotics, U.S. Treasury Department. I've been asked to comment on the subject a number of times and I've tried to make my position clear, that first we need more long term research to detect any possible serious side effects from chronic usage. But, secondly, I feel that the present penalty for personal possession is

too severe, and I've simply said that the penalties for sale and distribution should remain but, I favor a penalty more comparable to that, that we have for the other hallucinogens. LSD, which is far more a serious and toxic drug than marijuana is, after all, a mild hallucinogen. It just isn't a rational kind of set of penalties for these two classes of drugs.

Question.—Would you describe it as being more dangerous than alcohol? Marijuana is more serious than alcohol?

GODDARD. Well, trying to compare two different drugs is a very risky business itself. They have quite different mechanisms of action; alcohol's a depressant, where marijuana is a mild hallucinogen, at best, or maybe a euphoric.

Now, they both share some properties in common, however, they both distort our sense of reality, and therefore it's dangerous to operate heavy equipment or drive a vehicle when we're under the influence of either one of these.

Alochol, probably, lends itself more readily to control on the part of the individual, with respect to the dosage he's receiving than marijuana does, at least to the inexperienced.

So, there are some similarities, but there are also some differences. And as I've mentioned many times, we don't know what the long term effects of smoking marijuana or using marijuana in other forms might be, and we have to carry out this kind of research before, I for one, would be satisfied to say that the drug is safe under any conditions.

Question.—Doctor Goddard, what major safeguards do we need in the commercial drug testing?

GODDARD. Well, we seem to have good laws at the present time. It's a matter of having the laws that exist in the form of the Kefauver-Harris Amendment of 1962, followed by those who produce and distribute drugs for the marketplace. I'm satisfied we're making progress in this field. We're trying to get truth in drug advertising. I think we're beginning to see some signs of progress.

Question.—Do doctors know about the adverse affect of drugs? Are they well informed on that?

GODDARD. Well, this is one of the areas that the Kefauver-Harris Amendments was designed to correct, the failure on the part of firms who sell these drugs to sort of obscure or tend not to tell the doctor about the bad effects. We are seeing improvements in this, but I'm still not satisfied, that all of the scientific data is properly being provided to the prescribing physician.

Question.—Can you specify some drugs that you think might have adverse effects?

GODDARD. Well, we have recently in the past year, in fact, caused a number of "dear doctor" letters to be sent out, and I think the doctors know what these are well enough without my going into details now.

Question.—How serious is the shortages of flu serum going to be?

GODDARD. Well, I haven't kept up with the flu vaccine problems this year. I used to, when I was chief of the Communicable Disease Center, because we were the group that predicted how serious the flu season would be. The Division of Biologic Standards, part of the National Institutes of Health in the Public Health Service, determines what the nuture of the flu vaccine will be, that the manufacturers turn out. So, it's not under my perview, and I'm not all caught up on the subject right now.

Question.—How about drug pricing? Are you investigating companies that maybe sell drugs at inflated prices?

GODDARD. No, we have no responsibility for pricing policies of the drug industry. I'd like to make that clear.

Question.—You were speaking of ante facto action by business, getting into the area of your talk this afternoon. Could you communicate to us some of the idea in—in a minute or so?

GODDARD. Well, I'm simply trying to say that the business community, be more perceptive as to the writing that's on the wall and begin to take actions long before the Government pushes them into certain activities, become involved in the community activities, in our national affairs in a different way than they have in the past. This is a risk type of thing, I admit, but it's essential in my thinking, if the business community is going to withstand increasing government regulation.

I'm simply trying to say that the automotive industry could have avoided the creation of a National Safety Agency had they built more safety into their vehicles, something they've always been capable of, they have the scientific—the engineering know how; the only thing they lacked was the desire and the social perceptiveness to realize that if they failed to do it, it would be done to them.

This is what I'm also trying to tell the drug industry, avoid the heavy hand of regulation by acting in a responsible way. Make the decisions yourselves. The food industry has done quite well.

That kills it fellows.

Mr. KEITH. I would like to ask you again——

Mr. BROWN. May I ask if that is the same transcript you sent me?

Mr. KEITH. I have not yielded as yet.

I would like to ask, if I may, the question that was asked of you. You were asked whether or not marihuana is more dangerous than alcohol. Will you answer that question now?

Dr. GODDARD. I do not believe it is more dangerous than alcohol but it is difficult and dangerous to compare these two drugs. One is a drug that is a depressant; the other an hallucinogen.

Mr. KEITH. We realize there are amplifications to that answer but at any rate I can see where the press looks for a quick answer to something so they could make a headline. You are in the business of representing the public and leading them; I believe that by attempting to elaborate and equivocate upon that answer you asked for the response that you got from the public.

Now, the next question that was asked of you by Mr. Cohn, as I understand it, was whether or not you would mind if your daughter smoked marihuana any more than if she drank a cocktail.

What would be your answer to that today?

Dr. GODDARD. My answer is that I would not want my daughter or anyone else's daughter to smoke marihuana. We don't know what the long-term effects of the drug are.

Mr. KEITH. I tell my daughter, leave it alone.

Dr. GODDARD. So have I.

Mr. KEITH. And the public would get your meaning.

Now, this is sort of a lengthy approach, it would appear to the public in casual reading of the press comments as contrasted to the position I believe you take in some other area of jurisdiction of the FDA like fish protein concentrate where the official position is that fish protein concentrate is not fit for human consumption.

Dr. GODDARD. No, sir. That is not the case. I am sorry. I have never said that fish protein concentrate is unfit for human consumption. Whole fish protein concentrate has been approved by me and is going to be produced for distribution both here and overseas. In fact, I also share with you some concern, Mr. Keith. I feel rather strongly that I am in an anomalous position here of being accused of taking a soft position.

Mr. KEITH. Mr. Chairman, I am perfectly willing to let your statement stand with reference to fish protein concentrate.

The CHAIRMAN. I might say that the gentleman's time has expired. I failed to make it clear that we are only here for one purpose and not to go into other things. We do have an answer to your question, though, Mr. Keith.

Mr. Dingell.

Mr. DINGELL. Thank you, Mr. Chairman.

Doctor, I have not prepared myself for this day's hearings, having been devoting my thoughts to other matters a little while back.

I did send back to my office for some of my files for the impact of marihuana which I am impelled to look at some of the psychological

effects that take place as quoted in at least one major news magazine that not infrequently marihuana is at least a constituent of the so-called drug culture shadow world that we see. It certainly is dangerous and should be viewed with a great deal of concern by organized society.

Am I correct on this matter?

Dr. GODDARD. Yes, sir.

Mr. DINGELL. You have indicated to us that we do not know fully the physiological impact of the use of marihuana; am I correct?

Dr. GODDARD. That is correct.

Mr. DINGELL. But I read here in an article which I took out of the Washington Post, an article entitled "Doctor Finds Marihuana Far From Harmless," he goes on quoting Dr. Constandinos J. Miras of the University of Athens. He says:

I can recognize a chronic marihuana user from afar by the way he walks and talks and acts.

Do you have any knowledge that would indicate to you that this is not a factual statement?

Dr. GODDARD. I would have difficulty based on my reading of the literature on this subject and discussion of the subject with my colleagues that someone could tell one person who uses marihuana from afar by the way he walks, talks, and acts.

Mr. DINGELL. Mr. Miras' conclusions are based on 20 years' observation of chronic marihuana smokers in Greece. He defined a chronic marihuana user as one who smokes at least two marihuana cigarettes a day for 2 years or longer and he goes on to say he begins to see the personality changing typifying the long-term user—slow speech, the lethargy, the lowered individual activity.

He went on to say as follows:

They will accept as perfectly possible things which five years ago they did not even like to hear discussed. They will become suddenly silent without apparently provocation; they will even kill.

Then the article states that Dr. Miras is a pharmacologist. He goes on to cite this effect. He says:

Many of the human objectives he has been studying—

Referring to Dr. Miras—

were teachers, members of the arts, graduates of years past. Many of them left their professions and looked in other jobs but preferred most of all to sleep and talk of philosophy, he said.

Are these circumstances observable circumstances in connection with users of marihuana, Doctor?

Dr. GODDARD. Let me make two points, Mr. Dingell.

First is the pattern of usage. The use in other countries differs from our patterns. First of all, the drug, itself, may be different. It is often more powerful. In other words, the resin or marihuana is more commonly used in other countries of the world than it is in the United States where we tend to use the leaves which are pharmacologically less active, so you are dealing with a drug at a higher concentration. This is the point I want to make.

We have not had enough long-term experience or experience with long-term chronic users. We do know it is a dangerous drug. I cannot refute his statement but it is dangerous to make categorical state-

ments about this drug because we really do need a great deal more knowledge.

Mr. DINGELL. If I may, I would like to read just one more thing. Rat studies, for example, have showed that marihuana reduced reproduction activity 90 percent.

Dr. GODDARD. That is right.

The CHAIRMAN. Your time has expired.

Mr. Cunningham.

Mr. CUNNINGHAM. Thank you, Mr. Chairman.

I am not going to comment on the drug problem but I was very much surprised that the United Press said they don't owe you an apology. They certainly do.

I am very much disturbed with the irresponsible, sensational reporting that we get in our press today. This happened to me. Just last week, I was appearing before a Senate committee on a House-passed bill and I was talking about a section of that bill that I am very much concerned with and there was a UPI dispatch that said Congressman Cunningham said in effect if he does not get this provision in the Senate bill as it is in the House bill, he will kill the bill because I will be a conferee on that committee. I never made any such statement.

I didn't have a prepared text and I just spoke off the cuff for about an hour and a half. But they made the sensational opening statement and I immediately checked the transcript and found there was no reference to any such statement made by me; there was no foundation for it.

So, I just hope when I take this up with the UPI they will give me an apology as they did you which you should have and deserved to receive.

Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Rogers.

Mr. ROGERS. Thank you, Mr. Chairman.

Dr. Goddard, I am glad that you stated that you were not quoted correctly and an apology from UPI has been given.

Now, let me ask you this; You say alcohol is not addictive to the subject.

Dr. GODDARD. Well, physical dependence.

Mr. ROGERS. You say it is a dependence?

Dr. GODDARD. A physical dependence or addiction does occur and if you wish to equate those two, yes.

Mr. ROGERS. So, smoking cigarettes, for instance—some people have a dependency.

Dr. GODDARD. That is more of a psychological dependency.

Mr. ROGERS. I don't know what you call it; they get dependent on it.

Dr. GODDARD. Yes; they do.

Mr. ROGERS. What we need to get across to the public is what you basically have said but it has not been reported—that there is a dependency on these drugs and that it can be on marihuana, I presume, just as it could on cigarettes?

Dr. GODDARD. Yes.

Mr. ROGERS. So, a dependency—and I hope the press will get this point this morning, that it may not be an addiction in the scientific

sense of it but a dependency, which is just as bad as an addiction if the person is dependent upon a drug.

Now, let me ask you this: I think you have said that alcohol—you are not sure that one is any worse than the other—if one depends on anything it can become very serious. Actually, we have recognized in the law that marihuana is a drug and if there is a dependency on this drug it is a criminal act to sell it. Now, let me ask you this about LSD which is such a potential hazard: Should not this committee consider making possession of LSD a criminal offense?

Dr. GODDARD. Possession, Mr. Rogers?

Mr. ROGERS. Yes; possession.

Dr. GODDARD. I do not believe this committee should. I was asked this question by three committees of Congress last year. My opinion then, and still remains the same, is we should not make criminals of young people in our society who experiment with these drugs. Rather, we should focus our efforts in the drug abuse area, whether we are talking about marihuana, LSD, or whatever it may be, on diminishing the availability of it.

Then, an underlying problem that society has to examine is, why do these people experiment with drugs?

Mr. ROGERS. But we cannot get into that problem.

Dr. GODDARD. I don't think it helps.

Mr. ROGERS. Now we have said it is against the law to sell it.

Dr. GODDARD. Yes, and I believe that should be.

Mr. ROGERS. Don't we make it a penalty if they have opium or a hard drug, narcotic?

Dr. GODDARD. Yes.

Mr. ROGERS. And if there is a possession of it?

Dr. GODDARD. Yes.

Mr. ROGERS. Don't we make possession of marihuana a criminal offense?

Dr. GODDARD. Yes.

Mr. ROGERS. Isn't LSD worse than marihuana?

Dr. GODDARD. Yes.

Mr. ROGERS. Well, it seems to me we have not controlled it very well or stopped the sale of it.

Dr. GODDARD. I would say we have not stopped the sale of marihuana very well, either.

Mr. ROGERS. That is right. At least we can do something about it when we find it in possession. So, I just hope you will review your position here. I think this committee is going to have to study the situation and we have to stop this free flow of drugs.

Thank you.

The CHAIRMAN. Mr. Harvey.

Mr. HARVEY. Dr. Goddard, does marihuana degrade driving skills more or less than alcohol?

Dr. GODDARD. Yes; it does degrade them differently and I have tried to point out this is one of the dangers of hallucinogens and marihuana, specifically because it distorts the time sense very markedly; seconds seem like minutes, so one's perception changes markedly.

Now, alcohol also influences driving skills, depending on the level of alcohol blood levels that are attained. Up to 0.05 produces relatively little changes in driving skills; after that, rather marked de-

terioration sets in in the ability to track and maneuver a vehicle, attention span, and these kinds of things, so they are a little different—both very dangerous.

Mr. KUYKENDALL. Will the gentleman yield?

Mr. HARVEY. Yes.

Mr. KUYKENDALL. I think it is very important that we bring out here one thing that should be clarified about this letter of apology from the United Press. This is kind of a left-handed apology because in the same letter, and I would like to read from this letter, and this is quoting the reporter on the scene, it says:

> Mr. Cohn then asked whether you would mind if your daughter smoked marihuana any more than if she drank a cocktail and you replied no except in the context of the present law.

Now, this left a very clear implication that if it was not against the law it would be all right. This is in the letter of apology.

On the second page of this letter of apology, which is the strangest letter of apology I have seen, it says:

> Would you mind if your daughter took marihuana?
> Answer: We have talked about it at home. I would in terms of the law today. We really don't know what the long-term effects are. He never answered his daughter yes or no in either case.

There is something I want to question here as to whether or not it was made absolutely clear in this apology. I don't think it was.

Another point, here is a newspaper that didn't apologize, Mr. Chairman, the New York Times, and they questioned:

> He did not favor legalizing the drug but favored the removal of penalties for simple possession.

I have approved fully of the statement you have made here this morning. I wish you would have made it in Minneapolis and stuck with it, but I think it was a bad day in Minneapolis because I think you made yourself absolutely clear.

I don't think all these reporters—I don't think everybody that heard this was completely off their rocker in being misled so easily. I don't have any doubt about what your intent was but, sir, what I want to question you about is this: Don't you feel like you are responsible for your speculations in public as much as the actual scientific meaning?

Dr. GODDARD. Yes, sir.

The CHAIRMAN. Would you answer the question?

Dr. GODDARD. The answer to that last question is "Yes." However, I would like to add that, as opposed to the letter from the United Press International, the report contained in the pink sheet of October 23 where this particular publication called Victor Cohn, the reporter who was present, a veteran science reporter, and Mr. Cohn made this point in his story:

> Goddard stated two reservations. The first was that we don't know what its long-term effects are. For example, we don't know whether or not it may alter the chromosomes as LSD may do. I would not want young women who have not been married and children yet unborn to be affected.
> Goddard's second reservation continued that marihuana distorts perception of reality so that it is dangerous if you are driving a vehicle or operating heavy equipment.

Now, this was in response to the same question about my daughter and drinking and may I say I don't view my family as setting the

norm for the United States; rather, I feel my responsibility is to all parents of this country and to their children. We are concerned with a national problem of drug abuse and this is what we are trying to get at.

Mr. KUYKENDALL. If the gentleman would yield for one more quick question.

Do you feel no responsibility for this misunderstanding?

Dr. GODDARD. Well, I obviously have to feel responsibility, yes, because I was at the press conference. In communications, if I don't make myself clear, then I have been partly responsible.

Mr. KUYKENDALL. Thank you, Dr. Goddard.

The CHAIRMAN. Any further questions. Mr. Harvey?

Mr. HARVEY. No. I just would like to comment, Mr. Chairman, that I think Dr. Goddard, that what disappointed some of us on the committee is that we feel a part of your role as Commissioner is that of public education. Certainly it suggests more than just analyzing these drugs and being able to tell this committee the harmful effects. I think we would have all felt much easier if you had stressed in Minneapolis the "grim situation," which you have now told us that confronts law enforcement officers today.

This is what this committee is worried about and this is what I am particularly worried about, and we appreciate your explanation again.

The CHAIRMAN. Mr. Kornegay.

Mr. KORNEGAY. Thank you very much, Mr. Chairman.

Dr. Goddard, I, too, join my colleagues in saying we are glad you are here today.

I have a copy of the Washington Post article dated October 18, I believe, which described the conference in Minneapolis. The first statement of significance is the one you have already answered and that is related to your daughter, and I am not going back into that or about her smoking marihuana or drinking cocktails.

The next one is:

> Dr. Goddard said the long-term effect of smoking marihuana may be more serious than the effect presently known.

Did you say that, sir?

Dr. GODDARD. Yes.

Mr. KORNEGAY. Then you were quoted as saying that:

> Society should be able to accept both alcohol and marihuana.

Did you say that, sir?

Dr. GODDARD. Yes; but in the context of both of these are real problems that we have to accept them as problems and begin to work on them.

Mr. KORNEGAY. You didn't say accept the problem; you said accept the alcohol and accept the marihuana.

Dr. GODDARD. Sir, I must tell you that this press conference was a confusing one in every aspect. A fuse blew at the start.

Mr. KORNEGAY. It started informally and then they figured they were working into a pretty big deal so they moved inside; is that right?

Dr. GODDARD. What happened, Mr. Kornegay, was the university had a young woman on their staff from the press office and after the speech

in the front of the room where the meeting had been held she said, "We have some people who want to meet with you."

We were about to begin there and then someone else came along and said, "No; there are television cameramen who have set up in a nearby room," so we moved immediately there. We started the press conference and about 3 minutes after the beginning, as I recall, a fuse blew so the cameramen asked that it be stopped and we waited until the fuse was repaired.

Then they asked the same questions over again. They went back to the same question on alcohol and marihuana. Now, the transcript we have, therefore, is not complete in the sense that it does not contain the part that preceded the fuse blowing; whoever was doing the transcription wiped that when they picked up again.

So, I have no proof that I used it in the proper context nor is there any proof that I did not, and that is why I say this was an unfortunate series of events that day.

Mr. KORNEGAY. All right. Let me proceed with the understanding that it was a confusing situation. It goes on quoting you as saying:

I don't believe smoking marihuana leads to addiction of stronger drugs.

Did you say that?

Dr. GODDARD. Yes, sir.

May I explain why?

Mr. KORNEGAY. Yes, sir.

Dr. GODDARD. In the study carried out by the Federal facility of Lexington of some 2,200 admissions roughly in 1 year, they examined the use of marihuana as a precursor to the use of heroin and they found that there was a very strong correlation for individuals who came from 16 areas in the United States, 16 States including the District of Columbia and Puerto Rico. The correlation was about 80 percent. Almost everybody who used opium or heroin had started first with marihuana at age 17, roughly.

Then the next thing that happened was the mean age at the time of first arrest was about 18.7 years and the mean age at time of first use of herion was 20.9 years.

Now, quite in contrast to this, 12 Southern States showed an entirely different pattern. There was no correlation with marihuana use to those who were addicted to opiates. The opiates tended to be different. We didn't have the heroin addiction as commonly as in these other States so there are these extremes.

There are people who say that opium addicts always start on marihuana and that marihuana can lead to addiction to hard narcotics. Both are wrong.

With the number of estimated people in this country who use marihuana, between 400,000 and 3,000,000, and some people place the figure as high as 20,000,000 as representing those in our society who have tried marihuana, it is clear with only 60,000 heroin addicts in our country that not everyone who smokes marihuana has become addicted to heroin and that was the basis for my statement.

Mr. KORNEGAY. Of course, some start higher on the ladder than others.

I see my time is up but just one question, Mr. Chairman, and that is, it appears to me as I gathered from your testimony that you feel that

there ought to be a lessening of the severity of the laws on marihuana. I mean, you say it that way, making it too stringent.

Dr. GODDARD. Yes.

Mr. KORNEGAY. As I gather, one of the reasons you feel that way is that the laws on LSD are not stringent—not that you feel they are not stringent, but they are not as stringent on marihuana.

Dr. GODDARD. For possession.

Mr. KORNEGAY. I agree with my friend, Mr. Rogers, that you ought to be here asking to increase the laws on LSD rather than to lessen the stringency of the laws on marihuana.

Dr. GODDARD. Mr. Kornegay, I may well come back and ask that the penalties for the sale and distribution and manufacture of LSD be increased. I am simply saying that I think the penalties are inconsistent now and I do not feel as an agency head that making young people who are using LSD into felons is desirable for our society.

Mr. KORNEGAY. I agree with you. It appears to me that you have not rectified this and you ought to raise them on LSD rather than lower them on marihuana.

The CHAIRMAN. You clarify one thing, that it would be on possession instead of sale or anything like that.

Dr. GODDARD. Yes.

The CHAIRMAN. Before we get all intertwined, I understood you to say it was on possession.

Dr. GODDARD. That is right.

The CHAIRMAN. Mr. Nelsen.

Mr. NELSEN. Mr. Chairman, I have no questions.

I only wish to comment that I am sure that we all agree that the circumstances perhaps were unfortunate and perhaps misinterpreted to some degree and I hope the hearing today has fully clarified the situation.

Having served in an executive position in the Government, I know how difficult the role is at times. I have been before a congressional committee and have been cross-examined. I also know that it is not easy to get people to serve the Government in any capacity because qualified people are hard to find.

I do agree that this has been unfortunate and I hope the hearing today has fully clarified the position that you, Dr. Goddard, have taken and I think you agree that some of the circumstances were unfortunate.

Mr. BROWN. Would you yield?

Mr. NELSEN. I would be glad to yield, Mr. Brown.

Mr. BROWN. Dr. Goddard, did you find fault also with the New York Times article on your press conference in Minneapolis?

Dr. GODDARD. I thought it generally covered the points that were made there; yes.

Mr. BROWN. The reason I ask the question, and I ask it as a newspaperman more than a Member of Congress, is that I understand that the source was different; in other words, a different person heard your comments and wrote the article which was in the New York Times than the one who heard your remarks and wrote the United Press dispatch.

Dr. GODDARD. Yes, sir.

Mr. BROWN. I would like to put the whole article in the record at this point so that we can see the way the New York Times reported this case.

(The article referred to follows:)

[From the New York Times, Oct. 18, 1967]

PERIL OF MARIJUANA AND THAT OF ALCOHOL EQUATED BY GODDARD

MINNEAPOLIS, October 18.—Dr. James L. Goddard, Commissioner of the Food and Drug Administration, said yesterday "whether or not marijuana is a more dangerous drug than alcohol is debatable—I don't happen to think it is."

Dr. Goddard said that he favored removing all penalties for the possession of marijuana, leaving penalties only for its sale or distribution.

"We don't know what its long-term effects are," he said. "For example, we don't know whether or not it may alter the chromosomes, as LSD may do. I wouldn't want young women who haven't been married and had children yet, to be affected.

"It distorts your perception of reality so it's dangerous if you are driving a vehicle or operating heavy equipment."

Dr. Goddard was asked if he would object to his son or daughter using marijuana. He has a son, Bruce, 19 years old, and two daughters, Margaret, 21, and Patricia Ann, 18, in college.

"We've discussed this at home," he said, adding:

"I would object in terms of the law today and any possible long-term effects."

He said that he did not favor "legalizing" the drug completely but favored the removal of all penalties for simple possession.

"We need more research on chronic use," he said, "and I think this research will start now."

Dr. Goddard's comment on marijuana came after a lecture on business responsibility to an assembly at the University of Minnesota. He told that group that he would answer questions on any subject except marijuana.

But the first question at a new conference that followed was on marijuana. It was then that he gave his views on the subject.

VIEWS ARE ASSAILED

Dr. Robert W. Baird, a campaigner against marijuana and other narcotics, assailed Dr. Goddard's comments last night and demanded his resignation as head of the Food and Drug Administration.

Dr. Baird said that Dr. Goddard's comments had done "irreparable damage across the college campuses as well as in the high schools."

"This man's knowledge of narcotics is notorioulsy poor," Dr. Baird said. "Before he makes comments off the cuff, he ought to realize that 97 other nations who signed the Narcotics Convention of 1965, of which we were a part, can't all be wrong in realizing that marijuana is detrimental.

"I am surprised at his as a doctor. I am really mortified."

Dr. Baird, who is the director of the Haven narcotics clinic in Harlem and the chairman of the Suffolk County Narcotics Control Commission, said that he was "unequivocally" demanding Dr. Goddard's resignation "for equating marijuana on the same plane as alcohol."

A symposium on narcotics will be conducted by Dr. Baird today at the New York Hilton. About 1,000 college and high school students are expected to attend.

Dr. Baird said in a telephone interview that he would produce a dozen youngsters who had become involved in accidents of one kind or another after smoking a marijuana cigarette.

Mr. BROWN. You are reported in many instances in the same words as used in the UPI dispatch but among the comments, and this is in the first paragraph, you were quoted as saying:

Whether or not marihuana is a more dangerous drug than alcohol is debatable; I don't happen to think that it is.

Dr. GODDARD. Yes.

Mr. BROWN. And you are further quoted later on in the story where it was jumped to an inside page with reference to this question about the family discussion of marihuana, as saying, and I quote:

> We discussed that at home, he said, adding, I would object in terms of the law today and any possible long-term effects.

Then the article goes on to say:

> He said that he did not favor legalizing the drug completely but favored the removal of all penalties for simple possession.

Is that a fair interpretation of your view?

Dr. GODDARD. Well, on alcohol and marihuana I said it was debatable but that I felt it was not because I feel that we have a major problem with 11,000 deaths and about four and a half to five million alcoholics in our society, a very large social problem. We also have one of drug addiction of which marihuana is a part of the problem of drug induced——

Mr. BROWN. That really is not what I asked. What I asked was if you felt that this was a fair interpretation of your view. In other words, are both UPI and the New York Times wrong or was just UPI wrong in this?

Dr. GODDARD. I think that is a fairer interpretation of what I said at the press conference.

Mr. BROWN. Thank you.

The CHAIRMAN. Mr. Van Deerlin.

Mr. VAN DEERLIN. No one has asked you, Dr. Goddard (and it is really none of our business) but as a father, I am curious to know—does your daughter do everything you recommend, and refrain from those things you may warn her against?

I have three daughters coming along, the eldest 17. I should like to think that they might avail themselves of the wisdom that I have accumulated over a half century. I feel perhaps such is not the case. I think it is very important if we are going to reach the next generation that we don't tighten ourselves too much with the ideas or shibboleths of the past.

Even men in important national positions like yourself should feel free to think, and to discuss, without fear that you are going to be hauled in before a congressional court and held accountable for every last syllable that you uttered.

Dr. Goddard, this has no connection with what I have said thus far. Is marihuana an aphrodisiac?

Dr. GODDARD. It is generally not an aphrodisiac, but rather when persons who are interested in sexual activities use the drugs their interest will be heightened and the sensations will be heightened, as well. This has been frequently reported in the scientific literature in this country, from India and from other parts of the world.

No; it is not generally viewed by science as being an aphrodisiac.

Mr. VAN DEERLIN. Does marihuana have any medical benefits?

Dr. GODDARD. It is not accepted or used in medical practice in this country today; it has not been, of course, since 1937. This is not to say there is not great interest in some of the fractions of marihuana and the recent synthesis of THC is extremely interesting to pharmacologists because they feel that they can investigate some of the mechanisms

related to sleep and also that some of the fractions may be able to produce a mild form of euphoria which could be useful for those in mild depressive states. So, there is interest but there is no present use for this drug.

Mr. ADAMS. Will the gentleman yield?

Doctor, I shall share with Mr. Van Deerlin the position that it is important that officials be able to discuss subjects with some freedom and not feel that because a position may be unpopular that it can't be fully discussed. You can refer to Mr. Goodrich if you want, in answer to this question. Hasn't there been considerable discussion regarding a change in the type of prosecution for offenses for possession of hard narcotics as well as marihuana as to whether or not possession should be made an offense? For example, isn't it true, at the present time, that the way we make hard narcotics possession an offense is by a legal presumption that the possession is a part of a sale and that possession in and of itself is not criminal offense? Aren't you trying to open the discussion as to what generally should be done in the area of marihuana as well as LSD and all the rest I think it is important for this committee to not just shut you off on this discussion.

Dr. GODDARD. This is indeed what I was trying to do. I think one of my responsibilities is to report to the public, to help in the education of the public, tell them where we are on the national problem. I am simply saying I think this is important, that we engage in the dialog in our society and that Congress review the penalties of all the drugs being used.

Mr. ADAMS. I just want to make this point, that one of the problems we face in handling drugs as a social problem is if you make possession a felony offense, you cut off very often your sources of information and your ability to know (1) the size of the problem and (2) who is dealing in it because the person who is in possession, immediately, has the privilege against self-incrimination and will not, and often does not, talk as to his source of supply.

Dr. GODDARD. Mr. Staggers, can I make a comment on this statement that Mr. Adams brings to mind?

The CHAIRMAN. Yes.

Dr. GODDARD. Our department is very much interested in marihuana. We have no legal jurisdiction for the enforcement of the control activity, but let me point out that it is the National Institute of Mental Health's responsibility to conduct research. NIMH also is expected to provide services under NARA.

The Department of Health, Education, and Welfare has a responsibility for the dissemination of information and educational activities on narcotics and all drugs that are abused.

The Food and Drug Administration has to control the distribution of synthetic marihuana, if you will. We have the problems of juveniles in our society and we are very much concerned that the facts I mentioned earlier with respect to the age and time of the first use of marihuana being about 17½ years, the age and time of first arrest of heroin addicts being about 18 years; both these events occurring before they got locked in a drug subculture and used heroin and became addicts and burdens on our society.

The point I am trying to make is, our Department has a broad concern here, and we are hoping that we can look at the underlying prob-

lems of juveniles and youth in our society that lead them to have used drugs, including marihuana, and it is one that is being widely used today.

The CHAIRMAN. Mr. Watson.

Mr. WATSON. Thank you, Mr. Chairman.

Dr. Goddard, I differ about 180 degrees from my friend from California and my friend from Washington. I think you have a responsibility to the public not to discuss your own personal philosophies about these things because the parents of all teenagers are, I think, directly influenced by any judgment that you make.

Frankly, I believe the main trouble that you had in this particular instance is that you qualified your answer in reference to the use of marihuana.

Now, let me ask you this: You cited the fact that we have had 140-percent increase in the use of marihuana among young people in California alone. Further, you stated on page 5 of your prepared testimony that marihuana has been involved in nine out of every 10 investigations by the Bureau of Drug Abuse Control.

Despite those figures, you tell the American public that you would still advocate a reduction in the penalties for the possession of marihuana?

Dr. GODDARD. Yes.

Mr. WATSON. Despite those figures, you still advocate it?

Dr. GODDARD. What I have been trying to ask is that we review this whole matter. We feel that the major emphasis, the major effort should be on the control of sale and distribution and that there is an anomaly here.

Mr. WATSON. I don't want to interrupt you, but I think our problem is that you have qualified so many of your answers. I would like to get some "Yes" or "No" answers as far as possible.

You would still say, despite the tremendous increase in marihuana, despite the fact that nine out of 10 of your cases had involved marihuana, you would still recommend that the penalties for possession be reduced despite those figures?

Dr. GODDARD. Yes.

Mr. WATSON. Secondly, you made much ado about the long-term effects, and not knowing what the long-term effects are I am sure you are aware of the short-term effects.

Dr. GODDARD. Yes.

Mr. WATSON. Of course, we can only speculate what period would be required for you to determine what the long-term effects are. On the basis of the short-term effects and the detrimental effects as you have outlined, you would still recommend again that there is no more danger in marihuana than there is in alcohol?

Dr. GODDARD. This is not a question that I can answer with "Yes" or "No."

Mr. WATSON. Well, you have recommended it, have you not?

Dr. GODDARD. No; I have said it is dangerous to compare drugs of different pharmacological classes. Because I was asked the question, I compared the actions of the two and I have said that alcohol is a great problem for our society. In terms of the health problems, it is a greater problem than marihuana.

Mr. WATSON. Doctor, we know it is a tremendous problem; we are trying to get at the basic facts now of education.

Educationally speaking, you have spoken to the young people and said there is no more danger in marihuana than there is in alcohol. You have spoken to the American people and said that the penalties for the possession of marihuana should either be eliminated or reduced. That is your position in the eyes of the American public and I think you have done a great disservice to people who are concerned about the drug problem, and I say that in all respect.

May I ask you one thing further?

You said we should not make felons of young people who experiment with drugs. Even if that experiment leads to dependency or addiction, you would still make that statement? Can the experiment lead to addiction or dependence?

Dr. GODDARD. It can.

Mr. WATSON. You still make the statement that we should not deter to the point of making criminal penalties apply to young persons?

Dr. GODDARD. That is correct. The person then is like an alcoholic; he needs medical treatment if he becomes dependent on the drugs, not criminal treatment.

Mr. WATSON. But parents are trying to say no, don't use it, don't possess it.

Dr. GODDARD. So am I.

Mr. WATSON. You are saying possess it.

Dr. GODDARD. No.

Mr. WATSON. Without criminal penalties.

Dr. GODDARD. No.

Mr. WATSON. Aren't you? Did you suggest reducing or eliminating the criminal penalty?

Dr. GODDARD. I said let's review these penalties; I think they are inconsistent. I specifically said it is too severe, in my opinion.

Mr. WATSON. Well, aren't severe criminal penalties a deterrent? Are they not, sir?

Dr. GODDARD. I would have to ask a criminologist that question. I believe there is some argument about this.

Mr. WATSON. There is some argument. I am sure there is always argument about everything.

Dr. GODDARD. Certainly.

Mr. WATSON. Explain one thing. You say drug dependent rather than addiction. I am afraid we are playing semantics here now.

Addiction is a stronger term than dependency. What is the difference between dependency and addiction?

Dr. GODDARD. The difference may be whether or not a person has physical withdrawal symptoms upon discontinuing the drug. Opiate derivatives cause addiction.

Mr. WATSON. Do you not have the problem with any person who is dependent upon the drug as well as the addict?

Dr. GODDARD. Not necessarily; no.

Mr. WATSON. You do not have problems with a person who is dependent upon a drug?

Dr. GODDARD. No, sir.

Mr. WATSON. Would not have problems in withdrawal?

Dr. GODDARD. No physical signs of withdrawal upon cessation of usage of drugs. Persons are psychologically dependent upon but not addicted to.

Mr. WATSON. Who have no problems in withdrawal, someone who is dependent upon the drug? That is your position?

Dr. GODDARD. Well, I admit this gets down to trying to medically define the difference between addiction and dependence. In the World Health Organization they prefer now and in other organizations to talk about drug dependence which is a spectrum of problems with drugs going from the person who is psychologically dependent or habituated to the use of a drug or a compound such as tobacco on up through the person who is physically dependent upon a drug such as the opiate derivative heroin. So there is a whole spectrum.

Mr. WATSON. Doctor, oftentimes the mental dependence of a drug is just as serious as a physical dependence, but you are now trying to tell us it is easy for a person to withdraw without any problems.

Dr. GODDARD. I didn't say it was easy, sir; I said there was no physical signs of withdrawal.

Mr. WATSON. May I say in all respects I am afraid a disservice has been done in this regard.

The CHAIRMAN. Mr. Adams.

Mr. ADAMS. Continuing on that, Dr. Goddard, I preface this by saying that I have both prosecuted cases dealing with the hard narcotics and so-called soft narcotics and dealt with addicts as witnesses. Actually what you are referring to as addiction is an actual physical change in the nerve ends, are you not? the so-called hard narcotics when they cause withdrawal systems, it is produced by a physical deterioration in those nerve ends, isn't that true?

When they speak of withdrawal, when they say the skin crawls, it literally crawls, does it not?

Dr. GODDARD. Yes.

Mr. ADAMS. Whereas, with the others the problem may be extremely difficult but it is a mental problem as it is with stopping smoking, stopping alcohol, stopping all the rest?

Dr. GODDARD. Yes.

Mr. ADAMS. And it may be terribly severe and it may be something that the person cannot overcome?

Dr. GODDARD. That is correct. I stopped smoking cigarettes and it was an extremely difficult thing to do.

Mr. ADAMS. And you will have various degrees of this.

Now, I asked Mr. Van Deerlin to yield because I am concerned about, and I think your message covers, a broader spectrum than marihuana. What you are basically saying is that alcohol as well as marihuana as well as the hallucinogens over a broad spectrum are all extremely dangerous and bad for the general health of the individual, isn't that right?

Dr. GODDARD. Yes.

Mr. ADAMS. And that we should be examining all of these in terms of what we apply as specific penalties for the activity that is involved?

Dr. GODDARD. That is correct.

Mr. ADAMS. All right. Now, I know that there has been and I want to know if there is presently pending a study between the Bureau of Narcotics and FDA on jurisdiction over the band that lies between the

hallucinogens—and we will include marihuana in that—as to both jurisdiction and as to application. Is that presently under study?

Dr. GODDARD. There is no joint study presently underway. We have had meetings with the Treasury Department, Narcotics Bureau, to make clear we are not trying to grab the narcotics control problem away from them. We are not seeking it and we do have a working arrangement that works very well.

Mr. ADAMS. I understand that, what we have, and I think Mr. Dingell referred to it, that you are basically operating in this new type of drug-abuse area that has grown beyond the hard narcotics and are trying to determine what types and kinds of penalties will allow you to best deal with it in terms of stopping the overall spread of it; is that correct?

Dr. GODDARD. That is correct.

Mr. ADAMS. I have not heard you at any time in your testimony and I want to know if you ever have publicly stated that you thought that marihuana or the other hallucinogen drugs were good for anybody.

Dr. GODDARD. No; I never made that statement.

Mr. ADAMS. And that your problem has been one of trying to indicate to the younger public the dangers of this spectrum and suggest to us how you think the tools could better be developed to deal with this as a social problem?

Dr. GODDARD. Yes, sir.

Mr. ADAMS. I have no further questions.

Thank you.

The CHAIRMAN. Dr. Carter.

Mr. CARTER. What was the origin of marihuana as we know it? Where did marihuana come from?

Dr. GODDARD. This is an interesting question you have asked because there is some indication that it may have originated in this hemisphere. However, it has been used in the Middle East and in other parts of the world for over 5,000 years, and in a variety of forms, I might add.

Mr. CARTER. By whom was it commonly used? Do pharmacologists give an adequate statement of what group of people commonly used it?

Dr. GODDARD. It was used in older societies quite commonly by the priests, by the people involved in faith healing. It was also used by a fairly wide spectrum of people in the older societies and until the mid 1930's or early 1940's it was quite commonly used even in India in a variety of forms; they drank it in a tea, as well as smoked it.

Mr. CARTER. Do you recall the meaning of hashish?

Dr. GODDARD. Yes.

Mr. CARTER. What is that?

Dr. GODDARD. The word had its origin from a specific group that were known as assassins; they were given the drug prior to going out on missions, I am told.

Mr. CARTER. Yes, sir. They first took their hashish and then they went out to do assassinations. That is a very hurried history of the drug, rather dangerous drug.

It is my unfortunate experience to have a young man who went to medical school with me commit suicide after smoking a muggle cigarette, as it was called at that time.

Now, is alcohol addictive?

Dr. GODDARD. It can cause physical dependence and if you mean by that to equate it with addiction; yes.

Mr. CARTER. It does certainly have withdrawal symptoms, as you mentioned.

Dr. GODDARD. Yes; it does.

Mr. CARTER. I believe you stated that you opposed increasing penalties or penalizing those who possess this particular drug; is that true?

Dr. GODDARD. I have said I think that penalties for possession of this particular drug are too severe in contrast with LSD and I have compared them with the penalties in the field of the other hallucinogens and the other drugs that are abused where there is no penalty for personal possession but executive seizure can occur.

Mr. CARTER. You do differentiate between possession and possession for sale?

Dr. GODDARD. Oh, indeed.

Mr. CARTER. I wish you would make that plain. Certainly I regret that this unfortunate circumstance has arisen and most of us realize that our words can be distorted many, many times.

Thank you, Mr. Chairman.

Mr. WATSON. Doctor, will you yield?

Mr. CARTER. Yes.

Mr. WATSON. Of course, the matter of possession, I would be in favor of your position on LSD, but we are dealing with entirely two different things. We are unaware, certainly I am unaware, of any doctor prescribing marihuana. Are you aware of that?

Dr. GODDARD. No.

Mr. WATSON. They have prescribed LSD, peyote, mescaline, psylocibin?

Dr. GODDARD. No, sir.

Mr. WATSON. I yield to my doctor friend.

Dr. GODDARD. LSD is only an investigative new drug.

Mr. CARTER. As you know, lysergic acid has been used for different types of headaches.

Dr. GODDARD. Yes, but that is not LSD.

Mr. CARTER. Yes; it is.

Dr. GODDARD. Precursor.

Mr. CARTER. It has been used by the Mayo Clinic.

Dr. GODDARD. Yes, sir; it is a precursor but it is not LSD. It does not have any of the properties of LSD, Dr. Carter. It is not a hallucinogen.

Mr. WATSON. The amphetamines are a legal drug?

Dr. GODDARD. Yes.

Mr. WATSON. So there is a problem of possession of a legal drug as contrasted with the problem of possession of marihuana. The thing that disturbs me is that you suggest that he would use superlatives for the possession of the drug which is never prescribed for any medicinal purposes and can only be illegally possessed.

Dr. GODDARD. What I am trying to ask is have the possession penalties, not possession for sale, you made an important point there—have the possession penalties really contributed to our ability for society to handle the marihuana problem? Aren't we concerned about the whole spectrum of drug abuse? Isn't this our concern in the society, getting at that?

Mr. WATSON. If you make it a criminal penalty to possess it, I am sure that would be a deterrent.

Mr. CARTER. Mr. Chairman, there is just one thing. I know the users of narcotics are troubled, worried, and disturbed by the future. The youth of our country are at the present time troubled, worried, and disturbed, and it is not unusual that they seek release from their troubles in some cases. I regret that this is true. I think this is the wrong path but they are confronted with problems as the youth of no country have ever been confronted before.

Thank you.

The CHAIRMAN. Mr. Kyros.

Mr. KYROS. Dr. Goddard, I think that this hearing this morning has been very helpful, particularly in the colloquy you had with Dr. Carter and consequently Mr. Adams in showing how easy it is to get confused.

For example, you were talking about possession all morning long and it was helpful, I think, that you distinguished between some hoodlum or criminal having possession of marihuana for purposes of sale or some innocent youngster who had just got something in his pocket, might have got a whole cigarette for purposes of idle curiosity.

You are worried about the inconsistency of penalties presently applicable and I think everyone is. I think one of the problems that came out, Doctor, is that you are looking at this as a scientist; but one thing I think that came out clear is that you absolutely are against the use of marihuana by anyone in the United States.

Dr. GODDARD. Yes.

Mr. KYROS. And the use of any of these drugs?

Dr. GODDARD. Yes; I have never advocated its legalization.

Mr. KYROS. I think in that respect, sir, the hearing has been very helpful this morning, and I appreciate it very much.

Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Brotzman.

Mr. BROTZMAN. Thank you, Mr. Chairman.

Doctor, I regret that I didn't hear the formal part of your statement inasmuch as I was engaged in another meeting, but I wanted to be here very badly because I must be very candid with you and don't want to equivocate in any way.

I was terribly concerned about the remarks that were attributed to you by the press. It has been my responsibility in the past as a U.S. attorney to handle the law enforcement part of this situation. I have been led to believe that we were not really winning the battle in keeping our youth from being subjected to the addictive type of drugs.

I don't have any current statistics on this but at the time that I was in that job, it was a never-ending fight.

Now, from your experience in dealing with the individual that is addicted to the heavy drug, have you found that an undue proportion of them became addicted after they had started out smoking or using Cannabis sativa?

Dr. GODDARD. Yes, but that is not necessarily a causal relationship as you well appreciate.

Mr. BROTZMAN. I realize not a causal physiological relationship.

I don't say that it was a physical correlation but more terrible to me and more callous to me was the fact that those individuals who use marihuana had been picked out by the pushers that sold the heavy drugs; they were prospect No. 1 to try to get them to use something more.

Dr. GODDARD. Mr. Brotzman, this is an interesting point. Most addicts, I am told, are introduced to the drug by the people they associate with. Now, the people who handle heroin as pushers, I am told, never handle marihuana or almost never. So, you see the people who handle the hallucinogens, the amphetamines, the barbituartes, on the other hand nine out of 10 arrests we make we find them in possession of marihuana, too.

This whole question is very complex, as you well know. We have a drug subculture that exists. People get drawn into that subculture and the most frequent thing they start with is marihuana; you are quite correct on that. Now, if they stay in that drug subculture, they always tend to get arrested and they always tend then to go on and become involved with heron. But that does not mean that everyone who has used marihuana goes on to heroin, nor does it mean that, and it is a fact indeed that of those who use heroin 90 percent of them have had marihuana to start with.

Mr. BROTZMAN. Now, I don't say that every one of them do but I think that the record will show that a majority or maybe a large majority started out just this way.

I want to make this particular point. The prosecution usually is aimed at the person that is selling. However, in order to convict that person, many times you can't get the evidence of a clearly defined sale, so the reason for the "possession" in the law, according to my experience, is to get the pusher, and there you do have some means of checking what I think is a very dangerous crime against our whole society.

I have not heard the Narcotics Bureau state that they think that they should lessen the penalties on sale or possession of marihuana, or any other type of drug, have you?

Mr. GODDARD. No; to my knowledge, they have not. I cannot speak for them.

Mr. BROTZMAN. I must express this thought as I see the chairman about to bang the gavel. I think to take a step backward in this area right now would be bad for our country. I hope no younger person misunderstood the remarks attributed to you, as putting the stamp of approval on this because it is my sincere belief, and I would say this to my daughter, too, and I have, that this is at least an invitation to a life of degredation, hardship, and unhappiness.

I have seen young females turn to prostitution; I have seen young males turn to armed robbery because they had taken the first step. This is what I want to prohibit.

The CHAIRMAN. Mr. Brown.

Mr. BROWN. Dr. Goddard, when I asked you for the medical evidence on which you based your conclusions that the penalties for possession should be reduced, you sent me a bibliography of 137 different scientific studies, most of which have been done since 1960, and then went on to say that we need more research to come to some conclusion.

Now, can you tell me how much more research we ought to do?

Dr. GODDARD. To answer what question?

Mr. BROWN. To determine whether or not we should change the penalties.

Dr. GODDARD. I don't think we need the research to change the penalties. I think the penalties can be reviewed apart from the research. The research may contribute, but the penalties have been changed.

For example, prior to the Prettyman Commission report, as I recall the penalties for what I will call possession of marihuana, it is really the failure to have the transfer tax paid, you see, and have that paper in your possession. Those penalties were at that time, as I recall, mandatory sentencing for 5 years.

Now, the Prettyman report, as a result of that there was a reduction in the penalty, 2 to 10 for first offense and the judge in his discretion could place the individual on probation for marihuana possession. Now, that was a reduction in the penalty, itself, and those kinds of reductions can be achieved without further research.

Mr. BROWN. Dr. Goddard, I understand you want all penalties removed for possession.

Dr. GODDARD. Sir, may I say except the possession for sale.

Mr. BROWN. Possession for sale. The other possession is for use or just to have as a collection. Now, you want possession for use or ownerhip made legal?

Dr. GODDARD. What I tried to say——

Mr. BROWN. You want all penalties removed for possession for use or ownership?

Dr. GODDARD. I have not said that. I have said the penalties are too severe and that we should reevaluate them and reexamine them.

Mr. BROWN. I go back to the New York Times article where you were quoted. It says, "Dr. Goddard said he favored removing all penalties for the possession of marihuana, leaving penalties only for its sale or distribution."

I think this is the point, Dr. Goddard. If they remove the penalty itself for mere possession (not for sale, now, or distribution but the possession for use or ownership, collection, or whatever you want to call it) aren't we saying in effect that it is all right to have the demand, it is not illegal?

Dr. GODDARD. No.

Let me make this point, Mr. Brown. We have this problem with LSD and, believe me, it is a serious problem.

Mr. BROWN. I am not talking about LSD, we are talking about marihuana.

Dr. GODDARD. I understand, but there is no penalty for possession.

Now, let me make the point that young people were increasing their usage of it. Our enforcement efforts were directed at sale and distribution. Now, only when the young people began to perceive that there was a possible danger to their health in terms of the effect on chromosomal patterns and unborn children did we begin to notice any diminution in LSD usage.

So, you see, we are able to work in our area of drug abuse without having the penalty for personal possession, with just having executive seizure. I think the individual can be better influenced by educational efforts by getting at whatever it is that motivates him to use these things. What we have always tried to say is don't make the person a criminal, a felon.

Mr. BROWN. Dr. Goddard, I don't know whether you have seen the ad in the New York Times yesterday for "Pot, a Handbook for Marihuana," but it says this—and I hate to take my time reading this New York Times advertisement here, but I want to make the point that I don't agree with you and I do agree with some of my colleagues who are concerned about the fact that your remarks have been taken as license by many, many people. You shake your head and say no, they have not, but I think the ad would indicate they have if I may read it.

It says:

It is now an open secret that marihuana is considered harmless by some of the Federal Government's own health and mental health officials.

And in another paragraph it says:

"Drug chief equates peril of marihuana and that of alcohol." This headline in the New York Times reports that Dr. James L. Goddard, Commissioner of the Food and Drug Administration, favored removing all penalties for the possession of marihuana, leaving penalties only for its sale and distribution. This trend toward legalization of marihuana explains the growing demand for "Pot, a Handbook for Marihuana" now in its third printing. More we cannot tell you.

They are selling a handbook on the drug on the strength of your comments. I think they may be selling the drug itself on the strength of your comments.

Dr. GODDARD. I never said it was harmless. I have said it is dangerous.

Mr. BROWN. Mr. Chairman, may I ask a question of the Chair?

Will we hear any more competent testimony than that of Dr. Goddard on the medical and social aspects of marihuana and its use and will we hear from any enforcement officials or any parents whose children have "gone to pot"?

The CHAIRMAN. That was not the purpose of this meeting at the present time, which was to get clarification of the reported statement which aroused nationwide interest here.

Now, Dr. Goddard will be before this committee many times and we can pursue other matters then.

I would like to make this statement in closing, that I have gathered from the hearing today that you are against the use of marihuana and all other drugs.

You have not said whether you use alcohol or not, but there are a lot of people who don't advocate its use—I don't either—for children, tobacco or alcohol or anything else.

I think the whole controversy might be over the fact of possession here; I don't think that question comes within the province of your agency at all. I believe it is something that should never have been brought up. I think it is very unfortunate that it was.

It simply does not come within your province at all to say whether possession of marihuana should or should not be an offense. There has been a big hullabaloo here aroused that, perhaps if there had been a simple explanation given, might have cleared the air.

I think perhaps it has been very unfortunate that you have made the statements that you did when the question doesn't come before your agency about enforcement on possession.

Am I correct on this, that enforcement of penalties for marihuana possession does not come before your agency?

Dr. GODDARD. We do not have the responsibility for control of marihuana.

The CHAIRMAN. That is what I mean.

I am very happy to see that it is clear that you are against the use of any of these drugs at any time, not only for your family but for any other person or child. I think that is our responsibility here as Members of the Congress, to find out about that and try to verify it. I think this has been helpful. I want to thank you for coming.

Mr. BROWN. May I ask unanimous consent to put in the record the material to which I made reference, including the full text of the ad in the New York Times, and also an exchange of letters I have had with Dr. Goddard, because I do think that they help to clarify the record on this drug.

While I hesitate to include the 137 scientific references which he gave me, I would put those in at your discretion, Mr. Chairman.

(The material referred to follows:)

HOUSE OF REPRESENTATIVES,
Washington, D.C., October 19, 1967.

DR. JAMES L. GODDARD,
Commissioner, Food and Drug Administration,
Washington, D.C.

DEAR DR. GODDARD: As elsewhere in the nation, some doctors and pharmacists in my District have been displeased from time to time by past decisions by you or your office.

Because of the nature of your statement on marijuana as reported in the press earlier this week, I am sure I shall be receiving from highly respected people in these professions and in law enforcement in my District letters questioning the competence of the experimental work on which your conclusions were based. For this reason, would you be kind enough to send me a summary of this study?

Because of the nature of your remarks, I am also sending the enclosed letter to the Chairman of the Interstate and Foreign Commerce Committee urging that you be called for a hearing to explore the studies FDA has made on drug use, abuse and dangers so that public information media or individuals will not interpret your remarks about marijuana improperly or as applicable to all narcotics or hallucinogens.

Sincerely yours,

CLARENCE J. BROWN, Jr.,
Member of Congress.

DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE,
FOOD AND DRUG ADMINISTRATION,
Washington, D.C., October 20, 1967.

HON. CLARENCE J. BROWN, Jr.,
House of Representatives,
Washington, D.C.

DEAR MR. BROWN: This is in reply to your letter of October 19, regarding remarks attributed to me concerning marihuana.

I am enclosing a copy of the transcript of the remarks made at the October 17 Minneapolis press conference and two statements I have issued on the subject. A review of the enclosed material will show that I have not advocated free use of marihuana; that I have not dismissed its possible dangers to health; and that I have not failed to recognized the fact that possession of marihuana is illegal.

You will also note that I did not advocate the use of marihuana as has been reported. The report that I stated that I would not object any more to my daughter smoking marihuana than to her drinking a cocktail is not true.

It is my feeling that the present penalties imposed for use and possession of marihuana are disproportionate to the hazards presented by the drug. This is a view held by many responsible persons in our society.

The Food and Drug Administration has not made any studies of the effects of marihuana. My statements as to the relative dangers of marihuana reflect not only my views as a physician but the views of colleagues whose works have been published in the scientific literature. It is my understanding that further studies

of the effects of marihuana are now in progress at the National Institute of Mental Health.

Your interest in this matter is appreciated and I hope these remarks can be used to set the record straight.

Sincerely yours,

JAMES L. GODDARD, M.D.,
Commissioner of Food and Drugs.

HOUSE OF REPRESENTATIVES,
Washington, D.C., October 24, 1967.

DR. JAMES L. GODDARD,
Commissioner, U.S. Food and Drug Administration,
Washington, D.C.

DEAR DR. GODDARD: This is to acknowledge and thank you for your letter of October 20th with accompanying information regarding your recent remarks on marijuana.

As you may remember, my letter of October 19th included a specific request that you forward to me a summary of experimental work on which your conclusions were based. Since your letter made no reference to my request, am I to assume from your reply that your expression was not based on a comprehensive study, but, rather, on the views of colleagues whose works have been published in scientific literature and on your insight as a physician and father?

Your credentials as a physician and parent may be admirable. But I am concerned that they and the published studies of colleagues may not be adequate scientific evidence upon which to base so weighty a judgment for one who occupies such a responsible position in government.

In your letter to me you state your feeling that "present penalties imposed for use and possession of marijuana are disproportionate to the hazards presented by the drug". And yet you also say, ". . . we don't know what the long term effects of smoking marijuana or using marijuana in other forms might be . . .". If our knowledge is incomplete, is it sufficient upon which to base your feeling—whether that feeling is personal or official?

Any relaxation of penalties as established by present law must be founded on detailed and scienctific information and official conclusions. Your call for more long term research to detect any possible serious side effects from chronic usage of marijuana would seem to suggest that such studies and conclusions do not exist. Why, then, has the Food and Drug Administration not seen that such studies of the effects of the drug are made?

Does not the Bureau of Drug Abuse Control have the responsibility to initiate and conduct programs desgined to emphasize the social, physiological, and psychological aspects of drug abuse control? Are you satisfied with no more than an "understanding" that the National Institute of Mental Health is conducting further studies?

I would like to know whether or not you consider the Food and Drug Administration to have a prime interest in such research. I would like to know what research has been completed and what conclusions, if any, have been reached. What studies are now under way? If none have been completed or none are under way, then I would appreciate your opinion on what agency or agencies should be actively engaged in research on marijuana, what you have done to see that such studies are undertaken, and what, if any, reasons or circumstances have prevented such research from being conducted.

I appreciate your prompt response to my earlier letter, and I trust you will agree that the sooner the above questions are satisfactorily answered, the better for everyone concerned. In this I speak not only as a member of the House Interstate and Foreign Commerce Committee, but as one who is sorely worried by the possibility that any misinterpretation of the facts in this matter may lead to disaster for even one individual who might have read into your earlier remarks a license to indulge in the traffic or use of marijuana.

Sincerely yours,

CLARENCE J. BROWN, JR.,
Member of Congress.

33

DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE,
FOOD AND DRUG ADMINISTRATION,
Washington, D.C., October 31, 1967.

Hon. CLARENCE J. BROWN, Jr.,
House of Representatives, Washington, D.C.

DEAR MR. BROWN: This is in response to your letter of October 24 requesting more information about my views on marijuana. Your assumption is correct that my own opinions regarding marijuana are based upon "the published studies of colleagues." Enclosed is a bibliography citing many of the articles, books, and pamphlets which I have reviewed. The list includes articles about marijuana from the lay press as well as the scientific literature. I have relied upon the latter in forming my opinions.

Any physician or scientist must rely upon the knowledge available in scientific literature in reaching a decision. It is a rare case, indeed, when any single research study can provide a comprehensive answer to a problem of any complexity.

I have not expressed any conclusive judgments about marijuana; rather, I have emphasized that we know too little about the possible effects of long-term use of the drug. I do not think that this view is inconsistent with my opinion that the present penalties for possession and use of marijuana are disproportionate to the hazards presented by the drug.

I have never suggested, nor do I believe, that we should eliminate criminal penalties for the distribution of marijuana. The drug was dismissed by the medical profession long ago as having any unique therapeutic value; I can conceive of no benefit in giving it legal status in society.

You also asked about the status of the research long-term effects of marijuana. The FDA is dealing with the problem of drug abuse, but we have concentrated on those drugs over which the Congress has given us jurisdiction; that is, stimulants, depressants, and hallucinogens other than marijuana.

In terms of the FDA's statutory authority, however, this Agency does not have a primary responsibility in marijuana research, although our studies in the social, physiological, and psychological aspects of drug abuse are often relevant to marijuana.

Marijuana research is going forward in the National Institute of Mental Health (I am enclosing a listing of these studies). I am not in a position to report on the conclusions of this research, but I am sure NIMH would be as helpful as possible in this regard should you wish to pursue this matter.

If I can be of any further assistance, please do not hesitate to call.

Sincerely yours,

JAMES L. GODDARD, M.D.,
Commissioner of Food and Drugs.

POT

A HANDBOOK OF MARIHUANA

by JOHN ROSEVEAR

Legalization of marihuana is now called for not only by pot-users but by medical authorities and government officials weary of the pointless prosecutions. There is now wide conviction that marihuana should not be jumped together with the narcotic drugs. This book is a handbook of the information needed to cope with these questions.

Here is the fascinating history of marihuana, ancient and modern. Here is how and where the plant grows. Here are its chemical and psychic properties. Here are the various pipes and other methods of use.

It is now an open secret that marihuana is considered harmless by some of the federal government's own health and mental health officials. They have just recently distributed marihuana extract to the principal medical research organizations in the field, asking them to make tests similar to those of the famous LaGuardia report of 25 years ago. Now the reports are coming in: what the LaGuardia report said was correct!

"DRUG CHIEF EQUATES PERIL OF MARIHUANA AND THAT OF ALCOHOL." This headline in the *New York Times* reports that Dr. James L. Goddard, Commissioner of the Food and Drug Administration, "favored removing all penalties for the possession of marihuana, leaving penalties only for its sale or distribution."

This trend toward legalization of marihuana explains the growing demand for POT: A HANDBOOK OF MARIHUANA, now in its third printing. More we cannot tell you.

RESOLUTION

Resolved, by the Internal Security Subcommittee of thhe Committee on the Judiciary, That the testimony of Dr. Hardin B. Jones taken in executive session on May 21, 1974, and the testimony of Dr. Forest S. Tennant and David O. Cooke taken in executive session on June 13, 1974, be released from the injunction of secrecy and printed in the same volume with the public hearings of May 9, 16, 17, and 20, 1974, all on "The Marihuana-Hashish Epidemic and Its Impact on U.S. Security."

JAMES O. EASTLAND,
Chairman.

Approved: September 4, 1974.

INTRODUCTION

BY

SENATOR JAMES O. EASTLAND

Chairman, Senate Subcommittee on Internal Security

I consider the hearings which are the subject of this record to be among the most significant ever held by the Senate Internal Security Subcommittee, or, for that matter, by any committee of Congress. The widespread interest already generated by the hearings suggest that they may play a role in reversing a trend towards national disaster.

Without public awareness, our country has become caught up in a marihuana-hashish [1] epidemic that probably eclipses, in gravity, the national epidemics that have had so debilitating an effect on the population of a number of Middle Eastern countries. Speaking about this matter, Mr. Andrew C. Tartaglino, Deputy Administrator of the DEA, made this statement at the opening hearing on May 9, over which I presided:

> The traffic in, and abuse of, marihuana products has taken a more serious turn in the last two or three years than either the courts, the news media, or the public is aware. The shift is clearly toward the abuse of stronger, more dangerous forms of the drug which renders much of what has been said in the 1960's about the harmlessness of its use obsolete.

The epidemic began at Berkeley University at the time of the famous 1965 "Berkeley Uprising." Not only was pot-smoking embraced as a symbolic rejection of the establishment, but, together with the "dirty speech movement," the right to pot became an integral part of the catalogue of demands of the uprising. From Berkeley, the marihuana epidemic spread rapidly throughout the American campus community. Then it spread down into the high schools and junior high schools—and within the last year or two it has begun to invade the grade schools. It has also spread into the ranks of professional society and of the bluecollar workers, so that all sectors of our society are today affected by the epidemic. Today it is estimated that there are some millions of regular marihuana users in the country, and the evidence indicates that they are graduating rapidly to the stronger hemp drugs, hashish and liquid hashish.

The spread of the epidemic has been facilitated by the fact that most of our media and most of the academicians who have been articulate on the subject have been disposed to look upon marihuana as a rela-

[1] Marihuana and hashish are both derived from the cannabis, or hemp, plant. Marihuana consists of the leaves and female flowers; hashish comes from the resin of the plant. Hashish is roughly 8 to 10 times as strong as marihuana.

tively innocuous drug. (How the myth of harmlessness came to be so widely accepted is also part of the subject of this testimony.) There were some who even held that marihuana was a good thing, while most held that there really wasn't too much to worry about.

Taking advantage of the confusion and widespread ignorance, a variety of movements seeking the legalization of marihuana came into existence. They gathered strength rapidly. In fact, by early this year concerned scientists and government officials were almost ready to throw in the sponge because the battle looked so hopeless.

This situation, by itself was reason enough for concern. The Internal Security Subcommittee decided to look into it because of internal security considerations affecting the armed forces of the United States, and because of the evidence that clearly subversive groups played a significant role in the spread of the epidemic—both as propagandists and as traffickers. It was established, for example, in previous hearings of the subcommittee, that Timothy Leary's Brotherhood of Eternal Love had for a number of years been the largest producers of LSD and the largest organized smugglers of hashish in the country.

The hearings focused heavily on scientific evidence of physical or psychological harmfulness, because this was basic to any assessment of the impact of cannabis on security.

Important new scientific evidence had emerged within the last few years. But this evidence remained fragmented, sometimes inconclusive, and almost invariably completely unknown to the public. The situation was further confused by contradictory evidence and by the emergence of several best-selling books suggesting a more tolerant approach to marihuana.

One of the principal reasons why hard scientific evidence has been so slow in emerging is that it is only within recent years—in fact, since 1970—that accepted procedures for the quantitative analysis of marihuana have been established and that carefully standardized strains of marihuana have become available for research purposes. In the absence of standardized research materials and standardized analytical procedures, research scientists in the past, working with the utmost conscientiousness, often came up with sharply conflicting findings. Within the last few years, thanks to a remarkable program that has been developed at the University of Mississippi,[2] marihuana research is today moving forward without these handicaps—and, as this volume of testimony dramatically demonstrates, this research is producing some highly dramatic results.

---

[2] The program is known as the Marihuana Project of the Research Institute of Pharmaceutical Sciences, which is part of the School of Pharmacy at the University of Mississippi. The program was established in 1968, as part of a national program of research, by Dr. Coy Waller, formerly Vice President in Charge of Research at Meade-Johnson and consultant to the National Institute of Mental Health, who today serves as the Director of the Research Institute. The first Director of the Marihuana Project, from 1968 to 1971, was Dr. Norman Doorenbos. Since 1971, it has been under the direction of Dr. Carlton Turner, who also serves as Associate Director of the Research Institute.

In addition to standardizing the marihuana used for research purposes, Dr. Turner's scientists have developed analytical methods which enable them to give accurate readings on ten different cannabinoids contained in marihuana samples—a few years ago, they were able to analyze for only three cannabinoid components. The marihuana the Institute cultivates is now used routinely for all research projects sponsored through the National Institute of Mental Health, while the United Nations Narcotics Commission has recommended that the analytical procedures developed at the University of Mississippi be used worldwide.

If today we know far more about marihuana than we did two or three years ago, it is thanks in large measure to the pioneering work done at this internationally unique research center.

In the recent hearings, it was obvious that one of the first things that had to be done was to bring together the bits and pieces of recent research in an organized manner, because only in this way would the total significance of these findings become comprehensible. The subcommittee, therefore, issued invitations to some 20 prominent medical researchers and psychiatrists. Most of them were American, but six other countries were also represented in the panel of scientists. The pro-marihuana cabal could assail a single scientist whose research persuaded him that marihuana was a very dangerous drug: this they could get away with. But abuse and character assassination would no longer be persuasive at the point where it was demonstrated that a large number of top-ranking scientists who had done research on cannabis were convinced that it is a drug with deadly consequences.

With the assistance of several scientists who are internationally known for their research on cannabis and other drugs, the subcommittee staff put together a master list of scientific witnesses who, between them, could cover the newly available scientific evidence in a broad spectrum manner.

Among the eminent scientists who appeared before the Subcommittee were:

Dr. HARVEY POWELSON: Research Psychiatrist, Berkeley University; Chief of the Psychiatric Division of the Student Health Service at Berkeley from 1964 to 1972.

Dr. HENRY BRILL: Regional Director of the New York State Department of Mental Hygiene; member and/or chairman of drug dependence committees of American Medical Association, National Research Council, the World Health Organization, and the FDA; senior psychiatric member of the Shafer Commission.

Dr. DONALD LOURIA: Chairman, Department of Preventive Medicine and Community Health, New Jersey Medical School; Chairman and President, New York State Council on Drug Addiction, 1965 to 1972.

Professor W. D. M. PATON: Head of the department of pharmacology at Oxford University; Chairman of committee overseeing the British Government's drug research program; author of a standard textbook on pharmacology and widely recognized as one of world's leading pharmacologists.

Professor MORTON STENCHEVER: Chairman of the Department of Obstetrics and Gynecology at the University of Utah Medical School.

Dr. GABRIEL NAHAS: Research Professor at the Columbia University College of Physicians and Surgeons; simultaneously Visiting Professor at the University of Paris.

Dr. AKIRA MORISHIMA: Research geneticist; Associate Professor, Department of Pediatrics, Columbia University College of Physicians and Surgeons; Chief of the Division of pediatric endocrine service at Babies Hospital, New York.

Dr. CECILE LEUCHTENBERGER of Switzerland: Head of the Department of Cell Chemistry at the Institute for Experimental Cancer Research in Lausanne; founder and first Director of Cell Chemistry Department at Western Reserve University.

Dr. JOHN A. S. HALL: Senior Physician and Chairman, Department of Medicine, Kingston Hospital, Jamaica, since 1965: Associate Lecturer in Medicine, University of West Indies and visiting Assistant Professor of Neurology at Columbia University.

Dr. ROBERT KOLODNY: Director of the endocrine research section at the Reproductive Biology Research Foundation in St. Louis.

Professor M. I. SOUEIF: Chairman of the Department of Psychology and Philosophy at Cairo University; member of World Health Organization Panel on Drug Dependence; author of classic study on consequences of hashish addiction in Egypt.

Professor NILS BEJEROT: Karolinska Institute, Sweden; author of "Addiction and Society" and several other standard texts on the epidemiology of drug abuse. Widely recognized as one of foremost international experts in this field.

Dr. ANDREW MALCOLM: Toronto psychiatrist; member, Drug Advisory Committee, Ontario College of Pharmacy; formerly Senior Psychiatrist, Rockland State Hospital, New York (1955–1958).

Dr. HAROLD KOLANSKY: Currently Associate Professor of Psychiatry at the University of Pennsylvania School of Medicine; twice President of the Regional Council (Pennsylvania, New Jersey, Delaware) of Child Psychiatry; Director of Child Psychiatry, Albert Einstein Medical Center, Philadelphia, 1955–1969; Chairman, Department of Psychiatry, Albert Einstein Medical Center, 1968–1969.

Dr. WILLIAM T. MOORE: Currently Associate Professor in Clinical Psychiatry, University of Pennsylvania School of Medicine; Associate Professor of Child Psychiatry at Hahnemann Medical College for 13 years up until 1972; for the past five years Director of Training, Division of Child Analysis, Institute of Philadelphia Association for Psychoanalysis.

Professor ROBERT HEATH: Chairman of the Department of Psychiatry and Neurology at Tulane University Medical School.

Dr. PHILLIP ZEIDENBERG: Professor of Psychiatry at Columbia University; Chairman of the Drug Dependence Committee of the New York State Psychiatric Institute.

Dr. JULIUS AXELROD. Nobel Prize winning research scientist at the National Institute of Mental Health.

Professor HARDIN B. JONES: Professor of Physiology and Professor of Medical Physics at the University of California, Berkeley; Assistant Director of the Donner Laboratory of Medical Physics at Berkeley.

Dr. CONRAD SCHWARZ: Associate Professor, Department of Psychiatry, University of British Columbia and Consultant Psychiatrist to the Student Health Service; Chairman of the Drug Habituation Committee of the British Columbia Medical Association.

Dr. FOREST S. TENNANT, Jr.: Medical Director for several drug abuse programs in the Los Angeles area; officer in charge of the drug abuse program of the U.S. Army Europe, 1971–1972.

THE SCIENTIFIC FINDINGS

That our hearings succeeded in achieving their objective has been demonstrated by the dramatic increase of interest, on the part of the scientific community as well as the press, in the new scientific evidence on marihuana. For example, a recent issue of *Science* magazine (August 23, 1974) points out "the notion that marihuana is harmless has enjoyed a high degree of acceptability with only a minimum of scientific support. . . . Since 1969, when the federal government began making marihuana of controlled quality available to research scientists, evidence suggesting potential hazards has accumulated at a

rapid pace. Those five years of research have provided strong evidence that, if corroborated, would suggest that marihuana in its various forms may be far more hazardous than was originally suspected." I think it worthy of note that ten of the scientists whose findings were quoted by the article in *Science* were among the witnesses who testified in the subcommittee's recent hearings.

The collective testimony of the eminent scientists who came to Washington to testify may be summarized as follows:

(1) *THC, the principal psycho-active factor in cannabis, tends to accumulate in the brain and gonads and other fatty tissues in the manner of DDT.* This was established beyond challenge by the research of NIMH Nobel Laureate, Dr. Julius Axelrod, and his associates. As a corollary of this, they found that THC persists in the body long after the act of ingestion. In some parts of the body, residual amounts could be found as much as a week after ingestion.

(2) *Marihuana, even when used in moderate amounts, causes massive damage to the entire cellular process:*

(a) It reduces DNA and RNA synthesis within the cell, which in turn sharply reduces the mitotic index, or the rate at which the cells give birth to new cells. (Nahas, Morishima, Zimmerman, Leuchtenberger, Paton)

(b) In the case of the T-lymphocytes (the cells involved in the immune process), marihuana use at the three-times-a-week level results in a 41 percent reduction in cell birth. (Nahas and associates)

(c) It results in far more cells with defective chromosome complements—from 38 to 8 chromosomes instead of the normal complement of 46. (Morishima)

The findings of five of the scientists who testified converged on the central theme of cellular damage. Other research that had been done in this field was also referred to. Professor W. D. M. Paton of Oxford University, one of the world's leading pharmacologists, summarized this recent research in these terms:

> Numerous such effects have now been described, including actions on microsomes, on mitochondria, on neurones, fibroblasts, white blood cells, and on dividing cells, affecting metabolism, energy utilization, synthesis of cellular constituents, and immunological responses.

On the specific question of cellular damage, additional evidence is becoming available almost by the week. Since Dr. Nahas testified, for example, his findings on damage to the immune cells have been confirmed by two nationally prominent medical scientists, Dr. Louis Harris and Dr. Louis Lemberger. Other aspects of cellular damage will be covered in several research papers, prepared under official auspices, which are shortly to be published.

Needless to say, the confirmation that marihuana does such serious damage to the entire cellular process opens up an entire spectrum of frightening possibilities.

(3) *Tied in with its tendency to accumulate in the brain and its capacity for cellular damage, there is a growing body of evidence that marihuana inflicts irreversible damage on the brain, including actual brain atrophy, when used in a chronic manner for several*

years. Psychiatrists who testified said that they knew of many cases of brilliant young people who went on prolonged cannabis binges, and then tried to go straight—only to discover that they could no longer perform at the level of which they had been capable. (Heath, Powelson, Kolansky and Moore, Paton) Professor Paton referred to animal experiments which demonstrated that rats exposed to marihuana had smaller brains than rats which were not exposed, and to research by Dr. Campbell and associates in England which found brain atrophy in a group of young cannabis smokers comparable to the atrophy that is normally found in people aged 70 to 90. Professor Heath reported that, in experiments with rhesus monkeys exposed to marihuana, highly abnormal brain wave patterns persisted after the marihuana was withdrawn, suggesting long-term or permanent damage to the brain.

(4) *There is also a growing body of evidence that marihuana adversely affects the reproductive process in a number of ways, and that it poses a serious danger of genetic damage and even of genetic mutation.* Scientific testimony presented pointed to the following conclusions:

(a) Male hormone (testosterone) level was reduced by 44 percent in young males who had used marihuana at least four days a week for a minimum of six months. (Kolodny)

(b) Sperm count was dramatically reduced in the same group of marihuana smokers, falling almost to zero with heavy smokers, so that they had to be considered sterile. (Kolodny) A similar result was found with mice. (Leuchtenberger)

(c) Very heavy smoking in a number of cases resulted in impotence. Potency was recovered in some of these cases when marihuana was given up. (Kolodny, Hall)

(d) In animal experiments, the spermatids (the precursors of the sperm cells) were found to be abnormal in the sense that they carried reduced amounts of DNA. (Leuchtenberger)

(e) Regular marihuana use, even down to the once a week level, results in roughly three times as many broken chromosomes as are found in non-users. While further research is necessary, this suggests the possibility of genetic abnormalities. (Stenchever)

(f) In a number of animal experiments, marihuana was found to cause a very high rate of fetal deaths and fetal abnormalities, including runting and lack of limbs—the thalidomide effect. (Paton)

(5) *Chronic cannabis smoking can produce sinusitis, pharyngitis, bronchitis, emphysema and other respiratory difficulties in a year or less, as opposed to ten to twenty years of cigarette smoking to produce comparable complications.* (Tennant, Paton, Kolansky and Moore) Professor Paton pointed out that emphysema, which is normally a condition of later life, is now cropping up with increasing frequency in young people, opening up the prospect of "a new crop of respiratory cripples" early in life.

(6) *Cannabis smoke, or cannabis smoke mixed with cigarette smoke, is far more damaging to lung tissues than tobacco smoke alone. The damage done was described as "pre-cancerous."* (Tennant, Leuchtenberger) Although further research is indicated, preliminary observa-

61-801 O - 77 - 64

tions suggest that marihuana may be a far more potent carcinogen than tobacco.

(7) *Chronic cannabis use results in deterioration of mental functioning, pathological forms of thinking resembling paranoia, and "a massive and chronic passivity" and lack of motivation—the so-called "amotivational syndrome."* (Powelson, Bejerot, Zeidenberg, Malcolm, Schwarz, Jones, Kolansky and Moore, Hall, Soueif, Tennant)

Describing the zombie-like appearance of chronic cannabis users, Dr. Tennant said: "Major manifestations were apathy, dullness and lethargy, with mild to severe impairment of judgment, concentration and memory . . . physical appearance was stereotyped in that all patients appeared dull, exhibited poor hygiene, and had slightly slowed speech. . . ."

Several psychiatrists suggested that the total loss of their own will would make a large population of cannabis users a serious political danger because it makes them susceptible to manipulation by extremists. (Powelson, Kolansky and Moore, Malcolm)

THE SOCIAL CONSEQUENCES OF THE MARIHUANA EPIDEMIC

The scientific evidence presented to the subcommittee points to an array of frightening social consequences, or possible consequences.

(1) If the cannabis epidemic continues to spread at the rate of the post-Berkeley period, we may find ourselves saddled with a large population of semi-zombies—of young people acutely afflicted by the amotivational syndrome. There is evidence that many of our young people, including high school and junior high school students, are already afflicted by the "amotivational syndrome." The general lack of motivation of the current generation of high school students is a common complaint of teachers. Some of them point out that the growth of this phenomenon in recent years has roughly paralleled the spread of the cannabis epidemic.

(2) We may also find ourselves saddled with a partial generation of young people—people in their teens and early twenties—suffering from irreversible brain damage. Their ability to function may improve if they abandon cannabis, but they will remain partial cripples, unable to fully recover the abilities of their pre-cannabis years.

(3) The millions of junior high school and grade school children who are today using marihuana may produce another partial generation of teenagers who have never matured, either intellectually or physically, because of hormonal deficiency and a deficiency in cell-production during the critical period of puberty. This fear was expressed in particularly urgent terms by Dr. Paton and Dr. Kolodny. As Dr. Paton put it, we may witness the phenomenon of a generation of young people who have begun to grow old before they have even matured.

(4) There are other frightening possibilities, too. There is the possibility of which Dr. Paton spoke that we may develop a large population of youthful respiratory cripples. And there is the possibility—which can only be confirmed by epidemiological studies—that marihuana smokers are producing far more than their quota of malformed or genetically damaged children.

(5) There is the growing body of evidence that marihuana use leads to indulgence in other drugs.

(6) If the epidemic is not rolled back, our society may be largely taken over by a "marihuana culture"—a culture motivated by a desire to escape from reality and by a consuming lust for self-gratification, and lacking any higher moral guidance. Such a society could not long endure.

These are some of the reasons why we cannot legalize marihuana, and why society cannot remain indifferent to the epidemic.

THE EPIDEMIC POTENTIAL OF CANNABIS

What makes the prospect even more terrifying is the extraordinary epidemic potential of cannabis. It is doubtful that any other drug in common use today has a comparable potential.

I do not underestimate the damage done by the abusive use of alcohol. But the nature of alcohol places certain limitations on its epidemic spread. It is impossible, or at least very difficult, to take a quart of whiskey or a six-pack of beer to one's place of work, or, in the case of a teenager or grade schooler, to take it to school. If one did take it to school or to work, it would be difficult to find the time during the work day or during school hours to get oneself really intoxicated on alcohol. And if a worker or a student did manage to get himself stoned on alcohol, he would be given away by his drunken stagger or by the smell of alcohol on his breath.

But with marihuana, there are no such limitations. It is cheap enough so that even a fourth or fifth grader can afford to buy a joint or two with his weekly allowance. It is compact enough so that a few joints can easily be concealed on the body. All it requires is a 10 or 15 minute break to get thoroughly stoned. And, apart from a tired and passive look which may suggest that the user is short on sleep, there are no telltale symptoms; the user, though stoned, does not walk with a stagger, nor is there any odor on his breath. A student could sit through an entire day in a cannabis stupor, and learn nothing—and his teacher would be none the wiser.

On top of this, users of marihuana suffer from a much more compelling urge to proselytize and involve others than do users of alcohol. One can attend a cocktail party and drink ginger ale and not be harrassed and pushed by one's cocktail friends to get in on the act and drink. At pot parties, the pressures are infinitely greater.

Another factor contributing to the spread of the cannabis epidemic is the tremendous potency of the material available and the ease with which it can be concealed and transported. A pound of "liquid hashish"—a concentrated distillate derived from either marihuana or hashish—would theoretically be enough to intoxicate a city of 15,000 people.

Still another factor is that, with marihuana and hashish, chronic abuse begins at a use level which would be insignificant with alcohol. A person who took a drink of whiskey once a week or even three times a week, would be considered a light drinker; it has yet to be argued that alcohol consumption at this level can do any damage. But a person who smokes marihuana three times a week or more is generally considered a chronic smoker; and there are some scientists who insist that even once a week smoking constitutes chronic use. In support of this contention, they point to the facts that THC persists in the

brain for a week or more after smoking, and that some of the research covered in our recent hearings found dramatic changes even at the once a week level (cf. Stenchever on chromosome damage).

Finally, there is the almost unbelievable rate at which—if it is readily available—a cannabis user can escalate from occasionl social use to chronic and massive abuse. It generally takes years before a chronic drinker escalates to a quart a day. But, according to Dr. Tennant, GI's who arrived in Germany as casual marihuana users, would a month or two later be consuming 50 or 100 grams—and in some cases up to 600 grams—of hashish monthly. Three grams of hashish a day, it should be pointed out, is roughly 12 times the amount required to produce a hashish intoxication.

WHERE THE EPIDEMIC STANDS TODAY

There are conflicting estimates of the number of chronic cannabis users in our country. According to some estimates, there are roughly 20 to 25 million people who have used marihuana in one degree or another, but only one to two million who may be considered regular users. According to the estimate of NORML (National Organization for the Reform of Marihuana Laws), the total number of Americans who have been exposed to marihuana runs close to thirty-five million, while the number of regular users is past the ten million mark.

Figures on seizures of marihuana and hashish submitted to our hearings by the Drug Enforcement Administration strongly suggest the validity of the higher estimate. According to DEA, federal seizures of marihuana over the past five years have increased tenfold, to a total of 780,000 pounds in 1973, while federal seizures of hashish over the same period of time increased twenty-five fold, to a total of almost 54,000 pounds. These figures do not include seizures by state and local law enforcement authorities. Assuming that ten times as much got into the country as was actually seized—a fairly conservative estimate—this would mean that total consumption of marihuana in 1973 was probably close to ten million pounds, while total consumption of hashish probably exceeded 600,000 pounds. (These estimates make some allowance for non-federal seizures—for which no figures are available.)

These are truly staggering quantities when one understands just how potent marihuana and hashish are and how little is required to become intoxicated. No one could possibly get intoxicated on an ounce or two ounces of hard liquor. An ounce of hashish with a 10 percent THC content is sufficient for a hundred intoxications; an ounce of marihuana with a 1.5 percent THC content is enough for roughly twelve intoxications. And when it comes to "marihuana oil," or "liquid hashish," as it is sometimes called, the THC content of which can run as high as 60 to 90 percent, we have a substance with an almost lethal potential for mass intoxication. One drop of liquid hash is enough to send the user into the stratosphere, while a pound of the strongest variety would be enough to intoxicate a population of 15,000.

These figures provide some clue—but only a partial clue—to the damage done by the massive quantities of marihuana and hashish consumed in our country last year.

THE EMERGENCE OF AN ALCOHOL-CANNABIS EPIDEMIC

It must be emphasized that those who are caught up in the cannabis epidemic are not using marihuana or hashish as a substitute for alcohol. With increasing frequency they are being consumed together. The scientists who testified before the subcommittee were agreed that adding marihuana to alcohol, or alcohol to marihuana, does not produce an arithmetic effect but a synergistic, or compounding, effect. The combination of the two intoxicants produces a far more potent and dangerous form of intoxication, whose short and long term consequences we still know very little about. While there are reported to be some 10 million problem drinkers in our country, the overwhelming majority of those who use alcohol are what we call social drinkers, who take it occasionally and with moderation. But at the point where a person takes one drink of whiskey with a joint of pot, we are no longer dealing with a social drinker—we are dealing with someone who is suffering from a highly dangerous form of intoxication.

In its own right, the scale of the current cannabis epidemic would give us plenty to worry about and so is the scale of alcohol abuse. The emergence of an alcohol-cannabis epidemic is even more worrisome.

THE MYTH OF HARMLESSNESS

The spread of the epidemic has been facilitated by the widespread impression that marihuana is a relatively innocuous drug. This impression has been shared by liberals and conservatives, by laymen and judges, and even by people actively involved in the war on drugs. For example, in March of 1973 an advisory committee consisting of some 40 prominent D.C. citizens filed a report urging the complete legalization of marihuana on the ground that:

> No demonstrable medical evidence is available to support the assertion that marihuana use is hazardous or detrimental to the physical or mental health of the user.

The widespread acceptance of the myth of harmlessness has been due to several things. Certainly a role of some importance was played by the militant pro-marihuana propaganda campaign conducted by many New Left organizations, by academicians sympathizing with the New Left, and by the entire underground press, ever since the Berkeley uprising.

Some of this propaganda was positively euphoric on the virtues of marihuana. Dr. Joel Fort of San Francisco, a member of the Sociology Department of the University of California and a former consultant on drug abuse to the World Health Organization, had this to say on the subject: "Cannabis is a valuable pleasure giving drug, probably much safter than alcohol, but condemmed by the power structure of our society." An article in "The Sciences" by L. Greenwald in 1968 went even further. "Marihuana," said Greenwald, "restores to the student his ability to feel in an often hostile environment, and the liberating action of that drug is going to allow him to experience more intimate social contact."

But the myth of harmlessness has been stimulated in even greater degree by a number of highly publicized writings and by reports, some

official, some unofficial, which have taken a rather benign attitude toward marihuana. A major role was also played by the generous attention which the media bestowed on militant drug enthusiasts like Timothy Leary and Jerry Rubin. The damage was further compounded by the virtual blackout imposed by much of our media—at least until recently—on adverse scientific evidence about the effects of marihuana. The result has been that Congress and the American public have been exposed for years to an appallingly one-sided presentation of the marihuana controversy.

Another factor contributing to the myth of harmlessness was the selective manner in which the Shafer Commission Report was handled by the media. This report, as several witnesses pointed out, contained a number of apparently contradictory passages, which made it possible to write a story suggesting caution or to write one suggesting that its emphasis was on tolerance. But it did contain quite a number of fairly strong cautionary passages. It was for the purpose of setting the record straight on the Shafer Commission Report that one of the first witnesses heard by the Subcommittee was Dr. Henry Brill, who had served as senior psychiatric member of the Commission. This is what Dr. Brill had to say on the subject:

> I am concerned about the misinterpretations which have developed with respect to the marihuana report of that Commission. These misinterpretations result from reading the reassuring passages in the report and ignoring the final conclusions and recommendations, and the passages in the report on which they were based. As a result it has been claimed that the Commission's report was intended to give marihuana a clean bill of health, and as a covert, or indirect support for legalization of this drug in the near future, or as a step in that direction. Nothing could be further from the truth.
>
> From my knowledge of the proceedings of the Commission, I can reaffirm that the report and the subsequent statements by the Commission meant exactly what they said, namely that this drug should not be legalized, that control measures for trafficking in the drug were necessary and should be continued, and that use of this drug should be discouraged because of its potential hazards.

It was because of this pervasive imbalance in dealing with the question of marihuana that so many intelligent people have been under the impression that the scientific community regards marihuana as one of the most innocuous of all drugs. Part of the purpose of our recent hearings was to correct this imbalance—to present the "other side" of the story—to establish the essential fact that a large number of highly reputable scientists today regard marihuana as an exceedingly dangerous drug. We make no apology, therefore, for the one-sided nature of our hearings—they were deliberately planned this way.

MARIHUANA AND THE LAW

In previous statements, I have made it clear that I am opposed to the decriminalization of marihuana use and that I believe some penalties have to be retained. However, a man would have to be devoid

of compassion if he did not sympathize with the plight of a youthful offender who was caught smoking marihuana because he succumbed to peer pressures or to the bad advice he received from older students and from a small but vociferous group of academicians. (The academic propagandists for marihuana are protected by the First Amendment, but in my judgment they are far more culpable than the young people who have heeded their advice!) In most cases involving youthful offenders, especially first offenders, the purpose of justice is not served by sentencing them to prison and giving them criminal records. Our federal laws and many of our state laws have in recent years been modified in a manner that reflects a more compassionate approach, and the law is further tempered by the compassionate understanding which the great majority of judges have for the problems of young people.

Although there is still some unevenness in the state laws governing the use of marihuana and although there is always room for review and improvement, in practice very few young people are being sent to prison for simple possession of marihuana, especially when they are first offenders. On this point, there is such broad agreement that I feel it is no longer at issue.

But there is a militant lobby in our country which has been agitating and lobbying for the complete legalization of marihuana. As a stepping stone in that direction, they are working for the complete *decriminalization* of simple possession. This means that personal use of marihuana would no longer be covered by criminal law, that it would not even be considered a misdemeanor under the law. These matters still *are* at issue—and I truthfully believe that they cannot intelligently be decided without an assessment of the known and potential dangers posed by marihuana use.

Not all drugs are equal—no one, for example, has yet proposed that we deal with coffee and heroin, or tobacco and heroin, in exactly the same manner. And the evidence I have presented in the preceding pages should be sufficient to establish that the dangers of cannabis are much closer to the dangers of heroin, in scope and quality, than they are to the admitted but far more limited dangers of coffee or tobacco—or, for that matter, alcohol.

The scientists who testified before the subcommittee were unanimous on the point that it made no sense to send young people to prison for simple possession of a few joints of marihuana. On the other hand, they were strongly opposed to legalization, and not one of them spoke in favor of decriminalization. They expressed the belief that it would seriously undercut any national effort to discourage marihuana use if all penalties were removed for simple possession, as the Shafer Commission had recommended—and which remains the continuing objective of the pro-marihuana lobby. Dr. Brill, who, as a member of the Shafer Commission, had voted in favor of eliminating all penalties, indicated to the subcommittee that he was now rethinking this recommendation.

Commenting on the proposal that the decision on whether or not to use drugs, and especially marihuana, should be left to the individual, Dr. Andrew Malcolm, a distinguished Canadian psychiatrist, called for a combination of education and the law. Said Dr. Malcolm:

> It is necessary to have some external restraint when, indeed, some of the people are incapable of exercising internal re-

straint. But those people who propose [that the matter be left to] "wise personal choice" usually are unalterably opposed to any kind of external restraint. It is very foolish, because what we need, in fact, is both of these elements.

Dr. Phillip Zeidenberg, Chairman of the Drug Dependence Committee of the New York State Psychiatric Institute, while he held that the marihuana epidemic could not be eradicated by legal measures alone, nevertheless strongly opposed legalization and said that there have to be some penalties for use. These were Dr. Zeidenberg's words:

> I believe that legalization will turn on a "green light" which will enormously increase the number of chronic heavy users, just as it has in every other country where de facto legalization exists. Once this happens, marihuana will become an integral part of our social structure and take on complicated social and symbolic significance, as tobacco and alcohol already have. Once this happens, it will be virtually impossible to remove it.
>
> Ultrapunitive measures taken against individuals occasionally using the drug can only lead to the backlash of pressure for legalization. Offenders should be given light, but significant sentences, enough to be a sufficient deterrent to repeated use. Chronic heavy users should be offered psychiatric treatment, not jail.... The job of the law is to find the appropriate deterrent so that the marihuana problem is kept as a minor drug-abuse problem without crucifying errant adolescents.

Warning about the drive to legalize cannabis in the United States, Professor Nils Bejerot of Sweden said:

> The demand for legalizing cannabis has been strongest in those countries which have had the shortest experience and the weakest forms of the drug. Correspondingly, I consider that as a psychiatrist . ne's attitude to cannabis becomes more negative the more one sees of its effects.
>
> If cannabis were legalized in the United States, this would probably be an irreversible process not only for this country and this generation, but perhaps for the whole of Western civilization. As far as I can see, another result would be a breakdown of the international control system regarding narcotics and dangerous drugs.

The pro-marihuana lobby brandishes the statistic that there were some 400,000 arrests nationwide for marihuana offenses last year. They do so in a manner which creates the impression that some 400,000 young people went to jail because they were caught with a few joints in their possession. The actual situation is quite different.

The number of arrests involving marihuana was very high, among other reasons because virtually every petty criminal arrested for shoplifting or burglary or mugging or other similar offenses had marihuana in his possession at the time of his arrest. But according to many reports, our law enforcement authorities—federal, state, and local—in most cases do not even bother to make arrests when they find young people smoking marihuana or in possession of less than an ounce.

The cases that do come to court for the most part receive suspended sentences or fines, while most states now have a provision in their laws,

similar to the provision in the federal law, calling for the expunging of the record for first offenders after one year, if parole is satisfactorily completed.

However, the law is uneven from state to state. Some states, while they have the theoretical power to send first offenders to prison, in practice rarely use this power. But here and there, it must be conceded, simple possession is still punished by prison terms.

I believe it would be helpful in dealing with this situation if the federal law and state laws could be brought into basic harmony on the question of marihuana. I do not suggest that the states slavishly adapt their laws to the current federal model; in many respects, in fact, I think federal law has something to learn from existing state statutes.

There is one state statute that does not recommend itself as a model: that is the marihuana law recently adopted by the State of Oregon. Under this law, simple possession of small quantities of marihuana is not treated as a violation of the criminal law but as a civil violation—something akin to a parking ticket. While the maximum fine provided is one hundred dollars, in practice the fines imposed rarely exceed thirty dollars. And those thus fined, if they can afford it, can go on collecting marihuana violations just as freely as some chronic illegal parkers collect parking tickets.

This approach, I submit, is altogether too permissive and just doesn't take into account the serious social damage done by marihuana or the compelling need to protect society against the spread of the habit. It doesn't take into consideration the basic fact that all drug addiction—including marihuana addiction—is like a contagious disease. Society can't remain indifferent to the spread of this disease.

The law must be framed in a manner that makes it unmistakably clear to young people that smoking marihuana *is* a crime against society. This is something that decriminalization would completely destroy. I believe that the kind of escalated penalties provided by state law in New Mexico, to give one example, make much more sense. Under this law, the possession of one ounce or less for a first offender is punishable by a fine of $50 to $100 and/or 15 days in jail. The jail sentences are rarely imposed, but this much discretion is given to the judge. The penalty for repeat offenders is a fine of $100 to $1,000 and/or one year in jail. Suspended sentences are frequently given and there is provision for expunging the record after one year.

New legislation governing the use of drugs requires the most careful consideration by Congress because—as Dr. Bejerot pointed out concessions to tolerance, once made, are very difficult, if not impossible, to eradicate. However, as far as marihuana use is concerned, I believe that the philosophy guiding such legislation might well be based on the opinions expressed by Dr. Zeidenberg and the other scientists who testified before the subcommittee. I think there is much merit to Dr. Zeidenberg's proposal, for example, that instead of jail sentences, we might consider sending chronic abusers for a period of time to an institution where they will be given intensive education on drugs and psychiatric treatment if they need it.

When it comes to the pushers and the traffickers, I think our federal and state laws have got to be reinforced. I find it an outrage that, over and over again, criminals caught in the possession of hundreds and even thousands of pounds of marihuana get off with very light sentences or even with six months suspended sentence. For the pushers

and traffickers, there have got to be heavy minimum sentences, and they have got to be mandatory.

The suggestion has been made that it might help to break up the traffic in drugs if offenders at every level—users, pushers, and small and intermediate traffickers—could be assured of suspended sentences if they cooperated by identifying the source, or sources, from which they had obtained their drugs. This is a proposal which merits serious consideration.

There are some who argue that tough law enforcement is not the answer to the drug problem, that we won't be able to deal effectively with the drug problem until we eliminate our slums, eliminate poverty, eliminate unemployment, and create a social utopia. I am all in favor of doing everything we reasonably can do to improve the quality of our society. But the fact is that every year since the early sixties has witnessed a massive increase in the amount we spend for new social programs—and the same period of time has witnessed a staggering increase in our drug problem.

No drug problem has ever been controlled by decriminalization or by social reforms. In every country where the drug problems have been effectively controlled, it has been thanks to strong laws against both the use and sale of the drug. That is how it is controlled in Communist countries; and that is how it has been controlled in some non-Communist countries, both authoritarian and democratic. There is no serious drug problem, for the indigenous population or for the GI's, in either Taiwan or South Korea. Nor is there one in Japan. The contrast between Germany and Italy is most instructive in this connection. In Germany, where drug laws are lax and law enforcement ineffective because it is fragmented among the *Laender*, or states, there has been a runaway epidemic of hashish consumption among the American GI's. (According to Defense Department witnesses, this situation has now improved significantly—although it still remains serious.) In Italy, where the drug laws are much stronger, drug use among GI's has been kept to a minimal level. The GI's in both countries are basically the same. The difference is the law.

THE NEED FOR A NATIONAL EDUCATION PROGRAM

The scale of the marihuana-hashish epidemic makes it essential that we embark—with as little delay as possible—on a national educational program directed in the first place to our young people.

Can the facts that are assembled in this volume be communicated to young people who are disposed to be skeptical about information they receive from "the establishment?" I am convinced that this evidence *can* be communicated to young people and *can* influence them—because it is far more graphic, far more persuasive and far more authoritative than any information that has heretofore been available for marihuana education programs.

Dr. Forrest Tennant, who was in charge of the U.S. Army drug program in Europe from 1968 to 1970, told the subcommittee that at one point he had actually given up on anti-cannabis educational programs because the material at that time was not too persuasive, and while the programs discouraged some GI's, they stimulated the curiosity of others, so that there was no real net progress. He expressed

the conviction, however, that armed with the recent evidence that had been presented to the subcommittee by so many eminent scientists, it would be possible to mount an educational program that GI's would find credible. The fact is that no young person wants to run the risk of irreversible brain damage, and no young male wants his male hormone level reduced by more than 40 percent or his sperm count reduced to close to zero. Nor does any young person, boy or girl, want to run the risk of genetically damaged children. These are dangers that young people will respond to.

There is an even larger matter that should be considered by every young person who finds himself yielding to the temptation of drugs or to peer pressures. Whatever each of us does, affects, for better or for worse, all those around us. And the fact is that every young person who takes marihuana or hashish or other drugs, drags down not only himself, but drags down his friends, drags down his family, drags down his community, drags down his nation. I would commend to every young person who is prepared to stop and think the wise words of Dr. Gabriel Nahas, one of the eminent scientists who appeared as a witness before the Subcommittee:

> One may wonder... how long a political system can endure when drug taking becomes one of the prerequisites of happiness. If the American dream has lost its attraction, it will not be retrieved through the use of stupefying drugs. Their use only delays the young in their quest to understand the world they now live in and their desire to foster a better world for tomorrow.

A final word of an editorial nature. So many scientific papers and supporting documents were left with the subcommittee by the witnesses that the inclusion of all of them would have made this a document of almost prohibitive length. In the interests of economy, only a portion of these documents have been included in the Appendix. I particularly regret that it was not possible to include a bibliography of some 800 cannabis research papers which Professor W. D. M. Paton of Oxford prepared for the subcommittee, because this volume was already in page proof at the time of its arrival. I ask the indulgence of the scientists who gave supplementary material to the subcommittee which has not been included in the printed Appendix. Hopefully, this material can be included in a followup study or documentation.

On behalf of the subcommittee, I want to thank the many distinguished witnesses who gave so generously of their time to make these landmark hearings possible.

[Extract from the hearings on the Narcotic Sentencing and Seizure Act of 1976]

U.S. SENATE,
SUBCOMMITTEE TO INVESTIGATE JUVENILE DELINQUENCY,
COMMITTEE ON THE JUDICIARY,
Washington, D.C.

July 28, 1976

Senator BAYH. In the President's white paper and his address to Congress, the thrust on major traffickers that you are describing you want help with was mentioned. If you assess this policy, what is going to be the practice or policy pursued relative to marihuana?

Mr. BENSINGER. The policy that our agency, and I, personally, have directed with respect to marihuana is that it is not our principal or secondary or tertiary drug abuse priority or responsibility.

The marihuana arrests that DEA have made have decreased substantially for all classes, from 1 through 4. And the class 4 marihuana arrests have decreased 1,400 cases.

The principal efforts of our agency are directed against heroin, barbiturates, and amphetamines and cocaine. We will certainly investigate and refer for prosecution cases involving marihuana as a controlled substance. But it is not a priority, Senator, and has not been emphasized in our investigative and enforcement regional deployment of resources.

Senator BAYH. What about the possibility of decriminalizing it, the possession?

Mr. BENSINGER. I don't think we have enough knowledge, medically, on marihuana, Senator. This question has been asked repeatedly of me and of our agency. It has a THC content that varies, whether it is domestic marihuana of 1 percent, to the Mexican variety of 3 to 5 percent, to some grown in Jamaica of 5 to 8 percent. It has produced studies and individual instances which have caused a slowness in reaction, a danger to one's health, some responses that have not been in; (1) public safety of the individual, and (2) of the community.

I think personally until we get real definitive information from HEW, from the research organizations, certainly within our own agency, that this will not be a harmful commodtiy to use personally, or if used, it will not have an implication on the community, that we should say to the public we really don't have enough information, but let's legalize it anyway.

Senator BAYH. That isn't what I said. I said decriminalize it. It sounds to me like the physiological reactions you describe could be applied to alcohol as well as marihuana.

I don't want to put the Good Housekeeping seal of approval on it. We don't know as much as we should. But when you look at state and local cases, we are talking about three-quarters of the cases being marihuana related, which means we have had a lot of priority in the wrong way.

It seems to me as long as we have the statutory limitation, that there will be some people who will look for a headline and take time and effort to do a job in an area where we really don't have the kind of priority you are directing your attention to in this other legislation.

Mr. BENSINGER. Senator, the percentage of marihuana arrests is the smallest of any of the type of drugs that we have responsibility for enforcing the laws on.

The State and local jurisdictions have made, I would say in a year about 350,000. The Drug Enforcement Administration in terms of cannabis, through 1975, we decreased the cases significantly since then, and they are less than 2,000 interms of total arrests and are diminishing.

So the Federal effort is 90 percent on the other types of controlled substances.

Senator BAYH. You don't think perhaps we should address our attention to the Federal Criminal statutes, which would be a model for those jurisdictions that now do this?

Mr. BENSINGER. I think the Federal Government has a responsibility for standard-setting in all fields of criminal justice, sentencing, bail, the method by which hearings are held.

So I agree with that in principle. I think we do not have sufficient evidence and information from the medical authorities to say that these couldn't be damage to individuals and to the community if marihuana was continued to be made available. That is my personal view, Senator. I think it's a period of time

in this country where certain states have taken the option of removing felony sanctions, and that is certainly within their prerogative. I think we would like to have more information at the Federal level on that commodity.

Senator BAYH. Do you think we will ever get enough information that that won't be a political hot potato?

Mr. BENSINGER. I think we certainly will. I think the kind of attention you have addressed on this issue will be helpful.

Senator BAYH. I don't think we will ever get enough information. Maybe I am selling it short that it won't be a political hot potato. I think we better stand up and face realities, that we are talking about getting limited resources to get these kingpins that you and I want to put in jail forever.

You get a guy involved in peddling large amounts of heroin, and you have an experience factor, I have no compunction about putting that fellow away for life and just keeping him there.

If we are going to do that, it seems to me we are going to have to summon up all of the proscutorial and law enforcement resources we can, and direct them at those people, and as long as we have the statutory temptation in other areas, I fear we are not going to do as good a job there as we could.

Mr. Rauh, in the District of Columbia jurisdiction, could a summons approach on marihuana be used without a statutory change?

Mr. RAUH. We have a summons citation situation in the District of Columbia and that is used from time to time. The police can issue citations and have people come in without placing them under arrest.

Senator BAYH. Could it be used for marihuana?

Mr. RAUH. I believe it is used. I am not 100 percent sure of that.

Senator BAYH. If you don't know, that is understandable. But find out if it is used, and if so, how often it is used.

I have very mixed feelings. On one side I find my conservative "puritan" Hoosier upbringing that says let's not put the Good Housekeeping seal of approval on that, it can't be good for you. You can argue its value and its damage vis a vis alcohol and flip a coin in my judgment.

When you look at the problem of alcoholism, it is hard to sustain the present differentiation. When you get down to priorities and recognize the real world as it is, then I think to continue to follow the criminal approach is really not serving the public well.

Mr. RAUH. Maybe I didn't understand what you meant by citation. I interpret a citation or summons in lieu of arrest, which is advise the individual to appear in court, rather than arrest him and take him to court, but still he is going to court under either procedure.

Is that what you were referring to?

Senato BAYH. I guess what I was talking about is the kind of practice that is being followed in Oregon.

Mr. RAUH. That is quite different. We do not have that here.

Senator BAYH. I think you would probably have to have a statutory change for that.

Mr. RAUH. What they have done, as I understand it, is make it a civil fine.

Senator BAYH. It is a fine. It is not legal, but it is not a criminal offense. You just get fined for it.

Mr. RAUH. I apologize. You used the word summons and we do have a summons or citation procedure whereby a person stopped for a crime would be given a citation to appear in court. It is still a criminal matter in the District of Columbia.

Senator BAYH. I understand the conflict in terms there.

August 5, 1976

Senator BAYH. Let me direct your attention to another matter before this committee, and I know you have given consideration to it as well. Our subcommittee held hearings on legislation to decriminalize marihuana. I bring this to your attention because here again, if we are talking about limited resources, your assessment has been—mine is, and Mr. Alexander said he would concur—that the thrust ought to be directed at expanding limited resources where you

had the biggest problem and the maximum return on investment, and the biggest problem as far as society is concerned. And I think here when you look at marihuana, I am uneasy with the way criminal statutes deal with it from that perspective.

What is the latest information on the aftermath of decriminalization in Oregon and California and Alaska been?

Dr. DUPONT. The available evidence that we have suggests that there has been no increase in marihuana consumption specifically associated with decriminalization. And I base that on two studies: one in the State of Oregon and the other in San Mateo, Calif.

I would add extreme caution to the use of those studies, however, because these studies are relatively primitive. We now have under way a much more ambitious study of high school seniors in all of the country, and we are separating out those that live in States that have decriminalized marihuana possession and those that live in States where there has been no decriminalization. Since we have measures taken before the state decriminalized and after, we are going to be able to see whether there is any difference in use, either up or down, in those states that have decriminalized from those who have not. We don't have that study in yet, but the studies we do have suggest that there is no change either up or down associated with the substitution of a civil fine for a misdemeanor as punishment.

Senator BAYH. When could we see that study?

Dr. DUPONT. I think in 6 months perhaps, Senator. I will be happy to make it available just as soon as I have it.

On the marihuana issue let me say that I found the statements that you submitted for the Congressional Record last week very eloquent, and I concur with them. However, let me emphasize that I find the word "decriminalization" has itself become terribly politicized. I find it helpful not to use the word because it has become a kind of symbol that people rally around on one side or the other in such a way that they somehow miss what we are really talking about.

I would commend to the committee for consideration a specific solution, if you will, to the conflict that I think can command very broad support. And that is the approach that has been adopted in Sacramento, Calif., and in the state of Minnesota. It involves the use of a civil fine for a first offense for marihuana possession. But if there is another offense for marihuana possession within a 2-year period, then this becomes a misdemeanor criminal offense. It is my judgment from talking to people from many parts of the marihuana spectrum that this compromise commands very broad support. They found in Sacramento for example that 98 percent of the people did not come back again with a second offense within the 2 years of the first offense. This compromise satisfies most of the marihuana decriminalization supporters since it eliminates the use of criminal law for 98 percent of the people apprended for marihuana possession.

On the other hand, the marihuana decriminalization detractors have been concerned about the more serious drug abusers in that group arrested for marihuana possession and then want to continue to have the possibility of a criminal penalty for them. Of course the Sacramento and the Minnesota approachs do contain that.

So perhaps some compromise like that could form a basis of Federal legislative action. Such a compromise is not easily categorized as "decriminalization."

Senator BAYH. I don't recommend the use of marihuana, and I'm frankly not prepared to go the route of legalization, which is another political catch word.

Dr. DUPONT. The "legalization" issue is very much caught up with "decriminalization" in the public mind. There is no question that those things are equated by most people in the nation today.

This morning, while I was driving to the hearing, one of the local radio stations asked a question of the public on marihuana decriminalization. The answers they got from the public, although the question was clearly phrased, showed that the public just simply did not make the distinction between legalization and decriminalization. The answers were coming back either "for" or "against" marihuana, which is hardly the question we are trying to deal with.

As you quite rightly point out, we have a national policy of discouragement of marihuana use. It is the right policy. We can support it. That is not at issue. At issue is how does the law enforcement apparatus respond to the individual found to possess small quantities of marihuana for his personal use. That is the only issue that we're talking about, not whether we like marihuana or not. But you cannot get that idea across to the public. At least, I've tried for 2 years and I have failed miserably to get that idea across.

Senator BAYH. What percentage of all drug arrests are for marihuana?

Mr. DUPONT. If I were to cite a statistic, I would have to cite your report, I was just reading last night. I don't know the number, but it was something over half, as I recall reading last night.

Senator BAYH. The FBI was the source of the figure in our report of 70 percent.

Dr. DUPONT. That sounds right. That is an unfortunate drain on needed resources for more serious crimes, including serious trafficking in dangerous drugs.

Senator BAYH. It seems to be remarkable evidence of the lack of focus and priority in this particular area that 70 percent of the arrests are for marihuana. And IRS is despecializing its attention to the heroin problem.

Dr. DUPONT. Mr. Chairman, I would point out that Mr. Bensinger as Administrator of DEA has shown a particular understanding of this issue, and strong commitment to dealing with it. I am delighted he is focusing the Drug Enforcement Administration very clearly and precisely the way you are suggesting.

[From the New York Times magazine, Dec. 13, 1970]

WHAT WE HAVE FORGOTTEN ABOUT POT—A PHARMACOLOGIST'S HISTORY

(By Solomon H. Snyder*)

There was a time in the United States when extracts of cannabis were as commonly used for medicinal purposes as aspirin today. Not only was cannabis a medication that could be purchased without a prescription in any drug store (which is almost unbelievable when you consider that mere possession of marijuana is now a serious offense), but it was also prescribed by physicians as an important treatment for a large number of medical conditions, from migraines and excessive menstrual bleeding to ulcers, epilepsy and even tooth decay.

If cannabis was so widely and apparently successfully used, why is this hardly known today? Were there legitimate medical reasons for the fall-off in its employment by physicians or did legal restrictions largely account for the dramatic changes in its availability? The answer is probably a combination of the two.

Cannabis, the generic name for marijuana, hashish and related products, has been in use legally or illegally for about 3,000 years. The story of its varying role in different cultures—both as a medicine and as a mind-altering substance—and its spread from country to country is a fascinating one, and provides, moreover, important perspective on the controversy over whether marijuana is a threat to the well-being of the young, on why the drug seems to divide the generations and on what, if anything, ought to be done about it.

Before beginning this chronicle of cannabis as a medicine (I) and as an intoxicant (II), we should clarify the sometimes confusing jargon applied to the plant and its derivatives. The source of this medicine, or "dope," depending on one's point of view, is the plant Cannabis sativa. There are made and female forms, although, as may seem fitting for the mascot plant of the unisex generation, it has recently been cultivated in a hermaphroditic variety. The psychoactive ingredients have, for abount a thousand years, been assumed to derive almost exclusively from the female plant. But in the past year, chemical analyses of the pure psychotropic (intoxicating) substances of cannabis showed that they are present in equal concentration in male and female plants, an embarrassing revelation for hemp growers who have for years been discarding the male plants.

The cannabis palnt is also known as hemp, and its stalks have been a major source of fiber for cloth, beginning with the Chinese at least as long as 3,000 years ago. It grows freely as a weed in almost any climate, although the strains of plants grown in warmer climates produce more of the resin that contains the psychoactive material. The exact identity of this chemical was established in 1964 by Dr. Raphael Mechoulam in Israel, who showed it to be delta-1-tetrahydrocannabinol, and was even able to synthesize it from simple, basic chemicals.

Commonly referred to as "T.H.C.," the chemical in small doses produces a mild pot high, and in larger doses gives rise to hallucinogenic and psychotomimetic (resembling psychosis) effects similar to an L.S.D. trip. Despite this similarity, however, T.H.C. has no chemical resemblance to any psychedelic drugs such as L.S.D., mescaline or psilocybin.

---

*Solomon H. Snyder, M.D., is a professor of psychiatry and pharmacology at the Johns Hopkins School of Medicine. This article is adapted from a book he is writing about marijuana.

Unlike oplate narcotics, moreover, cannabis is not physically addictive. Thus its consumers do not develop the compulsive craving that turns oplate addicts into thieves, prostitutes and pawns of organized crime. Also, no deaths have ever been reported from marijuana, in contrast to heroin, which sometimes kills because a fatal dose is not much greater than the amount needed to get high.

Why are some preparations of cannabis terrifyingly powerful and others pleasantly mild? This seems to depend on which part of the plant is used. The flowering leaves of ripe male or female hemp plants secrete a sticky resin which is the source of all, or almost all, of the T.H.C. in cannabis. Marijuana, a Mexican term first applied to cheap tobacco and only in the late 19th century to cannabis, refers to preparations of leaves and stems of uncultivated plants chopped up into something resembling crude tobacco leaf—with some seeds included. The T.H.C. content of marijuana is fairly low, and its effects are thus comparatively moderate. In the United States it is usually smoked or baked into cookies. In India the same preparation is called *bhang* and is legal. It is blended conventionally into a pleasant-tasting liquid concoction drunk at social gatherings and is also prescribed by physicians for a variety of medical purposes. The tops of cultivated plants are harvested in India and processed into a somewhat more potent material called *ganja*, which is usually smoked.

The most potent cannabis preparation is obtained by carefully scraping the resin containing T.H.C. from the leaves of the cultivated plants. This gooey material is then pressed into hard blocks and, eventually, smoked. In India it is known as *charas*, and in other countries as hashish, which is about 10 times as powerful as marijuana and is the only cannabis derivative that can produce hallucinogenic and psychotomimetic effects with any regularity. Even experienced potheads are cautious in their use of hashish.

1. THE "MIRACLE DRUG"

The first reference to the medical use of cannabis is in a pharmacy book written about 2738 B.C. by the Chinese Emperor, Shen Nung, who recommended it for "female weakness, gout, rheumatism, malaria, beriberi, constipation and absent-mindedness." In China at that time, the hemp plant was also a major source of fiber for the production of rope, but there is little indication that its psychotropic properties were of much interest. Its pain-killing powers were well-known to the Chinese physician Hao-Gho, who mixed the resin with wine. This preparation, which was called *ma-yo*, was employed as an anesthetic in surgery.

Some years later cannabis extracts were introduced in India, where they have, for more than a thousand years, had medical applications. An Indian girl who worked for me as a laboratory technician tells a story of her experience with the drug: She came from a wealthy family in Bombay, which, when she was a little girl, sent her to the finest physician in the city because, apparently, the parents felt she was too skinny to attract a man. The doctor prescribed a glass of *bhang* before each meal, which greatly enhanced her appetite. By the time she was 17 she was voluptuous and eminently nubile, though not obese. Surprisingly, she cannot recall any psychotropic effects, nor was she told by her physician to expect any.

The ancients in other countries seemed to know cannabis as a balm or, perhaps, an antiseptic (though, of course, they knew nothing about bacteria then). In the papyrus of the pharaoh Ramses, for example, washing sore eyes with extracts of the plant was recommended. In a folk remedy of the Middle Ages in Europe, the dried leaves were kneaded and applied with butter to burns. Extracts were also used as drops for earaches and for preventing inflammation of ulcers, and there are even claims that women stooping due to a disease of the uterus were able to stand straight again after inhaling smoke from the plant.

Western physicians, however, remained largely ignorant of cannabis until 1839, when a 30-year-old British doctor serving in India, W. B. O'Shaughnessy, wrote a 49-page article in "The Transactions of the Medical Society of Bengal" describing his experiences with the drug. (The fact that we are able to pinpoint historically the introduction of cannabis into European medicine is itself notable, since most drugs seem to be gradually adopted by doctors after originating in folk medicine.) O'Shaughnessy reviewed the literature on the use of cannabis in Indian medicine during the preceding 900 years. A cautious man, he was not satisfied with the drug's well-documented record of safety and proceeded, in a series of animal experiments, to test its effects as well as the limits of the dosage. He found cannabis remarkably safe in animals, a conclusion which has been reaffirmed many times. In fact, despite many escalations of the dose he could not kill any mice, rats or rabbits. Then, Dr. O'Shaughnessy administered the

drug to patients suffering from seizures, rheumatism, tetanus and rabies. His findings were that it relieved pain, was an anticonvulsant and acted as a muscle relaxant.

O'Shaughnessy's work excited the interest of clinicians throughout Europe, and soon there were descriptions of its applications to a range of ailments, including menstrual cramps, asthma, childbirth psychosis, quinsy, cough, insomnia, migraine headaches, chorea and withdrawal from opiates. Some idea of this broad usage can be gleaned from 19th-century medical journals. One investigator wrote: "It acts as a soporific or hypnotic, causing sleep; as an anodyne in lulling irritation; as an antispasmodic in checking cough and cramp; as a nervine stimulant in removing languor and anxiety. Also, it raises the pulse and enlivens the sprits, without any drawback or deduction of direct or incidental convenience; and it conciliates tranquil repose without causing nausea, constipation or other signs of effect or indigestion, without headache or stupor."

Such testimonials from the medical profession were by no means rare. Hobart Hare's "Standard Textbook of Practical Therapeutics" stated: "Cannabis is very valuable for the relief of pain, particularly that depending on nerve disturbances; it produces sleep; it gives great relief in paralysis and tends to quiet tremors; it is used in spasm of the bladder due to cystitis or nervousness; it is used in cough mixtures and does not constipate or depress the system as does morphine."

Since extracts of hemp from colonial India were the most abundant source of cannabis in the 19th century, British physicians were responsible for the first explorations of the medicinal uses of the drug. Of course, in those days, before the current era of super-specialization in medicine, individual doctors researched and treated patients with a wide variety of illnesses. Thus, men like Dr. J. Russell Reynolds, a physician to Queen Victoria, devoted 30 years to careful evaluation of cannabis under many conditions. He was particularly impressed with its ability to relieve pain; his observation that the drug was an emotional or psychosomatic elements aggravated an illness is of special interest. Perhaps cannabis's tendency to release neurotic inhibitions and bring on euphoria, as well as its mild sedative action, was responsible for its unique ability to ease "nervous" pain. In much the same way today a mild barbiturate together with aspirin and caffeine—called Fiorinal—constitutes a most effective anti-tension-headache cocktail. Thus, Dr. Reynolds especially recommended cannabis for migraine headaches. "Very many victims of the malady," he reported, "have for years kept their sufferings in abeyance by taking hemp at the moment of threatening or onset of the attack."

There are also indications that cannabis can help prevent future attacks, or at least reduce the frequency and severity of the headaches. In modern medicine two different types of drugs are normally prescribed for these purposes; ergot derivatives such as ergotamine alleviate acute pain, and methysergide (Sansert)—which is, interestingly, a close relative of L.S.D. and is hallucinogenic itself in bigger doses—is used to ward off future headaches. Dr. Hare, a professor of medicine at the University of Pennsylvania, concluded that cannabis can fulfill both roles.

One medical complaint that can benefit from a drug that relieves "nervous" pain is menstrual cramps, since relatively severe attacks are often emotionally caused. Indeed, cannabis was prescribed extensively for the cramps in the 19th century, and physicians soon discovered that it also relieved excessive menstrual bleeding, or "menorrhagia." Its successes here seem to have beeen spectacular. For instance, Dr. Robert Batho reported: "It [cannabis] is par excellence the remedy for that condition . . . it is so certain in its power of controlling menorrhagia that it is a valuable aid to diagnosis in cases where it is uncertain whether an early abortion may or may not have occurred." How cannabis slows down menstrual hemorrhage is something of a mystery.

Like narcotic pain-relievers such as codeine, cannabis was also used frequently to control coughs. While today this may not seem to be so important, in the 19th century tuberculosis was the leading killer of the young—and debilitated people of all ages with incessant, intractable coughing; any medicine that could ease the cough was thus a blessing.

Cannabis was introduced in the West at a time when opiates were prescribed freely and addiction was far more widespread than it is today. As a consequence, it was natural that the drug should be tested as an aid in withdrawing patients from opium, as well as from other addictive substances, such as alcohol and chloral hydrate. For example, Dr. Edward Birch reported in The Lancet: "I am satisfied of its immense value [in withdrawing patients from chloral hydrate or

61-801 O - 77 - 65

opium] . . . the chief point that struck me was the immediate action of the drug in appeasing the appetite for the chloral or opium and restoring the ability to appreciate food."

The potential value of cannabis in helping to withdraw patients from alcohol or opium was rediscovered about 50 years later during an investigation of the marijuana problem in New York City sponsored by Mayor La Guardia in the early nineteen-forties. Doctors Samuel Allentuck and K. Bowman found that by substituting cannabis for heroin, "the withdrawal symptoms were ameliorated or eliminated sooner, the patient was in a better frame of mind, his spirits were elevated, his physical condition was more rapidly rehabilitated, and he expressed the wish to resume his occupation sooner." Other investigators, however, have said recently their experience is that cannabis is not effective as a means of easing off heroin.

One is struck by the suggestion of some researchers that, besides easing the craving for an addictive agent, cannabis had a tonic-like action, raising the spirits of the addict and increasing his energy and appetite. In O'Shaughnessy's first report on its uses in medicine, he cited its value in controlling convulsions. (Convulsions resulting from many different causes in those days were lumped together, while today we can distinguish epilepsy from other causes.) There followed reports of cannabis treatment of chorea, resulting from rheumatic fever, in which wild flailing of the arms—called St. Vitus's dance—resembled convulsions.

However, its possible value in epilepsy remained buried for many years until routine screening of many substances in animals for anticonvulsant activity revealed an analogue of T.H.C., that is, a chemical similar to it in composition, which seemed to have anticonvulsant properties. At this time, the late 1940's the attacks of most epileptics could be controlled by diphenylhydantoin (Dilantin) or phenobarbital, which are still the major antiepileptic drugs in medical practice today. To see whether T.H.C. could help epileptics, two researchers—Doctors J. Davis and H. Ramsey—chose five institutionalized children whose attacks could not be controlled with phenobarbital, Dilantin or even a combination of the two. Given T.H.C., two of the five became almost completely seizure-free, and the other three did at least as well as they had on their previous drug regimen. The unavailability of cannabis or T.H.C. derivatives in the succeeding decade prevented any further medical investigation of this problem.

The major use in the 19th century was as a pain-killer or mild sedative-tranquilizer and, since in those days opium had been the most widely used drug for these purposes, most medical reports on cannabis concentrated on comparing the virtues and drawbacks of these two drugs. One of the most obvious assets of cannabis, apparently quite clear to 19th-century physicians—but not yet clear to the United States Narcotics Bureau—was that prolonged use never led to addiction, nor did it result in tolerance to the drug's effects. This was commented on again and again in 19th-century medical journals, was confirmed in the investigations of Mayor La Guardia's committee and has been confirmed repeatedly in studies over the last three years using both crude cannabis as well as pure T.H.C.

In addition, cannabis products are far less toxic than the opiates. The latter drugs, including morphine and heroin, kill by depressing the respiratory centers in the brain, and do so in amounts only a few times greater than therapeutic doses. By contrast, cannabis may well be one of the least toxic drugs known.

What about effects on the vegetative functions of the body? Opiates slow down the churnings of the intestines and routinely produce constipation. Since opiate alkaloids retard the secretions of the liver and the pancreas, they slow down digestion. Opiates retard the flow of bile by constricting the bile ducts, so that the pressure inside them builds up—sometimes causing severe colic pain; another unpleasant side effect is their tendency to cause nausea and vomiting. Cannabis produces none of these effects.

In one important way opiates are better than cannabis: they are stronger pain-killers. For the excruciating colicky pain produced by a kidney stone or the crushing chest pain of an acute heart attack, morphine is a blessing. For these situations, cannabis is a weakling.

Still, we have seen that the drug could be valuable in treating a number of conditions. Why, has it been so neglected in recent years? Legal restrictions are at fault to a large extent, but they cannot be the sole reason. Well before the Marijuana Tax Act of 1937, in the late 19th and early 20th centuries, cannabis as a general medicine was already on the decline.

There had always been problems in prescribing the drug. For one thing, it is insoluble in water and so cannot be injected intravenously for rapid effect. When taken by mouth, moreover, it does not begin to go into action for one to two hours—longer than for many other drugs.

Even more troublesome was the difficulty during the 19th century of obtaining standard batches of cannabis. Different batches can vary tremendously in their potency, probably because the amount of resin in plants depends on ripeness, humidity, soil characteristics, temperature and time of year. In the early days of cannabis in European medicine, the drug became highly controversial on this account. On the one hand, highly reputed physicians were praising it as a "miracle drug." But at the same time others could not duplicate the therapeutic successes of their colleagues and concluded, like Dr. J. Oliver, that cannabis "is hardly worthy of a place on our list of remedial agents."

It is possible that the "therapeutic failures" simply reflected weak preparations. This variability was well-known even to O'Shaughnessy, who observed considerable deterioration of the drug's potency while transporting it from India to England.

Then, too, some of the therapeutic successes of cannabis could possibly have been "placebo" responses suggested by the physician. This is especially the case with headaches, menstrual cramps and emotional ailments, which are particularly responsive to suggestion.

Dr. Reynolds, an astute clinician, also pinpointed another difficulty: the variability of individual responses to the same dose of cannabis. "Individuals differ widely," he said, "in their relations to many medicines and articles of diet, especially those of vegetable origin—such as tea, coffee, ipecac, digitalis . . . and *cannabis*." Anyone who has attended a pot party can vouch for this piece of wisdom.

One more possible drawback might be that patients treated for medical conditions with cannabis might get high and become potheads. Yet, it is striking that so many of the early medical reports on cannabis fail to mention the plant's intoxicating properties. Rarely, if ever, is there an indication that patients—thousands must have consumed cannabis in Europe in the 19th century—were "stoned," changed their attitudes about work, love, their fellow men or patriotism. It is unlikely that the plants grown 50 to 80 years ago differed in chemical composition from those growing today. More likely, the difference is a matter of mental set or expectation on the part of the patient. When people see their doctor they want to be treated for a specific malady, and do not anticipate being "turned on" or "tuned in." And recent investigations have suggested that the mental effects of cannabis are quite dependent on the expectation of the subject.

In the mid-19th century none of the drug's difficulties seemed insuperable. Variations in individual response and in the potency of different batches of the drug could be readily taken into account by starting patients with a small dose which might then be increased gradually. The one or two-hour delay before the drug took effect could be tolerated, since most of the conditions to be treated were not life-or-death emergencies. For the same reason, it did not seem too much of a nuisance that cannabis could not be dissolved in water and injected.

It was probably the introduction of a variety of new synthetic drugs that started the decline of cannabis. A major factor was the introduction of the hypodermic syringe into American medicine from England. This facilitated the injection of fast-acting, water-soluble opiate drugs, a practice which soon became widespread. The great number of casualties in the Civil War spread the use of intravenous morphine rapidly. Although the danger of addiction had been well known since antiquity, somehow physicians managed to forget about it when they were presented with the convenient tool of injectable morphine. Opiate addiction became so prevalent among soldiers who had received it for their wounds that it came to be called the "soldiers' disease."

A few cautious physicians warned against what were soon to be the tragic results of this reckless prescribing of morphine. Mattison in 1891 reminded his colleagues of these difficulties and recommended cannabis instead: "With a wish for speedy effect, it is so easy to use that modern mischief-maker, hypodermic morphia, that they (young physicians) are prone to forget remote results of incautious opiate-giving. Would that the wisdom which has come to their professional fathers . . . might serve them to steer clear of narcotic shoals on which many a patient has gone awreck." By contrast, he felt that his experience confirmed that "cannabis indica is a safe and successful anodyne and hypnotic."

The new synthetic analgesics such as aspirin, as well as new sedatives such as barbiturates and chloral hydrate, also tended to replace cannabis. Just as with

morphine, the new drugs were more efficient to administer than cannabis, and made more money for the manufacturers, but they, too, had their drawbacks. Aspirin seems to be a less potent pain-killer than cannabis, and lacks its relaxing sedative action. Barbiturates, of course, can be addictive. What is worse, the lethal dose of barbiturates is so treacherously close to the therapeutic doses that these drugs are the most frequently employed chemical means for committing suicide. Those who use them fairly indiscriminately for nighttime sedation, even if they are not barbiturate addicts, often risk death from accidental overdoses or the effects of combining barbiturates and liquor.

Some of the objections to cannabis extracts as medicine may soon be resolved by new research. Since the isolation and synthesis of T.H.C. in 1964, doctors have been able to reproduce most of the effects of cannabis quite reliably. Thus it can be given in absolutely pure form and in regulated doses with predictable effects.

What is even more interesting is the possibility of developing variations of this molecule which may selectively retain certain of the actions of cannabis while discarding others. This is not mere speculation. Quite recently, Dr. Van Sim, a scientist at the Edgewood Arsenal near Baltimore, tried out several variants of the T.H.C. molecule on man. One of these markedly reduced blood pressure at doses which produced few if any mental changes. Dr. Sim suggested that this drug might be valuable for hypertensive patients.

Currently, several American drug companies are working feverishly to synthesize many new analogues of T.H.C., with the expressed aim of developing medicines for treating a variety of maladies. And all of this activity goes on despite the official status of cannabis as a "dangerous drug." It would be a good bet that the latter part of this century will witness the revival of cannabis in new forms as a valuable therapeutic agent.

II. THE "DELIGHT-GIVER"

Ancient Chinese writings refer to cannabis as "the liberator of sin." Probably there was a certain amount of controversy over the plant's merits then, just as there is today: other (presumably "pro-pot") Chinese writers refer to cannabis as the "delight-giver."

As a mind-altering substance, cannabis seems to have come of age in India, where it certainly was used as early as 1000 B.C. and soon thereafter became an in integral part of Hindu culture. Why the drug should catch on in India but not in China is unclear. Perhaps this has something to do with the difference in temperament of the Indians and Chinese—or their respective religions. One might be tempted to suggest that the placid, practical Chinese did not appreciate the euphoria produced by cannabis. Or maybe opium was too well ensconced as their national vice.

Hindus used cannabis as an aid in medication. Its religious role is suggested by passages in Indian folk literature, such as this one:

"To the Hindu the hemp-plant is holy. A guardian lives in *bhang* . . . *Bhang* is the joy giver, the sky flier, the heavenly guide, the poor man's heaven, the soother of grief . . . No god or man is as good as the religious drinker of *bhang*. The students of the scriptures of Benares are given *bhang* before they sit to study. At Benares, Ujjain and other holy places, yogis take deep draughts of *bhang* that they may enter their thoughts on the Eternal . . . By the help of *bhang* ascetics pass days without food or drink. The supporting power of *bhang* has brought many a Hindu family safe through the miseries of famine."

Even in India there seems to have been some angry discussion about the possible value or danger of cannabis. The writer of the paean above alludes to the controversy: "To forbid or even seriously to restrict the use of so holy and gracious a herb as the hemp would cause widespread suffering and annoyance and to large bands of worshiped ascetics deep-seated anger. It would rob the people of a solace in discomfort, of a cure in sickness. of a guardian whose gracious protection saves them from the attacks of evil influences . . . so grand a result, so tiny a sin!"

Disapproval of cannabis seems to have originated with the Christian missionaries and other Europeans. In a study of Hindu mystics, J. Campbell Oman noted that Christian missionaries often remarked, "Great numbers of Hindu saints live in a state of perpetual intoxication, which arises from smoking intoxicating herbs, fixing the mind on God."

Dr. George Morrison Carstairs, a professor at the University of Edinburgh and an authority on transcultural psychiatry, lived in a village in Northern India in 1951 and was struck by the attitudes of the ruling castes toward the

two most prevalent forms of intoxication there. The Rajputs, or warriors, drank *daru*, a potent, distilled alcohol from the flowers of the mahua tree, and seemed to regard cannabis as fit only for sissies. The Brahmins, on the other hand, employed cannabis both in religious services and for social refreshment.

Rajputs, of course, represent the temporal aristocracy, as Brahmins do the spiritual. Until the social reforms of 1948, the rajas of the Rajput class exercised autocratic rule over innumerable small principalities. In their upbringing, they were taught to put great stress on bravery and ferocity in the face of danger, and although the test of real danger was seldom met, every young Rajput lived with the anxiety that some day he might not prove adequate to the occasion. As a result, the Rajputs in the village tended to be boastful, touchy and inclined to assuage their anxieties with drinking bouts, Dr. Carstairs reported. Although ostensibly they prided themselves on drinking with discrimination—a fixed ration was allowed for each day—restraint tended to be forgotten in the course of an evening.

The Brahmins unequivocally denounced the use of *daru*, which they felt was inimical to their religious life—the first requirement of which was to "abhor meat and wine." Interestingly, Carstairs found that the gentle priests were far more vitrolic in their reviling of *daru* than were the Rajputs in their uninterested disdain for cannabis. The ruler of the village, a Rajput, thought himself a religious man and tried to reconcile his religious devotion with his drinking. This was vehemently rejected by the Brahmins, one of whom said: "He is all wrong; he is a bogus lecher always busy with wine and women. How can be find his way along this stony and throny path?"

Brahmins in the village would often visit a nearby pilgrimage center, where the chief object of worship was a large, black stone phallic symbol representing the god Shiva. The god was often cited as being a *bhang* drinker, and the Brahmins would attempt to model themselves after him. In his visits to the temple, Dr. Carstairs would generally encounter large numbers of holy men staggering about "stoned out of their minds."

Dr. Carstairs was struck by how similar Western Europeans and Americans are, in their commitment to a life of action, to the Rajputs. All share an upbringing which values individual achievement highly and considers sensual indulgence to be not wholly wrong if enjoyed within socially prescribed limits. The Brahmin theme of surrendering volition is unfamiliar, threatening and distasteful to Westerners, except for the new drug generation. Because of this, Dr. Carstairs concluded:

"The present writer would have to say that of the two types of intoxication which he witnessed and in a measure shared, he had no doubt that that which was indulged in by the Brahmins was the less socially disruptive, less unseemly, and more in harmony with the highest ideals of their race; and yet so alien to his own personal and cultural pattern of ego defenses that he much preferred the other."

After 500 A.D., cannabis began creeping westward from India, and references in the Persian and other Arabian literature began to appear. One of the most fascinating stories about the use of cannabis in Moslem cultures was told by Marco Polo about a secret cult organized in the 11th century by a Moslem religious leader, Hasan ibn-al-Sabbah. Since religion and philosophy in those days in the Moslem world were political tools to be imposed by force rather than persuasion, Hasan trained his followers as an army and was successful in capturing a number of fortresses. He is best known for refining the practice of assassination to an art—and herein lies the relevance of this tale to cannabis, as well as an interesting dilemma for philologists.

The assassins were specially recruited young men in their late teens and early 20's, who were well-treated, well-paid and sworn to total allegiance to Hasan. Marco Polo described a remarkable garden that Hasan constructed at his major fortress, the Alamut, where the young assassins were entertained under intriguing circumstances:

"He [Hasan] kept at his court a number of the youths of the country, from 12 to 20 years of age, such as had a taste for soldiering . . . Then he would introduce them to his Garden, some four, or six, or ten at a time, having first made them drink a certain potion [hashish] which cast them into a deep sleep, and then causing them to be lifted and carried in. So when they awoke they found themselves in the Garden . . .

"When, therefore, they awoke and found themselves in a place so charming, they deemed that it was Paradise in very truth. And the ladies and damsels dallied with them to their hearts' content . . .

"So when the Old Man [Hasan] would have any prince slain, he would say to such a youth: Go thou and slay So-and-So; and when thou returnest my Angels shall bear thee into Paradise. And shouldst thou die, natheless even so will I send my Angels to carry thee back into Paradise."

Most philologists seem to agree that the concept of assassination derives from Hasan ibn-al-Sabbah. There is however, dispute among them as to whether the word *assassin* comes from *Hasan* or from *hashish*. Some maintain that *hashish* itself derives from *Hasan*.

The decendants of Hasan survive today in colonies spread through Syria, Persia, Zanzibar and India. They are well-known to Westerners because of the fame of their leader, who claims direct descent from Hasan and is known as the Aga Khan. Cannabis must have been quite popular in the Arab world during the Middle Ages. For in the "Thousand and One Nights," which represent folk tales collected between about 1000 and 1700 A.D., there are many references to *bhang*, which the Arabians called *beng*, as well as to hashish.

Cannabis was probably brought to Europe by Napolean's soldiers returning from Egypt. At least it is well-documented that in Egypt, he discovered widespread use of hashish, particularly among the lower classes. Napoleon issued a proclamation prohibiting its sale or use.

Between 1840 and 1860 in Paris, a distinguished group of writers—including Theophile Gautier, Charles Baudelaire and Alexandre Dumas—became fascinated by the hashish experience. Their written descriptions probably still constitute the clearest, most thorough accounts of the effects of the drug on the psyche.

How did the "literary epoch" in the history of cannabis come about? Dr. Jacques Moreau de Tours, a prominent French psychiatrist at the Hospital of the Bicetre who became interested in treating his patients with the drug, introduced it to the popular author Gautier, who was 24 years old at the time.

Gautier founded the famous *Le Club des Hachichins* at the Hotel Pimodan on Paris's Isle Saint-Louis. There the patrons ate *Dawamesc*, a sweetmeat which had been advertised as an Algerian dessert delicacy to the romantic society of the day and which contained hefty quantities of hashish. The literary accounts of the club's members, accordingly, reflect high doses of cannabis. Gautier was the first to publish his experience, in a book called "*Le Club des Hachichins*":

"After several minutes a sense of numbness overwhelmed me. It seemed that my body had dissolved and become transparent. I saw very clearly inside me the hashish I had eaten, in the form of an emerald which radiated millions of tiny sparks. The lashes of my eyes elongated themselves to Infinity, rolling like threads of gold on little ivory wheels, which spun about with an amazing rapidity. . . . At certain moments, I still saw my comrades, but disfigured and grotesque, half men, half plants. The spectacle was so ridiculous that I writhed with laughter in my corner . . ."

Alexandre Dumas was imprssed with how hashish enhances erotic sensations. He wrote this in "The Count of Monte Cristo" and thus anticipated Timothy Leary by 100 years in wrongly declaring cannabis an aphrodisiac:

"And then followed a dream of passion like that promised by the Prophet to the Elect. Lips of stone turned to flame, breasts of ice became like heated lava, so that to Franz, yielding for the first time to the sway of the drug, love was as a sorrow and voluptuousness a torture, as burning mouths were pressed to his thirsty lips, and he was held in cool serpentlike embraces."

But cannabis is not really an aphrodisiac. Since the drug makes perceptions more vivid, sex can become spectacularly beautiful or, in some cases, hideously repugnant.

Although the experience of the nineteen-sixties in the United States suggests that the mind-altering consumption of cannabis tends to catch on and spread like plague, the chronicle of the plant's first 3,000 years in other cultures bespeaks a slower rate. Before the Christian era and until about 500 A.D., it was employed for this purpose almost solely in India, and to a lesser extent in China. In the next 1,000 years or so, it reached the Middle East and Near East. Only in the 19th century did it become well-known in Europe. And we must wait until the 20th century for it to reach the United States.

Marihuana came to the United States from Mexico and Cuba. The weed was smuggled by Mexican laborers across the border into Texas. American and Mexican sailors were also go-betweens, buying the drug in the ports of Havana, Tampico and Veracruz for $10 to $12 per kilogram (2.2 lbs.) and selling it wholesale in New Orleans at $35 to $45 a kilogram.

The consumers in New Orleans were largely the poor and the Negro population. When reporters of The New Orleans Morning Tribune wrote a series on "the marihuana menace," the stories that generated the most alarm were those claiming that large numbers of teen-agers smoked "mootas," New Orleans jar-

gon for marihuana cigarettes. The superintendent of the city's Children's Bureau told reporters that he felt many problem children living at the bureau had come under marijuana's influence (implicitly suggesting that it had *made* them problem children) and that two of them had run away because they couldn't get their "muggles" (another slang word for marihuana) there.

At this stage, only 16 states had laws against the sale or use of marihuana, and these were laxly enforced. This was, after all, the era of Prohibition, and the police had more pressing matters to attend to.

In the mid-thirties, however, a major crime wave struck New Orleans. Searching for some explanation for an outbreak of holdups, one which, it was hoped, would not expose police inadequacies, Frank Gomila, the Commissioner of Public Safety, concluded: "The crime wave unquestionably was greatly aggravated by the influence of this drug [marijuana] habit. . . . Youngsters known to be 'muggle-heads' fortified themselves with the narcotic [sic] and proceeded to shoot down police, bank clerks and casual bystanders. . . ." And state narcotic officers reported that in 1936, "60 per cent of the crimes committed in New Orleans were by marijuana users."

Soon newspapers throughout the country had taken up the story and sparked national concern. Nevertheless, neither the public nor law enforcement officers truly considered marijuana a serious problem. One index of how feebly the laws were enforced was the very low price of marijuana products, indicating that there was little risk of arrest from its sale. Even the Treasury Department in 1931 minimized its importance:

"A great deal of public interest has been aroused by newspaper articles appearing from time to time on the evils of the abuse of marijuana, or Indian hemp . . . inference that there is an alarming spread of the improper use of the drug, whereas the actual increase in such use may not have been inordinately large."

Still and all, the continued publicity gradually pressured the Treasury Department's Bureau of Narcotics into drafting a national law. At the same time, the bureau conducted a national campaign against the drug, working with state legislatures in developing state laws for the regulation of marijuana, and providing information for magazine articles about the threat.

Harry Anslinger, the United States Commissioner of Narcotics, himself wrote articles designed to "educate"—and terrorize—the readers. For instance, in one piece he reported:

"An entire family was murdered by a youthful marijuana addict in Florida. When officers arrived at the home they found the youth staggering about in a human slaughterhouse. With an ax he had killed his father, mother, two brothers and a sister. He seemed to be in a daze . . . He had no recollection of having committed the multiple crime. The officers knew him ordinarily as a sane, rather quiet young man; now he was pitifully crazed . . . The boy said he had been in the habit of smoking something which youthful friends called 'muggles' . . ."

It is remarkable how many times potheads are referred to as "addicts" in the popular literature of the twenties and thirties, despite medical evidence, available then, that marijuana is not addictive. As to the details of Anslinger's lurid account, it takes little psychiatric acumen to appreciate that such a crime would not be committed by someone who was "ordinarily sane."

The proposed Marijuana Tax Act never faced any grave danger in Congress, since marijuana smokers of the nineteen thirties—the underprivileged, black derelicts of society—were not represented in the hearings held in Congress prior to the final vote. The Congressmen were, moreover, assured by a Treasury spokesman that the bill would in no way "interfere materially with any industrial, medical or scientific uses which the plant may have." The reason that the Treasury felt that "medical uses" would not be interfered with was simply that the medical profession rarely used the drug at the time. Unlike the Harrison Narcotics Act, which made morphine and related narcotics available to physicians, the Marijuana Tax Act effectively banned cannabis as a medicine as well as an intoxicant.

Narcotics Commissioner Anslinger was the star witness at the hearings on the bill. He recited the well-worn tale of Hasan, hashish and the assassins. He introduced newspaper clippings that claimed cannabis caused crime, addiction and loss of reproductive powers. He said that it led to a "delirious rage after its administration and that prolonged use invariably produced "mental deterioration."

With such impressive testimony, the bill sailed smoothly through committee. Only two minor inconveniences arose during the hearings. One had to do with the bill's provision that the seeds of the plant as well as the flowering tops which smokers used should be outlawed, because the seeds contained a small amount of the intoxicant and might be used for smoking. Violent objection to this provision

came from, of all places, the birdfood industry. A representative of this industry appeared at the last minute in a rather excited state because, as it turns out, the bird-seed industry at that time was consuming about four million pounds of cannabis seed each year.

He observed that "it is a necessary ingredient in pigeon feed, and we have not been able to find any seed that will take its place. If you substitute anything for the hemp it has a tendency to change the character of the squabs produced." Congressman Doughton of North Carolina was curious about whether pigeons get stoned on pot. The manufacturers' representation answered, "I have never noticed it. But the seed does have a tendency to bring back feathers [which have fallen out] and improve the bird." The upshot was that the Government modified the bill. Since sterilized seed would do just as well for pigeon feed, but could not be used to grow the intoxicating plant, an amendment was passed exempting sterilized seed.

A less amusing series of objections to the bill remained. The final witness was Dr. William Woodward, the legislative counsel of the American Medical Association. This extremely conservative organization might be counted on to throw its weight behnd a law to stamp out a purported menace to the nation's health. Accordingly, the Congressmen and the Narcotics Bureau must have been surprised by Dr. Woodward's testimony. He not only proceeded to criticize the provisions of the bill which were to deter future investigations into cannabis's medical uses, but also was harshly critical of the committee's procedures for obtaining evidence.

"We are referred to newspaper publications concerning the prevalence of marijuana addiction. We are told that the use of marijuana causes crime. But yet no one has been produced from the Bureau of Prisons to show the number of prisoners who have been found addicted to the marijuana habit. An informal inquiry shows that the Bureau of Prisons has no evidence on that point.

"You have been told that schoolchildren are great users of marijuana cigarettes. No one has been summoned from the Children's Bureau to show the nature and extent of the habit among children. An inquiry of the Children's Bureau shows that they have had no occasion to investigate it and know nothing particularly of it."

Caught unawares after what had been a notably placid series of sessions, the Congressmen proceeded to badger and browbeat Dr. Woodward, questioning his qualifications (he was both a physician and a lawyer and spent five years working with the A.M.A., the Bureau of Narcotics and the American Pharmaceutical Association drafting a uniform narcotics act). "If you want to advise us on legislation," one committee member fumed, "you ought to come here with some constructive proposals rather than criticism, rather than trying to throw obstacles in the way of something that the Federal Government is trying to do."

Needless to say, the Marijuana Tax Act was passed by Congress—originally with a maximum penalty of a $2,000 fine and/or five years in prison. In 1956 penalties for sale or transfer were increased to a five-year mandatory sentence, and a third offense could bring prison sentences of up to 40 years and fines of up to $20,000. (In October 1970, however, Congress passed legislation that raised penalties for professional pushers, but allowed more lenient treatment of others caught selling drugs, including pot. The law also cut the maximum penalty for those simply possessing marijuana to one year—a sentence that may be suspended—and permitted the judge to expunge the offense from the records in cases of first offenders.)

One conclusion we can draw from this brief history is that marijuana means different things to different cultures. It may be an essential to the Hindu, who values, above all else, the experience of nirvana. Yet the same drug seems anathema to the hard-driving, traditionally prudish American. As culture change, so may their attitudes toward mind-altering substances such as marijuana and alcohol. A thousand years ago *bhang* was almost a sacrament in India. Today, India is becoming more Westernized and the Government, reacting to international pressures, has imposed some legal controls on hashish.

In contrast, the United States, so long the land of the Calvinistic work ethic—and of more or less covert violence—may be becoming a more introspective country. The younger generation is more concerned with here-and-now self-awareness than with accumulating money for some future gratification. Humanistic ethical considerations, such as concern for one's comrades, are replacing abstract morality and competitive individualism. All of this suggests a more contemplative, less aggressive national ethos, the kind that has existed in Eastern countries such as India for many years, fostered there, perhaps in part, by cannabis.

U. S. MARIJUANA LEGISLATION AND THE CREATION OF A SOCIAL PROBLEM

by
Roger Smith M.S.
Director Haight-Ashbury Amphetamine Research Project

The possession, sale or use of marijuana in the United States today is considered serious deviant behavior, both legally and socially, and the penal sanctions which may be imposed on a convicted marijuana offender are among the most severe in both the Federal and State penal codes. It is the threat of arrest and conviction which is currently the most persuasive argument advanced to young people when attempting to dissuade them from the use of the drug. Simple logic would suggest to us that there must be more to our proscription of marijuana than meets the eye; in order to merit such severe legal penalties, marijuana surely poses a major threat to the fabric of our society, in the same way that society is threatened by acts of murder, arson or burglary, criminal acts which carry similar stiff penal sanctions.

Although the professional literature reveals conflicting data regarding the pharmacological, psychological, and social effects of marijuana use, there is nowhere presented fact or research data which would justify our current legal attitude toward the drug. It is for this reason that we seek, in this paper, to examine some of the less tangible aspects of attempts to control marijuana use in this country, as well as to review some of the highlights of such legislation historically. Because the history of marijuana legislation has been extensively reported in both the professional and lay literature, a certain familiarity with the content and implications of that specific legislation is assumed, although reference will be made to it when it is of some particular value or interest.

The Historical Background

In the years which preceded the passage of the Marijuana Tax Act, the specter of "demon rum" was still quite clear in the minds of the moral entrepreneurs of this nation, when a new menace, the "killer weed" raised its ugly head. Like alcohol, it was an intoxicant which was sought after primarily because of the pleasure it gave the user, but unlike alcohol, it did not provide for the spiritually-redeeming morning-after hangover. Its use, like alcohol, is a pleasurable, hedonistic, non-productive, and above all, a sinful practice. As a pharmacological entity, marijuana can be regarded as a relatively innocuous and insignificant weed, but as a social, legal and philosophical entity, it has assumed menacing proportions. Just why this has happened requires a close examination of the images which were drawn of the marijuana smoker and the methods employed to arouse a generally apathetic and unaware public to this new menace.

It is somewhat difficult to understand where the impetus for such an energetic anti-marijuana campaign on the national level arose. In the late 1920's, marijuana was used primarily in the South and Southwest part of the country, where the majority of the habituates were Mexican descent, although the practice had slowly spread to the urban centers in the North, where marijuana smoking was practiced by musicians and other "bohemian" groups.

One of the earliest and most forceful of the anti-marijuana crusaders was Earle Albert Towell, who was convinced that he had discovered the ultimate aim of the tobacco industry; namely turning everyone on to marijuana, which, in his opinion,

would lead ultimately to the destruction of the morals and health of the nation. In his popular book On the Trail of Marijuana, The Weed of Madness, Rowell clearly outlines the potential of this new drug:

1. Destroys will power, making a jellyfish of the user. He cannot say no.
2. Eliminates the line between right and wrong, and substitutes one's own warped desires or the base suggestions of others as the standard of right.
3. Above all, causes crime; fills the victims with an irrepressible urge to violence.
4. Incites to revolting immoralities, including rape and murder.
5. Causes many accidents, both industrial and automobile.
6. Ruins careers forever.
7. Causes insanity as its specialty.
8. Either in self-defense or as a means of revenue, users make smokers of others, thus perpetuating evil.[2]

The Federal Bureau of Narcotics, formed in 1930 and staffed largely by ex-Prohibition agents, was apparently not particularly concerned with the national control of marijuana until the middle 1930's. By 1930, some 16 states had passed legislation restricting the sale or use of marijuana in some way, although these laws were not vigorously enforced, for the most part. In 1932, the Federal Bureau of Narcotics (FBN) was an interested observer at the National Conference of Commissioners on Uniform State Laws which touched on the matter of marijuana legislation on the state level. It was about this time that a rash of lurid articles and stories began to appear in the popular press concerning marijuana, most of which were outrageous enough to prompt the FBN to publically minimize the importance of the "marijuana menace."[3] At this time they apparently saw marijuana control as properly the baliwick of the states.

Despite the fact that following the Uniform State Laws conference in 1932, several additionalstates enacted legislation prohibiting the manufacture, sale or possession of marijuana, the FBN became increasingly insistent that the states were not doing enough and that if they did not step up their efforts, the FBN would be forced to seek legal controls at the Federal level. By 1936, the FBN, and particularly Commissioner Harry J. Anslinger, was deeply involved in a campaign to alert the public to the menace of marijuana. There is an interesting parallel between their efforts to shape policy with regards to marijuana and their previous campaign to impose their will on the administration of various pieces of legislation intended to control the distribution and use of the "hard" narcotics, principally the opiates and cocaine.

The opiate addict at the turn of the century was regarded as an unfortunate victim of ignorance, who had become addicted to drugs which he had initially used for

alleviating suffering, and not simply for the pleasurable feelings which accompanied its use. The majority of addicts at this time were women, most were Protestants, white and from rural areas. With the passage of the 1906 Pure Food and Drug Act, the patent medicines loaded with opiates were taken off the market, while the Harrison Act of 1914 curbed the indiscriminate sale of opiates across the counter. The Harrison Act, like the Marijuana Tax Act, is a revenue act, and is enforced by agencies within the Treasury Department. The original law made no mention of addicts or addiction, and reflected a growing concern about the widespread use of narcotics for the self-treatment of a variety of complaints. The legislation came at a time when the medical-profession was becoming aware of the potential dangers of such drugs and sought to sharply curtail their use.

Those who were addicted to narcotics immediately subsequent to the passage of the Harrison Act had little difficulty in receiving proper medical care, until a series of court interpretations of the Act made it impossible for the addict to obtain drugs from any source other than the black market. Thus, many cities opened up ambulatory drug clinics, the first being in New York City, in 1919, with hopes for rehabilitating the addict and preventing his involvement with criminal drug distributors. Later, other cities began opening drug clinics, and there were soon a total of 44 throughout the United States.

The clinic experience was the critical period insofar as the development of our current punitive policy toward drugs is concerned. The addict was publicly characterized as an individual in need of medical help and assistance when the clinics opened in 1919. Narcotics addiction was regarded as an unfortunate occurence, but not really the fault of the individual. The public was receptive to treating him as such. By 1923, all of the clinics had closed their doors, the addict was left with only the criminal underworld as his source of supply, and he had come to be regarded by the lay public as a willfully indulgent criminal, unwilling to respond to humane medical treatment, and fully deserving of society's moral and penal sanction. It was only after this radical transformation of the addict's image that the increasingly punitive approach advocated by the Federal Bureau of Narcotics could become official policy. It is of significance that nowhere in the discussions of the ambulatory clinics does one find a critical analysis of the treatment methodology. The FBN was instrumental in exposing the weaknesses of the clinics, and the press had a field day with them.

As the public became more aroused and outraged by the activities of narcotics addicts as described for them in the press, they became less receptive to pleas for moderation or rationality, and insisted on the strongest possible punitive measures. The addict was no longer a victim, but a threat, a transformation which took but four years to accomplish.[4]

In order to set the stage for federal legislation controlling marijuana, the FBN set about to promote the notion that the marijuana smoker was a serious threat and responsible for an increasing number of crimes, particularly crimes of violence, including murder and rape. To this end, they widely publicized several "examples" of heinous crimes which they claimed were directly related to the use of marijuana. For example:

> "In 1935, a 30 year old male "assaulted 10 year old girl, admitted being under the influence of marijuana, so "crazy", convicted in court trial. Hanged."

96

"1936, in San Antonio, Texas. Two women arrested for possession of marijuana violently attacked Officer C. Cullen. Arrested.

1921, male 30, beat to death with rock T. Bernhardt, boy, 14, while herding cattle in pasture; accused boy of polluting his water supply. Boy's head crushed, one eye gouged out, and missing. Arrested several hours later, he screamed and tore jail furnishings. Smoking marijuana at the time; claimed insane, found to be sane. Hanged.

1933 Tampa, Florida. A boy murdered his father, mother, sister and two brothers with an axe while under the influence of marijuana. Didn't know of all this until next morning. Arrested.[5]

While there were few people in this country who objected to statements linking marijuana use and crime, it is clear that in the numerous cases previously cited, the "casual relationship" between marijuana and crime was tenuous, at best, and in some cases, outright fabrication. Thus, we turned to other sources for confirmation of the dangerous qualities inherent in the drug. Longitudinal studies on users in this country were impossible because of the length of time that it had been a "social problem", as well as the fact that there had been no research done in this area. Thus, we looked to the experiences of other cultures. One of the more popular stories on the marijuana circuit was the story of the "Assassins", in which we discover that the use of hashish by members of a certain Persian religious sect led directly to the commission of political assasinations by individuals who were in no way predisposed to such violence. In another variation of the same story, FBN officials related the stories about how warriors would become fearless fanatics on the battlefield under the influence. They failed to explain how in the first instance hashish made one a stealthy, cunning assassin, and in the latter, a screaming fanatic.

Few have called into question this particular bit of folklore from another culture, and in fact, many law enforcement officials still use this story to underscore their contention that marijuana can lead to acts of violence. Mandel's analysis of this story would suggest that they were grossly distorted, and that indeed hashish was a reward for certain kinds of behavior, not the cause of it.[6]

As the campaign against marijuana was stepped up, an increasing number of sensational horror stories were related in magazines and newspapers, deploring the "juicy" sex and violence which was attributed to marijuana smoking. Some enterprising attorneys attempted unsuccessfully to introduce marijuana intoxication as a defense in capital cases.

By the time the Treasury Department went to Congress with the proposed Marijuana Tax Act, the fervor had reached a high pitch. The hearings before the House Committee on Ways and Means lasted five days. There was little doubt in anybody's mind that the legislation would be enacted. Rather, the primary function of the hearing was to titillate the legislators with horror stories. They were assured that the Act had the blessings of the newspapers. The Hashish-assassin story was related. The various crimes which the

Federal Bureau of Narcotics linked directly to marijuana were related, including the tale of the youngster who murdered his family while under the influence, and couldn't recall having done it the following day. A district attorney told the committee that marijuana was used as an aphrodisiac, but that prolonged use led to impotence. A pharmacologist who had done research on doped race horses testified that marijuana produced mental and physical deterioration when administered to dogs. Though he admitted that he had done no work with humans, he stated unequivocally that the drug was dangerous because it produced degeneracy of the brain. A district attorney from New Orleans related that several individuals who had been prosecuted through his office had claimed that they were not criminally responsible for their acts because they were under the influence of marijuana at the time the crime was committed.

The dissenting witnesses before the committee were limited. The birdseed industry feared that the new law would inhibit their use of hempseed. The Committee quickly amended their bill to allow them to continue their production unhindered.

The last remaining witness, Dr. William C. Woodward, the legislative counsel for the American Medical Association, and himself an attorney, opposed the bill on a number of counts. He felt that the state legislation was sufficient to meet the problem, and that previous testimony was based primarily on hearsay evidence. The passage of this act, he added prophetically, would inhibit further research into its pharmacology and would rule out further investigation into the medical possibilities of the drug. He cited its use in medicine as a sedative and muscle relaxant.

Dr. Woodward's testimony aroused the ire of the committee, who apparently had anticipated little opposition to their efforts. In response to his testimony, committee members challenged his credentials, which turned out to be impeccable, and criticized him for not cooperating. The members assured themselves that they were doing the right thing, by reminding the doctor of the tales of horror which had been previously related. In their parting shot, the doctor was rebuked: "If you want to advise us on legislation, you ought to come here with some constructive proposals, rather than criticism, rather than trying to throw obstacles in the way of something the Federal Government is trying to do."[7]

The Marijuana Tax Act quickly passed the House of Representatives, and shortly thereafter, the Senate. There was little debate during the Senate hearings. The star witness was again Commissioner Harry J. Anslinger, who reiterated the numerous crimes which he felt were comitted by individuals under the influence of marijuana.

The Marijuana Tax Act, now a part of the Internal Revenue Code, provides " a graduated occupational tax by all persons who import, manufacture, produce, compound, sell, deal in, dispense, prescribe, administer, or give away marijuana. A tax is also imposed upon all transfers of marijuana at the rate of $1 per ounce or fraction thereof, if the transfer is made to a taxpayer registered under the Act, or at the rate of $100 per ounce, if the transfer is made to a person who is not a taxpayer registered under the act." Obviously, the Act has not produced significant tax revenue, since few Marijuana Tax Stamps have been issued, although the Internal Revenue Service still attempts to collect $100 per ounce of illegally possessed marijuana from those convicted of violating the Act.

In many cases, this tax is collected from an individual upon his release from prison on parole, a time when the individual finds himself in a most difficult position financially.

The obvious intent of this legislation was to impose federal police powers into the area of marijuana enforcement. The original Act provided for a maximum penalty of $2000 fine and/or five years in prison, with probation or suspended sentence possible.

By the time that the Marijuana Tax Act had passed the Congress, most states had outlawed marijuana under the Uniform Narcotic Drug Act, an act which grouped marijuana with the opiates. This system of classification poses no problem for Donald Miller, Chief Counsel for the United States Bureau of Narcotics, who stated in a recent speech: "Legally, marijuana is not considered a narcotic drug under the Federal law, but it is considered a narcotic under the State laws. I do not consider these differences to be significant, since both laws are designed to control a substance which is socially unacceptable. It is less important that the controls fit like some finely balanced formula under either the taxing clause or the commerce clause of the Constitution, or in a category according to its similarity with other dangerous drugs. In fact, the Supreme Court of Colorado has ruled it is perfectly permissible to define marihuana as a narcotic drug."

With a reported upswing in the number of young people addicted to heroin a few years after World War II, increasing pressure was brought to bear by the Bureau for increased penalty provisions, both on the state and Federal level. By this time, however, there were grave doubts in even the most conservative minds about the relationship between marijuana smoking and insanity or violence. Hence, a new theme emerged, which persists to this date, despite data to the contrary. In testimony before the Senate subcommittee investigating drug abuse in 1955, Commissioner Anslinger, in response to a question regarding the relationship between marijuana and heroin addiction, stated: "...our great concern about the use of marijuana, that eventually if used over a long period, it does lead to heroin addiction." However, on the relationship between marijuana smoking and crimes of violence, he has taken a new tack: "It does not follow that all crime can be traced to marijuana. There have been many brutal crimes traced to marijuana, but I would not say that it is a controlling factor in the commission of crimes."10

Convinced that the answer to the problems of drug use and sale was heavier penalties, the Congress authorized minimum mandatory sentences, with no chance for probation, suspended sentence or parole, and an optional fine of up to $20,000 for individuals convicted of selling narcotics, including marijuana. For first offenders convicted of possession, the penalties were increased to 2 to 10 years, an optional fine up to $20,000 and the possibility of probation, suspended sentence, or parole.

Following the lead of the Federal Government, many states enacted new legislation which increased the penalty provisions in their narcotic laws, which, by definition, included marijuana. In several states, one convicted of selling marijuana to a minor could be subjected to death or life imprisonment.

The Federal Bureau of Narcotics is dedicated to the notion that increasing penalties is the only way to limit the traffic in narcotics. One of their initial fears upon passage of the Narcotic Control Act of 1956 was that judges would be hesitant about convicting an individual in a case which carried a minimum mandatory sentence.

In testimony before a House subcommittee in 1960, Commissioner Anslinger expressed great satisfaction with the sentences which had been handed down by Federal judges since the 1956 legislation, but expressed concern about the traffic in marijuana. The solution, as he saw it, lay in increasing the penalties. In response to the question as to whether marijuana led to heroin addiction, Anslinger replied: "Yes, Sir. That is the beginning, especially in the New York and Los Angeles areas. They start on marijuana and get sort of a jaded appetite and want to get to something real. Well, they switch to heroin, and that is when the trouble starts." 11

What we have seen then, in less than thirty years from the passage of the Marijuana Tax Act, is a dramatic transformation in the qualities of a drug, from a substance which produces moral degeneration, and is the cause of crimes of violence, to a drug which has only a tenuous causal relationship to crimes of violence, but is directly responsible for progression to harder narcotics. This transformation took place without benefit of even minimal research into the actual properties of the drug which was severely restricted because of the limitations imposed on legitimate researchers.

If the assumptions of the Commissioner, and law enforcement officials in general are correct, we might assume that with increased penalties for possession and sale of marijuana since 1956, the practice by 1968 would be almost totally eradicated. This apparently not being the case, we are forced to look at the implications of existing laws, and how they have shaped the contemporary scene.

The Current Scene

Marijuana smoking is no longer confined to the Southwest part of this country, nor are its users primarily from the lower socio-economic classes. Attorney General Thomas Lynch has characterized the current drug offender in California as being "young, white, urban, and without previous arrest record." It is perhaps this fact, more than any other, which accounts for the re-examination of our current laws which is being undertaken on all levels of government. During the White House Conference on Narcotic and Drug Abuse in September of 1962, doubts were voiced by many individuals who had pressed for severe penalties in 1956. Senator Thomas Dodd in a very forceful presentation to the conference, gave the following example of the implications of the minimum mandatory sentences, quoting from a United States District Judge:

> "The mandatory sentence can work extreme injustice. I was compelled to impose a five year sentence on a Marine veteran of the Korean campaign who was found with three or four marijuana cigarettes. He had been drinking in Tijuana and was arrested at the border. Obviously, three or four cigarettes did not make him a peddler and these were not commercial amounts.

100

> "He had a spotless civilian record and an excellent military career. He had received a Purple Heart and had been wounded in action and had a wife and children. I held up sentencing 60 days with the defendant's consent, to attempt to get the U.S. attorney to file a tax consent on a smuggling charge which would not have carried at least 5 years sentence. I was unsuccessful. I sentenced the man to 5 years in the penitentiary without parole." [12]

That conference suggested that "...the hazards of marijuana per se have been exaggerated and that long criminal sentences imposed on an occasional user or possessor of the drug are in poor social perspective." [13] The recent report of the President's Commission on Law Enforcement and the Administration of Justice also recommends differentiating between narcotic and marijuana offenders, giving more discretion in the sentencing of marijuana offenders, to the courts or correctional institutions.[14]

We should have learned something as a result of our national experience with marijuana. We did not. At this moment, legislation is being considered in the Congress which would make possession or sale of LSD a criminal offense, carrying with it long prison terms. This despite the fact that there appears to be a tapering off in the extent of LSD use, prompted not so much by the fear of arrest, but because medical research has suggested the possibility of real harm resulting from use under certain conditions. The information which was made public was not in the nature of bizzare claims or unfounded rumors offered by ill-informed enforcement officials, but rather, medical research. We as a nation seem obsessed with the notion that the threat of punishment will deter people from doing things which they enjoy.

In demanding new legislation, the legislators, both on the state and federal level, are assured that the real intent of the legislation is to control traffic, to arrest and imprison the criminal entrepreneur and not the so-called victim. As a practical matter however, few of the major traffickers in drugs are arrested, and it is the street level user or dealer who is arrested and imprisoned.

Let us examine some of the practical effects of our current posture toward marijuana. The obvious fact is that police activity is at an all time high. We witness the spectacle of police invading the high schools and grilling students about their use of drugs and that of their friends. Convinced that early detection is the only answer to later addiction, parents are bringing their teen-aged sons and daughters to the police station for arrest. Local police departments author ludicrous pamphlets for distribution in the schools which are an affront to even the novice. Telling lies to a youngster who has read scientific data on the pharmacology of marijuana in one of the many paperback books readily available in every magazine rack in town is hardly the way to develop a respect for law enforcement.

Nor does it pave the way to a receptive mind when an informed individual urges individual restraint and caution with regard to other more harmful substances.

Marijuana smoking among the majority of teenagers is interwoven into their daily round of activities. It is but one facet of an adolescent style which emphasizes clothes, music, friendship, sexuality, freedom from restraint, and non-violence. It is a drug which makes a small gathering in some homes more convivial.

Heroin addicts are regarded by most as relics of the past; as weak minded individuals who are untrustworthy and incapable of relating to other people. It would seem that this assessment is generally correct. The heroin addict of today is little different from the addict of ten or twenty years ago. He is still a product of a slum environment, he is still a dependent, inadequate individual, unable to cope with the challenges of everyday life. The pressure in most adolescent groups is away from the use of addictive drugs, contrary to popular opinion. Street gang workers in New York and other cities have noticed a trend away from violence and toward "coolness". One group, formerly called the Assassins, is typical of this change. Several years ago they were one of the most violent gangs in Manhattan. Today, the overwhelming majority of the gang smokes marijuana, and the club has been renamed the "Socializers." [15] This is not to suggest that we have found the answer to gang violence, but merely to emphasize that the culture has built-in mechanisms of control which restrict the use of drugs by all but the most disturbed youngsters in a way which is infinitely more effective than the threat of arrest and detention.

What of the youngsters who are arrested? Have we indeed saved them from a life of degeneration and crime as an addict? It is difficult to understand how being excluded from school as a menace to other youngsters contributed to the alleged "rehabilitative" process. The felony conviction of youngsters over 18 certainly poses major problems in terms of their educational or vocational plans.

Incarceration, although a decreasing probability for most convicted of marijuana offenses, is perhaps one of the best ways to assure continued drug use on a larger scale upon release. It is within criminal subcultures, not groups of potheads, that the peer sanctions against the use of addictive drugs are lowered. It would thus seem that the notion that there is a single line of progression from a mild drug to the addictive drugs leaves out the most important variables, namely, the individual's public and personal image, the cultural controls against certain forms of deviant behavior, including narcotic drug use.

Perhaps the most ludicrous expressions of our popular conception relating marijuana use to hard narcotics is the use of the nalline clinic for marijuana offenders. The purpose of this testing, authorized in 1957 legislation, was to "discourage" the individual from progressing on to harder drugs. Although this program might do much to discourage some from returning to heroin, we might speculate upon the implications of such a program in a larger urban area, where the majority of individuals taking Nalline shots are heroin addicts. The weekly meetings are very convivial events, with each person being required to wait around a reception room from 20 minutes to half an hour following the injection of Nalline before being examined. The associations that might be made in such a setting are obvious.

In reviewing the merits of this legislation, we must ask ourselves a question which as a nation we were forced to ask during prohibition: does the legislation restricting behavior which we have decided is harmful to our society cause more harm in its enforcement than the original harm which we set out to control? In the case of our current marijuana legislation, we must answer in the affirmative.

. . .

MARIHUANA: THE LAW AND ITS ENFORCEMENT †

DONALD E. MILLER*

CONFLICTING SOCIAL PHILOSOPHY

In searching for the causes of the growing national problem of drug abuse,[1] one reason appears clear to me. We cannot help but make slow progress in deterring drug abuse so long as there is an allegiance of some intellectuals to the "drug cult." These persons control large sections of public opinion, and hold the ear of many influential people—the authors, the editors, the lecturers, the educators and the theologians.

The general strategy of these "Spockian ultra-permissivists", as we might rightfully call them, is to proclaim that an individual's morals and vices are his own private affair, and that society has no right to invade this domain. Personally, I believe social disruption will increase when intellectuals define the important interests of society in purely individualistic terms. Somehow, I hope we can convince our young hedonists that they cannot live success-

* LL.B., Chief Counsel, Bureau of Narcotics and Dangerous Drugs, United States Department of Justice.

[1] Figures compiled by Bureau of Narcotics and Dangerous Drugs indicate that arrests for narcotic drug and marihuana violations have increased 200% in the past seven years, with a 55% increase in 1967 over 1966; for persons under the age of 21, the increase is 450% in the past seven years, with a 75% increase in 1967 over 1966. In 1963, about 6,500 pounds of marihuana were seized, and in 1967, over 51,000 pounds were seized.

fully in our society and at the same time ignore the rules of the group in which they wish to function. It is time for permissivists to stop and take a long look at what is happening and assess the irreparable harm being done.

Let us move to the next logical question—what should we do about drug abuse? Why not let the youth follow their private road to perdition in their own way? If the road were private, one might have some sympathy with that proposition—but, it is not! We may or may not agree that mere drug abuse is bad *per se*. But, when the habitual use of certain drugs happens to be detrimental to the well-being of both the individual and society, it must be regarded as a pernicious vice and proscribed by law. Actually, anti-social behavior which encroaches on individual and social welfare has never enjoyed an inviolable status immune from governmental regulation. It never should. The drug abuser is the agent of the spreading of drug abuse to his friends. His drug dependence and his drugs go where he goes and the people with whom he associates are exposed. The social costs of drug dependence, in wasted lives alone, removes the matter from the realm of a private affair. While many persons may not conclude that there is anything immoral or criminal about abusing one's self with drugs, most of us will agree that it would be highly undesirable for society to adopt a permissive attitude toward a deleterious practice.

DANGERS OF MARIHUANA

Recently, there has been considerable debate about the dangers (or lack of dangers) of marihuana. Real damage is being done by some scholarly men who are eager to attack the marihuana controls rather than justify them. They are more concerned with deriding the public officials who are charged with enforcing the laws than in helping them prevent drug abuse; they are more interested in condoning and rationalizing marihuana's use rather than presenting reasons for controlling it.

The impression is being created that virtually nothing is known about marihuana. This is false. The impression is being created that there is nothing harmful about marihuana. This is equally false. Too many people seem to think we should not pay any attention to the old studies. Too many of these permissivists argue that the studies of Benabud in Morocco, of Bouquet in Tunisia, of Chopra in India, of Gardikas and Joachimoglu of Greece, and of Wolff in South America are not valid.[2] The basis for their attitude is that they were not done in America, under American standards, using American subjects, and using American-type marihuana. I do not dismiss the studies so lightly, nor should anyone else who professes to have an objective viewpoint.

It is true that we do not possess absolute knowledge of the effects of marihuana. However, keep in mind that marihuana contains very powerful ingredients, tetrahydrocannabinols,[3] which are capable of producing many ill effects. Various studies from the Middle East, the Near East, and in the United States indicate that the mental effects are seriously detrimental.[4] Emotional balance is disturbed with waves of euphoria interspersed with phases of anxiety; paranoid episodes are frequent—giving rise to disturbances of conduct; volition and initiative are impaired; sensation is changed and distorted; and even the

[3]33 Fed. Reg. 9833 (July 9, 1968); 33 Fed. Reg. 11814 (Aug. 21, 1968). Notices were published proposing to control three synthetic tetrahydrocannabinols under the Drug Abuse Control Amendments of 1965 (21 U.S.C. § 321 [V]). The control became effective Sept. 21, 1968.

[4]*Supra* note 2.

so-called "American-type" marihuana can produce full-fledged hallucinations and delusions. There is also evidence of recurring episodes.[5]

A problem in the United States in the field of research is the lack of a potent standard product. Significantly, many persons report they obtain no effects whatever when they use marihuana. They are not the victims of a drug, but merely have been deceived with a hoax. There is so much gyping going on that it helps support the notion that marihuana is innocuous. Chemically speaking, many persons who confess on questionnaires to having been "triers" of marihuana really have done nothing more than to become partially asphyxiated from polluted air. Also, we know that marihuana varies according to where it is grown, when and how it is harvested, and its age.[6] Nevertheless, when potent substances are consumed, or the dosage of a weaker substance is increased, mental and physical reactions are intensified. The results of using the natural occurring tetrahydrocannabinols of marihuana seem to be conclusive. Dr. Harris Isbell of the University of Kentucky concludes that in sufficient dosage, the properties of marihuana "can cause psychotic reaction in almost any individual."[7]

EFFECTS OF MARIHUANA USE

The formal list of reported physiological and psychological effects of the intake of marihuana is quite varied and lengthy. For example, the 1965 report on Drug Dependence for the World Health Organization lists the following:

> Among the more prominent subjective effects of cannabis . . . are: . . . carelessness; . . . distortion of sensation and perception . . . impairment of judgment and memory; distortion of emotional responsiveness; irritability, and confusion. Other effects, which appear after

> repeated administration . . . include: lowering of the sensory threshold, especially for optical and accoustical stimuli . . . illusions, and delusions that predispose to antisocial behavior; anxiety and agressiveness as a possible result of the various intellectual and sensory derangements; and sleep disturbances.[8]

The Committee on Problems of Drug Dependence of the National Research Council (of the National Academy of Sciences) and the Committee on Alcoholism and Drug Dependence (of the American Medical Association Council on Mental Health) have correctly concluded, after appraising all available information concerning marihuana, that it is indeed a harmful drug, and that its legalization would lead to even more serious medical and social consequences than now result from its use.[9]

The effects upon the central nervous system are profound, but have been explored extensively by research. Little is known about the psychopharmacological aspects of marihuana: However, there is still a lot of literature indicating that its effects are detrimental to the central nervous system. For example, Dr. Donald Louria in his book *Nightmare Drugs* states that marihuana may produce all of the hallucinogenic effects of which LSD is capable.[10]

A medical symposium sponsored by the Ciba Foundation in 1965 summarizes much of the current research and opinions of leading medical authorities. Included in the conclusions of these studies are the following comments:

> One can easily imagine the difficult situation to which society would be condemned if the selling of hashish were legal.
> It is well known that taking hashish causes both pathological and psychic disturbances, thus rendering the addict a burden to society.[11]

MARIHUANA AND CRIMINALITY

Because of these findings, marihuana has earned a reputation for inducing criminal behavior. One prominent team of researchers which has studied the problem in India, where there has been long and widespread abuse of marihuana in all of its potent forms, concludes that:

> Excessive indulgence in cannabis is apt to produce in healthy individuals and more so in susceptible individuals, mental confusion which may lead to delusions with restlessness and disordered movements. Intellectual impairment as well as disorientation may show itself in various ways, such as weakening of moral sense. . . . Sometimes indulgence may release subconscious impulses and lead to violent crime.[12]

Earlier studies in 1939 in New Orleans disclosed that the number of marihuana users among major criminals was very high.[13] Even the LaGuardia report of 1944, which is so often cited as support for the harmlessness of marihuana, found in a number of test subjects that: ". . . [T]here were alterations in behavior giving rise to antisocial expression. This was shown by unconventional acts, anxiety reactions, opposition and antagonism, and eroticism. Effects such as these would be considered conducive to acts of violence."[14] and further that: "The conclusion seems warranted that given the potential make-up and the right time and environment, marihuana may bring on a true psychotic state."[15]

Of special significance is the investigation of Professor C. G. Gardikas in which he analyzed a group of 379 hashish-smoking criminals. He found that 117 of these became criminally inclined only after their habituation to hashish. Also, they had between them more than 420 sentences for assaults, woundings, threats, robberies, manslaughter, and

sex offenses.[16] P. O. Wolff refers to various other reports from Greece, Turkey, Tunisia, and Egypt which bear out this finding.[17] Wolff has also listed a number of specific incidents taken from his own observations in Latin America. In India, the Chopras state that: "Fits of aggressive mania are not infrequently observed after indulgence in cannabis."[18]

The manner in which marihuana causes or induces criminal behavior is not clear and seems to vary with the individual, the dosage, and the circumstances. A general survey of the literature indicates that it may stimulate criminal conduct in any of the following ways: (1) use by criminals to fortify their courage prior to committing crimes; (2) chronic use resulting in general derangement and demoralization; (3) use resulting in the lowering of inhibitions and bringing out suppressed criminal tendencies, and (4) use resulting in panic, confusion or anger induced in otherwise normal persons who have not been previous users.

A psychoactive drug such as marihuana does different things to different people, and even to the same person, depending on external and internal circumstances. Environmental and psychological factors, mood, disposition, attitude, suggestion, expectancy, motivation, and any abnormal behavioral patterns will determine the drug's effects. "The subjective effects (of marihuana) are exquisitely dependent, not only on the personality of the user, but also on the dose, the routine of administration, and the specific circumstances in which the drug is used."[19]

We are now in a wave of ever-increasing juvenile delinquency. More youngsters are getting arrested every year—at lower ages and for more serious offenses. These young people are often predisposed to impulsive and aggressive

behavior. Coupled with an equally complex adult problem involving hundreds of thousands of neurotic and psychotic persons in our midst, would it be wise to make available to them a chemical agent which would most likely release their inhibitions? We should not exaggerate the hazards of smoking a marihuana cigarette by a college student, who may be otherwise normal, and is seeking social acceptance from a group of his peers. But, on the other hand, it is appalling when we so often read that "there is no reliable evidence that marihuana causes crime." Both the logic and the evidence clearly support the proposition that marihuana can be a potent triggering chemical in persons predisposed to criminal behavior.

Here are just a few examples of statements compiled by Dr. Victor Vogel of the California Rehabilitation Center from 100 consecutive heroin addicts concerning their experiences with marihuana:[20]

> I got in quite a bit of trouble while I was high on marihuana—steal to get money to party and to buy marihuana; got involved in gang fights and was arrested twice for rape.
> Under the influence of marihuana, I broke into a church and robbed the collection box.
> I feel stubborn and get into arguments when I am high.
> Marihuana makes me paranoid and I get into fights.
> I got arrested for quite a few fights and scrapes when I was high on marihuana which gives you a false courage and you talk big and then blow it by starting a fight.
> I did about 15 drugstore robberies with a partner for narcotics. We used to get high on marihuana beforehand.
> I was walking down the road one time with a fellow and we were both high on marihuana. All of a sudden, for no reason, he jumped about four feet in the air

and began beating a man. He was like a wild man and we had to call the State Police.
I have gotten into plenty of trouble while high on marihuana, gang fights, and I beat up my wife.

ESCALATION PHENOMENON

One particularly grave danger of habitual marihuana use is that there is often a clear pattern of graduation from marihuana to the stronger drugs. Those who seek personal well-being and exhilaration through the stimuli of drugs ultimately discover that LSD, methamphetamine, and the opium derivatives have more to offer. This point has been disputed, of course, particularly in the case of student experimentation. Certainly, it is true that not all persons who ever smoked a marihuana cigarette have gone on to the use of LSD or heroin, but actual experience leaves little room for doubt that a large majority of addicts began their drug taking with marihuana. This pattern of graduation has been observed in the United States, the Near East, and in Africa,[21] though admittedly, the exact causal connection is unknown. In a sample of 96 heroin users examined in the United States, 83 admitted to the use of marihuana prior to their addiction.[22]

A good review of the subject is that of P.A.L. Chapple who studied 80 English heroin addicts. He found that 70 of these had first used marihuana and apparently considered its effects to be second only to those of heroin.[23] In studying these patients, Dr. Chapple was led to the conclusion that the connection between marihuana and heroin could not be accounted for, simply on the basis of the "mutual influence of availability in illegal society. . . ."[24] In an intensive research project conducted by Dr. John C. Ball, Chief Sociologist of the United States Clinical Re-

search Center in Lexington, Kentucky, it was found that of 2,213 narcotic addicts examined, from those states classified as areas in which marihuana is often available, 1,759 addicts or 80 percent had first used marihuana.[25]

A very significant survey has been made by Doctors Lee N. Robins and George E. Murphy, of 235 persons in St. Louis. The report indicates that about 50 percent of the persons in the survey who had used marihuana had also gone on to the use of narcotic drugs.[26]

It seems very reasonable that the more people we have who are experimenting with marihuana, the greater the danger that many of them will not be able to rid themselves of a new habit. They will then be contaminated as a consequence of association in sub-cultures involved with all types of drug abuse, barbiturates, amphetamines, LSD, and even heroin. If this assumption is true, and if the apparent increase in marihuana abuse continues unabated, it is certainly within reason that there will be a sharp rise in the incidence of narcotic addiction in the near future. There is already a showing that the increased use of marihuana is beginning to result in an increase of addiction in persons under the age of 21 years.[27]

The question of the permanency of the effects of marihuana remains open for investigation. More likely than not, the earlier failures in finding such effects in this country resulted from the unavailability of chronic users of

[27]Statement of Commissioner of Narcotics Henry L. Giordano before the House Subcommittee on Public Health and Welfare, February 27, 1968, where he stated:

> In 1963, only 13.9 percent of the new addicts reported were under the age of 21 years. In 1967, 21.2 percent of the new addicts reported were under the age of 21 years.... Also, preliminary reports show that the largest increases in youthful addiction are in areas other than the traditional addiction centers. Thus, as I predicted, we are beginning to register the ultimate experimentation with marihuana.

high quality marihuana. Further scientific study is needed, and the National Institute of Mental Health is presently carrying on a complete plan of research, covering all aspects of marihuana use. Pending the results of these new studies, no off-the-cuff decision should be made which is contrary to the existing belief—that marihuana is a harmful and dangerous substance which should be controlled in the best possible way. While these studies are going on, it is clear that a heavy burden of proof must rest upon the proponents of measures removing any controls.

Marihuana does differ significantly from the opium and "opiate" classes of drugs in that it does not produce addiction of the morphine type. Abstinence does not produce a physiological withdrawal syndrome in the user; however, its use does result in a psychological dependence. According to Dr. David Ausubel, in chronic users, deprivation may result in anxiety, restlessness, irritability, or even a state of depression with suicidal fantasies; all symptoms of a psychological withdrawal syndrome.[28] For these reasons, marihuana is more often said to be habituating rather than addicting, although one investigator claims that at least from a psychiatric point of view, there is little difference.[29] It is somewhat incredible that the lack of physical dependence liability has been cited by some observers as though it were a positive virtue of marihuana.

THE ALCOHOL ARGUMENT

One argument used by the permissivists that strikes me as naive is the comparison of marihuana and alcohol. Their reasoning is, "What is so bad about marihuana, it is no worse than alcohol?" The best reply to this is that a public health problem is not the less odious because it is sanctioned by a majority of the people. Before accepting the argument that marihuana is no worse than alcohol, one must consider the price paid by society for its inability to control abuse of alcohol. While no one can envisage return

[28]D. AUSUBEL, DRUG ADDICTION 273 (1958).
[29]Chapple, *supra* note 23, at 279.

to Prohibition as a politically achievable goal, and very few would desire it even if such were the case, the fact is, that according to the Public Health Service, there are today some 6 million chronic alcoholics.[30] These in turn adversely affect the lives of at least 20 million other persons, principally members of their families. One half of the annual toll of fatal accidents, or the death of more than 26,000 people, can be attributed in some measure to alcohol abuse.[31] Over one-half of all crime in the United States has been said to be connected with alcohol.[32] Despite all this, alcohol has been socially acceptable in our civilization for many years. This does not necessarily mean that now for the first time, marihuana, the recent fad of isolated groups of pseudo-intellectuals and hippies, should gain social acceptance. The result in any case can only be added damage from a new source. We now have more than 62,000 reported active narcotic drug addicts, untold thousands of amphetamine and barbiturate abusers, and millions of persons who drink too much alcohol.

Nevertheless, the comparison of the two is essentially unsound since the active principles of each are entirely different substances with different mental and somatic effects. Marihuana is a stimulant and hallucinogen, whereas alcohol is a depressant. The evidence indicates that marihuana, unlike alcohol, is nearly always consumed to the point of disorientating intoxication.

The American Medical Association and the National Academy of Sciences have this to say about comparing marihuana and alcohol:

> When advocates of legalizing marihuana claim that it is less harmful than alcohol, they are actually comparing

[32]*Supra* note 30, at 40.

> the relatively insignificant effects of marihuana at the lower end of the dose-response curve with the effects of alcohol at the toxicity end of the curve—i.e., the "spree" use of marihuana vs. acute or chronic "poisoning" with alcohol. If they compared both drugs at the upper end of the curve, they would see that the effects on the individual and society are highly deleterious in both cases.
>
> Admittedly, if alcohol could be removed from the reach of alcoholics, one of the larger medical and social problems could be solved. But to make the active preparations of cannabis generally available would solve nothing. Instead, it would create a comparable problem of major proportions.
>
> That some marihuana users are now psychologically dependent, that nearly all users become intoxicated, and that more potent forms of cannabis could lead to even more serious medical and social consequences—these facts argue for the retention of legal sanctions.[33]

We are told that people use marihuana to "escape" from problems and insecurities, much the same as alcohol is used. Dr. Benjamin Kissen takes exception to this rationalization.[34] He states that psychoactive drugs may be used in two ways: to diminish emotional tension and permit a person to function within reasonable limits, or the other, to allow the person to escape from reality. The first group (the sedatives), when used in moderation to allay excessive anxiety, often permits a person to function more effectively. On the other hand, the psychedelic drugs, such as marihuana, allow the individual to escape from reality so that he need not function at all. "The first group of drugs is often useful to society; the second group would only destroy it." I think Dr. Kissen is saying that literally millions of persons consume controlled portions of alcohol, a drug which has been engrained in our culture, and which is most often self-titrated for its beneficial effects. This is quite different from the marihuana users who have one motive when they use the substance—to achieve a physical

---

[33] *Supra* note 9.

[34] Kissen, *Faculty Byline "On Marihuana,"* 2 BROOKLYN DOWNTOWN MEDICAL CENTER REPORTER NO. 7 (1967).

and mental "thrill", to smoke more and more until there is an altering of the mental process.

The effect of marihuana on the performance of complex tasks, such as the operation of a motor vehicle, although a less spectacular concern, is of considerable social significance. In a statement before the United Nations Commission on Narcotic Drugs in 1963, the French Delegation expressed alarm over the high rate of road accidents which appeared to be attributable to the abuse of drugs and "particularly cannabis".[35] This danger has also been noted by authorities elsewhere and it was specifically dealt with in the report of the United Nations Commission in 1965.

EXTENT OF CONTROLS

The Marihuana Tax Act of 1937, 26 U.S.C. §4771 et seq.,[36] requires registration and payment of a graduated occupational tax by all persons who import, manufacture, produce, compound, sell, deal in, dispense, prescribe, administer, or give away marihuana. A tax is imposed upon all transfers of marihuana at the rate of $1 per ounce or fraction thereof if the transfer is made to a taxpayer registered under the act, or at the rate of $100 per ounce if the transfer is made to a person who is not a taxpayer registered under the act. Transfers are also limited generally to those made pursuant to official order forms obtainable from the District Director of Internal Revenue. Exceptions from the order-form and transfer-tax requirements are made in dispensing to a patient by a qualified practitioner in the course of his professional practice only, and in the sale by a druggist to or for a patient, pursuant to a written prescription issued by a qualified practitioner.

The law is designed to permit marihuana to be produced and used for industrial, scientific and medical purposes only. In determining which persons may be registered, and thereby sell or acquire marihuana, the regulatory scheme

---

[35]U.N. Doc. E/CN. 7/L. 268 (1963). Statement by French Delegation.

[36]*See* Sobeloff's article this edition p. 101.

requires as a condition precedent that the applicant be qualified to engage in the activity according to the applicable state provisions. A typical "street peddler" could not become registered, because such a person is not qualified by state law.[37] Consequently, the scheme of the Marihuana Tax Act of 1937 is critically different from that in the gambling and firearms tax statutes, and does not present the same risks of self-incrimination. Persons who intend to acquire marihuana illicitly cannot incriminate themselves because they are not allowed to register and pay the occupational and transfer taxes. Since no record is kept of those who unsuccessfully apply for a marihuana order form because they are not eligible, and since no notification is given to either a federal or state law enforcement agency, there is no " . . . real, and not merely trifling or imaginary, hazards of incrimination."[38]

The term "marihuana" includes many fancy and vernacular names: the so-called "American type", the so-called "Mexican type", "hashish", "kif", "bhang", "ganja", "charas", "cannabis", "cannabis resins", "cannabidol", "cannabinol", "tetrahydrocannabinol", "pot", "grass", "weed". It is true that there are varying degrees of potency ranging from almost no effects of poorly harvested marihuana to the severe effects of "hashish" or "charas". Most of the marihuana consumed in the United States is made up of the leaves and flowering tops of the marihuana plant. To a lesser extent, but which is definitely on the increase, "hashish" is also being consumed by users in the United States.

The various state legislatures have enacted programs for controlling possession and sale of marihuana by finding that marihuana and such drugs as those of the opium family have sufficiently similar social and physiological effects to warrant proscription in a single category labeled "narcotics".

In the course of developing their statutory schemes, the

---

[37]26 C.F.R. 152.22 & 152.23.

[38]Marchetti v. United States, 390 U.S. 39, 53 (1968).

legislators were recipients of a substantial ammount of information bearing on the social and physiological effects of marihuana. The Uniform Narcotic Drug Act, including the proscription against marihuana as a "narcotic", is now in force in 48 of the states.[39] The other two states also control marihuana under statutes similar to the control of narcotic drugs.

What is the right of states to classify marihuana as a "narcotic"? Despite some psychological and physiological differences in the effects of the drugs in the opium family and marihuana, the inclusion of marihuana in the statutory definition of "narcotic" is not constitutionally improper. The word "narcotic" is commonly used to designate drugs having the consciousness-altering characteristics of marihuana, *i.e.*, stupor, mental lethargy, marked alterations of mood, and possible physiological harm.[40]

This issue has been considered by the Supreme Court of Colorado.[41] That court sustained the Colorado Narcotic Drug Act against the appellant's challenge that the inclusion of marihuana in a class with heroin and other physically addicting drugs was an unreasonable and arbitrary classification violative of due process and equal protection of the law. Noting that its statute was in the language of the Uniform Narcotic Drug Act,[42] the court observed that legislative classifications are constitutional when based on a grouping of different items, if these items all bear some

---

[39]UNIFORM NARCOTIC DRUG ACT, § 1, 9B U.L.A. (1964). The exceptions are California and Pennsylvania. Legislation in some states is only in part based on the Act. Also, there have been varying amendments in a number of states. Consequently, the law in those states is not entirely "uniform".

> "Narcotic drugs" means coca leaves, opium, cannabis [the international term describing marihuana], and every other substance neither chemically nor physically distinguishable from any of them. . . .

reasonable relation to the public purpose sought to be achieved by the legislation involved. Several cases have been in accord with the Colorado holding.[43]

It, therefore, seems conclusive that the term "narcotic" as currently used, is a legal term with no precise technical meaning, used to describe a varied assortment of harmful and dangerous drugs. There is a problem of semantics, but the classification should not be upset merely because it is not made with mathematical nicety or because in practice the equating of marihuana and the drugs of the opium family results in some inexact reasoning. The wide degree of judicial accord is an indication that the classification of marihuana with the drugs of the opium family is a rational use of the legislature's power.

In developing their programs, the legislators are not bound by any one school of thought, nor are they bound to rely on only uncontroverted factual propositions. So long as the legislation rests on some rational basis, it is not to be declared unconstitutional. It is beyond dispute that the legislature, and not the courts, has the duty to assess and weigh the various and often conflicting considerations in legislative programs.[44] The legislature is not bound by any orthodoxy, but rather can range over the whole spectrum of human knowledge and experience in developing its legislative programs. "It makes no difference that . . . facts may be disputed or their effect opposed by argument and opinion of serious strength. It is not within the competency of the courts to arbitrate such contrarity."[45]

Baldwin, 193 U.S. 194, 209, 210 (1934); The *Carolene* case held that legislation ". . . is not to be pronounced unconstitutional unless . . . it is of such character as to preclude the assumption that it

Thus, all defendant-appellants have an extremely heavy burden to carry. It will not suffice to show merely that a body of scientific opinion, however sizable and respected, regards the legislative assumptions about the social and physiological effects of marihuana to be incorrect. Rather, the appellants must show that the assumptions are completely without support; that is, that no reputable body of opinion whatsoever exists on which the legislature might have rested its decision to proscribe marihuana in a statute dealing with drugs "narcotic" in character.

The information available to the legislators at the time of the enactment of the inclusion of marihuana within the proscriptions against narcotics was abundant. The legislative history of the United States Congress in enacting the Marihuana Tax Act of 1937, reveals there was a great deal of agreement among medical and scientific groups concerning the harmful effects of marihuana. The Seventy-fourth and Seventy-fifth Congresses were the beneficiaries of a large volume of material describing a variety of different experiences with marihuana, both in controlled environments and in real life.[46]

In 1942, the National Conference of Commissioners on Uniform Laws recommended that marihuana be included in the controls of the Uniform Narcotic Drug Act.[47] The legislative histories in the various states will also support the proposition that a rational basis for controlling mari-

---

rests upon some rational basis within the knowledge and experience of the legislators."

huana existed at the time of the enactment of their statutes.

Many of the defenses being raised today in opposition to the Uniform Narcotic Drug Act controls were handled in an extensive opinion by Chief Justice G. Joseph Tauro of the Suffolk Superior Court at Boston, Massachusetts, in the case of *Commonwealth v. Leis and Weiss*,[48] (unreported). After a thorough twelve-day pre-trial inquiry, in which many experts from the United States and foreign countries testified, Justice Tauro stated in part:

> . . . I do not find that the inclusion of marihuana in the statutory definition of a narcotic drug is constitutionally offensive. . . . [and] [i]t is my opinion, based on the evidence presented at the hearing, that marijuana is a harmful and dangerous drug.[49]

NEED FOR CONTINUED CONTROLS

Hence, we find very adequate reasons for proscriptions against marihuana. Even if we were to accept the doubtful proposition that the children of our colleges today possess a superior intelligence and are better able to deal sensibly with drugs, and even if we were to conclude that marihuana affects only the weak and the vulnerable, since when has our society stopped being concerned about a minority? The very purpose of many of our health laws is the protection of minorities. I am not impressed that a law student with a high IQ does not obtain a reaction from taking two or three puffs on a marihuana cigarette. I am concerned over the consequences of making the drug readily available in a society containing millions of persons predisposed to impulsive and aggressive behavior.

The question most people are inclined to ask at this point is why make possession of a controlled drug a violation of law? To me, it is reasonable to assume that the fear of suffering the consequences of the law does deter

---

[49]*Id.* at 26-27 of this publication.

countless reasonable and responsible persons. Avoidance of punishment and disgrace is a very decisive reaction of normal people. The vast majority of the people who have lived with the social contrivance of punishment, in the home, in the schools, at work and at play, will avoid certain courses of action which are potentially injurious. The condoning of unauthorized possession of a controlled drug is to approve of a ready source of supply for proselytizing. Such a view also condones a "drug cult" where all types of drugs may be available for the use of anyone who decides to find an escape or experience a different "high". We need to retain all of the penalties, otherwise it will be taken as an expression of relaxation, and a less harsh attitude toward drug abuse.

One extremely important aspect in the use of any mind-altering drug by an adolescent is the potential effect on his future psychological development. We all know that teenagers go through a very trying period of learning to cope with reality. They are in a constantly shifting state of equilibrium. Psychologists tell us that patterns of coping with the social processes—with reality—at that stage will greatly affect their adult behavior. Persistent use of mind-changing drugs as escapes from reality will hardly prepare them for entry into the realities of adulthood and a very complex society. If we can't ward off this trend of widespread misuse of drugs by our youth, there is a serious danger that large portions of the current generation and future generations will reach adulthood unequipped to take on parental, vocational and other citizen roles.

MARIJUANA LAWS — A CRIME AGAINST HUMANITY†

HYMAN M. GREENSTEIN*
PAUL E. DIBIANCO**

I. Introduction

American enforcement of laws prohibiting the use of marijuana is an unjustifiable and shocking practice which is ruining lives, interrupting careers and destroying relationships. Leaving an embittered citizenry in their wake, these laws are promoting social discord in the present as well as assuring similar strife for the future. They are an absurdity that must not be permitted to continue to ravage our nation and our sense of justice. It is therefore the contention of the authors that the use of the substance marijuana should be legalized immediately in order to stop the mindless alienation and criminalization of marijuana users, particularly the young, which our society is perpetrating by the continued enforcement of criminal sanctions against marijuana.

In the past several years, there have been many studies in the areas of science and legal scholarship about the effects of marijuana upon the individual user, the judicial system and society in general. These have proved illuminating with regard to arriving at an enlightened approach to the question of the legalization of marijuana. It is not one of the purposes of this paper to evaluate the scientific studies involved with an eye toward criticism of the methods used, nor is it one of our purposes to devote our entire effort to a detailed analysis of the efforts of others in the courts or in the area of legal scholarship. All this has been done by others in greater detail and with greater expertise than the authors of this article could hope to approximate. However, in order to make a persuasive argument, as this article is intended to be, it is helpful to utilize many of these studies, including case law, to understand fully the issue of the legalization of marijuana. It is from the basis of the knowledge imparted by these sources that it becomes proper to assert that legalization is desirable.

Two studies in particular are worth investigating, not only for the original thinking which they bring to bear on the marijuana problem but also because they serve as excellent reviews of the history of marijuana use, legislation and scientific knowledge. In short, they are essentially complete investigations of certain aspects of the marijuana issue. Dr. Lester Grinspoon's book, *Marihuana Reconsidered*,[1] and the very recent report of the National Commission on Marihuana and Drug Abuse, *Marihuana—A Signal of Misunderstanding*,[2] which was made under authority of the Comprehensive Drug Abuse Prevention and Control Act of 1970, primarily by various Nixon appointees, both provide excellent studies and summaries of scientific, legal and social issues involved in the marijuana

problem. In this regard they can be considered as updating the earlier landmark report of Professor John Kaplan.[3] Recourse to either of these sources or to various others[4] will provide the reader with a good understanding of the history of marijuana in this country, both its use and related legislation.

Generally, marijuana was introduced into this country by Mexican laborers and New Orleans inhabitants in the 19th century and was confined to use by minority groups until the early 1960's.[5] However, in the 1920's, word of the use of this substance and of its alleged association with more dangerous drugs such as heroin reached government and law enforcement officials and a general feeling of prohibition against drug use of any kind (this was the Era of Prohibition against alcohol use) led to the enactment of laws against the use of marijuana. This did not occur, however, until after the "marijuana scare," a concerted effort on the part of many agencies, public and private, to "inform" the public about the dangers of marijuana as a killer drug capable of the worst horrors upon its user and a social disaster as well. This campaign, which was based upon misinformation and emotionalism, is attributed in large part to the then Commissioner of the newly created Federal Bureau of Narcotics, Henry J. Anslinger, who based his early opinions upon the "scientific studies" of Dr. Frank Gomila, Commissioner of Public Safety of New Orleans, and his chemist wife.

Thus, by 1931 several states had enacted laws against the use of marijuana (by "use" is variously meant possession, distribution, cultivation, etc.), and by 1937, the year of the enactment of the federal Marihuana Tax Act,[6] nearly every state had made possession of marijuana illegal.[7] The Marihuana Tax Act also acted as a general prohibition against the use of marijuana, and over the years the penalties for the use of marijuana were increased.[8]

By 1956, the year of the last amendment to the Tax Act, the penalty for possession included a two-year minimum (mandatory), and the penalty for sale was five years for the first offense and ten for the second. All this and yet no one responsible for this legislation had ever done a comprehensive study as to the effects of marijuana. Everyone, it seemed was willing to "take Commissioner Anslinger's word for it" despite the fact that there had been several early objective studies made regarding the effect of marijuana upon individuals and society[9] which had cast doubt on the claims of those opposed to marijuana use. These studies were simply ignored or belittled by those involved in campaigning and legislating against marijuana. For example, in 1958, a joint American Bar

9 *See, e.g.*, MAYOR'S COMMITTEE ON MARIHUANA, THE MARIHUANA PROBLEM IN THE CITY OF NEW YORK (1944). (The LAGUARDIA REPORT.) W. Bromberg, *Marihuana Intoxication*, AMER. J. PSYCHIAT. 91 (1934) quoted in GRINSPOON at 18.

Association/American Medical Association Committee restudied the drug problem in the United States and was asked to report to the Federal Bureau of Narcotics. Among other heretical innovations, the committee urged the creation of heroin addiction treatment centers and a reconsideration of marijuana and other drugs. For this it was roundly condemned by Commissioner Anslinger, who, in a letter to the committee chairman called the report prejudiced, ambiguous, inconsistent, inaccurate and false propaganda, and went on to inform the committee that he was not trying to censor the report but merely wanted a "factual document."[10]

Commissioner Anslinger, without waiting for the committee's "enlightenment," went on to gather together his own group of "experts," one of whom was the Honorable Twain Michelson, Superior Court judge for San Francisco, California. Judge Michelson was highly critical of the ABA-AMA study, but could offer no scientific or medical data regarding the dangers of the various drugs in question (he did, however, quote from *Reader's Digest* and *Women's Home Companion*). Noting that he had read in a newspaper of a petition signed by more than 2,200 Modesto High School students asking the California legislature to prescribe the death penalty for those convicted of selling narcotics to minors, the judge stated:

> Here is an example of youth being aroused to the death dealing properties of contraband narcotics, but the ABA-AMA Joint Committee will not go along with them. Contrast this youth movement with the sentence imposed upon George Yokoyama by a California judge who placed the defendant on probation for two years, fined him $150 . . . "to be paid in installments," following his conviction of having "Approximately *900 pounds of growing marijuana*"—enough of the killer weed to send hundreds of juveniles reeling into a world of moronic behaviour, crime and near-insanity.[11]

As late as 1963, a federal government committee was describing marijuana as a very dangerous drug.

> What are these drugs that can turn potentially useful citizens into hopeless, estranged, dependent individuals? That can turn normal young men and women to crime? They are many and include . . . morphine, heroin . . . marijuana.[12]

Thus, the federal and state governments went roaring into the 1960's with completely thoughtless and repressive legislation, entirely unprepared for the increased use of marijuana and all the related problems which that would bring when the youth culture came into being.

While no one apparently ever polled the public to find out their views about

marijuana usage during the decades prior to the 1960's, it seems reasonable to assume that those among the citizenry who had an idea what marijuana was were probably in favor of harsh criminal penalties for its use because of the virulent antimarijuana campaign previously described. Yet today, public opinion, indeed all opinion, has altered its course. The National Survey, a poll conducted under the auspices of the National Commission, made a comprehensive statistical report of the attitudes of the public at large and various government officials and, *inter alia*, reported that at the present time, 51% of all adults polled believe that marijuana should be treated as a medical problem[13] and 87% object to putting users in jail.[14] Equally as important, 31% of all prosecutors polled admitted that they would not prosecute anyone arrested for smoking a marijuana cigarette at a private social gathering, and 53% admitted that the legislation against the possession and use of marijuana does not deter the under-30 group from such possession and use.[15] Perhaps most important was the conclusion of the National Commission itself, as will be discussed in greater detail later in this article, which, after its comprehensive, yearlong study, recommended partial legalization of marijuana use (private, personal possession of marijuana and casual transfers for little or no remuneration).[16]

This shift in opinion on the part of all concerned has been largely the result of an increased awareness of the effects of marijuana upon both the individual user and society. Generally, the awareness has been that of the relative harmlessness of marijuana in its effects upon the user when compared to many other drugs in use in America today.

II. What Is Marijuana? What Are Its Effects?

> It probably originated somewhere in Central Asia (as did mankind) and was first used perhaps five thousand years ago. Our marijuana is one-fifth to one-tenth as strong as other cannabis preparations which are preferred abroad, and it is looked down upon in other countries as fit only for the poor. It is the weakest of three grades used throughout the world; *ganja*, the intermediate grade, is the ground-up tops of specially cultivated plants; *hashish* or *charas* is the pure resin from the best cultivated plants and is usually the strongest. Marijuana is the entire foliage from ordinary plants. It is usually smoked, although it can also be ingested in foods or tea.[17]

This description of cannabis is the first step in an objective understanding of marijuana. But knowledge of what marijuana is does not tell us what marijuana does.

> Looking only at the effects on the individual, there is little proven danger of physical or psychological harm from the experimental or intermittent use of the natural preparations of cannabis . . .[18]

18 COMMISSION at 65.

So concluded the National Commission, going on to note that the heavy use of cannabis in its most potent forms over a long period of time, a practice of only 2%[19] of all marijuana users, leads to psychological dependence proportionate to use, some minor behavioral changes and possible (results of studies are as yet inconclusive) pulmonary alteration.[20]

Or, as the equally prestigious authority Dr. Lester Grinspoon, put it:

> It is quite true that among the hundreds and hundreds of papers dealing with cannabis, there is relatively little methodologically sound research. Yet out of this vast collection of largely unsystematic recordings emerges a very strong impression that no amount of research is likely to prove that cannabis is as dangerous as alcohol and tobacco. The very serious dangers of tobacco, particularly to the pulmonary and cardiovascular systems, are becoming increasingly well known. . . . It is a curious fact that the only socially accepted and used drugs known to cause tissue damage (alcohol and tobacco) are the ones whose use Western society sanctions. It is reasonably well established that cannabis causes no tissue damage. There is no evidence that it leads to any cellular damage to any organ. It does not lead to psychoses *de novo*, and the evidence that it promotes personality deterioration is quite unconvincing, particularly in the forms and dosage used in the United States today.[21]

Both the National Commission and Dr. Grinspoon devote a large portion of their reports to a detailed discussion of the physical and mental effects of marijuana on the individual user. The quotations reproduced above are indicative of the conclusions reached by both authorities. Both the Commission and Dr. Grinspoon based their conclusions upon careful analyses of the results of past and currently existing research projects by independent researchers. Many of the same studies are quoted by both the National Commission and Dr. Grinspoon,[22] and both sources appear aware of the results of most if not all of the existing projects and studies that are available on the subject of marijuana's effects on the user.[23] Generally, both the National Commission and Dr. Grinspoon report the following similar findings, many of which explode the old myths about the dangers of marijuana use.[24] As just mentioned, short-term use of marijuana causes no organic damage to its user or any adverse mental effects. In addition, there are no known cases of human fatalities attributable to marijuana use,[25] marijuana is not physically addictive,[26] does not lead to a decrease in ambition or motivation (what has been variously termed the "drop out" or "amotivational syndrome"),[27] is not a stepping-stone to the "harder drugs" such as heroin and cocaine,[28] does not produce psychoses in its users,[29] and is a mild

intoxicant (or psychoactive drug) which ought not necessarily be clasified as a hallucinogen.[30] It does not lead to crime, violent or non-violent,[31] does not cause that most dread of all American fears, an increased sex urge,[32] and it will not result, as its opponents used to assert in their heyday, in insanity.[33] In many users it will, unlike alcohol,[34] result in no substantial interference with driving. In fact, there are growing indications that cannabis preparations might have substantial medical value.[35]

Actually, marijuana use is, for the most part, a relaxing, pleasurable experience for the vast majority of its users,[36] one with no adverse side effects and one which is rapidly gaining in popularity in this country.[37] In fact, the worst that the National Commission could say about long-term use of marijuana was that it appeared to have become part of the change in life-style that the youth in this country is undergoing, but the National Commission expressed doubt that marijuana usage was the cause of this change and was uncertain whether marijuana use came before or after the change in attitude.

The National Commission, relying upon studies and data available largely from other countries, attempted to gather information as to the effect of marijuana on a person who not only used cannabis over a long period of time, but who used very strong potions of it on a frequent or daily basis. While the Commission was not able to reach any definite conclusions regarding such use, it reported that such use apparently led to no increase in psychoses, change in life-style, inability to perform job assignments or any other significant physical or mental abnormalities. (There was some evidence of pulmonary diminution and psychological dependence on the drug. There are conflicting studies as to whether behavioral changes occur.)[38] Although lack of a controlled study group makes reliability of these conclusions open to question, it would seem, nonetheless, that currently existing data tend to show that cannabis is a relatively harmless drug, especially in its weakest form—marijuana.[39]

Where does all this information, some of it inconclusive, lead us? Assuming, *arguendo*, that marijuana use is, compared to alcohol or tobacco use, relatively harmless, do we then legalize marijuana on that basis alone? Or do we go on the assumption that every drug, marijuana included, can be abused, and therefore the fewer drugs on the market the better? Even then, are criminal sanctions the proper tool for control of marijuana? Current governmental response to the increased use of marijuana by our youth and the increased awareness of marijuana's harmlessness in its effects on the user provides its own answers to these questions.

III. Recent Statutory Developments

Since 1969, every state and the federal government have made changes in their marijuana statutes, all of them lessening penalties in one way or another and generally they accord possession of small amounts of marijuana misdemeanor treatment.[40] As noted earlier, federal law has been, in past years, rather harsh in its treatment of the marijuana user. On October 27, 1970, Public Law 91-513, the Comprehensive Drug Abuse Prevention and Control Act of 1970,[41] was enacted. It is intended to encompass legislatively all drugs currently in use in the United States and those which might come into being or use in the future. With respect to marijuana it lessens criminal penalties dramatically. The Act places marijuana in the same category as heroin and other opium-derived drugs (there are five categories, or "schedules") because of its alleged high potential for abuse and because of the claim that marijuana has no currently accepted medicinal use and that its use is not considered safe, even under medical supervision.[42]

The penalty specified for distribution of marijuana, or for possession with intent to distribute the drug, is five years' imprisonment or $15,000 fine or both, and two years of mandatory parole for those imprisoned, for the first offense. The penalties double for a second offense.[43] However, those who distribute small amounts of marijuana for no remuneration are treated under a separate provision and accorded the same required penalty as those convicted of mere possession of marijuana (simple possession of any drug, be it marijuana, LSD or heroin brings the same penalty under the Act).[44] A conviction for possession of marijuana for a first offender brings with it, at the court's discretion, the possibility of a conditional discharge. That is, the first offender may be placed on a maximum of a year's probation during which time his conviction is not recorded as a final judgment. If the defendant successfully completes his term of probation, the conviction is set aside, and his record will show no conviction for a marijuana violation. (A separate file is kept by the Department of Justice to insure that no defendant receives such treatment twice.) For first offenders who are not sentenced under this provision or who violate their probation and are convicted of the crime of possession, the penalty is one year in jail or a $5,000 fine, or both. The penalty doubles for subsequent offenses.[45] The penalty for distribution is doubled (10 years and/or $30,000) for adults who distribute to minors; said penalty is increased threefold if the distributor has already been convicted once of distribution to a minor.[46] Thus, while federal law has become more lenient in its response to marijuana use, all phases of such use are still unlawful.

As for state laws, lack of uniformity has been their most noticeable characteristic. But here too, a lessening of the penalties has occurred recently. Most

states had extremely harsh penalties until the late 1960's. Some penalties are still rather heavy, compared to sister states' penalties and those of the federal government. But at least the specter of the death penalty has disappeared and that is, presumably, something every imprisoned marijuana offender can be grateful for. The reform movement among the states began its current drive with the passage of the Uniform Controlled Dangerous Substances Act by the National Conference on Uniform State Laws.[47] The Conference passed this Uniform Act on August 8, 1970, stating in its prefatory remarks that it sought uniformity among the states regarding the drug problem, and attributing the "drug abuse problem" to the increased mobility of the American citizens and their affluence.

The Uniform Act prohibits certain acts but leaves specific sentences to the individual states, thereby insuring the very lack of uniformity that the law was designed to remedy. Since its enactment, 30 states have adopted it and more are considering it for adoption.[48]

Under the Uniform Act marijuana is treated in much the same way as under the previously described federal Drug Act of 1970. All drugs are categorized into five schedules depending upon their potential for abuse, and penalties are assessed accordingly. Marijuana is again classified with the opiates, LSD, etc. There is also a provision against distribution to a minor, with a questionable comment,[49] and in many respects there is no difference between the federal law and the Uniform Act. Penalties under the Act are left to the individual states to determine. As mentioned previously,[50] every state has changed its law since 1969, and many of these states have adopted the Uniform Act. Those that have not are, in many cases, considering adoption, and many who decided not to adopt incorporated the philosophy of the Act or certain of its provisions into their statutory schemes. (The relevant chart provided by the National Commission is appended to this article. It is current up to March, 1972.)

Among the states, there are still glaring differences in penalties for marijuana use. By way of example, in Arkansas first and second violations of the provision against possession of marijuana are punishable by a *maximum* of one year in jail or a $250 fine or both.[51] The offender is labelled a misdemeanant. In Colorado, misdemeanor treatment is available to those who possess one-half ounce or less, but for those who possess more (keeping in mind that street use generally involves a "lid" which is one ounce) felony treatment occurs and the offender runs the risk of two to fifteen years for a first offense or a $10,000 fine or both. Penalties increase for subsequent offenses.[52] Sale of marijuana brings a penalty of five years to life in California, with a *mandatory minimum* of three years' im-

prisonment,[53] while in Maine, the penalty for sale is *not more than* five years' imprisonment and/or a $1,000 fine.[54] Sale to a minor is punishable by a *maximum* of five years' imprisonment and/or $5,000 fine in Georgia.[55] A similar violation in Missouri brings the incredible penalty of 10 years to life with no probation or parole possible![56]

Such is the unequal treatment that the states have accorded to marijuana use. Of course, the same objection (*i.e.*, unequal treatment) can be made about any penal provision. The reason this inequality has particular urgency in the area of drug laws is not only because individuality in state criminal codes is generally becoming less desirable in our modern, mobile times but also because, in the area of drug use and control, there seems little reason to discriminate among users. This is the reason for promulgation of the Uniform Act. Drug use is a nationwide problem, it cannot be insisted that its effect upon both users and upon society varies so much, in particular where marijuana is concerned, as to warrant different treatment by the several states.

IV. Recent Judicial Developments

Recently, there have been an increasing number of attacks upon the constitutionality of marijuana laws. These attacks began in the 1960's[57] and have kept pace with the increase in the number of marijuana arrests. In 1965 there were approximately 20,000 arrests by state authorities for violations of drug laws; the number burgeoned to 495,000 arrests in 1971—with 90% of those arrests for possession of marijuana.[58] This enormous increase has not gone unchallenged, but rare is the case in which a marijuana law has been declared unconstitutional. One of the most heralded early attacks was in the case of *Commonwealth v. Leis*,[59] a 1969 Massachusetts case in which the defendant argued the unconstitutionality of the state statute in question on a variety of grounds. In ruling the statute constitutional, the Massachusetts Supreme Judicial Court stated that it did not believe that smoking marijuana was a fundamental liberty. Further, the inclusion of marijuana in the category of narcotics was not arbitrary. (The court seems, in this case, to have defined "narcotic" as any mind-altering drug.) In response to the argument that marijuana should be treated in the same manner as alcohol, the court answered that more information is available about alcohol abuse than is known about marijuana and, further, alcohol abuse can be more easily controlled. Finally, the court did not feel that penal sanctions for the possession of marijuana imposed a cruel and unusual punishment upon the defendant primarily because at the time of the appeal no sentence had been

57 *See, e.g.*, People v. Leal, 64 Cal. 2d 504, 413 P.2d 665 (1966).
58 COMMISSION at 106; 1971 statistics submitted October 13, 1972, at ABA national institute seminar on drug cases, Los Angeles, by Michael R. Sonnenreich, Executive Director, National Commission on Marihuana and Drug Abuse, Washington, D.C.
59 355 Mass. 189, 243 N.E.2d 898 (1969).

handed down and because the court did not find persuasive the argument that *any* punishment for marijuana possession is cruel and unusual.

Reviewing the *Leis* decision after a period of four years gives one an advantageous position. However, perhaps the most faulty logic on the part of the court was equally apparent four years ago. Reference is made to the argument that more is known about alcohol's effects than is known about those of marijuana. That, of course, is not the same thing as saying that it is known that marijuana produces undesirable effects. More is known about the dangers of alcohol abuse than about many drugs which can be bought without prescription today,[60] and yet those drugs are not made illegal and their users put into penitentiaries. Also, the inclusion of marijuana in the category of narcotics, by defining "narcotics" as any mind-altering drug, is a masterpiece of judicial mental contortion which would conceivably open the category of "narcotics" to every tranquilizer and sedative available today. Finally, the statement that more is known about alcohol abuse and that such abuse can be better controlled than marijuana abuse is amusing. Much indeed is known about alcohol abuse in this country. Nine million of our fellow citizens are alcoholics, and billions of dollars each year are lost to the national economy because of the abuse of this drug.[61] If anything, one would have expected the court to take judicial notice of the fact that alcohol abuse is *out of control* in this country.

Another case remarkable for its justification of the inclusion of marijuana as a narcotic substance is *State v. White*,[62] a 1969 Montana case which reasoned that it does not matter that marijuana is known now not to be a narcotic. What is important is whether it was reasonable to classify it as such in 1937 (the date of Montana's law). (It does not matter that the burning of "witches" is now considered to be a stupid, illegal and immoral action. If it was considered reasonable in 17th-century Salem, will we uphold the practice now?)

A case from Florida the same year exhibited its own charm. *Borras v. State*[63] is interesting for the assertion upon the part of the Florida Supreme Court that marijuana is a "harmful, mind-altering drug," a remark for which the court offered no supportive citation. Further, the court met the argument that if one could constitutionally read obscene literature in one's home without fear of arrest, one could similarly smoke marijuana (this argument came quickly on the heels of the United States Supreme Court ruling in *Stanley v. Georgia*)[64] by maintaining that marijuana use is more dangerous to society than possession of obscene material. (Actually, the court's language reveals some uncertainty about this—it appears the court was not too keen on the idea of people reading obscene material either.) The state, it was reasoned, had an interest in preventing harm to the individual and to the public, and, therefore, the illegalization of marijuana was permissible. Then, in a flourish of pomposity and patriotic pride, the court announced that the State of Florida had an interest in having "robust citizens" capable of self-support who would bear arms and add to the country's resources.

Since marijuana is a threat to the individual and to society as a whole, its use can be totally prohibited.

The same court continued on in much the same vein in *Raines v. State*[65] by declaring that the classification of marijuana as a narcotic did not violate the Equal Protection Clause and that punishment under state penal provisions did not constitute cruel and unusual punishment.

Recent constitutional arguments have upon occasion been treated more kindly. *State v. Zornes*,[66] a 1970 Washington case, held that marijuana was not a narcotic, but merely a mild hallucinogen and that any prosecutions pending at the time of the enactment of Washington's amendments to its narcotic drug act (which removed marijuana from treatment as a narcotic) must be processed under the new law. (The latter was merely a question of statutory construction.)

In *People v. McCabe*,[67] a 1971 Illinois case, the Supreme Court held that classifying marijuana under the Narcotic Drug Act rather than under the Drug Abuse Control Act was so arbitrary as to deprive the defendant of the equal protection of the law. The court, with no more than a cursory analysis, noted that there were several cases *contra* but felt that those cases had not had the equal protection argument put before them in the same manner as had been the situation in *McCabe*.

In 1972 the continued questioning of the constitutionality of marijuana and other drug laws showed no signs of abating. In March, the Supreme Court of Appeals of West Virginia was asked, in *Scott v. Conaty*,[68] to declare unconstitutional that portion of the Uniform Controlled Substances Act which gave to the State Board of Pharmacy the power to reclassify drugs. (In the federal scheme, the Attorney General has this power.) The court declined to do so, and while the case at bar involved a charge of possession of LSD, the court mentioned, by way of *dictum*, that the law prohibiting the possession of marijuana is constitutional.

In April of this year, in *English v. Miller*,[69] the Federal District Court for the Eastern District of Virginia held that classification of marijuana as a narcotic drug violates the Equal Protection Clause because marijuana is thereby included with addictive drugs. However, the Fifth Circuit held that there is a rational basis for concluding that all drug traffic affects interstate commerce. Therefore, it held, in *United States v. Lopez*,[70] that the Comprehensive Drug Abuse Act of 1970 is constitutional through exercise of the Commerce Clause.

The recent case of *People v. Sinclair*[71] has also served to bring the marijuana issue into focus. In this case, the defendant leader of a politically radical group known as the White Panthers, was convicted of possession of marijuana and sentenced to 9½ to 10 years in prison. In reversing his conviction, the Michigan Supreme Court handed down four separate opinions in which four of the justices

71 387 Mich. 91, 194 N.W.2d 878 (1972).

voted for reversal and two merely for modifying the sentence imposed. The arguments were many and varied, including the opinion written for the court by Justice Swainson holding that the evidence used to convict was inadmissible because Sinclair had been entrapped. The argument that the sentence constituted cruel and unusual punishment was appealing to two of the justices while two also felt that classification of marijuana as a narcotic violated the Equal Protection Clause. One justice argued that the illegalization of marijuana denied the right to liberty and the pursuit of happiness.

In what was virtually a companion case, the court also decided *People v. Lorentzen*,[72] in which it held that a 20-year *minimum* term of imprisonment for sale of marijuana was cruel and unusual punishment. The court compared this sentence with others imposed upon those convicted of different crimes in Michigan and, *inter alia*, noted that the *maximum* for manslaughter in the state was only 15 years and for felonious assault with a gun merely four years.

Finally, the Hawaii Supreme Court was recently presented with the question of the constitutionality of the Hawaiian statute making possession of marijuana illegal in *State v. Kantner*.[73] The court held, in an exquisitely unique decision, that the marijuana law was constitutional. Three justices voted to uphold the law, two to declare it unconstitutional (the latter two on privacy, due process and equal protection grounds). One of those voting to uphold the law (Justice Abe) did so despite his own stated belief that the law was unconstitutional because he felt that the issue of constitutionality had not been properly raised. The majority opinion held that the classification of marijuana as a narcotic did not violate the due process and equal protection clauses of the federal and state constitutions because, while it may be true that marijuana is not scientifically a narcotic, the legislature has broad power in defining terms for legislative purposes, and, in any event, no one was misled by the legislative classification. Further, the court noted that marijuana was treated differently than other narcotic drugs under Hawaii law.

The classification argument has aspects of an "Oh, you know what we mean" justification. It overlooks the fact that by allowing an inaccurate classification, improper treatment of violators occurs. The legislature is not forced thereby to reconsider and justify the illegalization of marijuana. As for the argument that marijuana is treated differently, the very fact that it is included in the category of narcotics places a second offender in danger of receiving a mandatory one-year minimum imprisonment, a fate not imposed upon those found guilty for a second time of possession of LSD, amphetamines, barbiturates or any other "harmful drugs."[74]

For these and other reasons, the Supreme Court of the United States has

74 HAWAII REV. LAWS § 329-5 (1968). It should be noted that Hawaii has recently passed a law removing marijuana from the category of narcotics as of January 1, 1973. *See* Act 9, [1972] Hawaii, Acts: "The New Hawaii Penal Code."

been petitioned for a *writ of certiorari* asking that the statute prohibiting the use of the "narcotic" marijuana be declared unconstitutional.[75]

In addition to the many legal cases in which the constitutionality of the marijuana statutes have been questioned, there have been many similar arguments proffered by legal scholars and other interested parties. One of the most thoughtful and careful analyses of the entire question is to be found in the article by law professors Richard J. Bonnie and Charles H. Whitehead entitled "The Forbidden Fruit and the Tree of Knowledge: An Inquiry into the Legal History of American Marihuana Prohibition."[76] In that article, the authors supply a detailed history of the development of the laws against the use of marijuana as well as statistics and charts of laws, terms of imprisonment, numbers of arrests, etc. Far more important is their discussion of the nature and validity of some of the arguments most favored by those asserting the unconstitutionality of laws prohibiting the use of marijuana. The authors did not believe that equal protection or due process arguments would be successful primarily because doubt remained about the status of marijuana as a narcotic or a mild drug. Of course, in the two years since that article was written, both the report of the National Commission and the book by Dr. Grinspoon have appeared, hopefully laying that objection to rest.

The arguments that there is a right of privacy involving the use of marijuana and a right to put anything into one's own body are, the authors felt, without prior judicial support and rather shaky at best.

The professors felt that two other arguments had great appeal. The theory that any imprisonment for possession of marijuana constitutes cruel and unusual punishment seemed to them to be one which appellate courts might find convincing. Ironically, no court has since held accordingly, and some courts have specifically stated the opposite.[77]

Secondly, the authors argued that the state had no right, under its police power, to make the private use or the possession of marijuana illegal. This was so, they reasoned, because the private use of marijuana does not create a public harm, and police powers are available to the state only to promote the public welfare. Such an argument would cast upon the state the burden of producing a rational basis for the continued illegalization of marijuana. The authors felt confident no state could ever meet that burden.

The authors rejected the argument that marijuana use is protected religious activity,[78] noting the difference between protection of religious beliefs, as guaranteed by the Constitution of the United States, and mere religious activity. Finally, the authors opined that before any court would ever hold that smoking marijuana is a fundamental right, it would necessarily be required to find that there is such a concept as sensual individuality. This the authors expressed doubt would ever occur. (Note, however, Justice Levinson's dissent in *State v. Kantner,*

75 State v. Kanter, 493 P.2d 306 (Hawaii 1972); *petition for cert. filed* 40 U.S.L.W. 3577 (U.S. May 30, 1972) (No. 71-1558).

76 Bonnie & Whitehead, *supra* note 4.

77 *See, e.g.,* Commonwealth v. Leis, 355 Mass. 189, 243 N.E.2d 898 (1969).

78 *See, e.g.,* People v. Woody, 61 Cal. 2d 716, 394 P.2d 813, 40 Cal. Rptr. 69 (1964) (upholding religious use of peyote); Leary v. United States, 383 F.2d 851 (5th Cir. 1967), *rev'd on other grounds,* 395 U.S. 6 (1969).

holding that the fundamental right involved is not the right to smoke marijuana but the right to do what one wishes in the privacy of one's home, presupposing that no harm to society is involved.)

Another equally analytical essay is to be found in the Appendix to the report of the National Commission.[79] In this chapter, entitled "The Constitutional Dimensions of Marihuana Control," the lawyer-authors focus attention upon the extent to which the United States Constitution may be seen to impose substantive limitations upon the prohibition of marijuana for personal use and the equally important question of whether the federal government can impose its policies in this area of the law upon the several states. Any attorney contemplating a constitutional attack upon a law prohibiting the personal use of marijuana would be remiss if he did not read this chapter which argues that there are several avenues available for constitutional attack upon such statutes. First, the essay argues for the private use of marijuana as a fundamental right, part of *Griswold's* "zone of privacy."[80] The second possible attack lies within the doctrine of inherent limitations upon the police power of a state, limitations arising out of the state's interest in protecting only the public as opposed to the private welfare. Acknowledging that attacks based upon the Freedom of Religion Clause or the Equal Protection Clause have generally failed, the chapter goes on to note new approaches that can be taken within the framework of these constitutional clauses that may prove more successful. The article argues that federal preemption of the field of marijuana regulation and control can be accomplished either through the Commerce Clause or the enabling provision (section 5) of the fourteenth amendment. Congress, it is argued, could legislate state enforcement of federal penal provisions in order to avoid imposing a heavy burden upon the federal judiciary, and the desired uniformity of treatment of all marijuana offenders would be achieved.

Finally, there is the argument put in the form of a recent petition to the Attorney General's Office that, assuming marijuana use can be criminalized, it should not be classified as one of the most harmful drugs. That is, it should be removed from Schedule I and placed in Schedule V.[81]

It is arguments such as these, as well as those being proffered by appellate courts as cases continue to arise, which indicate clearly that the question of marijuana prohibition is one of those unsettled areas of the law. Everyone has his own favorite theory; many attorneys are attempting to find the theory that will appeal to a majority of justices in their appellate jurisdictions. With the advent of such cases as *People v. Sinclair*, it seems only a matter of time before marijuana statutes will begin to fall.

V. The Social Costs of Repressive Laws and Some Proposed Solutions

Despite the many varied arguments made in favor of legislative repeal or

79 COMMISSION at 1123 (app. vol. II).
80 Griswold v. Connecticut, 381 U.S. 479 (1965).
81 Petition has been filed with the U.S. Dep't of Justice by the National Organization for Reform of Marijuana Laws (NORML), the Institute for Study of Health and Society and the American Public Health Assoc. (APHA) (May 18, 1972).

judicial nullification of marijuana laws, the fact is that such laws are presently in force in every state as well as in the federal legal system. The cost of enforcing them is immeasurable, but some statistics should serve as gross indicators of the social expense involved.

It has been estimated that enforcement of the laws against marijuana cost the State of California $75 million in 1968 alone.[82] The increased alienation of the young and the encouragement of unhealthy police practices are two other, and often ignored, social costs. In fact, the entire judicial system seems to have undergone some compromise because of these laws. One study reports that, in addition to the many other social costs involved, we also have the misfortune (from one point of view) of seeing judgments of acquittal returned in the face of overwhelming evidence of guilt solely because of the hesitancy on the part of judges to convict young defendants and place them in jeopardy of receiving serious punishment.[83]

Another social "cost" lies in the credibility gap developing between the judiciary and the public in general on the one hand and law enforcement officers on the other hand. The officers, it is feared, are becoming skilled perjurers in order to obtain drug convictions, a fact that has not gone unnoticed.[84]

The costs to this country in actual governmental monetary outlay and, more importantly, in the rending and ruin of the social fabric are immense. One fears that, in some ways, they are also irretrievable, at least insofar as the attitudes of American youth are concerned.

Many proposals have appeared suggesting solutions to the marijuana problem. The National Commission has declared itself in favor of a policy of discouragement.[85] That is, the use of marijuana is to be discouraged, through partial prohibition of the drug. Total prohibition is deemed too harsh a remedy and, for that reason, the Commission recommends eliminating penalties for the possession of marijuana for private use, including private distribution of small amounts for no profit. Any other use (possession with intent to sell, cultivation, etc.) would continue to be a crime and, generally, the Commission urges felony treatment. Complete legalization is rejected because it is the hope of the Commission that marijuana is merely a fad which will soon die out if not encouraged. Also, the Commission does not believe that a substance which has uncertain long-term effects should be legalized. Nonetheless, the Commission does believe that the widespread use of marijuana in this country is an essentially innocuous practice and that the threat of incarceration is an unreasonable burden in certain instances. Further, legalization of some aspects of the marijuana problem would

85 COMMISSION at 134 *et seq.*

free both law enforcement officials and the courts to concentrate their efforts on the more serious violators of the drug laws, the importers and manufacturers of the "hard drugs," and those who deal in marijuana solely for profit.

However, the National Commission seems to have an uncertain commitment to its recommendations. Throughout its report one senses a feeling that the Commission realizes that complete legalization is forthcoming and that its report is an unsupportable middle way between the present repression and future legalization. "If responsible use of the drug (marijuana) does indeed take root in our society" the Commission intones, then it is foreseeable that future policy planners might reach a conclusion different from that of the Commission, which has decided to discourage marijuana use.

Another concern of the Commission, and one which possibly best explains its awkward "Yes, it's legal; No, it's not" stance is the emphasis that marijuana must be desymbolized. It is a drug used by the young to display anti-establishment attitudes, the Commission warns, and this is decidedly undesirable. However, should the day ever come that marijuana is desymbolized, so that the availability of the drug does not connote societal approval, then a policy change might be proper.

In these remarks are laid bare the "social concerns" of the Commission. We are told that responsible use of the drug is needed, the assumption being that inasmuch as only "drop-outs" use it, it is being put to irresponsible use. Or could the Commission be saying that since marijuana use is currently illegal, those who use it are necessarily irresponsible? This leads down the confusing path of requiring responsible use before legalization while insisting that responsible use will only come after legalization. Perhaps the Commission is actually stating that use is presently irresponsible because marijuana is as much a symbol as an intoxicant. Smoking marijuana to show anti-establishment values is not responsible—it is annoying to the American public. This too is one of the Commission's justifications for discouraging marijuana use.

But the Commission would have been better advised to recommend legalization of marijuana rather than discouragement on the basis of symbolization. Rather than concerning itself with the misguided antipathy of Middle America, the Commission ought to have realized that American youth desperately needs a symbolic victory of its own. At a time when the younger generation is being forced to fight an unpopular war (or is fighting against continuation of that war at home) and seems to have very little power to affect its own direction, let alone that of its country, a symbolic cause such as the legalization of marijuana takes on added significance. To the older generation, marijuana legalization is merely one of many matters to which its attention is drawn. To the younger generation, it is a matter of extreme interest and importance. Thus, the "symbol" approach the Commission takes can just as easily lead to the opposite conclusion from that reached by the Commission.

The Commission admits that private use of marijuana produces no social or individual harm and that laws prohibiting such use are constitutionally suspect. It agrees that even the practice of imposing civil fines would be of little value, since that would continue the current misuse of police manpower and the con-

current undesirable invasions of privacy necessary for law enforcement. And yet the Commission, hanging by a thread, argues for partial prohibition. Its justifications for this stance involve carefully constructed attempts to gather in every conceivable shred of evidence against marijuana use (it *might* have undesirable personal effects *if* used in *very heavy* amounts over a *long* period of time; it symbolizes anti-establishment values; its use is not responsible; it is of transient social interest, etc.).[86] While its carefully gathered statistical and scientific evidence goes in one direction, the Commission acrobatically, but not too convincingly, goes in the other.

Dr. Grinspoon opts for legalization of the personal use of marijuana of predetermined potency and consequently for governmental regulation of marijuana in much the same manner as alcohol.[87] He does not believe that long-term use degenerates the user,[88] and while he admits that marijuana is not completely harmless in its effects on the user, in the sense that no drug is ever completely harmless,[89] he does believe that its relative lack of harm merits kinder treatment for its use than the states and federal government have thus far afforded.

Approaching the subject from a different viewpoint, Professor John Kaplan wrote recently[90] that the problem with laws that seek to protect people from themselves is that they are so atypical that the "protected" person feels resentment toward the government because he knows of more dangerous activities that are not condemned. "The laws requiring one to protect himself are little islands of criminal liability in a vast sea of freedom to injure one's self."[91] These criminal laws, Kaplan goes on to say, are counterproductive in terms of educational programs because those to be educated—that is, the drug users—tend to feel that the educational process is just another means of enforcing the law. Thus, in implying that the prohibition against marijuana is doomed to failure, Kaplan points out that drug laws are successful only when people do not want a drug intensely. For example, the prohibition against alcohol did not work because the desire for alcohol on the part of large numbers of people was great. The ban against cyclamates does work because there is no black market demand for products with cyclamates.

Kaplan therefore proposes that marijuana be legalized and regulated in much the same manner as alcohol, with the potency of the drug controlled and maintained at a mild dosage. He further argues for licensing of sellers, sales to be conducted in liquor establishments only and other thoughtful limitations upon the distribution and use of marijuana.

Countless others have called for legalization of marijuana or at the very least a reconsideration of the current penalties imposed upon marijuana use. These voices include American Bar Association committees,[92] legislators[93] and the

President's Commission on Law Enforcement and the Administration of Justice.[94] All of these authorities appear convinced that the greatest undesirable effect marijuana produces is the possibility of imprisonment.

VI. Conclusion

In the past several years, as new information has become public, the marijuana issue has been brought more clearly into focus. The task of supporting the stance that marijuana use should be legalized has become much easier as a brief review of the material presented in this article should reveal. It is now generally conceded that short-term use of cannabis preparations is, for all practical purposes, without any detriment to the user and that the primary effect of such use is that of mild, pleasurable relaxation. The consequences of long-term use also appear to be relatively minor, and the only area about which there is still doubt is that of long-term heavy use, especially of potent preparations of cannabis. However, even here it is possible to extrapolate to the conclusion that, in comparison with the results that similar use of other drugs would bring, the effects would not be too deleterious.

However, it does not end the controversy merely to assert that marijuana preparations appear to be among the milder intoxicants. Several other questions must be resolved, among which is the question of whether any intoxicant should be condoned by a society. The National Commission found the argument that society should not formally approve the use of any intoxicant to be persuasive.[95] But once the use of a drug reaches the proportions that marijuana use has, the question shifts. The question then becomes whether any society should criminalize those who use intoxicants, once it is determined that the use of those intoxicants for the majority of users poses little or no threat of lasting harm. Our society has answered that question in the negative in the area of two intoxicants which are clearly harmful—alcohol and tobacco.

The current approach to the use of marijuana on the part of government is completely unreasonable and arbitrary. Without any real justification legislative bodies have criminalized the use of marijuana and have, in recent years, reasserted this approach despite the increasingly wide dissemination of information explaining the origin of such legislation—a beginning based solely upon anxiety, fear and misinformation. These laws have continued despite clear evidence of the relatively harmless effects of cannabis preparations for the average user, a claim the proponents of alcohol and tobacco use would be hard put to assert.[96] Those who enacted the federal Comprehensive Drug Abuse Act of 1970 even had the audacity to announce, while justifying the legislation in an introductory

on Individual Rights and Responsibilities) and Committee on Drug Abuse (section on Criminal Law) as reported in COMMISSION at 109 *et seq.*

93 11 CRIM. L. REP. (BNA) 2019 (April 5, 1972) (bill introduced in New York legislature seeking legalization of possession of four ounces or less).

94 PRESIDENT'S COMMISSION ON LAW ENFORCEMENT AND ADMINISTRATION OF JUSTICE, THE CHALLENGE OF CRIME IN A FREE SOCIETY (1967).

95 COMMISSION at 127 *et seq.*

96 COMMISSION at 15; KAPLAN at 317-20 (discussion of the dangers of alcohol as compared to those of marijuana use).

section as preventing the improper use of substances which have a detrimental effect on the health and welfare of the American people, that alcohol and tobacco were to be specifically excluded from control under the Act.[97] The mere mention of this is certain to do much for the credibility of the legislation with American youth.

The entire controversy surrounding marijuana occasionally seems in danger of becoming woefully misdirected. Rather than quibble over such unresolved questions as whether long-term, heavy use leads to an alteration of the pulmonary function, and whether the studies show this to be irreversible, perhaps we need to be reminded that the real issue is whether society should be invoking criminal sanctions against drug users at all. If one persists in the use of a drug, even assuming that such drug is deleterious to the user, society's reaction should not be criminalization of the user. In a Nation where heroin addiction is becoming more and more recognized for the sickness that it is, and methadone treatment centers are springing up throughout the Nation, how curious that users of another, much milder drug should still be treated entirely as criminals.

Leaving aside the question of the proper reaction of society to drug use in general, we must ask ourselves what society's response to the use of the specific drug marijuana should be. Should the use of marijuana—an essentially harmless drug in many respects—be criminalized solely on the basis that there is more to be learned about the use of the drug? Of course there is more to be learned about the use of the drug, but it would appear that sufficient knowledge has been gained to assure even the most critical observer that the use of cannabis will not destroy either its users or society. Further, once a large number of people have decided that they will persist in the use of an intoxicant, government should not continue to criminalize the users of that drug. This is a lesson we learned from the Prohibition Era.

The constant recourse to penal sanctions against the use of marijuana has become a greater evil than the use itself. Once preliminary indications reveal that a substance appears relatively harmless, the burden should shift to those who would ban its use to come forward with some evidence that the drug is harmful, rather than merely insisting that more can be learned about the effects of the drug, something which is true of every drug on the market. One senses that the refusal on the part of Government to end the criminalization of marijuana use has its roots not so much in a concern for the health and welfare of the marijuana user as much as in political and emotional considerations. The much-heralded generation gap is closing in the United States, not so much because the younger generation is growing appreciative toward the older for imprisoning it for use of an intoxicant milder that the one favored by the older generation, but because the "younger generation" is getting older. Marijuana users are reaching into business and professional circles, and it might not be too unreasonable to speculate that what is replacing the generation gap is an increasing alienation from their government on the part of a growing number of American adults.

The continued illegalization of marijuana has taken on the aspect of a government cover-up. Faced with growing evidence and support for the legal-

97 21 U.S.C. § 801, 802(6) (Supp. 1971).

ization of marijuana, the Government has continued to avoid the information presented and instead has sought new ways to justify illegalization. The arguments it offers are neither believed nor trusted.

Marijuana use is relatively harmless. That is an important consideration. The constitutionality of marijuana laws is questionable. That too is an important consideration. But the real issue of marijuana use now lies in considerations of justice, reason and fair play. Government must stop alienating American youth by pursuing the criminalization of marijuana. Instead of focusing on such false issues as whether long-term heavy use might prove slightly harmful—something that is true of the very food we eat—our national and local leaders should reaffirm the American principle that that government is best which governs least. The marijuana user should be allowed to seek his own ways to happiness, even if many would disagree with the emphasis he places on marijuana in this quest. Marijuana should be allowed to "float free" in our society, much like gold in the international market place, in order that it might find its market. If this were allowed, marijuana use might save some of our fellow citizens from the perils of alcohol and tobacco use.

Our Victorian attitude that "victimless crimes" may be punished because of their tenuous (often non-existent) connections with the general welfare must cease. Such "crimes" have been the focal point of more wasted energy and more grief than our judicial system can tolerate.

We must also stop this illogical discrimination between "user" and "seller," a categorization which we know does not exist. We should control these profit-mongers (the user-sellers) like any others we encounter in our society. If making a profit off drug use bothers government and the American public, why is the same not true in regard to alcohol and tobacco use? And if such profiteering is so unsettling, perhaps now is the time to re-evaluate our commitment to capitalism.

All those who piously assert their anxiety for the marijuana user should show some real concern for these users. Instead of worrying about the possibility that the users' hearts may skip a beat 40 years from now, these "protectors" should show some pity for those who are going to jail and having lives, marriages and careers ruined, all because of the enforcement of illogical, unsound laws.

By admitting that marijuana users should not be jailed, critics such as the National Commission have admitted that the prohibition against marijuana is unreasonable. That being so, there is no reason to discriminate among the various types of use. Big-city users, who must buy their marijuana, should not be preferred over rural users, who cultivate their own.

It must be recognized that marijuana is not entirely a legal or medical issue. It is also a social question. Social considerations such as those outlined in this article are the ones this nation should be addressing itself to. The unreasonableness of the present marijuana legislation is a matter that creates social implications for our legislators while also presenting legal questions for our courts. The evidence is clear—marijuana laws should be repealed.

Marijuana use should be treated as is the use of "the other intoxicant," alcohol. Legalization of marijuana use, with strict control by regulatory agencies, limitations on the age of the user, the manner and places in which it may be pur-

chased, its potency level predetermined, with no legally recognized justification for acts committed while under its influence, etc.—this is the more reasonable way of approaching the marijuana issue. Continued criminalization of marijuana users is an absurd way of dealing with essentially law-abiding citizens. This illogical stance on the part of government is serving only as more fodder for those who would convince our citizenry that government is an unresponsive tool in the hands of the few. In an ironic turnabout, it is the enforcement of a law that is endangering society, harming society's members. The laws against marijuana use have become a crime against humanity.

State	Year of Uniform Law[1]	Uniform Act	Classification of Marijuana[2]	Conditional Discharge for First Offense Possession Available[3]	Possession for Personal Use[4] Relevant Amount	Penalty	Possession[5]	Sale[6]	Cultivation	Sale to a Minor

1 "Year of Law" means the last year in which the jurisdiction's marihuana laws were revised or amended in any way. This includes those jurisdictions that enacted entirely new laws, as well as those that may have only changed a penalty provision.

2 The Uniform Controlled Substances Act classifies marihuana as a hallucinogen. This is the modern trend, as most jurisdictions have come to realize that scientifically marihuana is not a narcotic.

3 Conditional discharge is designed to permit a judge to place a first offender on probation in lieu of sentencing him to prison. It is usually applicable only to cases of first offense possession, and is available only once with respect to any person. In addition, this provision calls for confidentiality of the defendant's record upon fulfillment of all the terms and conditions of his probation. This precludes any criminal record from following the individual in later life.

4 Some jurisdictions have created a separate penalty for possession of a limited amount of marihuana. While state laws usually do not specify their reasons, it may be inferred these states consider possession of less than the designated amount to be possession for personal use.

5. In states with no special provision for possession of small amounts, the "possession" offense covers possession of any amount. In states which do have such a special provision, "possession" offense covers possession of over the specified amount. Possession does not include possession with intent to sell. This offense is usually punishable as if it were the actual offense of sale. Thus, the penalty for possession with intent to sell is the same as that for sale in 36 jurisdictions. The following 12 jurisdictions do not have a penalty for possession with intent to sell: Colorado, Florida, Georgia, Indiana, Maine, Mississippi, Missouri, Montana, Nevada, Pennsylvania, Texas, and the District of Columbia. Six other states have made possession with intent to sell a separate offense from sale: Arizona, California, New York, Ohio, Rhode Island, and Vermont.

6 This heading may include delivery, distribution, dispensing, furnishing, transportation, trafficking or transfer according to the individual jurisdiction.

7 "NMT" designates not more than.

8 There are several jurisdictions that give prosecutorial and sentencing discretion as to whether a particular offender is to be treated as a felon or a misdemeanant. This is indicated on the chart by use of "OR" in the appropriate column.

9 In the Mississippi Uniform Act, two separate penalties for possession were mistakenly included. The Mississippi Legislature is currently attempting to correct this error.

Marijuana Use, Distribution, and Control

William H. McGlothlin

In this chapter, we will examine the available information on marijuana use, distribution, economics, and control. We will also consider the use patterns, along with alternative control policies, that may become evident in the United States within the next few years.

Prevalence and Patterns of Use

In the past few years, numerous surveys have been conducted on the prevalence of marijuana use—especially in high schools and colleges. Berg (1970) has summarized the statistics from 69 sources. Table 3-1 shows the percentages of those who have ever used marijuana, as determined by national surveys conducted during

the period 1970 to 1972; results from a 1970 survey of New York State are also shown.

Table 3–1

SURVEY RESULTS ON PREVALENCE OF MARIJUANA USE; 1970 TO 1972

Sample	Year	*Percentage of marijuana users*

High school (New York State)[4]	1970	23	26	20

SOURCES: [1]Parry, 1971; [2]Commission on Marihuana, 1972; [3]Gallup Poll, *Los Angeles Times,* Feb. 10, 1972; [4]Chambers, 1971; [5]Groves and others, 1971; [6]*Gallup Opinion Index,* Report No. 80, February 1972; [7]Josephson and others, 1971.

These data indicate that, in the general population, males are about twice as likely to have tried marijuana as are females. The male-female ratio is about 3:2 for college students, and it is somewhat closer at the high school level. Two surveys have shown that the percentage of college students who have used marijuana is nearly twice that for the same age group (18 to 24) of nonstudents (Chambers, 1971; Parry, 1971), although this difference is probably decreasing as marijuana use becomes more widespread. Usage

is still low among the older age groups; the 1970 New York State survey found that those who had ever used the drug constituted 4 percent for the 35 to 49 age group and 2 percent for those 50 and over; the 1972 Gallup survey reported 7 percent for the 30 to 49 age group and 2 percent for those 50 and over. The survey of the Commission on Marihuana and Drug Abuse, however, reported 6 percent for those 50 and over.

The values presented in Table 3-2 represent a best estimate of the number of persons who had used marijuana one or more times by mid-1972. They are based on a composite of the various survey results projected to the 1972 time period. Since data on student usage are much more extensive than those for nonstudents, these estimates are treated separately from the remainder of the population. In summary, we estimate that as of mid-1972 about 22 million persons in the United States had used marijuana, that is, about 14 percent of the population age 11 and over.

Frequency. Until recently, most survey results were reported only as percentages "having-ever-used" or in vague terms such as *occasionally, frequently,* and *regularly.* Table 3-3 provides limited data on frequencies of use. In the early 1970s, apparently about one-third of all persons who had ever tried marijuana were using it one or more times per week. More males than females have tried marijuana, and males are also more likely to use the drug frequently. The proportion of females who have ever used the drug who fall in the range of three or more times per week, is about one-half that for males (Hochman and Brill, 1971; McGlothlin and others, 1970b). In schools where marijuana usage has existed for several years and prevalence is high, the proportion of frequent users tends to be relatively high; for example, San Mateo County high schools in California. Schools that exhibit low prevalence of use typically show that 50 percent or more of those who have ever used marijuana are experimenters (fewer than ten times) (McGlothlin, 1971). Limited data on usage among persons over 35 also show that a high proportion of those who have used the drug are in the experimenter class (Chambers, 1971).

Table 3-4 provides frequency-of-use estimates that are consistent with the data shown in Table 3-3. Estimates are made by sex, by student and nonstudent status, and by two age categories in

Table 3–2

the nonstudent group. In the early 1970s, the frequency-of-use data were reasonably plentiful for the student population, but were scarce for other groups. In particular, the 18 to 34 nonstudent group was estimated to have a relatively high proportion in the daily-use category because of the subculture characterized by heavy drug use,

which is largely contained in this segment. However, since no data were available on the size of this subculture, this estimate could be substantially in error.

In summary, of the estimated 22 million persons in the United States who had used marijuana one or more times by mid-1972, we further estimated that 48 percent had stopped using the drug or had used it fewer than ten times; that 37 percent were currently using marijuana one to eight times per month; and that 15 percent were using on a basis of three or more times per week. Of those who used the drug three or more times per week, an estimated 80 percent were males.

Amount. Information on the amount of marijuana consumed per use is essential—both from the standpoint of assessing the impact on the user and for estimating the volume and economics of the marijuana market. In this country, marijuana is normally smoked in the form of cigarettes, so the natural unit of measure is the number of cigarettes per use or per day. Certain exceptions exist. Marijuana may be smoked in a pipe, but probably no more than 10 percent is used in this manner (Haines and Green, 1970); it is also occasionally taken orally, but the amount consumed in this manner is negligible (Haines and Green, 1970). Finally, use in the form of hashish is increasing and probably represents 15 to 20 percent of the total at present. Although survey data generally do not distinguish between marijuana and hashish use, seizure data provide the basis for an estimate. In 1971, federal agencies seized 100,627 kilograms of marijuana and 3,526 kilograms of hashish (Bureau of Narcotics, 1971). Assuming that hashish is approximately five times as potent as marijuana by weight (Lerner and Zeffert, 1968; Mechoulam, 1970), the hashish seizures would be equivalent to 17,630 kilograms of marijuana, or about 15 percent of the total seizures. Hashish use is increasing and has been projected to represent 20 percent of the total use by mid-1972. For the purposes of this subsection, total use will be estimated in terms of marijuana cigarettes and then 20 percent will be subtracted as representing use in the form of hashish.

Studies that report the amount of marijuana smoked per occasion indicate that the majority of users consume no more than one cigarette. One study found that 50 percent reported using one

[a]Includes persons who have stopped using marijuana and/or have used a total of less than ten times.

cigarette or less and 10 percent more than three cigarettes (Nisbet and Vakil, 1971). Another interview study of fairly regular users (median two times per week) found that the large majority smoked one-half to one cigarette "to get high," but that 76 percent reported they normally smoked an additional amount subsequent to achieving this effect (Haines and Green, 1970). A third study of an older sample (mean age 44) of persons who had typically used marijuana for many years found that 63 percent used no more than one cigarette per occasion, while 26 percent stated that they normally smoked three to five (McGlothlin and others, 1970a). The potency of available marijuana varies widely and contributes to the variability in amount consumed. The delta-9 tetrahydrocannabinol (THC) content varies from 0.1 to 5.0 percent in the dried material exclusive of stems and seeds. Mexican-grown marijuana sold in the United States averages about 1 percent THC (R. T. Jones, 1971; Lerner and Zeffert, 1968); domestic marijuana contains only 0.1 to 0.5 percent THC (Phillips and others, 1970).

Experimental data provide further evidence on the effective marijuana dose level. When given as a single administration, smoked doses of 2 milligrams of THC, or its marijuana equivalent, are sufficient to produce a mild euphoria in experienced users; 7 milligrams produce some perceptual and time-sense changes; and 15 milligrams produce a relatively high level of intoxication (Isbell and others, 1967; Weil and others, 1968). Assuming that marijuana contains 1.0 percent THC and that a cigarette weighs 0.5 gram, these doses are equivalent to about one-half, one and one-half, and three cigarettes respectively. Marijuana users do not necessarily smoke it in a single dose, however, and larger amounts would be required to maintain these effects over a period of several hours.

Table 3-5 presents an estimate of the mean amount of marijuana smoked per user per occasion as a function of frequency of use. More precisely, it is the mean amount smoked during the days on which any marijuana is consumed. The estimated amount used increases with frequency of use. This is partially a reflection of the fact that frequent users are more likely to smoke at intervals during a longer period of intoxication, or at more than one time during the day. No estimate of amount used is made for the category of Table

Table 3–5

ESTIMATED NUMBER OF MARIJUANA CIGARETTES (OR EQUIVALENT) CONSUMED AS A FUNCTION OF FREQUENCY OF USE

Frequency of use	Number of persons	Mean number cigarettes smoked per person		Annual consumption	
		Per occasion	Per month	Number of cigarettes	Percent
Daily	1,056,000	3.0	90	1,140,000,000	43
3–6 times week	2,228,000	2.0	36	962,000,000	37
1–2 times week	3,855,000	1.5	9	416,000,000	16
2–4 times month	4,596,000	1.0	2	110,000,000	4
Total	11,735,000			2,628,000,000	100

3-4 showing those who use less than one time per month, since this group consists primarily of the experimenters or persons who have stopped using marijuana. Their contribution to the total amount of marijuana consumed is negligible.

Table 3-5 also shows the total estimated annual consumption of marijuana cigarettes, that is, number of users times number of cigarettes used per month times 12. Hashish use and smoking by pipe are included in terms of cigarette equivalents. Note that 1 million marijuana users account for 43 percent of the estimated 2.6 billion marijuana cigarettes consumed. A comparable relationship exists with respect to alcohol.

Market

Annual National Consumption. Assuming an average cigarette weight of 0.5 gram,[1] the gross weight of the 2628 million ciga-

[1] Data from 54 seizures in the Los Angeles area showed the average net weight per cigarette to be 0.61 gram, with a range of 0.25 to 1.12 grams

rettes smoked annually is 1,314,000 kilograms of dried, cleaned marijuana. As discussed previously, the amount of hashish consumed is assumed to be equivalent to about 20 percent of the total consumption, so we may substract this amount (262,800 kilograms), leaving 1,051,200 kilograms of clean marijuana plus 52,560 kilograms of hashish.[2]

Crude marijuana loses 25 to 30 percent by weight when prepared for smoking, due to the removal of seeds, stems, and excess moisture (Doorenbos; 1971). Assuming a weight ratio of 10:7 for crude to cleaned marijuana, an estimated 1,501,700 kilograms of crude marijuana are required to satisfy the annual consumption.

In larger quantities, marijuana is usually sold in the form of wrapped bricks of compressed material ostensibly weighing 1 kilogram. In actual practice, the bricks typically weigh substantially less than 1 kilogram. Statistics from 35 seizures involving some 5000 bricks revealed an average net weight of 780 grams, with a range of 539 to 995 grams.[3] The number of short kilograms necessary to supply 1,501,700 kilograms of crude marijuana is thus 1,925,250.[4]

Source. Some marijuana is cultivated or collected from low-potency wild growth in the United States, but most is grown outside the country, principally in Mexico.[5] As of 1972, substantial

---

(data provided by William Arnold of the California State Bureau of Narcotics, Los Angeles office, and Paul Kayne of the Los Angeles Sheriff's Crime Laboratory). The mean weight for some 9000 marijuana cigarettes seized by the New York City Police Department in 1969 and 1970 was 0.32 and 0.36 gram respectively (New York City Police Department annual reports, 1969, 1970). Other sources indicate cigarettes used in Eastern states are smaller than those rolled in the West, possibly due to the higher cost of marijuana (see Haines and Green, 1970).

[2] Assumes the potency is five times that of marijuana.

[3] Data supplied by Norman Nordweir (U.S. Customs, Los Angeles Office), Lloyd Sinclair (BNDD, Los Angeles Office), and William Arnold (California State Bureau of Narcotics Enforcement, Los Angeles Office).

[4] An alternative approach to estimating the amount of marijuana consumed is to utilize data on the number of cigarette papers sold, which is available from tax records. After subtracting those used for tobacco cigarettes, this presumably provides an estimate of the number used for marijuana. This approach has been attempted (see McGlothlin, 1971), but the instability of the recent cigarette paper sales data made the results of dubious value.

[5] This subsection is largely based on information obtained in interviews with U.S. Customs, BNDD, California state and local narcotics agen-

quantities originated in Jamaica and to a lesser extent in Central America, Southeast Asia, and other areas; but the primary source was still Mexico. For the present purposes, we assume that 90 percent of the crude marijuana consumed in the United States originates outside the country.

Of the 1,501,700 kilograms of crude marijuana consumed annually in this country, 90 percent (1,351,500 kilograms) originates outside the United States. Adding 130,000 kilograms of marijuana seized,[6] we get the total amount of marijuana grown in foreign countries for the United States market: 1,481,500 kilograms or 1,899,400 short kilograms. The land required to produce this amount is about 7600 acres.[7]

In Mexico, marijuana sells for $6 to $10 per 1-kilogram brick in the fields, and purchases are often of the order of several tons. It is normally trucked to points on the Mexican side of the border, where it sells for $35 to $40 per short kilogram in quantities of 100 kilograms or more. At the $35 price, the estimated annual expenditure for marijuana before importation is $66 million.

Hashish is generally assumed to originate in Lebanon and other Middle Eastern countries. Prices paid at the point of origin are not well established, but it may be bought in several Middle Eastern countries for $35 to $45 per kilogram. Assuming an annual United States consumption of 52,560 kilograms and a price of $40 per kilogram, the current estimated expenditure at the point of origin is $2 million.

Importation. The enormous bulk of the marijuana traffic does not impose severe restrictions on the Mexican side of the

---

cies, and various other persons familiar with the sources and distribution of marijuana and hashish. Some published and unpublished data on prices and seizures were obtained from BNDD and U.S. Customs, and several published descriptions of the retail marijuana market were also utilized.

[6] 1971 BNDD and Customs seizures plus an estimated 30,000 kilograms by California state and local narcotic agencies. The Mexican government also reported seizing 35,000 kilograms of marijuana and the destruction of 390,000 kilograms of dried marijuana in the fields during the period October 1969 to March 1971 (BNDD *Bulletin,* U.S. Department of Justice, May–June, 1971).

[7] Based on the average of 300 pounds of dried cleaned marijuana obtained per acre from experimental cultivation in Mississippi (Doorenbos, 1971).

border. At the point of importation and beyond, the bulk involved imposes a severe limitation and is the major factor shaping the distribution system on the United States side. When one considers that approximately 4 tons of marijuana per day must be smuggled into the United States, typically in lots of no more than 50 to 300 kilograms, and that the bulk of marijuana makes it infeasible to store in quantity on the United States side, the prohibitive complexity of organizing more than a relatively small operation becomes apparent. By comparison, the annual importation of heroin is equivalent to only one or two days of smuggling activity for marijuana by weight, and heroin can be imported and stored in the United States well in advance of its distribution.

Amounts of marijuana smuggled from Mexico vary from 1 or 2 kilograms brought across the border by an individual to as much as 5 tons brought up the coast by boat, as reported in the *Los Angeles Times* of May 5, 1971. The vast majority of smuggling attempts involve amounts on the low end of the scale. In 1971, the mean weight of the 6312 marijuana seizures made by Customs was less than 15 kilograms (Bureau of Narcotics, 1971). About 85 percent of marijuana seized at the United States–Mexican border is intercepted in vehicles. However, some authorities are of the opinion that aircraft and boats are carrying an increasing portion of the traffic—considerably more than is indicated by the percentage of seizures.

Hashish is most frequently smuggled into the United States aboard commercial aircraft. The mean weight for 1757 Customs seizures in 1971 was 1.8 kilograms (Bureau of Narcotics, 1971), although in the early 1970s seizures of 40 to 50 pounds were not infrequent.

Distribution. On entry into the United States, marijuana sells for $75 to $90 per short kilogram in lots of 100 or more bricks at points near the Mexican border. Virtually all warehousing of large quantities of marijuana is done outside the United States. Normally, the buyer for a given lot of 100 kilograms or more is known before importation, and dispersal or transshipment takes place immediately after delivery.

Typically, although an individual who buys in 100-kilogram lots would not sell in quantities of less than 5 or 10 kilograms, he

may frequently be willing to sell much larger quantities for lower profits, particularly to another known wholesaler, a transaction that involves little risk. In general, the price is dependent on the size of transaction, extent of risk, and distance from the border. The quality of the marijuana and the actual weight of the "kilogram" bricks are also factors, especially in smaller transactions. Finally, the price varies with availability, and there is some seasonal fluctuation corresponding to the time of harvest in Mexico. In the spring of 1972, marijuana was in short supply; and the price per single short kilogram in California was $300 to $400, or about double the price for 1971. For the present purposes, such prices are assumed to be atypical, and calculations are based on the 1971 prices, that is, $150 to $200 per single short kilogram in California and other border states and $225 to $275 in most other areas of the country.

Assuming an annual consumption of 1,925,250 short kilograms of marijuana (including Mexican, domestic, and other origin), the annual expenditures in the United States as a function of lot size are estimated as shown in Table 3-6.

Table 3–6

ESTIMATED ANNUAL UNITED STATES EXPENDITURES FOR MARIJUANA, 1972

Level, lot size	Price per short kilogram	Annual expenditure
100 kilograms and up	$ 85	$163,600,000
10–15 kilograms	150	288,800,000
1 kilogram	250	481,300,000

Hashish sells for $600 to $1000 per pound. Apparently, there is little regional variation in price, although it generally sells for less in areas where there is a relatively large market or where it is in competition with low-priced marijuana, for example, San Francisco and Los Angeles. No information was available on price for multipound lots. Assuming the annual consumption at 52,560 kilograms, or 115,900 pounds, and a price structure similar to that

61-301, O - 77 - 70

for marijuana, the annual expenditures for hashish are estimated as shown in Table 3-7.

Table 3–7

ESTIMATED ANNUAL UNITED STATES EXPENDITURES FOR HASHISH, 1972

Level	Price per pound	Annual expenditure
10 pounds and up	$500	$57,950,000
1 pound	800	92,700,000

The standard retail unit for marijuana is an ounce or "lid" of uncleaned material. Generally, the "ounce" is short by about the same proportion as the brick; that is, it averages around 22 grams instead of the full 28.3 grams. Marijuana is also sold in 1-pound, ½-pound and ¼-pound quantities. The 1972 price per short ounce in California and the Southwest was $10 to $15; in most other areas, a short ounce sold for $20 to $25, and prices in Chicago and Ohio were quoted as high as $35 to $40. Marijuana may also be retailed in "nickel bags," containing 3 to 5 grams and selling for $5. Occasionally, the smaller quantities are sold in loose cleaned (manicured) form or as cigarettes. The addition of adulterants such as oregano is not uncommon in this form.

Hashish retails for $5 to $10 per gram, but it is often sold to the ultimate consumer in 1-ounce quantities at prices ranging from $70 to $125.

Several authors have described the distribution of marijuana at the retail level (Anonymous, 1969; Carey, 1968; Goode, 1969, 1970; Mandel, 1967). The majority of persons who use the drug several times per week technically have also sold marijuana, although it may be no more than sharing a purchase with friends at no profit. One survey reported that 85 percent of persons who use it three or more times per week fall in this category (Goode, 1970). Others casually sell to a few close acquaintances to earn enough for their own supply and a small amount of money. Others retail mari-

juana as a full-time occupation. Still others move further up the ladder, buying in quantities of 5 to 10 kilograms, selling some as single bricks and retailing the remainder in ounces or fractions of a pound.

Retail expenditures. In order to estimate the retail expenditures for marijuana, it is necessary to assume the size of the purchase made by the ultimate consumer. As would be expected, heavier users are more likely to buy larger amounts in a single purchase. The buying of ¼ pound up to 1 pound, or even a kilogram, for sharing among a group of users is not uncommon. In one study of fairly heavy users, 17 percent stated they purchased a kilogram at a time about one-half of the time (Hochman and Brill, 1971). The size of purchase is also influenced by the economic status of the buyer and the price of marijuana; for example, purchases of less than an ounce are relatively uncommon in California where the ounce price is $10 to $15, but in the East a cost of $25 per ounce reportedly results in more frequent purchases of smaller quantities, especially among lower socioeconomic groups. The retail expenditures for marijuana and hashish are estimated in Table 3-8, account being taken of the variability in purchase sizes as a function of frequency of use. The number of users and percentage of total consumption by frequency of use are taken from Table 3-5. The national average price of marijuana is assumed to be $250 per short kilogram and $20 per short ounce, or $700 for a short kilogram bought in short-ounce units. The more frequent users are assumed to obtain their supplies at less than $20 per short ounce, by purchasing in larger quantities, by sharing in group purchases, or by obtaining lower prices through familiarity with dealers. The average price paid by those who use daily and those who use three to six times per week is estimated to be $450 and $575 per short kilogram respectively. Of those persons who use the drug two times per week or less, half are assumed to buy at $20 per short ounce and half in smaller units equivalent to $30 per short ounce, for an average of $875 per short kilogram.

Similar assumptions were made for hashish purchases. Retail prices for hashish were assumed to be $8 per gram and $90 per ounce. Three-fourths of the daily users and one-half of those who use three to six times per week were estimated to obtain hashish at

Table 3–8

ESTIMATE OF RETAIL EXPENDITURES FOR MARIJUANA AND HASHISH

	Frequency of use			
	Daily	3–6 times/wk	≤ 2 times/wk	Total
Number of users	1,056,000	2,228,000	8,451,000	11,735,000
Annual consumption:				
Proportion of total consumption	43%	37%	20%	100%
Marijuana	827,850 kg[a]	712,350 kg[a]	385,050 kg[a]	1,925,250 kg[a]
Hashish	49,840 lb	42,880 lb	23,180 lb	115,900 lb
Retail cost:				
Marijuana	$ 450/kg[a]	$ 575/kg[a]	$ 875/kg[a]	$ 581/kg[a]
Hashish	$2,000/lb	$2,500/lb	$3,600/lb	$2,500/lb
Total annual expenditures:				
Marijuana	$372,530,000	$409,600,000	$336,920,000	$1,119,050,000
Hashish	$ 99,680,000	$107,200,000	$ 83,450,000	$ 290,330,000
Total	$472,210,000	$516,800,000	$420,370,000	$1,409,380,000
Individual user expenditures:[b]				
Annual	$447	$232	$50	
Weekly	$ 9	$ 4	$ 1	

[a]Short kilograms.
[b]Average expenditures for all users: annual, $120; weekly, $2.

the ounce price and the remainder at the gram price. All who use the drug two times per week or less were assumed to buy at the gram price.

The estimated annual retail expenditure for marijuana and hashish combined is about $1.4 billion. Average cost per user is about $9 per week for daily users and about $4 per week for those who use three to six times per week.

Subtracting the previously estimated annual expenditure for marijuana at the short-kilogram level ($481 million) and that for hashish at the pound level ($93 million) from the retail expenditure in Table 3-8 leaves a gross retail profit of $835 million. Several authors have concluded that marijuana-hashish dealing at the retail level is a low-profit operation—a dealer serving only about 25 customers and making $200 to $300 per month (Carey, 1968; Goode, 1969; Mandel, 1967). At this rate, the gross retail profit estimated here would be sufficient to employ some 280,000 persons in retail selling. Data are not available for estimating the number of persons involved in the wholesale marijuana-hashish market. If we assume the average gross profit to be $20,000 per year per person, then the gross wholesale profit subsequent to purchase on the United States side of the border ($353 million) would result in some 17,500 persons being employed at the wholesale level.[8] Figure 3-1 provides a summary of the estimated use, distribution, and economics of the marijuana-hashish market for mid-1972.

Enforcement

Seizures. In 1971, the U.S. Bureau of Customs and the federal Bureau of Narcotics and Dangerous Drugs (BNDD) seized 91,400 kilograms and 9,200 kilograms of marijuana, respectively (Bureau of Narcotics, 1971). The corresponding hashish seizures were 3,100 kilograms and 400 kilograms. California state and local seizures in 1970 accounted for an additional 26,000 kilograms of marijuana (Bureau of Criminal Statistics, 1970b). Data on seizures by other state and local agencies are generally not available but are

[8] Since both wholesale and retail dealers often sell other drugs in addition to marijuana, the total number of persons involved is likely to be substantially larger than the numbers estimated here.

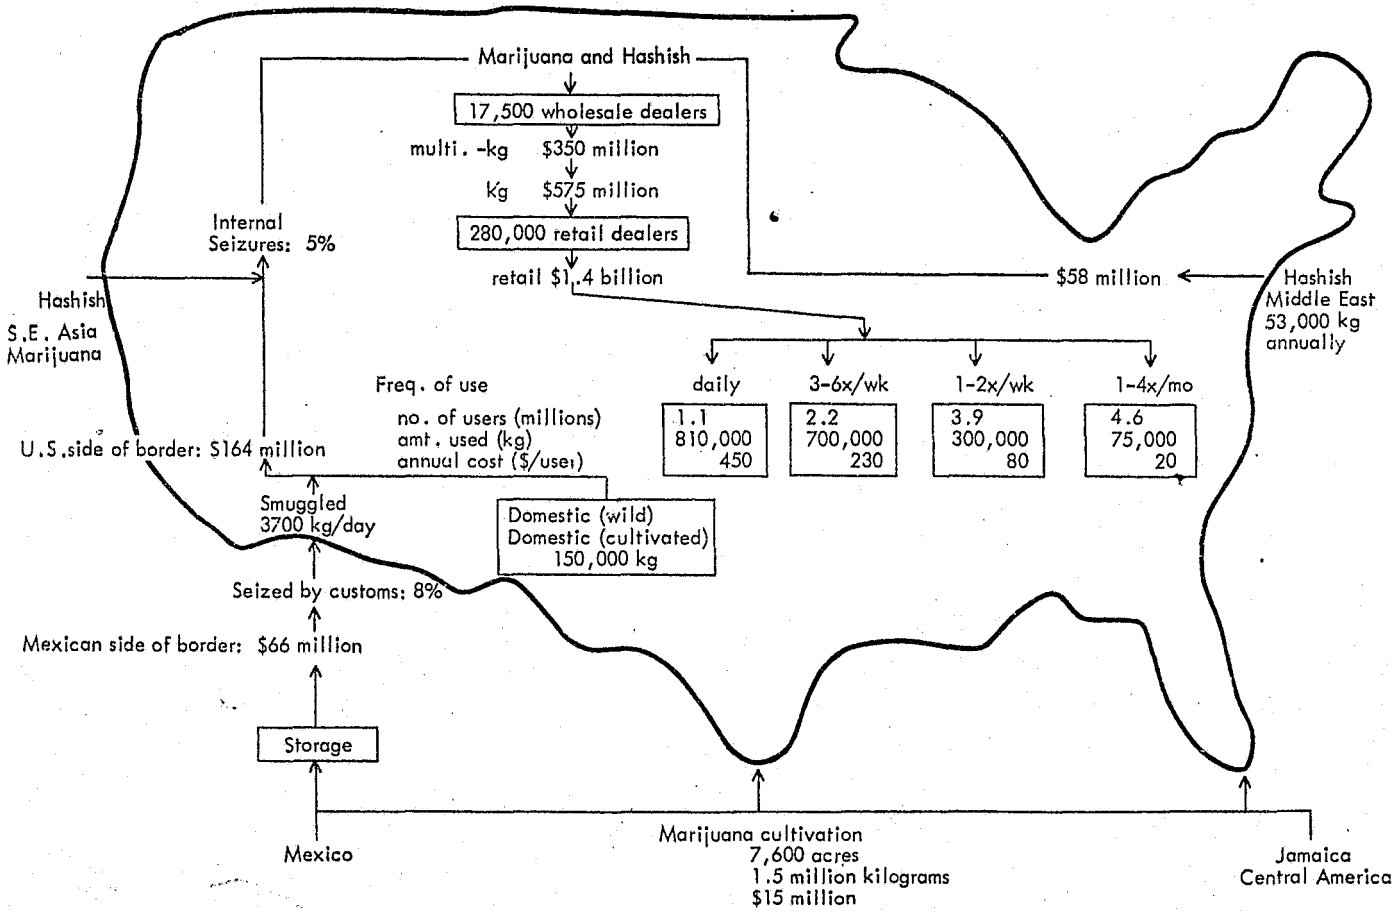

FIGURE 3-1. Summary of marijuana-hashish use, distribution, and economics for 1972.

known to be relatively small in comparison to those for California (McGlothlin, 1971). The marijuana seizures by Customs (1971), BNDD (1971), and California (1970) represent 8 percent of the estimated 1972 consumption. Assuming that the 1971 consumption was no more than 75 percent of that for 1972, and that state and local agencies other than those of California seized an additional 20,000 kilograms, the total 1971 marijuana seizures represented about 13 percent of the 1971 attempted importation.

Arrests. Statistics from the 1970 *Uniform Crime Reports* show 157,000 arrests for marijuana or 45 percent of the total 346,000 drug arrests (Federal Bureau of Investigation, 1971). The 1970 adult and juvenile marijuana arrests in California totaled 69,000 (Bureau of Criminal Statistics, 1970b). For 1969, 34 percent of the 55,000 California marijuana arrests were of persons age 18 to 20, which yields an arrest rate of 1.8 per 100 (Bureau of Criminal Statistics, 1969). Of marijuana arrests for persons 18 and over, 86 percent were males, for an arrest rate of 3.0 per 100 in the 18 to 20 age group. In San Mateo County, California, 50 percent of senior high school males reported marijuana use during 1969 (San Mateo County School Study, 1968 through 1972). Assuming the statewide average for marijuana use at about 80 percent of that for San Mateo County, the arrest rate for males age 18 to 20 who used marijuana one or more times in 1969 is estimated to be 7.4 per 100. If we further assume that virtually all the arrests are among the 60 percent who used marijuana on more than an experimental basis (ten or more times), the arrest rate for this group of males age 18 to 20 is 12 per 100.

The number of California arrests for sale or transportation of marijuana in 1969 was 7800 (Bureau of Criminal Statistics, 1969). If we assume that the number of persons involved in wholesale and retail selling in California during 1969 was 30,000, the arrest rate was 26 per 100.[9]

In summary, the risk of arrest for use or sale of marijuana is quite substantial, at least in California. The penalties imposed by the courts are also significant. Of the 37,700 adult (18 and over)

[9] Assumes the number of persons involved in wholesale and retail selling in 1969 was 50 percent of the 300,000 estimated for 1972 and that 20 percent of the total were in California.

nonfederal arrestees in 1969, 21 percent were convicted on felony charges. Incarceration rates were relatively low—0.6 percent of the total arrested received prison sentences, and 8 percent received jail sentences; however, the additional implications of felony convictions are severe. The cost of processing the California adult and juvenile marijuana arrests for 1969 has been estimated to be $43 million, or about $780 per arrest (McGlothlin, 1971).

Future Use

Current trends. Figure 3-2 presents some trend indicators of marijuana use and control between 1967 and 1971. Obviously the seizure and arrest data may reflect variations in enforcement emphasis as well as changes in usage.

As the percentage of students who have ever used marijuana approaches or exceeds the 50 percent mark, increasing interest focuses on trends in the proportion of such students who continue use. A comparison of the Gallup college surveys for 1970 and 1971 indicates continuing use may be nearing a plateau (Gallup Opinion Index, 1972). On the other hand, the San Mateo County secondary school data show a definite increase over the same period, in the proportion of students who use marijuana one or more times per week (San Mateo County School Study, 1968 through 1972). This survey showed a tendency toward leveling out of use from 1969 to 1970, but the sharp rise resumed in 1971. Interview studies have provided additional data on the question of duration of use. One 1970 college survey found that, of those persons who had been initiated to marijuana more than three years before and who had used it on more than an experimental basis (ten or more times), 37 percent had currently either stopped or were using infrequently, and 32 percent and 31 percent reported current usage at several times per month and several times per week, respectively (Hochman and Brill, 1971). Another 1970 college study found that 77 percent of those who had been initiated to marijuana four or five years previously were still using to some degree (Lipp, 1971).

In summary, the currently available (1972) trend data on marijuana usage leave unanswered the question of whether it is likely to be a transient or a permanent phenomenon. The number of persons who have ever used marijuana in continuing to increase,

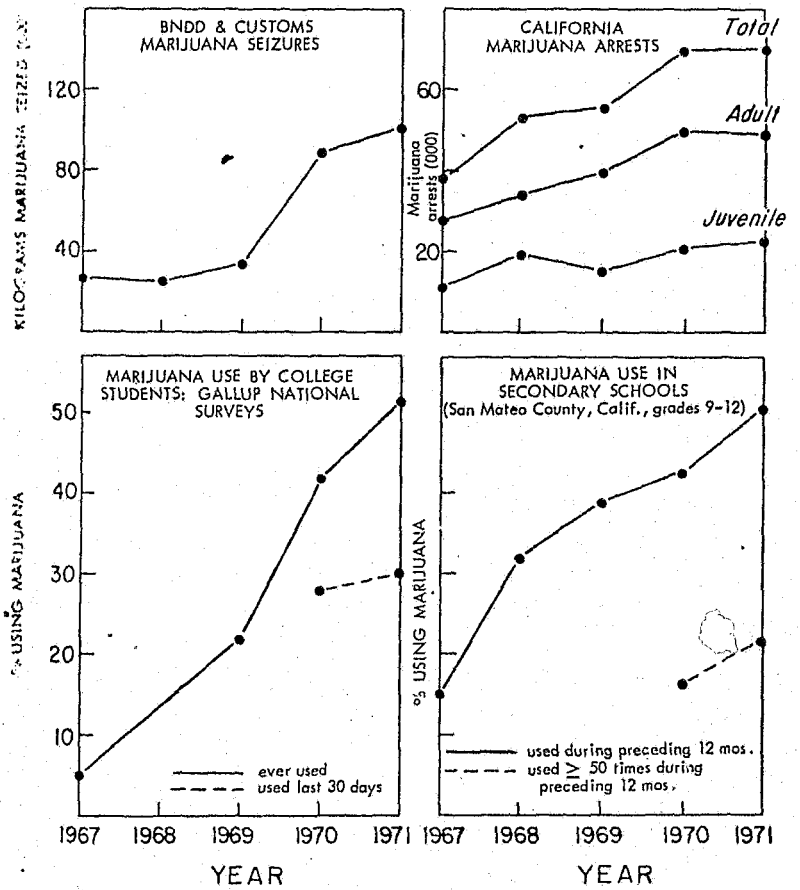

FIGURE 3-2. Marijuana trend indicators: use and control.

probably at a rate of 25 to 30 percent per year. In addition, there is no evidence as yet that the number of persons who discontinue after a significant period of usage are exceeding the number who are initiating such behavior. On the other hand, the behavior has many of the characteristics of a fad or temporary style: its very rapid acceptance by that segment of the population most susceptible to fads; the fact that it has been enthusiastically propagandized via music, a pseudophilosophy, and the popular media; the fact that its use is, in part, an antiestablishment reaction stemming from factors other than the properties of the drug itself. In addition, the

appearance of Western-style (Occidental) marijuana use among university students in most countries throughout the world has more the flavor of adoption of styles of music or hair length than a lasting behavior.

The contrary view holds that since cannabis (marijuana) is the second most widely used intoxicant in the world, it clearly is a drug that may prove attractive to large numbers of people on a continuing basis. Once a drug with these features is introduced into a culture on a widespread basis, it seems quite likely to be retained by some portion of the population. Blum has noted that in the history of drug use there are few instances in which a drug achieved widespread acceptance in a culture and was subsequently discarded (Blum and Associates, 1969a).

Insights from Other Cannabis-using Cultures. Cross-cultural generalizations are hazardous; however, a brief examination of the prevalence and patterns of cannabis use in cultures where it has existed for centuries may be helpful in forecasting the future use in the United States. For instance, what proportion of the population elects to use the drug under conditions of acceptance in countries with a long history of use? In Nepal, which is reportedly the only country in the world that imposes no restrictions on cannabis use, approximately 4000 acres are officially cultivated and taxed, and additional amounts of hashish are harvested from wild growth for commercial purposes (McGlothlin, 1971). In spite of the fact that cannabis is legal, readily available, and inexpensive, Nepalese use is very limited and virtually all the crop is illicitly exported to India and Pakistan.

In India and Pakistan, charas (hashish) was prohibited in 1945, but other preparations of cannabis (bhang and ganja) are still legal in selected states. Daily users probably number 2 million to 3 million, or about 4 per 1000 on a per capita basis (McGlothin, 1971). However, since use is restricted to lower-class males and is concentrated in certain states, daily users may constitute as high as 5 percent of the relevant population in some areas.

In Morocco, occasional and regular cannabis users were estimated to represent 10 percent of the population before prohibition of the drug in 1954 (Roland and Teste, 1958). Since use was primarily restricted to males, this was about 25 percent of the adult

male population. Other estimates of regular use have run as high as 50 percent of the native male population in some areas of South Africa (South Africa Drug Report, 1952) and 40 to 50 percent of the male population in Jamaica (*Marihuana and Health,* 1972).

In summary, in very few areas in the world does the prevalence of cannabis use approach that for alcohol in the Western culture. Usage is largely restricted to lower-class males, and daily use seldom exceeds 5 to 10 percent among this group. By comparison, it is estimated that 2.5 percent of United States males age 14 to 34 are currently (1972) using marijuana daily and that an additional 4.6 percent are using it three to six times per week (Table 3-4).

Probably the most significant comparison between the use of marijuana in the United States and that in other cultures concerns the amount consumed. In Table 3-5, the typical American dosage is estimated at one to three marijuana cigarettes, or 5 to 15 milligrams of THC, per day. The maximum amount consumed by heavy users is of the order of ten cigarettes, or 50 milligrams of THC, per day. By contrast, the *average* amount consumed by daily users in India, Egypt, and Morocco is estimated to contain 45 to 60 milligrams of THC, and the maximum is around 200 milligrams (McGlothlin, 1971). Some studies have indicated usage equivalent to more than 700 milligrams of THC (Chopra and Chopra, 1939). In Greece, chronic hashish users serving as experimental subjects are routinely given smoked-THC doses of 150 milligrams, whereas 15 milligrams is normally the maximum dose administered to experimental subjects in this country. The one- to three-cigarette dosage of the early 1970s is also low in comparison with the six to ten cigarettes per day estimated for regular users in the 1940s (Charen and Perelman, 1946; Mayor's Committee, 1964). It is also low in comparison with the amounts used in the early 1970s by American soldiers in Vietnam and Germany. One study of heavy hashish users among the United States military forces in Germany found an average use of more than 3 grams per day, that is, the equivalent of 30 marijuana cigarettes per day (Tennant and others, 1971).

In summary, most of the current marijuana smokers in the United States are best described as playing at cannabis use in com-

parison with users in other cultures. It seems likely that the average amount of THC consumed by continuing users in this country will increase in the next few years, although probably not to the level observed in other cultures. Additional experience, the availability of more potent preparations, and the development of tolerance among frequent users will tend to increase the average amount consumed. In addition, it would not be surprising if some individuals daily consume 200 milligrams of THC or more in the form of hashish or other concentrated preparations, an amount greatly in excess of that previously observed in this country. Experience in other countries indicates that the use of these very large amounts occurs in about the same proportion of users as does alcoholism in the United States, that is, about 5 to 10 percent of the total number of users.

Predicted Use in 1976. Table 3-9 compares higher and lower predictions of marijuana-hashish usage for 1976 with the estimate for 1972. The predicted use of larger quantities of THC in the form of marijuana or other preparations is reflected in the 1976 estimates. It is estimated that daily users and those who use the drugs three to six times per week will be using five and three marijuana cigarettes, or equivalent, respectively, in comparison with three and two cigarettes assumed in Table 3-5 for 1972. Although the lower estimate for 1976 assumes a somewhat smaller population of users than that for 1972, the predicted larger amounts per user result in an increase in total consumption. The estimated retail expenditures are calculated on the same basis as those in Table 3-8.

Alternative Control Policies

Marijuana control policies have been discussed at length in previous documents (Kaplan, 1970; Brill, 1971–1972). The present section will be primarily limited to an examination of the major alternative policies in the context of the quantitative estimates of use, distribution, and enforcement effectiveness developed in the previous sections.

Several features characterize the current (1972) marijuana-hashish market as summarized in Figure 3-1. First, in the case of marijuana, the fact that 99 units of inert substance must be handled for every one unit of the active drug means that large amounts of

Table 3–9

ESTIMATED MARIJUANA-HASHISH USAGE AND EXPENDITURES FOR 1972 AND 1976

	1972 estimate	1976 prediction	
		Minimum	Maximum
Number of users:			
Daily	1,100,000	800,000	2,500,000
3–6 times/week	2,200,000	2,000,000	3,500,000
1–2 times/week	3,900,000	3,000,000	6,000,000
1–4 times/month	4,600,000	3,000,000	10,000,000
Total	11,800,000	8,800,000	22,000,000
Annual national consumption of crude marijuana or equivalent	1,900,000 kg	2,300,000 kg	5,400,000 kg
Wholesale expenditures	$ 600,000,000[a]	$ 700,000,000[a]	$1,700,000,000[a]
Retail expenditures	$1,400,000,000[b]	$1,600,000,000[b]	$3,700,000,000[b]

[a]1972 prices at 1-kilogram level.
[b]1972 prices.

bulky material must be transported—an estimated 4 tons are smuggled into the United States daily. Second, distribution within the United States involves numerous independent operations with little evidence of central organization. This is probably closely related to the difficulty of smuggling and storing large quantities of the drug. Third, the market involves a large number of users who make a relatively small amount of money by retail selling. Fourth, the monetary cost of marijuana use to the individual is relatively low, that is, $0.50 to $9 per week, depending on the frequency of use.

The effectiveness of the present marijuana control system may be measured (1) in terms of enforcement statistics, for example, drug seizures and arrests for sale and use; (2) indirectly in terms of availability and price of the drug; and (3) directly in terms of extent and type of use. An overall evaluation should also consider the costs of control, monetarily, as well as in terms of unintended side effects such as alienation of youth or diversion to more dangerous drug use. With regard to the more quantitative measures, and based on California statistics, we estimate that the current marijuana control system results in seizure of 13 percent of the marijuana and hashish intended for sale, in the arrest of 26 percent of those who are regularly involved in selling and in the arrest of up to 3 percent of those who use marijuana one or more times during the year (Bureau of Criminal Statistics, 1970a).

The present control system has had only limited success in restricting the availability of marijuana and hashish. Availability is not sufficiently open that purchases can be easily made by persons who are not involved in the drug subculture, but regular users generally have little difficulty obtaining the drug (Haines and Green, 1970). Periodic shortages occur, but they appear to be mostly related to seasonal fluctuations in harvesting, rapid increases in demand, and variations in supply related to the situation of storage being largely outside the United States. The price of marijuana increased by about 50 percent from 1969 to 1972, but this increase was not a limiting factor for most users. With respect to controlling the extent of marijuana use, the present policies have obviously been unsuccessful in preventing the rapid increases over the past few years.

With respect to possible policy changes, there are three primary alternatives: (1) increase criminal sanctions for both use and sale; (2) decrease or eliminate penalties against use and continue or increase efforts to eliminate the supply; and (3) regulate the sale of marijuana in the manner of alcohol controls.

The adoption of the first alternative in terms of penalties as well as arrests would undoubtedly increase the level of deterrence. It seems equally clear that society would be unwilling to incur the costs of such an approach. The current trend toward decreasing or eliminating penalties at the user level is essentially being forced by the realities of the widespread usage. This leaves the second and third alternatives as feasible policy changes.

Suppress Supply. The immediate question with regard to alternative 2 concerns the ability to suppress the supply of marijuana and hashish. The increased pressure against smuggling by Customs in 1969, 1970, and 1971 clearly resulted in a sharp increase in seizures (see Figure 3-2). The current estimated seizure rate of 13 percent is substantial when interpreted in terms of risk of arrest. While no attempt was made in the present study to estimate the results of additional enforcement efforts, such a policy can reasonably be expected to further increase both seizures and arrests. On the other hand, there is no indication as yet that the present level of enforcement is capable of severely restricting the availability of marijuana.

Efforts are also being made to eliminate the sources of marijuana in Mexico (McGlothlin and others, 1970b). Information necessary for evaluation of the progress of this effort is not available, but clearly this approach to cannabis control on a worldwide basis would be more difficult to implement than the current attempt to suppress the sources of opium. Cannabis grows wild in many portions of the world and may be cultivated with relatively little effort in any temperate or tropical climate. It requires no processing in the crude form, and relatively little for the more concentrated preparations.

Increase Smuggling Controls. The major difficulty in smuggling marijuana is the excessive bulk. The estimated 3700-kilogram amount smuggled into the United States daily contains only about 37 kilograms of THC. Further significant increases above the already high marijuana seizure rate will likely result in efforts to de-

crease the risks of detection by means of reductions of bulk. The most obvious countermeasure would be the gradual replacement of the marijuana market with hashish from the Middle East, smuggled into the United States either directly or by way of Mexico or Canada. Hashish is estimated to contain 5 percent THC compared with 1 percent for marijuana, and is also a solid; for equivalent amounts of THC, hashish requires far less space than does the leafy marijuana. As mentioned earlier, the increased smuggling of hashish is already evident—the ratio of hashish to marijuana seizures in 1971 was double that for 1970. Very little technical skill is required for converting hashish to an extract containing up to 20 percent THC; this method has already been employed on a small scale and seems likely to be used increasingly. In general, any method that permits importation in a more concentrated and compact form will increase the ease of concealment for smuggling and will reduce information leaks by permitting more centralized operations.

Another result of increased enforcement effectiveness would be an increase in the price paid for marijuana and hashish. One of the announced objectives of Operation Intercept in 1969 was to place the price of marijuana beyond the reach of the adolescent. The price in the United States increased by about 50 percent from 1969 to 1972; however, the relative costs of comparable levels of intoxication achieved by use of marijuana and alcohol are probably still of the order of 1:2 or 2:3. This result of Operation Intercept would indicate that the price of marijuana might rise by 50 to 100 percent if the risks of importation and distribution are again substantially increased. It is interesting that the price of hashish is about $1 per gram in Holland and Denmark, which have relatively permissive policies; about $3 per gram in Norway, which stresses enforcement; and $8 per gram in the United States ($3 per gram in ounce quantities).

Limitations on marijuana supply should also be considered in the context of availability of other drugs. For instance, during the period when the price of marijuana increased by 50 percent, the widespread availability of LSD resulted in its wholesale price dropping to one-fifth its former level. Marijuana shortages apparently result in increases in the use of other drugs (McGlothlin and others, 1970b). Alcohol and hallucinogens are the most frequent substi-

tates, but there is also some increase in sedative, stimulant, and opiate use, especially among those who are heavily involved in the drug subculture. Finally, increased domestic cultivation of marijuana is another possible reaction to heightened controls against importation. Marijuana plants may be grown indoors as well as outside. Should sanctions be dropped at the user level, cultivation for personal use might pose a difficult legal problem.

Contribution to Criminal Behavior. A control policy that attempts to deal severely with the seller and deals leniently or not at all with the user will inevitably encounter difficulty in differentiating between the two categories. A major disadvantage of maintaining marijuana in the illicit drug category is the encouragement of large numbers of young persons to become involved in retail selling. It is especially easy to begin selling marijuana on a casual basis and quickly become seriously enmeshed in a highly criminogenic subculture. As previously discussed in the section on the marijuana market, the majority of regular users have technically sold the drug at some time—280,000 persons are currently estimated to earn all or a significant portion of their income by retail selling. Applying the same formula of $250 per month for the retail dealer to the 1976 upper estimate of $2 billion in gross retail profits would result in some 670,000 persons employed in the retail selling of marijuana.

In addition to encouraging young marijuana users to adopt the dangerous and unproductive life of retail selling, the large wholesale profits are attractive to organized crime—a development that is considered more likely if the more concentrated preparations replace marijuana. The present estimated wholesale market of $600 million per year (1-kilogram level) is predicted to increase to $700 million to $1.7 billion by 1976. With additional pressure against smuggling and distribution, price increases might raise these market values by 50 to 100 percent.

Regulate Sale. Legal distribution of marijuana would provide the usual advantages of licensing, including control of conditions of sale, especially those relating to the age of the purchaser. Other controls employed in some countries are the limiting of the amount purchased and the issuing of permits for use.

Another advantage of regulated sale is the imposition of quality and potency control. As discussed earlier, increased pressure

61-801 O - 77 - 71

against sales and smuggling seems likely to result in a shift to more potent forms. While the availability of the more potent preparations of cannabis does not necessarily result in the consumption of larger amounts of the active ingredient, there is general agreement that excessive use is more prevalent under such conditions. Some countries have initiated controls that allow consumption of low-potency materials but prohibit the more concentrated forms (Krisnamoorthy, 1969). Regulated sale would also prevent adulteration. This has not been an appreciable problem thus far because of the lack of an economic incentive, but if extracts come into use it is likely they would often be mixed with other active adulterants.

Another major advantage of legal sales is the removal of large numbers of youth from the criminogenic retail sales occupation. It would also reduce the cost of enforcement, disassociate marijuana from other drug sales, and encourage a credible approach to education.

Finally, if sales of marijuana were regularized in the same manner as sales of alcohol, the profits that now go into criminal channels could presumably be converted to tax revenues. If we assume the same tax percentage for marijuana as alcohol (approximately 30 percent), the current estimated $1.4 billion retail expenditure for marijuana and hashish would yield around $420 million in taxes per year, or about 8 percent of the current alcohol tax revenue. The 1976 lower and upper estimates of retail sales would result in tax revenues of $480 million and $1.1 billion or 9 to 22 percent of the current alcohol revenues. The current retail price of marijuana could probably be doubled and still be competitive with alcohol and, since marijuana is easy to grow and process, the tax percentage could be substantially higher than 30 percent of the total price. Thus, it is reasonable to predict that tax revenue could be nearly $1 billion at present, and possibly as much as $2 billion within five years, or some 40 percent of the alcohol revenue.

Future Policies. We have examined some of the implications of various marijuana control policies in the context of estimates of current and future use and distribution. In summary, the current prevalence of marijuana use is high and is likely to continue to increase, at least for two or three years. Among younger age groups,

the present policies do not effectively deter use, particularly in certain areas of the country. The reaction of policy makers to the failure of deterrents and to the cost of criminal sanctions has been to reduce penalties against the user, while continuing or increasing pressure against distribution. It is reasonably certain that this trend will continue in the immediate future, possibly including dropping other than token sanctions against the user. Additional pressure against smuggling and sale of marijuana should further increase seizures and prices, although as yet there is no evidence that this approach is capable of severely restricting availability. A likely countermeasure is the shifting to hashish or other concentrated preparations in order to reduce the risks associated with smuggling. A major cost of a policy aimed at suppressing supply is the criminalizing of large numbers of young persons involved in retail sales. A policy of legalization would eliminate this problem, encourage a credible educational approach, produce a substantial tax revenue, and provide control of potency and other controls related to legal sale. On the other hand, legalization would very likely produce greater prevalence of use, whereas strong efforts against the supply of marijuana, together with token sanctions against use, would indicate social disapproval and discourage its use, at least among some portions of the population.

The major uncertainty concerns the future trends in marijuana usage related to factors other than control policies. If the demand for marijuana continues at the present or higher level and efforts to suppress the supply are unsuccessful, then a policy of continued prohibition would have most of the disadvantages of legalization and none of the advantages. On the other hand, the current epidemic use of marijuana among the middle class is too new to allow confident predictions as to whether or not it will be a permanent phenomenon. Early legalization would provide official, and perhaps irreversible, sanction to a potentially harmful behavior that might otherwise have been primarily a transient phenomenon.

[From the National Observer, Nov. 30, 1974]

A CHANGE IN POLICY ON POT?

(By William J. Lanouette)

More than two million Americans will smoke some marijuana today. Maybe 2,000 of them will be arrested.

For some very different reasons, those statistics are beginning to disturb a growing number of people and their elected representatives here. And if this concern spreads, as now appears likely, it could produce a fundamental shift in the nation's policy toward pot.

Attitudes are quite dissimilar. Some people are annoyed because they think that all pot smokers should be arrested. Some think no pot smokers should be arrested. Some think that pot smoking is wrong—for medical or moral reasons—but also that laws applied so selectively are unfair. And some think that regardless of the arguments for or against pot smoking, the police should be battling more serious crimes.

SEPARATE CONCERNS

These varied concerns were focused here recently by a series of loosely related events that together renewed debate about the public and political response to pot. From this debate emerges one fundamental shift in attitudes: a tendency to separate concern about the possible medical harm of pot from the legal harm caused by enforcing the present laws.

Marijuana is still a long way from being "legalized," that is, sold commercially as a legitimate product. Yet the chances that the possession and use of small amounts will be "decriminalized"—publicly discouraged but not punished by jail terms—may be only months away. And oddly enough, the move to decriminalize pot could be boosted by a widespread concern for "law and order."

The shift in public attitudes began at the top. Although former President Nixon wouldn't even read the 1971 commission report recommending decriminalization, President Ford and the First Family have taken a different approach. "I'm sure the children have tried it," Betty Ford said in September. "I think children try everything, don't they?"

THE KEY QUESTION

Columnists, including William F. Buckley, Jr., Ann Landers, and James J. Kilpatrick have supported decriminalizing pot. Attorney General William Saxbe said he would not lobby for a change in marijuana laws on Capitol Hill, but "neither will I block any efforts to make the changes."

Last week the Ford Administration's chief drug-policy spokesman edged close to advocating decriminalization without explicitly saying so. Dr. Robert L. DuPont, director of both the White House Special Action Office for Drug Abuse Prevention and of the National Institute on Drug Abuse, said: "The key question today is whether the benefits of deterrence are available at a lower cost than the current criminal sanction. I think that they are."

THE COST OF JAIL

With this shift in attitudes, New York Democratic Rep. Edward Koch is trying to muster support for his pot-decriminalization bill. "While many thousands are being arrested for possessing marijuana, many millions are not," Koch said in an interview last week. "I think that both Constitutional liberals and Constitutional conservatives will want to rally around this issue—because of the unfairness of it. By an estimate I've seen it would cost $79 billion a year to put every pot smoker in jail. And even assuming pot's as vile as its worst critics say, so do you correct that by putting everybody in jail?"

Sen. Harold Hughes, Iowa Democrat, is now posing two questions to witnesses before his subcommittee on alcoholism and narcotics, which is examining current pot policies. "Is the health hazard so great as to endanger society or is it so minimal that government should refrain from interfering with the individual user? Do the criminal laws impose on the individual and on society a burden

which is so great and so unfair that they are far more damaging than the use of marijuana itself could be?

"Even if we find that marijuana does present serious health hazards," Hughes says, "are we justified in using the criminal law to solve a health problem when we do not use it in any similar way to solve the very well-known problems created by the use of such substances as alcohol and nicotine?"

THE OREGON APPROACH

Committee witnesses, including narcotics agents from New Jersey, urged a reassessment of national marijuana laws. Most favored an approach begun last October in Oregon, where possession of 10 ounces or less is a "violation," like a traffic ticket, punishable by a maximum fine of $100.

Also last week, Dr. DuPont presented to Congress his agency's fourth annual "Marijuana and Health" report. It was due in March but delayed, he said, "to include new findings from several important studies in order that the report would accurately reflect the present state of our full scientific knowledge." He conceded, however, that "there are more unanswered than answered questions. But these recent findings give reason for concern in several areas."

SEX AND DRIVING

Among those he highlighted were: depressed levels of the male sex hormone testosterone in heavy users of marijuana, possible interference with the body's immunity responses, and adverse effects on driving skills while high on marijuana. Yet, he warned, "we do not know today that *cannabis* [marijuana] use definitely is more dangerous in all respects than we previously thought. Much of the research reported is very preliminary, involving testing in animals, not man. Some of it is contradictory."

Indeed, the testosterone experiment, which DuPont gave the most attention, used out-patient subjects and showed that levels of the male sex hormone were depressed, but it was contradicted by a clinical attempt to replicate it. However, these results were confirmed by a third project, as yet unpublished. The leader of the first study, Dr. Robert Kolodny of the Reproductive Biology Research Foundation in St. Louis, explained at a Senate hearing this May that his "study has a number of problems."

Kolodny noted, for example, that the survey was small, involving 20 men. Researchers had no way to verify that marijuana users weren't using other drugs that might also lower sperm levels, such as LSD or alcohol. And they had no control on the purity or potency of the marijuana smoked. Kolodny also has stated publicly this year that he favors decriminalizing marijuana, despite the possible adverse effects suggested by his research.

VALUE AS TREATMENT

Other findings in the fourth "Marijuana and Health" report suggested that the drug might have some useful therapeutic value. From more than 35 studies it appeared to have analgesic, anticonvulsant, and sedative effects. It may also be useful in treating cancer and glaucoma. However, as in the possible harmful effects, research was said to be either inconclusive, tentative, or contradictory.

"Of the studies we've funded, more have been reassuring about the effects of marijuana than alarming, by far," says Dr. Robert Petersen, the report's author. "But you can say more about negative findings at a press conference than positive ones. After all, what more can you say after you've said, 'There's no significant difference between marijuana use and nonuse'? Furthermore, if you look long and hard enough at *any* substance you're certain to pick up some negative consequences."

Many of the marijuana studies that DuPont delayed his report to include were first publicized at a hearing on the "Marijuana-Hashish Epidemic and its Impact on United States Security," held in May by Sen. James Eastland, an avowed foe of pot. He held the hearings, Eastland said, "to present the 'other side' of the story, to establish the essential fact that a large number of highly reputable scientists today regard marijuana as an exceedingly dangerous drug."

The Mississippi senator favors "the kind of escalated penalties [for repeaters] provided by state law in New Mexico." Eastland is expected to be a powerful opponent of any Senate moves to decriminalize marijuana because of his influence as chairman of the Judiciary Committee, the body with jurisdiction over drug-control laws.

In the House, too, the subcommittee chairman who must consider any move to decriminalize marijuana is publicly against such a measure. Democratic Rep. Paul Rogers of Florida, a member of the Presidential commission, dissented from the commission's majority recommendation to decriminalize pot. Today he says that "for simple possession of a small amount of marijuana I think there should be a civil fine, but not jail as a penalty." He anticipates that "if the Administration makes a request to decriminalize marijuana, I would think the Congress would be willing to go into the matter. But I question strongly whether there's much support for complete decriminalization."

But despite the views of key chairmen, such as Eastland and Rogers, many observers here see important changes in the pot laws coming during the next Congress. An influx of younger, more liberal members, and rising support for decriminalization in many parts of the country, may make the recent experience in Oregon a model for pot policy in both Federal and State legislatures.

[From the U.S. News & World Report, Apr. 28, 1975]

The Private Use of "Pot"—A Growing Public Issue

Laws against marihuana are undergoing sweeping and controversial changes in this country.

At one time, because of widely held fears about marihuana's effects, every State made its use a serious crime, a felony. Then, in the 1960s, a movement sprang up to reduce the smoking of marihuana to a less serious classification of crime, a misdemeanor. By 1974, despite considerable opposition, every State had done this.

Now this trend toward softening the legal sanctions against marihuana has entered a new phase: "decriminalization." Legislatures of nearly half the States are considering bills that would make the private smoking of small amounts of marihuana no longer a crime. Oregon has already done this—in 1973.

The California Senate passed such a bill on March 20, and the State Assembly is expected to add its approval soon. Prospects are considered good for passage of similar measures this year in Alaska, Hawaii, Minnesota, Maine and the District of Columbia.

Now Congress, too, is being asked to join this spreading movement. A bill introduced on April 17 would make it no federal crime to possess up to a single ounce of marihuana.

A CIVIL OFFENSE

In effect, the "decriminalization" would reduce the private smoking of marihuana in small amounts from a crime to a civil "infraction," something like a traffic offense. An offender, if caught, could be fined, but would not incur a "criminal" record.

Some variations of this concept would go even further, making private use or nonprofit transfers of small amounts of marihuana completely legal. The only penalties would be for "trafficking" in marihuana, that is selling it for profit, or for smoking it in public.

"Decriminalization" does not mean "legalization," which would permit over-the-counter sales of marihuana, much like alcohol and tobacco.

It would, however, be a significant change in the way this country has dealt with marihuana for almost half a century. And it is encountering opposition.

Arguments against softening marihuana laws center mainly on the health hazards the drug is said to present.

At hearings held by the Senate Internal Security Subcommittee in June, 1974, many opponents of marihuana testified that its use is clearly dangerous. Some suggested that the "epidemic" increase in use may have been promoted by subversive groups bent on endangering the nation's security.

Arguments are made that many young people who start smoking marihuana graduate to harder, more harmful drugs, such as cocaine and heroin.

Even among opponents of marihuana, however, there are many who do not favor sending users to jail.

WIDESPREAD USE

The movement toward "decriminalization" grew out of the explosive growth of marihuana smoking that occurred in the mid-1960s. For large numbers of American youths, marihuana became a symbol, flaunted in their fight against "establishment values" and the Vietnam War. "Pot" parties became a vogue among students, in high school as well as college. "Reefers" were passed from hand to hand almost anyplace young persons gathered. At "rock" concerts, the air was redolent with the pungent odor of "grass."

By 1972, an estimated 26 million persons had tried marihuana. Thirteen million were regular users, most of them young persons.

Increased use, naturally, brought increased arrests. Some police, prosecutors and judges soon found their time preoccupied with "pot busts" at the expense of fighting serious crime.

In 1965, an estimated 18,815 persons were arrested for State and local violations of marihuana laws. By 1973, arrests had jumped to 420,700. The vast majority of such arrests—93 per cent—were for simple possession of marihuana, usually of small amounts.

The most notable impact of the arrests was that for the first time hundreds of thousands of white, affluent or middle-class parents saw their children being treated as criminals.

Many young offenders were tossed into prison for long terms, forced to mingle with hardened criminals, often subjected to sexual abuse by inmates.

Even those who escaped prison were saddled with arrest or conviction records that would stay with them for life, adversely affecting their job prospects and credit rating.

Many law-enforcement authorities soon reacted to parental complaints by easing up their drive against the weed. Some police began "looking the other way," although the increasingly open use of "grass" kept arrests rising. Some prosecutors—officially or unofficially—adopted policies of nonenforcement.

Many judges began suspending sentences or imposing fines or drug-education programs instead of jail terms. But the stigma of arrest remained even for those spared jail.

While this move toward softening penalties was occurring, new looks were also being taken at the health aspects of marihuana use.

DEBATE ON HARM

For many years, a common view had been that marihuana was a seriously harmful drug that led to addition, incited crime and sexual immorality, and could possibly even lead to insanity. Users were widely regarded as menaces to society.

A presidentially appointed Marihuana Commission, though, reported in 1972 that: "From what is now known about the effects of marihuana, its use at the present level does not constitute a major threat to public health. [And] neither the marihuana user nor the drug itself can be said to constitute a danger to public safety."

The Commission recommended the decriminalization of private use and nonprofit transfers of marihuana in small amounts. The prestige of this report, more than anything else, is credited with sparking the current decriminalization drive.

The report also prompted more research. Some experiments suggested that high levels of marihuana use might have detrimental effects on immunity to disease, on brain and body cells and on sexual potency.

Other researchers attacked such suggestions. Some claimed that marihuana actually has therapeutic applications that would help in treatment of glaucoma and asthma and in organ transplants. In 1974, though, the U.S. Department of Health, Education and Welfare concluded "there is as yet no direct clinical evidence confirming" such claims.

Although doubt still clouds the effects of heavy marihuana use, few researchers have found occasional or moderate use to be dangerous. Since many violators of marihuana laws were occasional or moderate users, they developed a growing

resentment toward Government interference in a matter they regarded as no danger to society.

CHANGING THE LAWS

Out of this resentment grew a campaign to change the marihuana laws. In the forefront of this fight was the National Organization for the Reform of Marihuana Laws (NORML), whose $150,000 annual budget is funded largely by the Playboy Foundation.

Keith Stroup, director of NORML, summarizes the argument for decriminalization of marihuana this way: Admittedly, marihuana use may result in some harm. But criminal laws have failed to deter its use, while attempts to enforce those laws have strained the limited resources of the criminal-justice system. And criminal prohibition engenders disrespect for the law when use of marihuana is treated as a crime while use of other potentially harmful drugs, such as alcohol and tobacco, is not.

Richard J. Bonnie, a University of Virginia law professor who was associate director of the Marihuana Commission, adds: "No criminal law can be fairly or effectively enforced unless it commands a popular consensus. Yet, the consensus that supported the marihuana laws from 1915 to 1965 evaporated as soon as the prohibition encountered the rigors of public dialogue."

One thing that is helping the move toward decriminalization is Oregon's year-and-a-half-old experiment with its new law. In October, 1973, the State made private possession of less than one ounce of marihuana a civil infraction punishable by a maximum fine of $100. Public use of marihuana remains a crime. So does trafficking in it.

Pat Horton, district attorney for Lane County (Eugene), Oreg., says the new law has resulted in many benefits: Police can now concentrate on violent crime, young persons have a better relationship with police, and it has reduced by one third the total number of court cases awaiting trial.

A 1974 survey by the Drug Abuse Council showed marihuana use did not go up after passage of the law as some had feared. And there was no influx of "pot-heads" into Oregon.

The move toward decriminalization has also been aided by the endorsements of numerous civic and professional groups including the American Bar Association, the American Medical Association and the National Council of Churches.

NORML's director Stroup says the fact that 1974 was an election year slowed the drive toward decriminalization because many candidates were fearful of voter reaction on such a controversial issue. But 1975 is an off year for elections, and Mr. Stroup says that and the growing youth vote make prospects good that many of the 23 States considering decriminalization will approve it soon.

The outlook for early passage of such legislation by Congress is described as highly uncertain.

PROBLEMS AHEAD

Public opinion appears almost evenly divided on the issue. A nationwide poll by the Drug Abuse Council in October, 1974, showed that 40 per cent of those questioned favored stronger penalties while 39 percent favored decriminalization. The rest were undecided or against change at this time.

Eventually, however, Mr. Stroup predicts, decriminalization will become widespread, perhaps within two years if Congress approves it soon.

"When Oregon said private use wasn't a crime, it in effect said marihuana wasn't immoral," Mr. Stroup says. "Ever since then, we've considered the war to be over."

For large numbers of Americans, however, the marihuana war is far from over. Many battles lie ahead before "pot smoking becomes a generally accepted recreation for Americans.

[From the Congressional Record, Oct. 11, 1974]

A NEW PROBLEM: LEGAL MARIHUANA

The SPEAKER pro tempore. Under a previous order of the House, the gentleman from Maryland (Mr. Hogan) is recognized for 10 minutes.

Mr. HOGAN. Mr. Speaker, it may come as a surprise to most Members of this body that there is such a thing as legal marihuana. But this is a fact, and it is causing serious problems for law enforcement agencies.

The current laws prohibit possession, sale, or use of only one species of marihuana—cannabis sativa—and they do so in a most specific way.

Taking advantage of this legal technicality, the drug trade is switching to growing and selling cannabis indica, a species of marihuana that was identified and described in published works in Europe nearly 200 years ago.

Although drug peddlers are now referring to Cannabis indica as "legal grass," it is at least four times as strong, and costs approximately three times as much "on the street" as the single species that was outlawed when the U.S. laws on marihuana were written in the 1930's. Since there had been only one species of marihuana "naturalized" in the United States, the code makers adopted the so-called monotypic concept of this drug when the language of the statutes was drafted.

One of my constituents, Prof. James L. Reveal of the University of Maryland, has already been called as a witness in several court cases as a result of this anomaly in the drug laws.

He recommends a speedy change in the United States Code to include all species of cannabis in the prohibitions on the possession, sale, or use of this harmful drug.

The following letter to me from Professor Reveal will give Members much of the background related to this problem:

Hon. LAWRENCE J. HOGAN,
Representative from Maryland, House of Representatives,
Washington, D.C.

DEAR CONGRESSMAN HOGAN: One of man's oldest domesticated plants is *Cannabis*, variously called hemp, marijuana or cannabis. Cannabis has long been regarded as a multi-purpose economic plant, being a source of fiber, a medicine, an oil and an edible fruit. It is also known for its hallucinogenic properties, and it is in this latter regard that *Cannabis* has become best known to the general public under a variety of local, common names—marijuana or marihuana, grass, pot, etc.

In the scientific community, cannabis is generally referred to by its generic name, *Cannabis*. For our purposes, *Cannabis* had its formal baptism in 1753 when the Swedish naturalist Carl Linnaeus published the scientific name *Cannabis sativa* in his Species Platarum. We know that Linnaeus actually saw living plants of *Cannabis sativa*, and probably collected the specimens that still exist in his collection in England himself. This species, the hemp plant, was grown throughout much of Europe for its fiber, having come to Europe at least 1,500 years before Christ from Asia. By 1753, hemp had been established even in the Americas, for the Pilgrims of New England had brought this crop to North America in 1632.

In 1783, the French biologist Jean Baptiste Lamarck published an account of a second species of *Cannabis* which he called *C. indica* in the first volume of his Encyclopedia. Lamarck contrasted *C. indica* from *C. sativa*, noting the several morphological differences between the two species as well as the use of the former as an intoxicant. Apparently, the hallucinogenic aspects of *Cannabis* were either largely unknown to Europeans, or the plants of *C. sativa* which were being grow only for fiber, oil and seeds—were not particularly rich in the chemical compounds responsible for the hallucinogenic effects. Lamarck called attention to these differences, and wrote that the stems of *C. indica* were unsuitable for fiber as it had "a thin cortex rendering it incapable of providing fiber" (as translated from the original French), but he did note that *C. indica* was used by man for its intoxicating properties instead.

Since 1783, other species of *Cannabis* have been added to the genus. In 1812, Stokes proposed *C. macrosperma*, but this has proved to be identical to *C. sativa*. The name *C. generalis* was proposed by Krause in a 1905 German flora, but this too is a synonym of Linnaeus' name. A possibly good species was described from Indochina in 1917 by Crévost, which he named *C. gigantea*. Due to a paucity of material and critical observations, I and others have not been able to determine

if this is a valid species or merely a synonym of *C. sativa*. From the U.S.S.R., *C. ruderalis* was described by Janischewsky in 1924, and this entity is regarded as a good species.

As there has only been (until recently) one species naturalized in the United States, *Cannabis sativa*, the opinion has been expressed that the genus *Cannabis* is monotypic, i.e., the genus consists of but a single species. In the 1930's, when the laws regarding marijuana prohibition were enacted, the monotypic concept was largely accepted in the United States, although the committee hearings used several different species names and several publications—unfortunately mostly in Russian—held that the genus was polytypic, i.e., that the genus consists of more than one species. In the late 1960's when the current Federal laws were established, the polytypic concept was well known for in 1964, "Flora Europaea," a book on the plants of Europe which had to deal with the monotypic versus polytypic question, recognized the two species that occur in Europe; *C. sativa* and *C. ruderalis*.

The significance of this monotypic versus polytypic concept of the genus has moved from the realms of academic debate and study to the courtroom. Our current laws prohibit the use of only one species, *Cannabis sativa*, and do so in a most specific manner. As a result of recent publicity from court trials, lawyers have used the argument that the government must prove that the marijuana in question is *C. sativa* as called for in the statute. Concomitant with the developments in court is the fact that the growers of marijuana have stopped growing *C. sativa* for the drug trade, and have stated to grow *C. indica* almost exclusively.

The man on the street is now aware of the differences. It is possible that some growers wrap their marijuana in specially coded packages distinguishing between crops of *Cannabis sativa* and *C. indica*. The street price for *C. indica* is nearly three times higher than that for *C. sativa* currently in the Washington, D.C., area because one species is legal and the other is not.

It should be noted that all species of *Cannabis* produce tetrahydrocannabinol (THC), the chemical compound that causes the euphoric effect of marijuana. However, well-documented studies have shown that the amount of THC is much greater in *C. indica* than that found in most populations of *C. sativa*. As a result, the introduction of *C. indica* onto the streets of the United States could be significant.

As our current laws are very restrictive in defining the term "marijuana" I feel it is necessary to alter the definition to include all species of the genus *Cannabis*. I feel that this is urgently needed legislation as street jargon has apparently christened *C. indica* with the name "legal grass." Long-term debate can only delay those persons charged with the duty of protecting the citizens from the illegal use of a controlled substance.

Finally, let me say that the debate amongst my colleagues as to whether or not *Cannabis* is monotypic or polytypic is a discussion we all relish. More work has been done on this genus in the past few years than anyone could have foreseen, due to the problem of species definition. However, this debate should be amongst the taxonomists of the world via their usual channels of publication and not in the courtrooms of America. Quick action on your part will solve the legal problems of *Cannabis*, for I can guarantee that the discussion of one or more species of this genus will continue for years to come.

Thus, let the laws of the United States fall into line with those of most nations of the world which prohibit the use of *Cannabis*—any element of the genus—and not merely one species. I hereby submit to you the suggestion that the definition of marijuana in the Controlled Substance Act be reworded as follows:

Title 21, Section 802 (15) "The term "marihuana" means all parts of any plant of the genus *Cannabis*, whether growing or not, . . ."

This rewording would make it impossible for anyone to claim that a particular kind of marijuana is implied, and more importantly, all the chemist will have to do is prove that the material in question is *Cannabis* (and therefore marijuana) which they can now do with existing tests. Currently, there is no chemical test that will distinguish the various species of the genus.

Sincerely yours,

JAMES L. REVEAL,
Associate Professor of Botany.

[From the Washington Evening Star, Apr. 13, 1972]

"Maybe they're right, but I can't give it up."

WHITE PAPER
ON
DRUG ABUSE

September 1975

A REPORT TO THE PRESIDENT
FROM
THE DOMESTIC COUNCIL DRUG ABUSE
TASK FORCE

THE VICE PRESIDENT
WASHINGTON

September 29, 1975

Dear Mr. President:

I am pleased to submit for your consideration the White Paper on Drug Abuse prepared at your request by the Domestic Council Drug Abuse Task Force. The White Paper documents the principal findings of the Task Force, assesses the current extent of drug abuse in America and presents a number of recommendations for improving the Federal government's overall program to reduce drug abuse.

Drug abuse is one of the most serious and most tragic problems this country faces. Its cost to the nation is staggering: counting narcotics-related crime, health care, drug program costs and addicts' lost productivity, estimates range upwards of $17 billion a year. In addition to these measurable costs, the nation bears an incalculable burden in terms of ruined lives, broken homes and divided communities.

The Task Force believes that the optimism about "winning the war on drugs" expressed so eloquently and confidently only a few years ago was premature. It urgently recommends that the federal government reaffirm its commitment to combatting drug abuse and that public officials and citizens alike accept the fact that a national commitment to this effort will be required if we are to ultimately succeed.

The Task Force submits this White Paper in the knowledge that it does not provide all of the answers to solving the drug abuse problem. The issues are complex and changing and the Federal effort represents only part of the nation's total response. However, I believe that the recommendations contained in the White Paper provide a solid base upon which a re-invigorated national effort can be built.

The Members of the Task Force, the contributors to the White Paper and I appreciate the opportunity to have participated in this vital undertaking.

Respectfully submitted,

Nelson A. Rockefeller

The President
The White House
Washington, D. C.

DOMESTIC COUNCIL DRUG ABUSE TASK FORCE

RICHARD D. PARSONS, Chairman, Associate Director and Counsel, Domestic Council.

Special Assistant for Coordination of Foreign Narcotics Information, Central Intelligence Agency.

WILLIAM A. CARLSON (to July 31), Director, Office of Planning and Evaluation, Department of Agriculture.

JOHN FEDKIW (Dr.) (from August 1), Assistant Director, Economic Analysis and Program Evaluation, Office of Management and Finance, Department of Agriculture.

JAMES R. COWAN (Dr.), Assistant Secretary, Health and Environment, Department of Defense.

THEODORE COOPER (Dr.), Assistant Secretary for Health, Department of Health, Education, and Welfare.

ROBERT L. DUPONT (Dr.), Director, National Institute on Drug Abuse, Department of Health, Education and Welfare.

JONATHAN C. ROSE, Deputy Assistant Attorney General, Anti-Trust Division, Department of Justice.

JOHN R. BARTELS, JR. (to May 30), Administrator, Drug Enforcement Administration.

HENRY S. DOGIN (from June 1), Acting Administrator, Drug Enforcement Administration.

ABRAHAM WEISS (to August 12), Assistant Secretary for Policy, Evaluation and Research Department of Labor.

WILLIAM KOLBERG (from August 13), Assistant Secretary for Manpower Department of Labor.

SHELDON B. VANCE (Ambassador), Senior Adviser to the Secretary and Coordinator for International Narcotics Matters, Department of State.

DAVID R. MACDONALD, Assistant Secretary, Enforcement Operations, and Tariff Affairs, Department of the Treasury.

VERNON D. ACREE, Commissioner of Customs Department of the Treasury.

JOHN D. CHASE (Dr.), Chief Medical Director Department of Medicine and Surgery Veterans Administration.

HAROLD HORAN, Senior Staff Member, National Security Council.

EDWARD E. JOHNSON, Assistant to the Deputy Director, for Federal Drug Management, Office of Management and Budget.

Ex-Officio

RAYMOND P. SHAFER, Counsellor to the Vice President.

Additional studies indicate that as many as 16 percent of male high school graduates followed in a national sample had used cocaine at some time during the five years following graduation. There are other subpopulations in which use of cocaine is also high.

The data indicate that cocaine is used for the most part on an occasional basis (several times a month or less); usually in the company of others; and is likely to be taken in combination with alcohol, marihuana, or some other drug. Cocaine is not physically addictive.

About one percent of patients admitted to Federally funded treatment facilities reported cocaine as their primary drug of abuse; an additional 12 to 13 percent reported that they used cocaine in association with other drugs, mainly heroin. Thus, the data obtained from treatment programs and surveys generally reflect the fact that cocaine, as currently used, usually does not result in serious social consequences such as crime, hospital emergency room admissions, or death.[9] The implications of this conclusion are discussed later in this chapter.

In summary, although the rate of increase of first use of cocaine is alarming, significantly less is known about cocaine use in the United States than about the other drugs described in this assessment.

MARIHUANA[10]

Marihuana is the most widely used illicit drug, with an estimated 20 percent of Americans above the age of 11—25 to 30 million people—

[9] The phrase "as currently used" is important. The effects of cocaine if used intensively—particularly if injected—are not well known, but recent laboratory studies with primates, as well as reports of the effects of chronic cocaine injection during the early 1900's suggest that violent and erratic behavior may result. For this reason, the apparently low current social cost must be viewed with caution; the social cost could be considerably higher if chronic use began to develop.

[10] A great deal of controversy exists about marihuana policy. On the one hand, recent research indicates that marihuana is far from harmless, and that chronic use can produce adverse psychological and physiological effects. Therefore, its use should be strongly discouraged as a matter of national policy.

However, in light of the widespread recreational use—and the relatively low social cost associated with this type of use—the Federal Government has been deemphasizing simple possession and use of marihuana in its law enforcement efforts for several years. For example, very few persons are arrested by Federal agents for simple possession and use; those who are charged with this offense normally are also being charged with some other, more serious offense as well. However, vigorous law enforcement aimed at major *traffickers* has been and should continue to be undertaken at the Federal level.

The task force endorses this moderate view and expects the lower priority that has been established for marihuana will also be reflected in our demand reduction efforts by the elimination of many non-compulsive marihuana users now in our treatment system.

having used it at least once. In short, marihuana has joined alcohol and tobacco as one of the most widely used drugs in the United States.

Historical Trends

National attention first focused on marihuana following reports of widespread use during the mid-1930's. Discussion culminated in legislation which imposed Federal criminal sanctions against both the distribution and use of marihuana. Although proscribed by Federal law, the use of marihuana continued during the ensuing years, but at relatively low levels. Marihuana use was most common among urban minority groups and Mexican-American workers in the Southwest during this period.

A significant increase in the use of marihuana began to occur during the mid-1960's when its use became associated with artistic and anti-establishment life-styles; use then rapidly spread across geographic, demographic, and social boundaries.

The sources of supply have traditionally been Mexico, the Caribbean and South America. They remain so today.[11]

Current Situation

Rates of marihuana use have been rising steadily over recent years as shown in chart 10.

Chart 10

TRENDS IN THE USE OF MARIHUANA

EVER USED

	1968	1969	1970	1971	1972	1973	1974
National Sample of Adults	—	—	—	15%	16%	—	19%

National Sample High School Graduates	—	6%	9%	—	—	—	21%

[11] In addition, there is an unknown but presumed small amount of domestic growth.

Current estimates suggest that up to 20 percent of the general population over the age of 11 has used marihuana at least once, and that use is encountered in nearly all population groups. Over 40 percent of those who have ever used marihuana are current users, and at least half of the current users use it at least once a week.

Rates of use may be considerably higher or considerably lower, depending on the segment of the population under study. The highest rates of use have been reported among so-called "hippies" and high school dropouts. There appears to be a slight preponderance of males among marihuana users, although this distribution varies considerably from study to study. Other findings which occur consistently include the following:

- Urban residents use at higher rates than rural residents;
- Use is greater among those with higher levels of education and income;
- Use is more frequent in the northeastern and western United States than in other regions.

A recent development which is cause for great concern is the increasing availability of the much more potent marihuana derivations—hashish, and other preparations of high THC (tetrahydrocannabinol) content. Unlike common forms of marihuana, these potent drugs are known to have serious physical and social effects on the user.

DAWN provides some interesting data on various drug crises attributed to marihuana. During the nine months between July 1973 and March 1974, marihuana comprised only one percent of all emergency room drug mentions, but 51 percent of all crisis center drug mentions. This distribution of mentions by facility type reflects the kind of acute psychological problems likely to occur in association with the use of marihuana, with panic reactions or "bad trips" predominating over the more life-threatening reactions which would lead to appearance in an emergency room.

From a treatment point of view, data show that approximately 17 percent of patients admitted to Federally funded drug treatment programs from January to April 1975, reported marihuana as their primary drug of abuse.[12] There is considerable controversy regarding the interpretation of these data for a number of reasons. The frequency of use reported by these "primary marihuana abusers" is less than once a week for nearly 45 percent of the patients. It seems clear that these people do not have a serious drug problem and should not be in treatment. Most likely, they were referred to treatment by the criminal justice system, by schools, or by parents who were concerned about

[12] This includes NIDA, VA, and DOD. When NIDA is viewed alone, the marihuana figure is 21 percent.

the marihuana use. But when treatment facilities are full, this is a poor utilization of resources and these occasional marihuana users should not be occupying treatment slots. (Chapter 4 will develop this concept further.)

OTHER DRUGS

In addition to these four major categories of drugs, Americans abuse a variety of other substances.

Hallucinogens [13]

Except for the use of peyote in the religious ceremonies of some American Indian tribes, the use of hallucinogens is a recent development in the United States.

Limited, nonmedical use of LSD began in California in the 1950's, but was greatly accelerated in the early 1960's as publicity associated with its use grew. In the early 1960's this drug was diverted from legitimate research sources, but by 1964 illegal manufacture of LSD was established. Today, virtually all LSD in the United States is produced illicitly and, because only very small amounts are needed to produce an effect, it is easily concealed.

Hallucinogen use is very different from most other drugs. Addiction, or even extended regular use is very unusual. These drugs are rarely used more than twice a week. Since a major reason people use these drugs is to experience unusual mental effects, most users stop taking these drugs entirely after the "trips" lose their novelty.

Surveys of hallucinogen use show that most who use do so less than once a month, and that weekly use is very rare. None of the surveys support conclusively the widespread belief that these drugs are not as popular as they once were, but there has been a definite decline in the number of hallucinogen-related medical problems.

Hallucinogens can cause a number of side effects, including panic reactions and long psychotic or depressive episodes. Most reactions are unpredictable and the negative side effects can occur after several "safe trips." The possibility of medical side effects such as chromosomal or genetic change has neither been thoroughly documented nor entirely eliminated.

Solvents and Inhalants

These are chemicals that are used for a variety of medical, industrial, and household purposes, and can also be inhaled to produce intoxication. The ingredients of these products are often unknown to the purchaser, abuser or doctor treating an adverse reaction.

---

[13] LSD, (Lysergic Acid Diethylamide Tartrate), mescaline, psilocybin, peyote, etc.

Very little is known about the pharmacology of solvents. Partial tolerance may develop, and the effects of these substances are intensified when used with other depressants, especially alcohol.

Data on solvent use are sparse. The few available surveys indicate that about 7 percent of junior and senior high school students may have inhaled solvents once or twice and that about one percent of these experimenters continue to inhale periodically.

Volatile substance abuse occurs almost exclusively among the young, perhaps because solvents are often the most readily available intoxicants to children. Accordingly, maturing out of the inhalant habit is the general rule. Even heavy users will persist for only a few years, and then abandon solvent sniffing by their teens. (Many of these individuals, however, then begin the excessive use of alcohol, barbiturates or other substances.)

The fact that solvent inhalation lasts for such a short time for most users leads to the conclusion that it is primarily a reflection of the immaturity of those young people who become involved with it. Nonetheless, abuse must be monitored and action taken as appropriate. One simple action might be to use unpleasant additives in the manufacturing process. Further, the task force believes that the intervention efforts using peer groups discussed in chapter 4 will help some young people resist the pressure to experiment with these substances if and when the inhaling of solvents becomes temporarily popular among their friends.

B — DRUG PRIORITIES

One of the major themes of the Federal strategy discussed in chapter 1 was the importance of differentiating in terms of the particular drug of abuse, and the frequency and quantity of use. Implicit in that decision to differentiate is the assumption that public policy should be most concerned with those drugs which have the highest costs to both society and the user, and with those individuals who have chronic, highly intensive patterns of drug use.

In order to determine the social cost of a particular drug, we should consider the following factors:

- *The likelihood that a user will become a compulsive user, either physically or psychologically dependent on the drug:* closely linked to this concept is the ability of the drug to produce tolerance, requiring successively higher intake to achieve the same result.
- *Severity of adverse consequences of use, both to the individual and to society:* in terms of criminal behavior, health consequences, economic dependence and the like. (This is discussed in greater detail below.)

- *Size of the core problem:* the number of compulsive users who are currently suffering (or causing others to suffer) adverse consequences.

ADVERSE CONSEQUENCES TO THE INDIVIDUAL

The adverse consequences of drug use are of two types: consequences which are the direct result of drug use, and indirect consequences which are associated with drug use. *Direct* consequences include:

- *Illness or death:* Illness or death can occur from overdose, a severe toxic or allergic reaction to a drug, or from rapid withdrawal. In New York City, drug-related deaths are a major cause of death for males aged 15 to 25. Death due to drug abuse is often the result of ignorance—ignorance of possible contaminants in drugs, ignorance of the danger of using combinations of drugs, ignorance of the strength of the drug purchased and of techniques to determine nonlethal doses. If drug use affects reproductive organs, or when certain drugs are taken during pregnancy, a second generation may suffer casualties.
- *Acute behavioral effects:* The paranoia produced by intravenous injection of amphetamines can cause violent behavior and consequent criminal acts such as rape and homicide. Acute paranoia and extreme anxiety from the effects of hallucinogenics, and depression (in the withdrawal state) from stimulants such as amphetamines, are other examples of behavior effects.
- *Chronic behavioral impairment:* Adverse behavioral effects may also be chronic as with the inertia, apathy and depression associated with long-term heroin use. Also, impairment can be measured in things such as loss of productivity, health costs, welfare assistance, and criminal costs.
- *Intellectual Impairment:* Some evidence of intellectual impairment has been reported by clinicians on the West Coast. Specifically, mental status evaluations of chronic users of hallucinogens who stopped after two or more years revealed a clinical impression not unlike that of mild chronic brain disease.

Indirect consequences include:

- *Injury or death associated with impaired judgment:* Potent, mind-altering drugs such as LSD can affect judgment, which may for example, result in accidental death by succumbing to bizarre hallucinations, such as believing one can fly. Even a "mild" drug such as marihuana may distort preception and thus increase the risk of death in automobile accidents of either a driver or pedestrian.
- *Injury or death associated with conditions of use:* Poor nutrition and neglected hygiene stemming from the total focus of energy

on obtaining drugs can cause damage to vital organs. Transmission of viral hepatitis from shared needles is another medical problem of drug abusers. Young people in the drug culture are particularly susceptible to pneumonia. Infections associated with injections using unsterile needles may be fatal.

- *Developmental difficulties:* The potential for personality impairment due to drug use is an important consequence, but one difficult to assess. There are crisis periods in the course of every individual's development, but adolescence is a particularly vulnerable period because the individual seems inundated with crises. These crises provide an opportunity for growth, formation of new ideas, and the emergence of a healthier and more mature personality. The use of drugs as a means to deal with these crises may diminish, delay, or prevent this maturation process.
- *Barriers to social acceptance:* The public image of the drug user is extremely negative; thus, the user is often stigmatized, making it extremely difficult for a current or former drug user to find acceptance in society. Moreover, arrest and conviction for violation of drug laws results in the creation of a criminal record which may follow a user for the rest of his life.

ADVERSE CONSEQUENCES TO SOCIETY

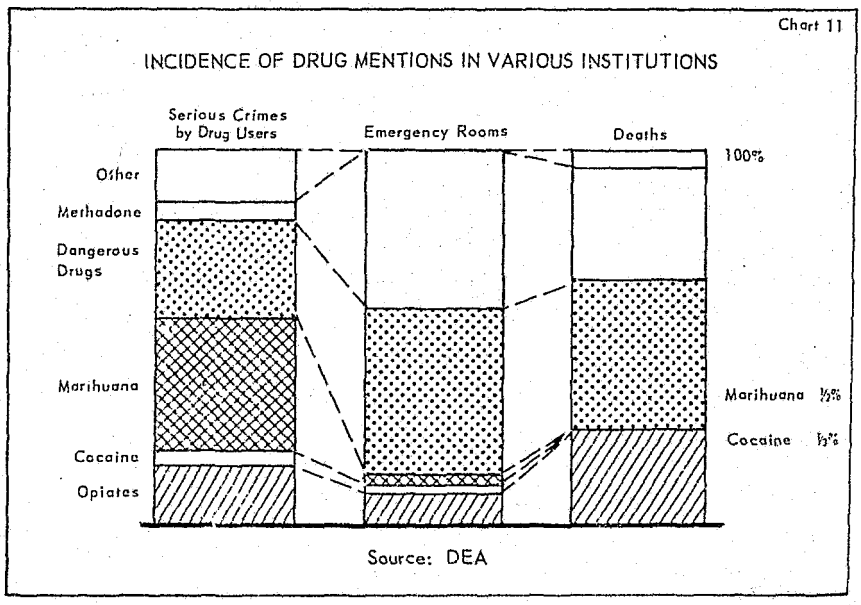
Obviously the above adverse effects to individual drug users are society's loss, too. But there are also more directly measurable costs to society. A recent study estimated that the total measurable cost of drug abuse—direct program costs, health care costs, property losses attributable to drug-related theft, and lost productivity—was $10 billion to $17 billion per year.[14]

Still another way to look at the social cost of drug abuse—one which is of particular interest in this discussion of drug priorities because it can be broken down by drug—is to look at drug users' appearances in the various institutions we have established to deal with people in trouble.

Among the largest and most important of these institutions are the welfare system, the criminal justice system, and the health care delivery system. Drug users often appear in these institutions, and may be identified as users. If we assume that at least part of the reason for their appearance is drug use, the frequency of appearance provides one rough indicator of the magnitude of the social cost of drug abuse.

[14] Social Cost of Drug Abuse, Special Action Office for Drug Abuse Prevention, 1974; This excellent survey is summarized in the *Federal Strategy, 1975.*

Our capability to monitor these appearances is irregular and limited in scope, but some data exist. Chart 11 illustrates the fraction of drug users who had used various drugs prior to their appearance in three different places where people in trouble show up: the criminal justice system (serious crimes only);[15] emergency rooms and medical examiners' offices.



SUMMARY: DRUG PRIORITIES

Chart 12 ranks the various drugs according to the following criteria: (1) likelihood that a user will become physically or psychologically dependent; severity of adverse consequences, both (2) to the individual and (3) to society; and (4) size of the core problem.

---

[15] The large proportion of marihuana mentioned is probably a reflection of its widespread use in society.

Chart 12

SUMMARY OF DRUG PRIORITIES

		DEPENDANCE LIABILITY	SEVERITY of CONSEQUENCES		SIZE OF CORE PROBLEM
			PERSONAL	SOCIAL	
HEROIN		HI	HI	HI	HI 400,000
AMPHETAMINES	NEEDLE	HI	HI	HI	HI 500,000
	ORAL	LOW	MED	MED	
BARBITURATES	MIXED	HI	HI	HI	MED 300,000
	ALONE	MED	HI	MED	
COCAINE		LOW	LOW	MED	LOW
MARIHUANA		LOW	LOW	LOW	LOW
HALLUCINOGENS		MED	MED	MED	LOW
INHALENTS		MED	HI	MED	LOW

Though the data are flawed and the rankings therefore imprecise, a clear pattern emerges.

- Heroin ranks high in all four categories;
- Amphetamines, particularly those injected intravenously, also rank high in all four categories;
- Mixed barbiturates rank high three out of four categories;
- Cocaine,[16] hallucinogens, and inhalants rank somewhat lower; and
- Marihuana is the least serious.

On the basis of this analysis, the task force recommends that priority in Federal efforts in both supply and demand reduction be directed toward those drugs which inherently pose a greater risk to the individual and to society—heroin, amphetamines (particularly when used intravenously), and mixed barbiturates—and toward compulsive users of drugs of any kind.

This ranking does not mean that *all* efforts should be devoted to the high priority drugs, and none to the others. Drug use is much too complicated and our knowledge too imprecise for that. Some attention must continue to be given to all drugs both to keep them from exploding into major problems and because there are individuals suffering severe medical problems from even a low priority drug, such as marihuana.

[16] This ranking is on the basis of current use patterns. As mentioned earlier, if intensive use patterns develop, cocaine could become a considerably more serious problem.

However, when resource constraints force a choice, the choice should be made in favor of the higher priority drugs. For example:

- In choosing whom to treat, we should encourage judges and other community officials not to overburden existing health facilities with casual users of marihuana who do not exhibit serious health consequences. (But, a person who is suffering adverse consequences because of intensive marihuana use should have treatment available.)
- In assigning an additional law enforcement agent, preference might be given to Mexico, which is an important source of both heroin and "dangerous drugs", rather than to Miami, where an agent is more likely to "make" a cocaine or marihuana case.

This drug priority strategy is essential to better targeting of limited resources and it will be further addressed in relation to supply and demand reduction activities in chapters 3 and 4. Further, the process of assessing the current social costs of drug abuse should be a continuing one, to ensure that resources are allocated on the basis of priorities which reflect current conditions and current knowledge.

[From the Christian Science Monitor, Oct. 16, 1975]

MARIHUANA: UNDERMINING THE LAW

(An Editorial)

No one can fail to sympathize with the enormous difficulties of enforcing marihuana laws in the United States. But for a presidential task force to recommend that marihuana be given low priority in the government's fight against illicit drugs is no less than astonishing. It undermines the law and indeed the very spirit of law. For it says in effect: If you cannot carry out the law, turn your back on it.

That is far from a constructive approach for the White House to take as the nation seeks to uplift moral integrity in government and a respect for law and law enforcement. If the American people indeed believe that marihuana laws are no longer valid or useful, the right course is to rescind or revise them. The task force, working under the White House Domestic Council, attacks the problem from the wrong end.

It should be noted that the report is not unanimously supported. An addendum to it by the Treasury Department and Bureau of Customs warns against a policy of enforcing only selected drug laws. In its words, "Enforcement must be evenhanded and comprehensive to be effective and corruption-free. To diminish efforts against marihuana and cocaine can only erode further respect for law and law-enforcement officers."

To remove marihuana entirely from the purview of law would be foolhardy and dangerous. We are not unmindful of the growing sentiment for relaxation of marijuana laws because of the alleged harmless of the drug. But the fact is that there is yet no conclusive evidence that marihuana is *not* injurious to one's health and indeed mounting evidence that it does have negative effects. Until further studies are made and the scientific community can reach some consensus—and this may take another four or five years—it is surely prudent to keep sanctions against the spread of the drug's use.

Nor should the public forget the link which marihuana has with the sale of hard drugs and with criminal activity. Commissioner of Customs Vernon Acree, a member of the task force, reportedly filed a sharply dissenting letter describing illicit marihuana distribution as a growing multibillion-dollar business linked with organized crime.

True, the task force does not advocate less vigorous enforcement of the law against the major traffickers of marihuana but only a deemphasis on arrests for possession and use of it. Yet if leniency with users is declared to be national policy, this would certainly embolden the traffickers.

It is to be hoped that serious thought and discussion will now be given to this issue. The President has ordered all federal agencies dealing in the field to study and respond to the task force report within 60 days. They will confront some sobering statistics in the report, such as the fact that the use of heroin and deaths from usage have been gradually increasing since 1974. The "situation is deteriorating," the report warns.

The federal agencies might bear in mind the finding of many studies as they assess the task force recommendations: Users of heroin start on marihuana.

[From the Christian Science Monitor, Dec. 8, 1975]

MARIHUANA

Your recent editorial, "Marihuana: undermining the law," is receiving close and thoughtful assessment among Domestic Council members responsible for publication of the "White Paper on Drug Abuse." Our consensus is this: your editorial misinterprets the white paper's balanced and moderate statements on marihuana.

Simply put, the magnitude of the drug problem and the fact of budget and manpower constraints force us to attempt to utilize limited resources in a way which has the greatest impact on reducing the social cost of drug abuse. All drugs are not equally dangerous and all drug use is not equally destructive. Common sense would seem to dictate that we give priority in our law enforcement and treatment efforts to those drugs which pose the greater risk to society and to individual users. Based on current knowledge and use patterns, heroin, amphetamines and barbiturates appear to be the highest risk drugs.

This does not mean that all efforts should be devoted to high priority drugs and none to the others. You may rest assured that the federal government has no thought of abandoning marihuana control efforts. Federal law enforcement will continue to focus on major traffickers of all drugs, including marihuana. Such enforcement efforts are and will continue to be augmented by states and municipalities. Treatment and rehabilitation projects will remain open to compulsive marihuana abusers. Research teams will continue to seek confirmation of indications, preliminary as of now, that marihuana does indeed cause serious health consequences for abusers.

RICHARD D. PARSONS,
Associate Director and Counsel,
White House Domestic Council.

The Rape of Mary Jane

By Lynn Darling

"If the cannabis epidemic continues to spread at the rate of the post Berkeley period, we may find ourselves saddled with a large population of semi-zombies. . . . If the epidemic is not rolled back, our society may be taken over by a 'marijuana culture'—a culture motivated by a desire to escape from reality and by a consuming lust for self-gratification, and lacking any higher moral guidance. Such a society could not long endure."—SENATOR JAMES EASTLAND

"It is now much too late to debate the issue: Marijuana versus no marijuana. Marijuana is here to stay. No conceivable law enforcement program can curb its availability."—Consumer Reports

"Dope will see you through times of no money better than money will see you through times of no dope."—ANCIENT PROVERB

There's been quite a lot of talk about marijuana lately. In Senate hearing rooms and at weekend conferences, through forests of medical reports, press releases, and prepared statements, reasonable men in well-cut suits and with impeccable credentials talk of marijuana and advocate the lifting of criminal sanctions against those who used it.

They talked in ways once wildly alien to their subject, using, as was natural to them and to those they sought to convince, the terms of the marketplace to buttress their arguments. They spoke of the time and money wasted in prosecuting offenders, of the useful lives destroyed by arrest records, of a generation of young people forever alienated from whatever passes for the system these days. Statistics swirled through their analyses like leaves in a November storm, but all they really said about marijuana was that they were resigned to its presence. Not in deference to the threat it once symbolized, but because that threat is gone now and because a symbol without the tides that forced it to the surface is harmless.

It was, of course, all very gratifying to the multitudes of grass smokers to hear Congressman Ed Koch and Senators Harold Hughes and Jacob Javits express their determination to get dope decriminalized in the next legislative session, to read Ann Landers huffily informing an outraged reader that there was no sense in arresting people for smoking the stuff, and to watch Dr. Robert Dupont, chief Administration spokesman on drug abuse, go through death-defying semantic somersaults in an effort to endorse the lifting of criminal penalties without officially saying so.

But it was also outrageous, this talk—not because what was said was new or different or startling, but precisely because it wasn't. Five years ago, marijuana was a phenomenon, frightening, mysterious, renegade, and what you had to say about it said a lot about a number of things; how you felt about the war, for instance, and the kind of life you led, your proximity, perhaps, to madness. Now grass is in a cultural no man's land, nothing, really, to get excited about, but lacking any kind of official societal imprimatur. Its prosaic nature is underscored by the interminable comparisons to alcohol and tobacco, as it becomes slowly relegated to the status of mere social lubricant, something to be categorized, studied, and, it seems, accepted. No longer the tattered banner of a generation of self-proclaimed outlaws, it has finally entered the arena of the mundane, its fate in the hands of the architects of the status quo—doctors and lawyers, Senators and city councils.

It was different once, and these latest reports and political endorsements call forth specters of just how it was different, in a time too recent to be clouded in nostalgia but already too far away to feel the sharpness of its pain. The '60s. Remember? A rag-tag army was about, capturing media headlines, asking questions, demanding answers, delighting in its differences and in the cultural shock waves it sent forth. The recruits were young for the most part, drafted from safe suburban cloisters that had given them everything, given them nothing, given them a war to hate. Smoking grass back then came down to the war in the way that everything then seemed to come down to the war.

Vietnam was not a mere political issue, anesthetized on an operating table, to be

ILLUSTRATED BY BOB BARKIN

How the Deadly Marijuana Reefer Was Transformed from the Scourge of Western Civilization and a Revolutionary Cultural Symbol into a Smokable Middle-Class Cocktail, a Legal-Legislative-Bureaucratic Mess, and Not Such a Big Deal After All

analyzed and dissected rationally and without emotion in the ways its promoters favored. No, to be against the war was nothing less than a way of life, in the most trenchant reading of that phrase. Its opponents did not see Vietnam as some strange anomaly, to be examined against the background of a hearty American optimism. To them, it *was* America, and it made every aspect of the society that supported it suspect, almost indecent, every facet of the national character absurd. It forced re-examination of the status quo, from its broadest proconceptions to the swarms of minutiae that buzzed around it. Every act, every decision, became a statement the forms one's pleasure took as important a declaration of principle as the moratoriums and the marches.

"The connection seemed so obvious at the time," a friend of mine, a veteran of those days, recalls. "If the Vietnam War was all that the alcohol generation had managed to produce, then screw it. My friends and I, we thought that the world would be a better place if everyone would just get stoned. I thought my life was the natural and desirable opposite of the war. Lighting up a joint was an act of rebellion. You took pride in it, you were breaking a law of a society you felt no allegiance to. But then, I also took pride in not putting dimes in parking meters at the time."

Above all, the war provoked passion, torrents of outrage that tried to sweep away all the brackish, abandoned rituals that came before it. Its opponents proclaimed their innocence, screamed it, brandished it, disavowed all complicity in what they saw to be a vast, all-encompassing guilt. The lines were clearly drawn by the media and by the opposing forces themselves, the demarcation always self-evident throughout a cultural upheaval with more twists and turns than a badly rolled joint. There were "them" and there was "us"—the one massive, monolithic, the keeper of the army's childhoods and, it was feared, the wardens of their futures; the other raucous, self-consciously outrageous, junkyard angels recklessly making their way through the tricky existential terrain. Straights and freaks. The divisions between the two seemed unalterable, absolute. There was, it was whispered, no going back.

Innocence, however, must be protected, and passion nurtured through customs and ceremonies of its own. The abandonment of one set of rituals demanded the creation of new ones to reinforce an identity, distinguish the faithful and make them recognizable to one another. Rituals, as they have always done, could defend the new world against the horrors that had created it. There were not only new political models but cultural and social ones as well. And to this end, symbols were essential.

The true nature of one's commitment to change and the degree of alienation could only be measured by the ways in which one chose to put principle into practice—the degree of militancy endorsed, which products of the corporate state one avoided, the ways one tried to relate to friends and lovers. On these things people might differ, but the banners and the rallying cries that developed around the ideology remained the same, provided some constants, and reinforced shared assumptions. The long hair, faded jeans, and gaudy beads and bangles seemed to many on the outside to be a uniform as constricting in its own way as three-piece suits and understated jewelry, but they were more than that. They signified a conscious effort, at least in the beginning, to fuse style with content, to translate the adoption of new attitudes into the esthetics of day-to-day living.

In the end, they helped to create a community, however tenuous, something around which to form an identity and to stop a war. Even outlaws need intimacy and, as one young lawyer now working in a Congressional office remembers, "You trusted people who wore their hair long, dressed in jeans, and smoked dope. You really thought of them as your brothers and sisters, although that sounds so strange to say now. You felt that with them you had the power to change everything and the commitment to try."

The importance attached to style back then often managed to create strange new heroes and bizarre standards of excellence. A friend points to his own experience one summer in Paris when he was

involved in the the counterculture: "I met this young guy there named Carlos and I was convinced he was the most amazing and worthwhile person I had ever met. I was awed by all the impressive things he'd done. These are the things that impressed me so much. First, Carlos lived in Los Angeles and Frank Zappa thought he was so weird looking that he asked him to be a go-go dancer at his concerts. Then he went to San Francisco and took speed for a year without dying. Then he went to Paris and he looked so weird that he was asked to join the Paris production of *Hair*. Then one day he walked down the Rue de Rivoli and he looked so weird that Salvador Dali asked him to tea. See what I mean? Very impressive. Every morning Carlos would stand on the balcony of his apartment and say 'Life is so beeuteeful. I am so beeuteeful.' And this was a guy whose only attribute was that he looked like a woman who had been run over by a steamroller. The narcissism of that time was incredible. Sometimes all that really mattered was a good performance."

Marijuana, of course, was the most potent symbol of the tumultuous decade, both for those on the outside looking for clues as to what was going on and for those on the inside who smoked it. It was both condiment and catalyst, highlighting at times the despair with which one looked at the world, banishing it at others in exchange for a gleeful euphoria. Dope, it seemed, could do anything. As Annie, who smoked and still does, recalls, "I got high to work and high to relax. I smoked to write letters to my friends so I wouldn't bullshit and to write to my father so I could. It was a revolving door really. The more I smoked dope, the more I realized the world was crazy, and the more I realized the world was crazy, the more I smoked dope. When you find yourself in an existential mire, you get high not to get out of the swamp, but to appreciate the fact that you're up to your waist in it and to be able to simply recognize it as a condition."

To smoke grass back then was not only a rejection of the mundane and the system that supported it, but an affirmation of one's status as a renegade. The decision to try it was exotic and dangerous, putting the initiate right up there with Patrick Henry and Jesse James. It was a rite of passage, signifying the coming of age in absurd America, an act no less awesome than the losing of one's virginity. It was a malleable tool, the means to many ends. There were those who thought it would help them find the key to the secrets of the universe, or, failing that, the one to the front door. For most, however, it was simply a lot of fun. Not, like alcohol, a prerequisite to fun, but the parameters of pleasure itself. Smoking dope seemed to create the world anew, transformed even the most boring of tasks into an exotic adventure. A trip to the supermarket while stoned made the conquest of Everest seem by comparison like, well, a trip to the supermarket. Marijuana enriched the new culture, gave it its own unique myths, legends, music, vocabulary, and sense of humor.

In many ways, the experiences associated with smoking grass seemed at the time to provide a good counterpoint to the prevailing notions of ambition and success. Hard work, self-sacrifice, and unblinking motivation had got us into Vietnam; it had robbed one's parents of their freedom. Suddenly there was no future worth sacrificing the present for. If you believed, as many did, that the world was about to destroy itself, it was all you could do to enjoy the trip, which, after all, was what getting high was all about. Smoking dope didn't alleviate the pain, answer the questions, or bring down the Establishment, but it was what you did when you weren't doing these things. It was the best way to spend the time waiting for whatever it was you thought was sure to arrive. Apocalypse. Revolution. Madness. Whichever came first.

Somehow, finally, it came to an end. Looking back, it's hard to say just how or when—some say it was Kent State, others the day they realized their theses were due in a month. No matter. In time the movement or counterculture or whatever it was called exhausted its options with a dizzying, terrifying speed, culminating in tawdry little parodies of itself. Yippies, zippies, and 50 factions of SDS collided with teenage gurus, primal screams, transvestite liberation, and a thousand other mad little mockeries, each of them screaming at one another like sideshow barkers at a county fair, screaming into the night after there was no one left to listen. Somehow, too, the war ended, after a fashion—no searing *mea culpas*, no reclamation of principle, simply a semantic victory called peace with honor.

The system, it seemed, would stagger on: its opponents grew older, became exhausted. The movement had answered, or at least endorsed the asking, of many questions, fearful questions. But it had nothing to say about need and the awkward, embarrassingly personal ways in which it betrayed itself. Marches and mass meeting provided no catharsis for rejection or jealousy or vulnerability. Ultimately a decision had to be reached—some went up to the mountain, others underground, most simply survived.

The meaning of the moment gradually disappeared, but style is made of sterner stuff. The college students may have decided to give electoral politics and the nine-to-five routine another chance, but jeans were still comfortable (after hours) long hair (within limits) still attractive, and grass still fun to smoke. And once the rage and threats and, yes, the godforsaken novelty of it all had passed, the style became marketable to those for whom it had no context, for those who didn't know RYM I from I or a Trotskyite from a macrobiotic dinner.

The accoutrements of the counterculture, it turned out, had two things going for them, sex and youth. Jeans became chic, long hair fashionable, and marijuana intriguing. Threatening no longer, but with just enough of the forbidden about it to make it exciting. One lawyer who handles a lot of possession cases says he knew that marijuana was becoming middle class when housewives started approaching him at parties asking him if he could get them a joint. "They told me they had heard it was very 'sensual,' " he says with a shrug. "I think maybe they'd been reading *The Joy of Sex*."

Some veterans of the generation gap find all of this most annoying. "You know," said a friend of mine, thoughtfully sipping his Scotch and soda, "it may have been the function of our generation to obliterate ourselves on drugs so that people a little older and a little younger than us could five years later pick up a joint instead of a can of beer."

Perhaps he's right. Now, lots of people smoke marijuana, 26 million in the country. The college students and the street freaks graduated from their respective

halls of learning and became lawyers and secretaries and shop clerks and bureaucrats, and they still smoke and now their younger brothers and sisters do too. Treasury Department officials smoke. So do construction workers. There is no more "us" and there is no more "them," and marijuana is beginning to have all the symbolic content of a vodka martini.

Not that people don't get excited about smoking it anymore, it's just that most of the ones who do are either under 20 or over 35. Well, maybe not even them. My friend Simon is 16, has smoked for three years, and he smiles tolerantly when asked about marijuana. "Look at it this way," he says. "The only reason you smoke dope is to get stoned. And the only reason you get stoned is because it's fun and because it makes everything a lot better. What more can you say?"

Not much, it seems. Asking people why they smoke marijuana these days or why they don't is like asking them why they drink a particular brand of bourbon or why they're unfaithful or why they're never on time. It's like asking them why they perform any of the other prosaic routines of their lives, rituals graceless and meaningless in themselves, important only when they happen to reflect a glimmer of poignancy or need. There was a time when marijuana seemed a symbol of something, a statement of conviction and community, a talisman of change that seemed inevitable and euphoric. That time, of course, is past, and the things that marijuana was made to mean seem as sadly ephemeral and insubstantial as the smoke that wafted up from the pipes and joints passed in the darkened rooms and demonstrations.

Now some people smoke grass because of the still lingering whiff of illegality it exudes, some because they think it's chic, and some because of what it used to say about the people who smoked it. But mostly they smoke it because it's there and because their friends do and because they enjoy it. It is becoming, finally, as mundane and boring as most of the other things people do to make themselves feel a little better and their world a little more comfortable.

If, as many signs indicate, the laws against marijuana use soon are liberalized, much of the credit will belong to the National Organization for the Reform of Marijuana Laws (NORML), housed in a townhouse on M Street.

Although the organization does not, God forbid, advocate the use of marijuana, it urges that it be decriminalized, and the means it uses to achieve that end are a far cry from the smoke-ins that the kids once used to try to convince their elders. NORML staff members lobby on the Hill and in state legislatures, refer people busted on marijuana charges to lawyers, provide witnesses and information to those challenging the law across the country, and put out volumes of literature aimed at proving that it is the law and not the weed itself that is harmful to users.

Started in 1971 by Keith Stroup and Larry Schott, who were then working for the President's Commission on Product Safety, the organization now has more than 10,000 dues-paying members and an annual budget of $200,000, derived in equal part from membership fees, the Playboy Foundation, and sales of a motley assortment of merchandise from belts to bumper stickers to gold pins and Christmas cards.

According to Schott, he and Stroup first became interested in doing something to change the laws when "a friend of ours got busted and we saw just how big a hassle it could be." Their experiences in government had taught them something about what worked on Capitol Hill and what didn't, and from the beginning they decided that movement tactics and counterculture rhetoric wouldn't work.

"We decided, why not try the traditional methods to change the law," says Schott. "Instead of protest marches, we'd try the common middle class approach."

It's an approach that works. NORML has helped to reduce the penalties for possession in several states, including Texas, which until last year had the most severe penalties in the country—two years to life for possession of any amount. Currently, the group is trying to convince the Drug Enforcement Administration (DEA) to remove marijuana from its Schedule I classification, which puts it in the same category as heroin and cocaine. They also have filed a landmark suit in District Court asking that possession laws be declared unconstitutional on grounds they violate the right to privacy, and they will be lobbying intensively this year for various decriminalization bills pending in Congress and in state legislatures.

Last fall, NORML held a three-day conference here to bring its members up to date on the latest developments in the marijuana crusade. If such an event conjures up images of a thousand stoned out freaks sitting around passing joints, getting laid, and trading brownie recipes, forget it. The whole affair was about as rowdy as a dentists' convention. Most of the conference's 150 or so participants were white and male and close to the untrustworthy side of 30; dressed in dapper suits with neatly trimmed hair, they each paid about $60 apiece to turn on their color TVs and to sleep in the Key Bridge Marriott Hotel's idea of tasteful comfort.

Which is not to say there weren't a few flamboyant throwbacks floating about. Several New York Yippies were there, doing what they do to make a living these days—selling good dope at correspondingly steep prices to the affluent bourgeoisie. And then, of course, there was the resident eccentric—a strange-looking fellow in blue suede cowboy

Acapulco Gold: Registered Trademark?

One of the legends dear to dope smokers maintains that large American tobacco companies have been preparing quietly for the day marijuana is legalized. Liggett & Myers, the American Tobacco Company, et al have drawn detailed marketing plans on the best ways to sell legal grass, the rumors have it, and they have registered official trade names—"Panama Red" and "Acapulco Gold," known to users as two of the more potent strains of marijuana—with the US Patent Office. When the blessed day of legalization finally comes, it will take a mere flick of the corporate wrist to package the grass and haul in the profits. It's a great rumor, except that it ain't so.

"Look," the man at the Patent Office explained, "The truth is, honey, you can't register a trademark unless you're already selling a product in interstate commerce. You can't do it ahead of time, so unless those companies could prove that they were already selling the stuff across state lines, they couldn't register a name for it. You know, we get calls like this all the time. Funny how rumors like that get started, isn't it?"

boots who stalked about with a huge plastic marijuana plant, burning sticks of incense, inspiring everyone concerned to increasingly creative suggestions as to what he could do with both items. But the main attraction of the conference—the speakers and panel members—were as respectable as a prayer breakfast.

Dr. Robert Dupont, whose close-cropped blond hair and horn-rimmed glasses make him look like an overly earnest 1950s fraternity brother, was there; so was Dr. Dorothy Whipple, a 73-year-old Washington pediatrician who can cut entire state legislatures down to size with a single grandmotherly admonition; Dr. Lester Grinspoon of the Harvard Medical School was there, as well as DC Superior Court Judge Charles Halleck and a plethora of district attorneys, scientists, and politicians. Such people lend dimension to the respectability which is one of NORML's most effective attributes—with it, the organization hopes to de-emotionalize the marijuana issue, insuring that its future will be decided in terms of logic and rationality.

This was NORML's third conference, and the marked difference between this gathering and the original says a lot about where the issue has gone in the last two years. Except for a few unregenerates, Stroup and most of the NORML membership remember that initial foray with something of a wince. Blithely entitled the People's Pot Convention, it was held in the middle of the week and everyone interested was invited free. The results were inevitable—several hundred freaks, clouds of dope, and a bust by the local vice squad.

This year, however, there were long panel discussions on all aspects of marijuana. There was a medical panel, in which experts in specialties from toxology to immunology blew holes in many of recent negative medical findings; a legislative panel in which Congressman Ed Koch and a number of state legislators talked of ways to pass pending decriminalization bills; a legal panel that discussed the status of various constitutional challenges, and a lawyers' meeting where trade secrets were exchanged on how best to get a client off a possession charge. There even was a panel on fund-raising, complete with charts and figures on cash disbursements and fixed assets acequired. Only in the media panel, where journalists from the *Washington Post*, *Time* magazine, and the wire services discussed the widespread publicity given to negative medical reports without corresponding attention to detrimental legal effects, did the delegates permit themselves a few expressions of righteous indignation. "If 420,000 arrests a year aren't news," said one delegate, "then we owe King George an apology."

Throughout it all, delegates discussed arguments designed to turn objections against decriminalization neatly on their heads. Nowhere was this more apparent than at the panel led by what Stroup described as "our token in-house conservatives," who took on the question of marijuana's hydra-headed public image.

"What you've got to understand," said Paul Kuhn, NORML's state coordinator for Illinois, "is the national mood. The country is tired of change, it's reluctant and fearful. That's why conservatives are badly needed on this issue."

But Kuhn warned of the necessity first to destroy the lingering image that surrounds marijuana for many social conservatives. When such people think of the drug, he said, they still think of a "bunch of goddam hippies, protesting the war every day and going home each night and shacking up."

"Ah," came the nostalgic sigh from one member of the audience, "those were the days."

On Saturday night, NORML threw a party. Your typical young middle class get-together really. Rock music of the unobtrusive sort drifted among the knots of people who stood about eating pâté and french bread and smoked the passing joints as nonchalantly as they sipped their champagne. It was all very pleasant in the ways traditional to such gatherings, where people who don't really know each other all that well search for common ground,

or at least some artificial turf, on which to rest comfortably for a few hours. All in all, a far cry from what the newspapers used to call "pot parties." No one goes to parties simply to smoke dope anymore, and no one really thinks about the fact that they don't. Still, there were those that night who seemed to sense the oddness of it all.

"I don't know," said the long-haired girl in the bluejean skirt as she took one last look at the party, "It's post-60s, post-war, post-brother and sister, post-women's lib. It's even post-dope. I just don't know what it is."

"It's late," said her companion. "Let's go."

Politicians and district attorneys and bleeding heart liberals may be running around telling folks that marijuana is no big deal, but Senator James O. Eastland knows better.

Last spring, as chairman of the Senate Subcommittee on Internal Security, he held hearings on the marijuana issue, blandly announcing that he would hear no one who did not have something negative to say on the subject, a move that some cynics suggest was not unaffected by the fact the subcommittee was then operating under the threat of stiff appropriations cuts. After the last witness had spoken his piece and the report was published, it came as no great surprise to anyone that the Mississippi Democrat had found marijuana to be just about as harmless as a cholera epidemic. In fact, the Eastland report contends, marijuana is nothing less than a tool for the New Left to be used in the conversion of our nation's youth to the radical overthrow of the government. Subcommittee staffers also will tell you that marijuana "addiction" leads to street crimes, turns people into "semi-zombies," and leads not only to irreversible brain damage, but to the possible destruction of Western civilization.

Such anachronistic outpourings would merit little more than a tolerant smile if Eastland were not chairman of the Senate Judiciary Committee, which has jurisdiction over all drug control laws and which will be considering this year a bill introduced by Senators Harold Hughes and Jacob Javits to decriminalize marijuana. Although Eastland himself doesn't think much of jail terms for possession offenders, he thinks even less of proposals that would eliminate all criminal sanctions for possession of minor amounts and for the non-profit sale of the drug, which is the basic thrust both of the Javits-Hughes proposal, as well as its House counterpart introduced by Democratic Congressman Ed Koch.

Despite Eastland's power over the committee, Javits has expressed a no-nonsense optimism over the bill's chances of success in Congress this session. "I'm really gung-ho on it this year," he said,

adding that the bill's primary selling point would be the fact that present marijuana penalties divert time and money away from the battle against violent crime.

But even committee staffers sympathetic to decriminalization take a less than hopeful view of the possibility of its passage. They cite difficulties with the way the bill is written—particularly its arbitrary selection of three ounces as the cut-off point for simple possession and its rather nebulous attitude toward possession with intent to sell—and with the way its sponsors believe a decriminalization bill can be sold to the Congress.

"Talking about the waste of law enforcement resources and quoting the arrest statistics is all very well and good if you're talking to state legislatures," noted one committee aide, "but all those arguments have little to do with the situation as far as the federal law is concerned. The fact of the matter is that little federal money is spent on prosecuting possession cases, and extremely few people arrested for possession are arrested under the federal law. When you get right down to it, a decriminalization of federal possession laws wouldn't really change the present situation much at all."

Such a law would, however, provide a model and incentive for change to the state legislatures, who might find it easier to reform their own statutes once it was simply a matter of bringing them into conformity with federal regulations. This role-model theory of decriminalization could result, however, in something of a political double bind—"You could have the situation where the states are looking to Congress to decide what to do about marijuana, and Congress is looking to the states to see what it should do," noted one Senate aide. "It could make for a stalemate."

The influx of new liberal Democratic votes into the Congress this session may help to break such a stand-off, but it is probably unrealistic to expect passage of a decriminalization bill this year. This could be the first year, however, that the real issues surrounding the decriminalization question receive serious consideration by Congress, Senator Eastland's bombast notwithstanding.

The DC Mayor's Advisory Committee on Narcotics Addiction, Prevention and Rehabilitation thinks marijuana should be decriminalized. So does the American Bar Association and the National Council of Churches. So, for that matter, does William F. Buckley. None of them seems to have affected the Metropolitan Police Department at all.

Marijuana arrests here for simple possession have escalated drastically, up from 255 in 1971 to 2,553 last year, but the police say they're not really trying to be harshly vigilant. In fact, the vast majority of those busted for grass in the District are arrested as they walk down the street joint in hand, or for having it in their cars when stopped for a traffic violation.

People still get busted in their homes for simple possession but it's becoming rare. As a rule, according to Captain Charles Light, head of the Metropolitan Police Department's narcotics division, the rising number of arrests has little to do with "any deliberate effort on our part. We're not making any concerted effort to get these people, but if a police officer sees someone walking down the street smoking marijuana, he's going to arrest that person. It's as simple as that."

Well, maybe not quite that simple. Police officials, after all, had a lot to do with US Attorney Earl J. Silbert's abrupt about-face on his decision not to prosecute those arrested with fewer than five joints in their possession. At the time, Light and the others said that their opposition to the decision was based on what Light termed "the impracticality of living with such a policy," and the belief that the announcement too blatantly overstepped the bounds of prosecutorial discretion. Silbert's ill-fated policy undoubtedly did present a number of problems, but there are those who feel procedural problems were not the only reasons the police were opposed to the change.

"I think to a certain extent it was a question of power, really," said one official in the US Attorney's office. "It was an infringement of their territory. I think you also have to consider the fact that marijuana arrests constitute an easy way for a police officer to build up a good record on the job, and I don't think that was something they wanted to give up."

Light, for his part, blames the burgeoning number of arrests on "our public leaders. Marijuana smoking has become very popular. When you have a number of people in a position of authority saying there's nothing wrong with it, people start having less respect for the law." Although he feels that laws still on the books ought to be enforced, he says that arresting people for possession has become little more than "a nuisance. The results just don't justify the time and effort and manpower expended on them." He would like to see the situation clarified one way or the other—"Either they start bringing these people to trial and fining them or they should legalize marijuana. But the way it is now, people no longer fear the law."

District police may be arresting people in record numbers for marijuana possession, but judges and prosecutors have made it clear such cases don't particularly interest them, and some of them have gone to great lengths to prove it.

Last spring, for instance, Superior Court Judge Charles Halleck ruled that District marijuana laws—up to a year and a $1,000 fine for possession—applied only to the specific species of the plant mentioned in the statute—cannabis sativa L. Since it is impossible to tell whether or not processed marijuana is from that particular species or from any of the two to five others, Halleck's ruling, while not binding on the other judges, indicates marijuana convictions are not among his priorities.

Judge David L. Norman tried a different approach. Last April, he declared the DC marijuana law unconstitutional on the grounds that present penalties for possession constitute cruel and unusual punishment—he threw out 52 cases and continued another 50.

"It was really amazing there for a while," noted one attorney. "While Norman was sitting as motions judge, there weren't any convictions for marijuana possession in DC. Every lawyer in town took his case to Norman and had it thrown out." The honeymoon ended, however, when the DC Court of Appeals overturned Norman's decision and reinstated all the cases he had disposed of.

Many of the other 23 judges sitting in Superior Court take a dim view of Norman's and Halleck's decisions. As Halleck himself noted, this kind of "de facto decriminalization" operates under the threat of what he calls "judicial roulette—you just have to hope you get a judge who won't put you in jail." Most first-time busters will not have to worry about such judicial brow furrowing, how-

ever, since the majority of them will never get to trial in the first place. If one has no prior arrest record and is arrested for possession of a third of an ounce or less, he will be "diverted" into a whimsical program run by the US Attorney's office known as First Offender Treatment (FOT).

The FOT program requires participants to take a tour of the FBI building, to attend a rap session on marijuana, to watch criminal trials for about eight hours, and to write an essay about either the drug itself or their arrest experiences. At best, FOT lets offenders avoid a conviction and serves as a warning. Bill Pease, one of two young assistant US Attorneys running the program, doesn't give the impression he expects the program to stamp out marijuana.

"So," Pease says with a smile that does him credit at 9 AM, "you want to talk about the devil weed?" He admits that the FOT program has a certain Mickey Mouse quality about it, but he asks, "What are you going to do? We want to avoid prosecuting first offenders, there's no point in convicting them. We're not going to give a lecture on the moral ramifications of smoking grass—what moral ramifications? But we have to do something. We try to say to them, 'Look. We're giving you a break this time, but don't hassle us again. If you do, you're going to have to go the whole route.' We're not naive enough to think that they're never going to smoke again, we just want them to stop smoking where they're going to get caught. If people simply kept their pot smoking confined to their own homes, arrests would plummet."

After all this cultural, social, and legal examination of marijuana, what do the scientists say about the devil weed? Depending on what you read, it seems marijuana can cause cancer, impotency, promiscuity, chromosomal damage, cerebral atrophy, breasts on men, and the destruction of Western civilization. It also can clear up asthma, stop cancer, and ameliorate glaucoma. The folks at the DEA are happy because some of the "studies" seem to prove they were right all along. And the folks at NORML are happy because some of the studies prove *they* were right all along. None of the studies so far, however, has proved anything definitive about the drug's alleged harmfulness one way or the other. Some of the findings are contradictory, others are suspect because of faulty research techniques, including inadequate controls, excessive dosage levels and less than acceptable laboratory conditions. In still others, there has been a tendency for some researchers to interpret their findings in the light of their social biases against the drug.

A much publicized case in point is the study conducted by Dr. Robert G. Heath at Tulane University. Called as a witness at the Eastland committee hearings last spring, Heath reported his research indicated marijuana use caused permanent brain damage. The subjects of his experiments were ten rhesus monkeys who were given the drug through smoking machines, and, in two cases, through injections. Some of the monkeys had electrodes planted in their brains, while others did not. Sure enough, at the end of the experiments, two of the monkeys died (from respiratory complications) and several suffered brain damage.

Dr. Heath apparently was convinced that the results had some pretty terrifying things to say about human users of the drug, since he maintained that the dosage levels given to the monkeys were equivalent to the average amounts consumed by American high school students. Evidently, Heath has made the acquaintance of some strange adolescents. Translating his dosage levels in terms of the average weight and potency consumed by users, a smoker would have to smoke at least 120 to 240 joints a *day* to even approach the amounts given the monkeys, in which case brain damage would probably be the least of the smoker's worries. Meanwhile an HEW study conducted in Jamaica under strict laboratory conditions, using human subjects, came to precisely the opposite conclusion—that no brain damage resulted from the amounts (an average of seven joints a day) given to the subjects. And seven joints a day is heavy use.

The ambiguous nature of the situation was underscored last fall by the release of HEW's fourth report to the Congress on *Marijuana and Health*. Although the report's publication was delayed eight months to insure that it would be up to date, Administration drug spokesman Dr. Robert Dupont noted, "There are more unanswered than answered questions."

Despite such official hedging, most attention centered on the report's findings that heavy use of the drug might result in abnormally low levels of the male sex hormone testosterone, possible adverse effects on the body's immunity responses, and interference with driving skills. The report noted, however, that none of the research in these areas can be considered conclusive and went on to mention the possible therapeutic effects of the drug when used as, among other things, an appetite stimulant, an anti-convulsant, or a painkiller. Research in these areas is also inconclusive.

In fact, about the only conclusion that does emerge from the ambiguities, contradictions, and general brouhaha is that it has yet to be established that there is any real difference between people who smoke dope and people who don't. □

Leaves of Grass

If your interest in marijuana runs more to the literary than the experiential, here are a few books that give some idea what the fuss is all about:

A Child's Garden of Grass (Pocket Books, $1.25). The all-time great book about everything you want to know about marijuana except the boring stuff. It's all there, how to smoke it, eat it, grow it, make love on it, and appreciate being high on it. It's also a swell introduction to stoned humor and the whole dope sensibility. It will make you laugh, and it's better than a night light.

The Book of Grass (Grove Press, $1.25). The intellectuals' response to the aforementioned. A sporadically interesting anthology of what everyone from George Washington to Allen Ginsberg has to say on the subject. A *Bartlett's Familiar Quotations* for the dope smoker.

The Cultivator's Handbook of Marijuana (Book People, $2). Discount Book's store clerks say this is their best selling work on the mysteries of producing a smokable plant.

Marijuana: A Signal of Misunderstanding, The First Report of the National Commission on Marijuana and Drug Abuse (Government Printing Office, $1). The Bible of the decriminalization effort. Appointed by then President Nixon to study the drug and to make recommendations concerning its status, the Commission got the ball rolling by coming out as the first quasi-official body to recommend decriminalization. Nixon wouldn't read the report when it first was published in 1971, but look what happened to him. An interesting example of liberals' attempts to come to terms with the ghost stories of the '60s.

High Times. A brand new glossy magazine, reportedly well financed, that just may be the '70s' answer to the underground press. Published quarterly, each and every issue is, as the promo ad quite rightly contends, devoted entirely to "getting high, really high" on every drug imaginable and then some. The last issue featured everything from an anonymous article entitled "I was JFK's Dealer" to an interview with John Finlator, former deputy director of the Bureau of Narcotics and Dangerous Drugs, to a lovingly photographed centerfold of a brick of Columbian grass, not to mention detailed market quotations on dope prices from New York to San Francisco and harvest reports from around the world. All in all, a rather laughable combination of the *National Enquirer* and the *Wall Street Journal*, just for druggies.

Marijuana-Hashish Epidemic and Its Impact on United States Security. Hearings Before the Subcommittee of the Internal Security Act and other Internal Security Laws. Shelve it under fiction.

COMMENTARY
on the
SINGLE CONVENTION ON NARCOTIC DRUGS, 1961

(Prepared by the Secretary-General in accordance with paragraph 1 of Economic and Social Council resolution 914 D (XXXIV) of 3 August 1962)

UNITED NATIONS

FOREWORD

This Commentary has been issued in pursuance of paragraph 1 of Economic and Social Council resolution 914 D (XXXIV) of 3 August 1962. The Secretary-General wishes to express his thanks to Mr. Adolf Lande, former Secretary of the Permanent Central Narcotics Board and the Drug Supervisory Body, for his valuable assistance in preparing the Commentary.

ABBREVIATIONS

The following abbreviations are used in the commentary:

The "Single Convention", for the Single Convention on Narcotic Drugs, 1961, done at New York on 30 March 1961, reproduced in United Nations, *Treaty Series*, vol. 520, p. 151

The "Second Draft", for the second draft of the Single Convention, document E/CN.7/AC.3/7 and Corr.1 (English and Spanish only)

The "Third Draft", for the third draft of the Single Convention, which served as the working document of the Plenipotentiary Conference, documents E/CN.7/AC.3/9 and E/CN.7/AC.3/9/Add.1, both documents being reproduced in the "Records", vol. II, pp. 1-31

The "Records", for the Official Records of the United Nations Conference for the Adoption of a Single Convention on Narcotic Drugs, documents E/CONF.34/24 and E/CONF.34/24/Add.1, reproduced respectively in United Nations publications, Sales Nos. 63.XI.4 and 63.XI.5

The "Commentary on the 1931 Convention", for the publication entitled "Convention for Limiting the Manufacture and Regulating the Distribution of Narcotic Drugs of July 13th, 1931, Historical and Technical Study by the Opium Traffic Section of the Secretariat of the League of Nations", League of Nations, document C.191.M.136.1937.XI. (Series of League of Nations publications 1937.XI.3)

The "Model Code", for the Model Administrative Codes to the International Opium Conventions of 1925 and 1931, League of Nations, document C.774.M.365.-1932.XI. (Series of League of Nations publications 1932.XI.8)

* * *

The "Board", for the International Narcotics Control Board

The "Commission", for the Commission on Narcotic Drugs of the Economic and Social Council

The "Council", for the Economic and Social Council

The "Permanent Central Board", for the organ which became known as the Permanent Central Opium Board and later the Permanent Central Narcotics Board [Permanent Central Board being the treaty name of that former international organ, established under chapter VI of the 1925 Convention]

The "Plenipotentiary Conference", for the United Nations Conference for the Adoption of a Single Convention on Narcotic Drugs, which met in New York from 24 January to 25 March 1961

The "Supervisory Body", for the organ which became known as the Drug Supervisory Body [Supervisory Body being the treaty name of that former international organ, established under chapter II of the 1931 Convention]

"WHO", for the World Health Organization

* * *

The "1912 Convention", for the International Opium Convention, signed at The Hague on 23 January 1912, referred to in article 44, para. 1, subpara. (*a*) of the Single Convention, and reproduced in League of Nations, *Treaty Series*, vol. VIII, p. 187

The "1925 Agreement", for the Agreement concerning the Suppression of the Manufacture of, Internal Trade in, and Use of Prepared Opium, signed at Geneva on 11 February 1925, referred to in article 44, para. 1, subpara. (*b*), of the Single Convention, and reproduced in League of Nations, *Treaty Series*, vol. LI, p. 337

The "1925 Convention", for the International Opium Convention, signed at Geneva on 19 February 1925, referred to in article 44, para. 1, subpara. (*c*) of the Single Convention, and reproduced in League of Nations, *Treaty Series*, vol. LXXXI, p. 317

The "1931 Convention", for the Convention for Limiting the Manufacture and Regulating the Distribution of Narcotic Drugs, signed at Geneva on 13 July 1931, referred to in article 44, para. 1, subpara. (*d*) of the Single Convention, and reproduced in League of Nations, *Treaty Series*, vol. CXXXIX, p. 301

The "1931 Agreement", for the Agreement concerning the Suppression of Opium Smoking, signed at Bangkok on 27 November 1931, referred to in article 44, para. 1, subpara. (*e*), of the Single Convention, and reproduced in League of Nations, *Treaty Series*, vol. CLXXVII, p. 373.

The "1936 Convention", for the Convention for the Suppression of the Illicit Traffic in Dangerous Drugs, signed at Geneva on 26 June 1936, referred to in article 44, para. 2, of the Single Convention, and reproduced in League of Nations, *Treaty Series*, vol. CXCVIII, p. 299

The "1946 Protocol", for the Protocol amending the Agreements, Conventions and Protocols on Narcotic Drugs, concluded at The Hague on 23 January 1912, at Geneva on 11 February 1925 and 19 February 1925 and 13 July 1931, at Bangkok on 27 November 1931 and at Geneva on 26 June 1936, signed at Lake Success, New York, on 11 December 1946, referred to in article 44, para. 1, subpara. (*f*), of the Single Convention, and reproduced in United Nations, *Treaty Series*, vol. 12, p. 179

The "1948 Protocol", for the Protocol Bringing under International Control Drugs Outside the Scope of the Convention of 13 July 1931 for Limiting the Manufacture and Regulating the Distribution of Narcotic Drugs, as Amended by the Protocol Signed at Lake Success, New York, on 11 December 1946, signed at Paris on 19 November 1948, referred to in article 44, para. 1, subpara. (*h*), of the Single Convention, and reproduced in United Nations, *Treaty Series*, vol. 44, p. 277

The "1953 Protocol", for the Protocol for Limiting and Regulating the Cultivation of the Poppy Plant, the Production of, International and Wholesale Trade in, and Use of Opium, signed at New York on 23 June 1953, referred to in article 44, para. 1, subpara. (*i*), of the Single Convention, and reproduced in United Nations, *Treaty Series*, vol. 456, p. 3

Article 4
GENERAL OBLIGATIONS

Paragraph 1

1. The Parties shall take such legislative and administrative measures as may be necessary:

(*a*) To give effect to and carry out the provisions of this Convention within their own territories;

(*b*) To co-operate with other States in the execution of the provisions of this Convention; and

(*c*) Subject to the provisions of this Convention, to limit exclusively to medical and scientific purposes the production, manufacture, export, import, distribution of, trade in, use and possession of drugs.

Commentary

1. In providing for a general obligation of Parties to "take such legislative and administrative measures as may be necessary to give effect to and carry out the provisions of the Convention", article 4 only states expressly what would in any event be the consequence of undertaking treaty obligations. The phrase "to give effect to and carry out" has the same meaning as the shorter phrases "*pour exécuter*" and "*para dar cumplimiento*" of the French and Spanish texts.

2. For the meaning of the word "territories", see above, comments on article 1, paragraph 1, subparagraph (*y*) and foot-note 22 relating to those comments.

3. Legislation authorizing a central organ of the executive branch of Government to give effect by decree to decisions of the Commission on Narcotic Drugs or of the Economic and Social Council under article 3 appears to be one of the legislative measures which Parties are required to take under article 4 if they have not yet done so. A delay in placing a drug under the national narcotics régime caused by the need for parliamentary legislation or for action by the component states, provinces or cantons of a federal country would hardly be compatible with the object and purpose of the provisions of article 3.

4. All measures which Parties must carry out under the various terms of the Single Convention require, of course, some domestic administrative action. By several specific provisions Governments are moreover required to maintain particular administrative institutions: a "special administration" for the purpose of applying the provisions of the Single Convention, [1] possibly national opium, coca leaf or cannabis agencies, [2] as appropriate, and, with "due

[2] Article 23, article 26, para. 1 and article 28, para. 1.

regard to their constitutional, legal and administrative systems", "arrangements at the national level for co-ordination of preventive and repressive action against the illicit traffic". [3]

5. A few specific administrative actions which are not expressly indicated in the text of the Single Convention, but which, it is suggested, Parties are required to take under the general rule of article 4, may be mentioned: maintenance of a staff sufficient in numbers and technical qualifications to carry out their treaty obligations, provision of training facilities for members of this staff where needed, and maintenance of a system of inspection [4] of businesses engaged in the various phases of the narcotics trade (agriculture, manufacture and wholesale and retail trade). [5] Governments which do not already have the required facilities would also fulfil their obligation regarding training by enabling members of their staff to participate in training arrangements offered by other countries or by international organizations such as the United Nations, the World Health Organization or the International Criminal Police Organization (INTERPOL). [6]

6. Co-operation of States is an indispensable requirement for effective narcotics control. This is recognized in the Preamble of the Single Convention, which states that "effective measures against abuse of narcotic drugs require co-ordinated and universal action", and that "such universal action calls for international co-operation". The general rule of article 4 requiring Parties "to take such legislative and administrative measures as may be necessary" "to co-operate with other States in the execution of the provisions of this Convention" is supplemented by some specific provisions. Article 35, paragraphs (*b*)-(*e*), contains rules regarding co-operation in the fight against the international illicit traffic. Article 36, paragraph 2, subparagraph (*b*), dealing with the extradition of illicit traffickers, is another provision aiming at international co-operation in this campaign. [7]

---

[3] Article 35, para. (*a*).

[4] The obligation to make inspections appears also to arise from the provisions of article 29, para. 2, subpara. (*b*), article 30, para. 1, subpara. (*b*), clause (i) and article 31, para. 3, subpara. (*b*).

[5] The word "inspection" appears in the heading of article 34, but no express provision for inspection is made in the body of this article; the same applies to the corresponding and substantially similar article 43 of the Third Draft which served as working document of the Plenipotentiary Conference (E/CN.7/AC.3/9, *Records*, vol. II, p. 17). The corresponding article 46 of the Second Draft (E/CN.7/AC.3/7), in its second paragraph, requires Parties to maintain a system of inspection. This paragraph, but not the word "inspection" in the heading of article 46, was deleted by the Commission on Narcotic Drugs at its thirteenth session because it was superfluous, since all Governments provide in any case for inspection (E/CN.7/SR.398, pp. 6-7, and Annex V of the Report of the Commission on Narcotic Drugs on the thirteenth session, *Official Records of the Economic and Social Council, Twenty-sixth Session. Supplement No. 9.*

[6] An intergovernmental organization in special relationship with the Economic and Social Council.

[7] See also article 31, para. 1 requiring Parties not to permit exports of narcotic drugs except in accordance with the laws and regulations and within the import limits of the importing country or territory, and paras. 4-7 containing rules governing the co-operation of importing and exporting countries in the implementation of the import certificate and export authorization system.

7. It undoubtedly follows from the rule of article 4 on co-operation that a Party is bound not to permit its territory to be used as a base of operation of the illicit traffic in other countries or to become a refuge of international illicit traffickers, and that it must take appropriate legislative or administrative measures to this end. [8] Where that aim cannot be accomplished by the prosecution of crimes committed abroad [9] or by extradition, [10] such other appropriate measures must be taken as are feasible under the constitutional limitations and in accordance with the basic principles of the legal system of the Party concerned. Penalizing local participation of all kinds in the illicit traffic in other countries [11] and measures of expulsion may serve the purpose.

8. The question may be raised whether rendering technical aid to countries which need it in order to be able to implement the provisions of the Single Convention is a legal obligation of the Parties under article 4, paragraph (*b*). Experience has shown that foreign aid is indispensable to various Governments if they are to be enabled to make a full contribution to the fight against the abuse of narcotic drugs. There may not be general agreement on the existence of such a formal legal obligation; but giving technical assistance to countries which need and request it undoubtedly corresponds to the object and purpose of the Single Convention, and is within the spirit of the provision of article 4 requiring co-operation with other States.

9. The object of the international narcotics system is to limit exclusively to medical and scientific purposes the trade in and use of controlled drugs. From the beginning this has been a basic principle of the multilateral narcotics system, although all the treaties providing for it authorize some exceptions. The 1912 [12] and 1925 [13] Conventions and the 1953 Protocol [14] contained provisions incorporating this principle. The gradual extension of the scope of its application is a characteristic feature of progress in this branch of treaty law. It is one of the most important achievements [15] of the Single Convention that it ended the exceptions permitted in earlier treaties, subject only to transitional provisions of limited local application and duration pursuant to article 49, and apart from two cases presenting no problem of public health because they exclude the consumption of the dangerous substances involved.

10. The provisions to which paragraph (*c*) is "subject", i.e. which are excepted from its application, are article 49, article 2, paragraph 9 (whose practical importance seems highly hypothetical) [16] and article 27 (permitting

---

[8] Such an obligation may also be implied in the provisions of article 35, paras. (*b*) and (*c*).

[9] See below comments on article 36, para. 2, subpara. (*a*), clause (iv).

[10] See below, comments on article 36, para. 2, subpara. (*b*).

[11] See also article 36, para. 2, subpara. (*a*), clauses (i) and (ii).

[12] Article 9, which, however, uses the phrase "medical and legitimate purposes".

[13] Article 5, which already employs the phrase "medical and scientific purposes"; see also article 13, para. 1 of the 1931 Convention.

[14] Article 2, article 5, introductory paragraph, and article 6, para. 1.

[15] The others being the extension of a comprehensive system of control to the cultivation of the coca bush (article 26) and to that of the cannabis plant grown for the production of cannabis and cannabis resin (article 28, para. 1).

[16] See above comments on this provision.

the use of coca leaves for the preparation of a flavouring agent which must not contain any alkaloids, and the production [17] of, trade in and possession of leaves intended for this purpose. [18]

11. The term "medical purposes" has not been uniformly interpreted by Governments when applying the provisions of the narcotics treaties containing it. [19] Some have prohibited the consumption of narcotic drugs by all addicts excepting only when necessary to alleviate suffering during withdrawal treatment; a number of other countries have permitted consumption by persons whose addiction proves to be incurable of the minimum quantities required to prevent painful withdrawal symptoms and to enable them to lead a normal life. There have also been a few cases in which all consumption of narcotic drugs by addicts was prohibited, even in the course of withdrawal treatment.

12. The term "medical purposes" does not necessarily have exactly the same meaning at all times and under all circumstances. Its interpretation must depend on the stage of medical science at the particular time in question; and not only modern medicine, sometimes also referred to as "western medicine", but also legitimate systems of indigenous medicine such as those which exist in China, India and Pakistan, may be taken into account in this connexion. [20]

13. The term "medical purposes" includes veterinary and dental purposes. [21]

14. Drugs in Schedule II and their preparations, as well as preparations in Schedule III, are not excluded from the scope of article 4 including its paragraph (*c*). [22]

15. The "use" of drugs is not specifically listed in article 36, paragraph 1, among the actions which, subject to its constitutional limitations, a Party must treat as punishable offences. It appears that it is left to the discretion of each Party to decide whether it wishes to penalize the non-medical consumption of narcotic drugs by addicts, or whether it prefers to prevent such abuse solely by administrative and penal measures by which the production, manufacture and distribution of drugs must be controlled under the terms of the Single Convention. [23]

16. In addition to article 4, paragraph (*c*), the provisions of article 33 and of article 36, paragraph 1, deal with the possession of drugs. Under these provisions, Parties must take the required legislative and administrative measures to limit exclusively to medical and scientific purposes the possession of

---

[17] Article 1, para. 1, subpara. (*t*).

[18] Leaves from which "all ecgonine, cocaine or any other ecgonine alkaloids have been removed" are not "coca leaves" as defined in the Single Convention; article 1, para. 1, subpara. (*f*); see also below, comments on article 27, para. 1.

[19] See above foot-notes 12-14.

[20] *Records*, vol. I, pp. 25-26.

[21] *Records*, vol. I, p. 207; vol. II, pp. 123, 267, 280 (foot-note 8) and 285 (foot-note 27).

[22] Article 2, paras. 2 to 4; see also below, comments on article 33.

[23] See comments on article 36, para. 1.

drugs, [24] must not permit the possession of drugs except under legal authority, [25] and subject to their constitutional limitations must make possession of drugs contrary to the provisions of the Single Convention a punishable offence. [26]

17. The question arises how far and in what way these provisions govern the possession of controlled drugs; do they apply without regard to whether the drugs are held for illegal distribution or only for personal consumption, or do they apply solely to the possession of drugs intended for distribution?

18. Article 4, paragraph (*c*), undoubtedly refers to both kinds of possession; but whether that provision must be implemented by imposing penal sanctions on possession for personal consumption is a question which may be answered differently in different countries. [27] Some Governments seem to hold that they are not bound to punish addicts who illegally possess drugs for their personal use. This view appears to be based on the consideration that the provisions of article 36, which in its paragraph 1 requires Parties, subject to their constitutional limitations, to penalize the possession of drugs held contrary to the provisions of the Single Convention, are intended to fight the illicit traffic, and not to require the punishment of addicts not participating in that traffic. Article 45 of the Third Draft, which served as working document of the Plenipotentiary Conference, enumerated in its paragraph 1, subparagraph (*a*) "possession" among the actions for which punishment would be required. This paragraph is identical with the first part of paragraph 1 of article 36 of the Single Convention, dealing with "possession" as one of the punishable offences. Article 45 of the Third Draft is included in chapter IX, headed "Measures against illicit traffickers". This would appear to support the opinion of those who believe that only possession for distribution, and not that for personal consumption, is a punishable offence under article 36 of the Single Convention. The Draft's division into chapters was not taken over by the Single Convention, and this was the only reason why the chapter heading just mentioned was deleted, as were all the other chapter headings. Article 36 is still in that part of the Single Convention which deals with the illicit traffic. It is preceded by article 35, entitled "Action against the illicit traffic", and followed by article 37, entitled "Seizure and confiscation".

19. Parties which do not share this view, and which hold that possession of drugs for personal consumption must be punished under article 36, paragraph 1, may undoubtedly choose not to provide for imprisonment of persons found in such possession, but to impose only minor penalties such as fines or even censure. Possession of a small quantity of drugs for personal consumption may be held not to be a "serious" offence under article 36, paragraph 1, and only a "serious" offence is liable to "adequate punishment particularly by imprisonment or other penalties of deprivation of liberty".

---

[24] Article 4, para. (*c*).

[25] Article 33.

[26] Article 36, para. 1.

[27] No doubt appears to exist as regards the obligation of Parties to apply penal sanctions in implementing the rule of article 4, para. (*c*), concerning manufacture, production, export, import, distribution, trade and possession for distribution; see below, comments on article 36, para. 1. As to use, see above.

20. Penalization of the possession of drugs for personal consumption amounts in fact also to a penalization of personal consumption. [28]

21. It has, on the other hand, been pointed out, particularly by enforcement officers, that the penalization of all unauthorized possession of drugs, including that for personal use, facilitates the prosecution and conviction of traffickers, since it is very difficult to prove the intention for which the drugs are held. If Governments choose not to punish possession for personal consumption or to impose only minor penalties on it, their legislation could very usefully provide for a legal presumption that any quantity exceeding a specified small amount is intended for distribution. It could also be stipulated that this presumption becomes irrebuttable if the amount in the possession of the offender is in excess of certain limits. It may also be remarked that constitutional limitations, which can free a Party from all obligation to punish an action mentioned in article 36, paragraph 1, will generally not prevent the penalization of the unauthorized possession of drugs.

22. It may finally be mentioned that Parties must prevent the possession of drugs for other than medical and scientific purposes by all the administrative measures which they are bound to adopt under the terms of the Single Convention, whatever may be their view on their obligation to resort to penal sanctions or on the kind of punishment which they should impose.

23. What has been said in regard to the need for penal sanctions for limiting the possession of controlled drugs exclusively to medical and scientific purposes pursuant to article 4, paragraph (*c*), also applies to the obligation of Parties under article 33 not to permit the possession of drugs except under legal authority. While there may be a difference of opinion as to the obligation of Parties to impose penal sanctions on persons found in the unauthorized possession of drugs held for personal consumption, it should be kept in mind that Governments must in any event take all the administrative measures which they are required to adopt under the Single Convention in order to prevent any unauthorized possession for any purpose whatever. There can be no doubt that Governments may refrain from imposing imprisonment in cases of possession of drugs held for personal consumption without legal authority. Possession of drugs for distribution without such authority must, on the other hand, be made punishable "by imprisonment or other penalties of deprivation of liberty". [29]

24. It is also apparent that the obligation of Parties not to permit the possession of drugs except under legal authority requires them to confiscate drugs if found in unauthorized possession, even if held solely for personal consumption. See also below, comments on articles 33 and 37. [30]

25. Parties cannot legally authorize the possession of drugs for other than medical and scientific purposes, except in the cases in which non-medical

---

[28] See above for the omission of the "use" of drugs in the enumeration of punishable offences in article 36, para. 1.

[29] Article 36, para. 1.

[30] The obligation to confiscate drugs posessed without legal authority for non-medical consumption is held to derive from article 33 if article 37 is not applied, because such possession is not considered to be an offence under article 37.

consumption or industrial use is exceptionally permitted by the Single Convention.[31] See also below, comments on article 33.

26. As regards the meaning of "production" and the application of the term "manufacture" to the separation of substances which may in the future be placed under international narcotics control from plants, see above, comments on article 1, paragraph 1, subparagraphs (*n*) and (*t*).

27. It will be noted that the English text of article 4 is preceded by the figure 1, without any following numbered paragraph. This is an oversight due to the fact that article 4 of the Third Draft had two numbered paragraphs, of which the first was retained in its entirety by the Convention as finally adopted by the Plenipotentiary Conference, while the second paragraph was deleted.[32] The number 1 does not, however, appear in French and Spanish texts, in which the required change was made.

Article 33

POSSESSIONS OF DRUGS

The Parties shall not permit the possession of drugs except under legal authority.

Commentary

1. Article 33 must be read in connexion with article 4, paragraph (*c*) requiring Parties, subject to the exceptions expressly permitted by the Single Convention, [1] to limit exclusively to medical and scientific purposes the possession of drugs. It has therefore been stated in the comments on that paragraph that apart from these exceptions, Parties may not authorize the possession of drugs for other purposes.

2. It may be repeated here that some Governments consider that they are not required to punish the unauthorized possession of drugs by addicts for their personal use, because the word "possession" as used in article 36, paragraph 1, covers only possession for distribution, and is not meant to include possession for personal use; but even if this view is not accepted, there cannot be any doubt that Parties need not consider unauthorized possession of drugs for personal use to be a "serious" offence within the meaning of article 36, paragraph 1, liable to punishment by imprisonment or other penalties of deprivation of liberty. They may choose to impose minor penalties such as fines or even censure. [2]

3. Whatever the position the Parties may take on this question of penal sanctions, it does not affect their obligation under article 33 not to permit the unauthorized possession of drugs for personal consumption, like any other possession of drugs without legal authority. If they choose not to impose penalties on the unauthorized possession for personal use, they still must use their best endeavours to prevent this possession by all those administrative controls of production, manufacture, trade and distribution which are required by the Single Convention, and whose basic objective is the prevention of the abuse of drugs and therefore also to prevent the *unauthorized* possession by addicts. It is also submitted that Parties which do not consider such possession to be an offence under article 36, and therefore are not required to apply article 37 regarding the seizure and confiscation of drugs, are nevertheless bound to confiscate the drugs found in the unauthorized possession of persons

---

[1] Article 2, para. 9, article 27 and article 49.

[2] For a more extensive discussion of this legal question, see above comments on article 4, para. (*c*).

for personal consumption. This obligation appears to be implied in the provision of article 33. [3]

4. It will be noted that article 33 applies to all drugs and their preparations. Drugs in Schedule II and their preparations, as well as preparations in Schedule III, which it may be possible for individuals to acquire without medical prescriptions, [4] are not excepted. [5] Although free from the prescription requirement, they are not excluded from the scope of article 4, paragraph (*c*), requiring Parties to limit the possession and use of drugs to medical and scientific purposes, and they may be sold only by State enterprises or licensed traders or dispensed or administered by persons duly authorized to perform therapeutic functions. [6]

5. Parties may therefore not authorize the possession of drugs in Schedule II and their preparations as well as of preparations in Schedule III [7] by individuals for the purpose of abusing them. They should therefore require their licensed retail traders not to sell these drugs and preparations to an individual who obviously intends to abuse them, and in any event not to sell excessive amounts of them to a single person.

6. They would also be bound to confiscate these drugs and preparations if found in the possession of a person who needs them not for medical purposes, but exclusively for the purpose of abusing them.

7. The Parties are, however, not bound to adopt measures which are not expressly or impliedly required by the Single Convention in order to enforce the limitation of the possession and use of drugs in Schedule II and their preparations, or of preparations in Schedule III, to medical and scientific purposes. It is moreover suggested that, unless more strict controls are required by national law than those prescribed by the Single Convention, the application of article 33 to the unauthorized possession by individuals of these drugs and preparations for the purpose of abusing them will generally be very difficult indeed, and in many cases not only impractical but also impossible.

8. It may be mentioned in this context that the leaves of the cannabis plant, when not accompanied by the tops, are not "drugs", [8] and are therefore not subject to article 33. [9]

9. For a provision in an earlier treaty requiring Parties to take measures to prohibit the delivery to or possession by any unauthorized person of drugs,

---

[3] See also above, comments on article 4, para. (*c*); the United Nations Secretariat is not aware of any constitutional provisions which would prevent such course of action. It is however suggested that where such an obstacle should exist, the same effect could be accomplished by making the unauthorized possession of drugs by addicts for personal consumption an offence, to be punished exclusively by the confiscation of the drugs.

[4] Article 30, para. 6.

[5] Article 2, paras. 2 to 4.

[6] Article 30, para. 1, subpara. (*a*) and (*c*) in connexion with the references in foot-note 5.

[7] Preparations in Schedule III will, however, generally hardly be liable to the kind of abuse which the Single Convention is intended to prevent; see article 3, para. 4.

[8] Article 1, para. 1, subparas. (*b*) and (*j*), and Schedules I and II.

[9] See article 28, para. 3 and comments thereon.

see article 7 of the 1925 Convention. This provision has, however, a more limited scope than article 33 of the Single Convention. [10]

[10] Article 7 of the 1925 Convention does not apply to raw opium, prepared opium, coca leaves, cannabis and cannabis resin; to the possession for retail trade or personal consumption of drugs in Group II of the 1931 Convention (and of the 1948 Protocol) and to those preparations which either by express treaty provisions or by operation of article 8 of the 1925 Convention are exempted from the application of this Convention, i.e. to the so-called "preparations for the export of which export authorizations are not required" which are a group of preparations whose position corresponds to some extent to that of preparations in Schedule III of the Single Convention; see articles 8 and 4, para. (*d*) of the 1925 Convention, article 13, para. 1 and para. 2, subparas. (*a*) and (*b*) of the 1931 Convention; see also *Commentary* on the 1931 Convention, para. 135; article 7 of the 1925 Convention moreover applies only "as regards the internal trade" to the drugs which it covers. It may however be noted that all the drugs and their preparations covered by article 7 or excluded therefrom are subject under the narcotics régime preceding the Single Convention, to the import certificate and export authorization system of chapter V of the 1925 Convention, the only exception being "the preparations for the export of which export authorizations are not required".

7. Article 36 is not one of the provisions which do not apply to preparations in Schedule III. Illicit traffic in such preparations is therefore governed by the terms of this article. [8] "Illicit traffic" in leaves of the cannabis plant when not accompanied by the tops is, however, not subject to article 36 because the leaves are not drugs. [9]

8. No provision of article 36 is self-executing in countries where constitutions provide for that effect of treaty provisions. [10]

[8] Article 2, para. 4.

[9] Article 1, para. 1, subpara. (*b*) and comments on article 28, para. 3.

[10] Article 36, para. 4.

Paragraph 1

1. Subject to its constitutional limitations, each Party shall adopt such measures as will ensure that cultivation, production, manufacture, extraction, preparation, possession, offering, offering for sale, distribution, purchase, sale, delivery on any terms whatsoever, brokerage, dispatch, dispatch in transit, transport, importation and exportation of drugs contrary to the provisions of this Convention, and any other action which in the opinion of such Party may be contrary to the provisions of this Convention, shall be punishable offences when committed intentionally, and that serious offences shall be liable to adequate punishment particularly by imprisonment or other penalties of deprivation of liberty.

Commentary

1. The enumeration in paragraph 1 of the activities which should be penalized very closely follows that of article 2, paragraph (*a*) of the 1936 Convention. [1] In order to make sure that all activities coming under the general heading "illicit traffic" [2] would be covered by paragraph 1 and that any gap which may exist in the list in that provision, [3] not only the actions specifically mentioned but "any other action which in the opinion of 'a Party' may be contrary to the provisions" of the Single Convention must be treated by that Party as a punishable offence in accordance with the terms of article 36. While it is left to the judgement of each Party to determine what action not specifically mentioned in paragraph 1 is contrary to the provisions of the Single Conven-

[1] The list of 1936 does not include "cultivation" and "production", which at the time of the conclusion of the 1936 Convention were not yet subject to a comprehensive régime of international control. See, however, article 5 of that Convention relating to Parties which have such a national régime; this list includes "conversion", which in so far as it relates to the transformation of drugs into other drugs, is covered by the term "manufacture" as defined in article 1, para. 1, subpara. (*n*) of the Single Convention. See also above, comments on that provision.

[2] *Records*, vol. II, p. 236.

[3] *Records*, vol. II, p. 238.

tion, it may be noted that this paragraph, like the other provisions of the Single Convention, must be implemented in good faith. [4]

2. Only those of the activities mentioned in paragraph 1 which are "committed intentionally" fall within the scope of this paragraph, and consequently within that of the other provisions of article 36. This limitation applies to the activities specifically listed in paragraph 1 as well as to those which are included by the general definition. Actions which are not taken wilfully or knowingly, but only as a result of "negligence", are therefore not subject to the provisions of article 36. [5] Governments will, however, find it necessary to punish unintentional violations of their narcotics laws and regulations if due to culpable negligence.

3. Some of the activities mentioned in paragraph 1 may not be considered to be those of "principal actors" as this term is understood in some penal codes, but only as forms of "participation" as defined in paragraph 2, subparagraph (*a*), clause (ii), and would therefore also be punishable under the terms of that clause.

4. The activities mentioned in paragraph 1 must also be made punishable offences if they deal with preparations including preparations in Schedule III. [6]

5. The term "manufacture" as used in the paragraph under consideration also covers activities referred to as "extraction" [7] or "preparation". The inclusion of all three of these terms is obviously due to the fact that the authors of paragraph 1 followed closely the text of article 2, paragraph (*a*) of the 1936 Convention.

6. The transformation of drugs into substances not covered by the Single Convention does not appear to be "manufacture" as this term is used in this context. [8]

7. It will be noted that paragraph 1 does not refer to "use". As has been pointed out elsewhere, [9] article 36 is intended to fight the illicit traffic, and unauthorized consumption of drugs by addicts does not constitute "illicit traffic". [10]

8. As regards the view that the term "possession" in the context of paragraph 1 does not include possession for personal consumption, and that in any event Parties which do not share that view need not consider possession for personal consumption to be a "serious" offence punishable by imprisonment or other penalties of deprivation of liberty, see comments on article 4, paragraph (*c*). [11]

---

[4] See also above, comments on article 2, para. 5, article 22 and article 24, para. 1, subpara. (*b*).

[5] *Records*, vol. II, p. 235.

[6] Article 2, paras. 3 and 4. The terms "cultivation" and "production" of course cannot refer to preparations; article 1, para. 1, subparas. (*i*), (*s*) and (*t*).

[7] The extraction of cannabis resin from the cannabis plant may, however, also be "production"; article 1, para. 1, subparas. (*d*) and (*t*).

[8] Article 1, para. 1, subpara. (*n*) and comments on that subparagraph.

[9] See above, comments on article 4, para. (*c*).

[10] Article 1, para. 1, subpara. (*l*).

[11] See also comments on article 33.

9. Paragraph 1 requires "adequate" punishment of the offences which it covers if they are serious. The Plenipotentiary Conference did not accept by the required two-thirds majority a proposal to require "severe" punishment. [12] The opponents of the word "severe" invoked the considerations that the degree of severity of a penal sanction required in different countries to achieve its social purpose might differ widely; that what could be an adequate penalty in one State might not be considered to be severe in another State; and that the word "severe" carried overtones of "retribution", which was one of the purposes of penal law which should not be emphasized. [13] It is, however, submitted that in order to be "adequate" for the fight against serious offences of the illicit traffic, the penalties must be sufficiently severe to have the desired deterring effect under the special conditions of the country in which they are imposed. This idea is also embodied in the requirement that the "adequate punishment" should be meted out "particularly by imprisonment or other penalties of deprivation of liberty". The imposition of fines alone would in no case constitute an "adequate" punishment for serious offences of the illicit traffic.

10. The term "imprisonment" in its broad sense covers all penalties of deprivation of liberty. By following the introductory paragraph of article 2 of the 1936 Convention in including the whole phrase "by imprisonment or other penalties of deprivation of liberty", the Conference appears to have made it clearer that not only confinement in an institution which is technically a prison, but also that in other places such as labour or "re-education" camps, constitutes an "adequate" penalty as required by paragraph 1 of article 36.

11. It will be noted that the obligations of Parties under paragraph 1 are subject only to their "constitutional limitations", while those under paragraph 2 are subject to their constitutional limitations, their legal system and domestic law. [14]

12. The question arises whether a federal State is relieved from obligations under paragraph 1 if it is unable to enact the required penal legislation on account of lack of authority under its federal constitution to do so. This question should be answered in the negative. A Party is in such a case bound to obtain the necessary action by the legislatures of its component states or provinces which have jurisdiction in matters of penal law.

13. The Secretariat of the United Nations is not aware of any constitutional limitations which would prevent a Party to the Single Convention from implementing article 36, paragraph 1, by national or local legislative actions.

14. For a corresponding provision in the narcotics régime preceding the Single Convention, see introductory paragraph and paragraph (*a*) of article 2 of the 1936 Convention.

---

[12] *Records*, vol. I, p. 147; see also vol. II, p. 239. The introductory paragraph of article 2 of the 1936 Convention requires "severely punishing".

[13] *Records*, vol. II, pp. 234-239; see also above general comments on article 36.

[14] As regards this difference in the "escape clauses" of the two paragraphs, see *Records*, vol. II, pp. 236-237 (statement of the representative of Canada who was Chairman of the Drafting Committee of the Plenipotentiary Conference).

[Excerpt from an article entitled, "The International Drug Control System" by Adolph Lande, Appendix, "Drug Use in America: Problem in Perspective," volume III: The Legal System and Drug Control, March 1973, pp. 129–130.]

Question of Treaty Provisions Preventing Policy Options on Certain Controversial Questions

Punishment of the acquisition (including purchase) of narcotic drugs or psychotropic substances for personal consumption

The terms "possession" and "purchase" used in the penal provisions of the Single Convention mean only possession and purchase for the purpose of illicit traffic. Consequently unauthorized possession and acquisition (purchase) of narcotic drugs for personal consumption need not be treated under the Single Convention either as punishable offenses or as serious offenses. If a government does not accept this view, they may consider purchase and possession for personal use to be offenses punishable by fines, censure or the confiscation of the drugs, or to be serious offenses punishable by deprivation of liberty, including imprisonment.[865]

The provisions of the Protocol of 1972 permitting the substitution of treatment and rehabilitation for conviction or punishment of addicted offenders will remain ineffective for the United States at least for a very long time.[866]

However, nothing in the Single Convention would prevent the United States from imposing on illegal purchase and possession of narcotic drugs for personal consumption penalties it considers advisable.

The Vienna Convention does not require parties to prohibit the possession of psychotropic substances in Schedules II, III or IV without legal authority,[867] but only to provide that the possession of substances in Schedule I should be prohibited without a special license or prior authorization.[868] The penal provisions of the Vienna Convention [869] are patterned after those of the Single Convention although the former define the punishable offenses in general terms instead of using the largely enumerative method of the latter. The penal provisions of the Vienna Convention aim at the illicit traffic; illicit acquisition (purchase) and possession of *all* psychotropic substances for personal consumption are not punishable offenses under the Vienna Convention, even though the government concerned might not permit the possession of substances in Schedules II, III and IV without legal authority. Here again a government which does not share this view, could in any event treat such purchase and possession as offenses which are not serious and which are punishable by fines, censure or even only by confiscation of the substances involved. The liberty of governments to impose heavy penalties would not be restricted by the Vienna Convention.

These legal considerations are of less importance in the Vienna Convention than in the Single Convention because the provision of the former, permitting the substitution of measures of treatment and rehabilitation for offenders who abuse psychotropic substances for their conviction or punishment, could be applied by the United States.

Distribution and sale of narcotic drugs and psychotropic substances

Illicit distribution and sale of narcotic drugs and psychotropic substances would be treated as serious punishable offenses subject to appropriate punishment, particularly by deprivation of liberty, including imprisonment. However, governments would be permitted to treat them as non-serious offenses and to punish them by fines, by censure or by confiscation. Such a case would include possession or distribution of a small amount of a relatively less dangerous drug for distribution to a friend without consideration or without profit.

Under the Vienna Convention, treatment and rehabilitation of all distributors of psychotropic substances, who abuse such substances, could be substituted for their conviction or punishment.

The corresponding provision of the amended Single Convention would remain ineffective for the United States, at least for a very long time.

Legalization of the non-medical use of cannabis and cannabis resin

As long as cannabis and cannabis resin remain in the Schedules I and IV of the Single Convention, or are removed only from Schedule IV or are trans-

[868] Article 7, paragraph (b).
[869] Article 22.

ferred to Schedule II, which involves deletion from Schedule IV, the United States is bound by the Single Convention to prohibit their non-medical use.

In accordance with a recommendation of the World Health Organization, the Commission, by a simple majority of its members present and voting, could remove cannabis and cannabis resin from the Schedules of the Single Convention. Cannabis and cannabis resin would thus cease to be drugs within the meaning of this Convention and would be freed from all drug control provisions.[870] No longer considered drugs, cannabis and cannabis resin could be produced, exported, imported, distributed, traded, used and possessed for non-medical purposes without any controls, except those which the United States would wish to maintain or establish. However, a somewhat anomalous situation would exist because article 28, paragraph 1 of the Single Convention would continue to be in force, except if deleted by an amendment of this treaty. It would continue to require that the cultivation of the cannabis plant for the production of cannabis and cannabis resin be controlled as is the cultivation of the poppy for the production of opium; but despite these controls the cannabis and cannabis resin could be produced for any purpose, including non-medical consumption.

The legalization of the non-medical use of cannabis and cannabis resin presupposes that these substances would not be included in a Schedule of the Vienna Convention.

THE NON-MEDICAL USE OF THE LEAVES OF THE CANNABIS PLANT

The Single Convention[871] does not prohibit the non-medical use of the leaves of the cannabis plant if they are not accompanied by the tops of the plant.[872] Parties are required to adopt such measures as might be necessary to prevent the misuse of and illicit traffic in the leaves. The measures required to prevent misuse might include the prohibition of the sale of very potent leaves, of the sale of excessive quantities to one individual and of the sale to persons below a certain age. These are only a few examples of what parties might have to do under the vague provision of the Convention. The obligation to prevent the illicit traffic in the leaves may be carried out by limiting the trade in the leaves to government shops or licensed traders. Generally speaking such measures as are adopted in many countries to prevent excessive consumption of alcohol and illegal trade in alcohol may be sufficient.

MAINTENANCE PROGRAMS

The treaty provision limiting the use of drugs "to medical and scientific purposes"[873] has always been interpreted by some governments to permit consumption by persons whose addiction has proved to be incurable of the minimum quantities of addictive drugs required to prevent painful withdrawal symptoms and to make it possible for these addicts to lead a "normal" life. No party to the drug treaties has objected to this interpretation. However, the use of drugs in maintenance programs must in all cases be determined by *medical considerations*, which include the desire to *help* the addicts or other abusers of controlled drugs.[874]

ARTICLE 36* PENAL PROVISIONS

Subject to its constitutional limitations, each Party shall adopt such measures as will ensure that cultivation, production, manufacture, extraction, preparation, possession, offering, offering for sale, distribution, purchase, sale, delivery on any terms whatsoever, brokerage, dispatch, dispatch in transit, transport, importation and exportation of drugs contrary to the provisions of this Convention, and any other action which in the opinion of such Party may be contrary to the provisions of this Convention, shall be punishable offences when

[870] Article 1, paragraph 1, subparagraph (j) and article 2, paragraph 1–5; see also article 4, paragraph (c).

[871] Nor the Vienna Convention as long as the leaves are not included in one of its Schedules.

[872] Article 1, paragraph 1, sub-paragraph (b) and article 28, paragraph 3.

[873] The first drug treaty which uses this term is the 1925 Convention; the 1912 Convention uses the phrase "medical and legitimate purposes".

[874] The same would apply to the Vienna Convention, when in force, which also limits the use of psychotropic substances to "medical and scientific purposes".

*Executive G, 90th Cong., 1st sess., Senate Mar. 8, 1967, the "Convention on Narcotic Drugs, 1961," pp. 20–21, Message from the President of the United States.

committed intentionally, and that serious offences shall be liable to adequate punishment particularly by imprisonment or other penalties of deprivation of liberty.

2. Subject to the constitutional limitations of a Party, its legal system and domestic law,

(*a*) (i) Each of the offences enumerated in paragraph 1, if committed in different countries, shall be considered as a distinct offence;

(ii) Intentional participation in, conspiracy to commit and attempts to commit, any of such offences, and preparatory acts and financial operations in connexion with the offences referred to in this article, shall be punishable offences as provided in paragraph 1;

(iii) Foreign convictions for such offences shall be taken into account for the purpose of establishing recidivism; and

(iv) Serious offences heretofore referred to committed either by nationals or by foreigners shall be prosecuted by the Party in whose territory the offense was committed, or by the Party in whose territory the offender is found if extradition is not acceptable in conformity with the law of the Party to which application is made, and if such offender has not already been prosecuted and judgement given.

(*b*) It is desirable that the offences referred to in paragraph 1 and paragraph 2 (*a*) (ii) be included as extradition crimes in any extradition treaty which has been or may hereafter be concluded between any of the Parties, and, as between any of the Parties which do not make extradition conditional on the existence of a treaty or on reciprocity, be recognized as extradition crimes; provided that extradition shall be granted in conformity with the law of the Party to which application is made, and that the Party shall have the right to refuse to effect the arrest or grant the extradition in cases where the competent authorities consider that the offence is not sufficiently serious.

3. The provisions of this article shall be subject to the provisions of the criminal law of the Party concerned on questions of jurisdiction.

4. Nothing contained in this article shall affect the principle that the offences to which it refers shall be defined, prosecuted and punished in conformity with the domestic law of a Party.

Article 22* Penal Provisions

1. (a) Subject to its constitutional limitations, each Party shall treat as a punishable offence, when committed intentionally, any action contrary to a law or regulation adopted in pursuance of its obligations under this Convention, and shall ensure that serious offences shall be liable to adequate punishment, particularly by imprisonment or other penalty of deprivation of liberty.

(b) Notwithstanding the preceding sub-paragraph, when abusers of psychotropic substances have committed such offenses, the Parties may provide, either as an alternative to conviction or punishment or in addition to punishment, that such abusers undergo measures of treatment, education, after-care, rehabilitation and social reintegration in conformity with paragraph 1 of article 20.

2. Subject to the constitutional limitations of a Party, its legal system and domestic law,

(a) (i) if a series of related actions constituting offences under paragraph 1 has been committed in different countries, each of them shall be treated as a distinct offense;

(ii) intentional participation in, conspiracy to commit and attempts to commit, any of such offences, and preparatory acts and financial operations in connexion with the offences referred to in this article, shall be punishable offences as provided in paragraph 1;

(iii) foreign convictions for such offenses shall be taken into account for the purpose of establishing recidivism; and

(iv) serious offences heretofore referred to committed either by nationals or by foreigners shall be prosecuted by the Party in whose territory the offence was committed, or by the Party in whose territory the offender is found if extradition is not acceptable in conformity with the law of the Party to which application is made, and if such offender has not already been prosecuted and judgment given.

*Executive G, 92d Cong., 1st Sess., Senate, June 29, 1971, the "Convention on Psychotropic Substances," p. 16, Message from the President of the United States.

(b) It is desirable that the offences referred to in paragraph 1 and paragraph 2(a)(ii) be included as extradition crimes in any extradition treaty which has been or may hereafter be concluded between any of the Parties, and, as between any of the Parties which do not make extradition conditional on the existence of a treaty or on reciprocity, be recognized as extradition crimes; provided that extradition shall be granted in conformity with the law of the Party to which application is made, and that the Party shall have the right to refuse to effect the arrest or grant the extradition in cases where the competent authorities consider that the offence is not sufficiently serious.

3. Any psychotropic substance or other substance, as well as any equipment, used in or intended for the commission of any of the offences referred to in paragraphs 1 and 2 shall be liable to seizure and confiscation.

4. The provisions of this article shall be subject to the provisions of the domestic law of the Party concerned on questions of jurisdiction.

5. Nothing contained in this article shall affect the principle that the offences to which it refers shall be defined, prosecuted and punished in conformity with the domestic law of a Party.

[From the National Observer, Sept. 25, 1976]

LEGAL MARIHUANA: A COLOMBIAN PIPE DREAM?

(By Thomas D'Arcy Quinn)

"Marihuana legalizada" exploded headlines on the front pages of newspapers throughout the country. The announcement came suspiciously on the Ides of March this year—which immediately made me beware.

Could it be true, after years of antimarihuana "reefer madness" play in these same newspapers, that suddenly the personal consumption of the illicit plant was legal and accepted in the land that produces the best species of it in the Western Hemisphere?

Not really.

Later that week I witnessed a youth, his eyes popped and red, being hauled to jail for smoking in a movie house in Cali. And within a month after the spurious announcement, a gringo friend spent two weeks in jail for two joints found in his pocket.

Confusion resulted from the media's misinterpretation of a new decree about marihuana issued by the minister of justice, Dr. Samuel Hoyos Arango. Facing perplexed dissent from most sectors of Colombian society, including the attorney general, Dr. Jaime Serrano Rueda, the minister of justice hastily explained that his Decree 701 did not legalize or even decriminalize marihuana. It simply reduced the penalties for possession of small quantities (set at 28 grams of marihuana and 10 grams of hashish) from an automatic three years in jail to a sentence of a month to a year, along with a fine of 200 to 2,000 pesos ($7 to $70).

That still meant jail even for people caught with a little bit. On the other hand, anyone caught with amounts exceeding these so-called "personal dose" equivalents faces a sentence of 3 to 12 years. "With this measure," explained Hoyos Arango, "we're trying to make a distinction between the mere consumer and the real dope pushers."

A RICH EXPORT MARKET

There seem to be several reasons why Colombia has taken a lead among its Latin American neighbors in softening its dope laws, at least toward small consumers. One is that in Colombia's recent crusade against the drug culture, no one was getting imprisoned except the users. Ninety-five per cent of 2,500 drug convictions in 1974 were for possession of less than an ounce of marihuana.

To Hoyos Arango that figure seemed a bit incongruous and inhumane, and—more important, perhaps—costly: The government spent over $500,000 per year to process and maintain these marihuana convicts.

But another possible reason, which holds an irresistible attraction for the minister, who is an economist as well as a law expert, is the commerce of marihuana. In the hands of the international Mafia, Dr. Hoyos Arango declared, the marihuana business sabotages the Colombian economy and corrupts the society. "The day that consumption of marihuana should become legalized," he said in a carefully hypothetical tone, "this would affect the Mafia in the sense they would no longer have this magnificent business they have today." Then he added, almost wistfully, "And the business of exportation [of marihuana or cocaine] is a very rich market."

Rich indeed. According to a study contracted in 1971 by the old U.S. Bureau of Narcotics and Dangerous Drugs, the U.S. marijuana traffic today amounts to more than $2 billion. Of that, at least $500 million would be tax revenue if the U.S. Government took it over the way it did alcohol at the end of Prohibition.

So far no one in the present Colombian government besides the economics-oriented minister of justice dares allude to the incredible prospects of legalized marijuana exports. Privately, some Colombians feel it logical that this struggling Andean country should exploit the pot market in the North, just as it exploits that other nonnutritious drug, coffee.

FROM ROPE TO DOPE

Occasionally, though, strange references to Colombia's interest in the marijuana commerce bob to the surface. For instance, columnist Guillermo Nieto Cano of the highly respected, nationally circulated newspaper El Espectador recently published a piece entitled, "Marihuana: A Product High in National Interest?" In the article, Nieto Cano told of a conversation with a "distinguished agriculturist" who, he said, asserts that the Colombian government has been experimenting for more than two years with three special kinds of *cannabis sativa: cannabis Sincnsis, cannabis Indica,* and *cannabis vulgaris.*

"We plan to have the best marijuana products in the world ready for the eventual international market," Nieto Cano quoted the man as saying.

Marijuana is not native to Colombia, and there are several exotic theories about how it got here. According to a 1951 United Nations "Bulletin on Narcotics," the substance was first introduced into Latin America by the Spanish in 1554 by way of Chile. Today, however, Chile produces no smokeable strains.

One aprocryphal yarn says black musicians spread the seeds while jamming their way up the Magdalena River, Colombia's main artery for centuries.

More likely, slave and pirate ships brought the distinctive blond or gold types of marijuana to the northern Caribbean coast of Colombia ages ago. In the interior of Colombia, however, the darker, red strains have predominated since World War II.

In the early 1940s the Allies needed rope fibers for the war effort, so they provided hemp seed from Asia and Africa to farmers in the Colombian interior. But the tough, stringy male hemp did not flourish here. On the other hand, the bushy, resinous female not only survived, but some botanists say it actually evolved into more potent forms in the lush, high Colombian soil.

GRASS FOR CONNOISSEURS

Cannabis connoisseurs rank Colombian marijuana alongside such Asian types as so-called Thai-sticks from Thailand or Cambodian temple balls, distinguishing it from the stringier and milder Mexican variety.

Though no formal studies have been made on the subject, an interesting indication of the wide variety of Colombian pot emerged recently when a nervous young Latin model caught the eye of Capt. Leopoldo Azuero, chief of customs at the Barranquilla International Airport. As Azuero routinely asked to examine the large carry-on bag the girl was clutching, she suddenly tried to abandon the bag and run off. And for good reason: It contained a neat double compartment with 16 polyethylene bags, each filled with about a half ounce of a different type of marijuana.

One bag contained what the dope culture calls *llanos* brown, a common sort of marijuana from Colombia's llanos, or grassy plains. Another contained an oily kind referred to as lowland purple. Others were the maroon or black pot from the jungle coast near Turbo; Santa Marta golds; red strains from the mountainous Manizales area; orangeish *mango biche* (unripe mango) from the department of Cauca; the potent, pale "moon grass" from the Guajira Desert; famous "red point" from around Cali; and resin-sticky, finger-length flowers (used to produce hash) from dwarf plants in the tropical prairies.

Stuck into this amazing sample case was a note in English to a man in Fort Lauderdale, Fla., advising that there was 5,000 pounds of each class of marijuana ready for immediate shipment.

It's precisely because Colombia provides such a rich selection of marijuana that people such as the minister of justice or the U.S. Drug Enforcement Administration agree that its exportation is big business, whether legal or illegal. In fact, the profit margin for dealing the weed internationally is even higher than it is for the more expensive cocaine (much of which is processed in Colombia too).

For instance, the farmer gets about $7 per pound. For him, that's a premium price. The same quantity fetches $50 to $70 for the Colombian middleman. The big gain comes when this pound gets to New York or San Francisco, where it's worth $700 at retail. The smuggler, of course, probably sells the pound for $300 to $350 wholesale . . . but he usually deals in nothing less than a ton at a time.

It's not surprising, then, that marijuana syndicates operating in Colombia seem so organized and well-equipped. They go into isolated farming areas—mountainous Andean nooks or far-off jungles—and set up co-operatives among the farmers. They make long-term loans and supply seeds and fertilizers, like a regular farmer's bank. If peasants resist such blandishments, the syndicates might run them off their land. Syndicate members recently killed 24 Malaya Indians in a secluded region of the Sierra Nevada de Santa Marta.

Some of the syndicates are so rich that they apparently shrug off large losses. Colombian officials were aghast not long ago when they discovered an abandoned airfield in the Guajira Desert (which has been described as "a landing strip the size of Massachusetts") with no fewer than five discarded airplanes, including one DC–3. This was just one of an estimated 10,000 clandestine airports in Colombia.

The United States has been attempting to combat these syndicates through a special program begun in 1973 of State Department narcotics agents and Drug Enforcement Agency (DEA) men who act as technical advisers to Colombian police and otherwise try to keep a low profile.

But not always. One DEA agent infiltrated a smuggling band as an airplane toms officials chartered a plane to check on a recent bust. But upon landing at Cartagena last year. Another time, about a year ago, DEA and Colombian customs officials chartered a plane to check on a recent bust. But upon landing at the site of 50 confiscated bushels of marijuana in the distant llanos, they became embroiled in a confusing shoot-out with DAS (Colombian FBI) agents who had been waiting for the owners of the dope to show up and thought the plane was full of Mafiosi.

In 1973 I convinced a Bogotá marijuana wholesaler to take me to a hashish farm in the Colombian llanos. To get there, we took two different buses and a taxi Jeep—an 18-hour odyssey that brought us, finally, to a 1,000-acre ranch protected day and night by riflemen on horseback.

There the farmer directed us on horses to a field where sugar cane swayed lazily in plains breezes in a far corner of his spread. As we approached the sugar cane, I could smell the marijuana patch even before I could see it. In the hot midday sun the heavy, sweet aroma made me dizzy before long, like too much jasmine.

A SMILE—AND A WARNING

The dwarf marijuana plants—knee high, bushy, and glistening with honey-like resins—were scattered over an acre hidden in the center of the undulating cane. "For three months' labor on this field," he told me, "I pay 10,000 pesos [then $400—expensive for Colombian pay standards]." Most of that went for constant pruning and manicuring. The farmer explained that most hashish is collected in dark, pliable balls by scraping the resin-sticky hands of laborers after they've worked the plants. He said he learned the process from a Dutch youth who had spent time rubbing hashish in Kashmir, India.

The farmer impressed me as being a simple, hard-working man with calloused hands and a friendly, open demeanor. When I was leaving, however, he cautioned me. "The people I sell to are everywhere," he said, "We depend on your discretion." He added pointedly, with a smile, "And so should your wife and baby . . ."

In contrast, I once accidentally ran across a smaller marijuana operation while exploring the isolated homesteading areas on the Pacific coast of Colombia. I arrived at a small rancho at nightfall and asked for lodging. There the man and his family offered me a bamboo bed and a meal of beans, corncakes, and watery hot chocolate . . . and proudly showed me a small plot of marijuana among cassava at the back of the house.

"I have about 30 marijuana plants," he explained. "Twice a year I dry the flowers and take them to Cali to buy us new clothes and medicines. It's not much, but it's a little better than growing coffee."

Both farmers said that while they did not smoke the stuff themselves, they liked the profits as much as they disliked the risks.

It never occurred to either cultivator that someday they might help Colombia's balance of payments by selling their marijuana to their own government rather than to the black market. But it has occurred to others.

(Excerpt from hearings)

Subcommittee on Internal Security

of the

Committee on the Judiciary

UNITED STATES SENATE

May 8, 1975

on

Marihuana-Hashish Epidemic And Its Impact on United States Security

Mr. MARTIN. Mr. Jenson, you attended the International Commission on Narcotic Drugs conference in Geneva last month. Was the question of marihuana discussed at that meeting?

Mr. JENSON. Yes, it was. It was one of the most discussed items at the Geneva convention because there was a great concern on the part of many countries that are members of this convention that there was a trend toward liberalizing, or legalizing, or decriminalization of the marihuana laws in the United States; and this gave great concern to those countries that consider marihuana just as significant, if not more significant a problem within their countries, within their boundaries, than some of the other drugs that the United States considers to be the most harmful drugs, such as heroin.

They feel that if the United States does not pursue with the same vigor the laws relating to marihuana, that this will help to enhance the trafficking of marihuana in those other countries; and this they are very much opposed to. And, if we did take that course of action, it's very possible that we would have great difficulty—possibly it would be impossible—to encourage or to enlist the support of foreign governments such as France and Mexico in the fight to eliminate the trafficking of heroin and those other drugs if we do not continue to enforce the marihuana laws.

Mr. MARTIN. Did they pass a resolution on the subject?

Mr. JENSON. Yes; there was a resolution that was passed to that effect, that the efforts would continue by all of the parties to the Single Convention; that there would not be any reduction in the momentum of the effort that is being applied to limit the problem of drug trafficking and the usage of marihuana.

Mr. MARTIN. Was there any division on this resolution?

Mr. JENSON. No. It was a unanimous vote, passed unanimously.

Mr. MARTIN. It had the support of the Communist countries as well as the non-Communist countries?

Mr. JENSON. That's correct. Russia and Yugoslavia were both represented and were strongly in support of the passage of this resolution.

Mr. MARTIN. Would you be able to provide a copy of this resolution for the record?

Mr. JENSON. Yes, sir.

[The information referred to follows:]

Text of resolution adopted February 24, 1975, by the U.N. Commission on Narcotic Drugs meeting in Geneva

The following resolution, which was recommended for adoption by the Economic and Social Council of the UN, was sponsored by the Federal Republic of Germany, Australia, Egypt, France, India, Sweden, Switzerland, Togo, USSR, Yugoslavia. It was approved by a vote of 26–0, with one abstention (Iran).

"The Economic and Social Council,

"(A) referring to the provisions of the Single Convention on Narcotic Drugs, 1961, in particular to Article 2, Paras. 1 and 5, Article 4(B) and (C) and Article 35 (B) and (C),

"(B) recalling that cannabis and cannabis resin, in addition to being listed in Schedule I of that Convention, are also included in its Schedule IV,

"(C) reaffirming that, in view of the numerous findings of scientific research on cannabis, there can be no doubt as to the harmful nature of cannabis,

"(D) noting with concern the recent increased availability in many parts of the world of new concentrated forms of cannabis, such as the so-called 'liquid cannabis,' 'liquid hashish,' or 'oil of cannabis,'

"(E) considering that cannabis and drugs derived from cannabis have lost their original medical role and are the most frequently abused drugs and that this fact requires joint action by all countries parties to the International Convention on Narcotic Drugs,

"(F) realizing that a reduced control regarding cannabis and drugs derived from cannabis in one area might create an important source of supply of, and illicit traffic in the same substance in other areas,

"1. recommends to all countries and competent international organs and organizations not to lose momentum in taking appropriate measures against cannabis abuse, supply of cannabis and cannabis resin, and, in particular, illegal trade and traffic in cannabis and drugs derived from cannabis, in order not to endanger the success of global and regional efforts in this field;

"2. draws to the attention of governments the desirability of taking all practicable measures for the treatment, rehabilitation and education of abusers of cannabis;

"3. urges that scientific research in relation to cannabis should be continued and accelerated;

"4. requests the Secretary-General to inform all governments of this resolution, inviting them to take action for its effective implementation, in accordance with the pertinent provisions of the Single Convention on Narcotic Drugs, 1961."

Mr. MARTIN. By the way, what is meant when people talk about decriminalization? I think it might be helpful to clarify this.

Mr. JENSON. I would like to defer to Mr. Rosthal, if I may, on that point, he being the lawyer, and let him describe the difference between decriminalization and legalization and all the other terms used in this area.

Mr. ROSTHAL. There is some confusion about it; but I think basically what we mean by legalization is a State or the Federal Government permitting the sale of marihuana much as they permit the sale of alcohol and tobacco. That would be legalization.

Decriminalization goes to the penalty structure; that is, you say it is not a felony, it is not a misdemeanor; it is a matter that can be treated as in S. 1450 which I believe is before the committee now. S. 1450 would treat some types of marihuana possession as a fine and not as a conviction for a crime.

Mr. MARTIN. Would you feel competent to express an opinion on whether or not decriminalization or legalization would put us in conflict with the terms of the U.N. Single Convention?

Mr. ROSTHAL. You've got to separate the type of offenses when you're talking about the Single Convention. For example, there is no doubt in my mind that we could never penalize trafficking by fine. I think the Single Convention is very clear; that the more dangerous, the more criminal, and the more coordinated offenses which are possible with the drug must be punished by criminal sanctions. On the other hand, if you were to ask me if simple possession, which is a misdemeanor under our Federal law today, could be treated in a fine situation, where there was no criminal result, but there was a penalty, there must be a penalty, I would say—and there are lawyers who might disagree with me—but I would say that the fine would meet the strictures of the Single Convention for simple possession.

Mr. MARTIN. You pointed out in your testimony, Mr. Jenson, that under the Controlled Substances Act of 1970, youthful first offenders are placed on probation rather than being sent to prison. This legislation, I believe, has been copied by a majority of our States, has it not?

Mr. JENSON. Yes, it has. I don't have the exact count now, but I know it represents something like 38 of the 50 States.

Mr MARTIN. Are many youthful offenders in fact being sent to prison for simple possession of a few joints of marihuana? Do you have any impression of the situation nationwide?

Mr. JENSON. No; there are a relatively small number of those persons charged with simple possession that actually ever serve any time, that actually ever go to jail.

Mr. MARTIN. The majority of them are let off on probation or their cases are dismissed?

Mr. JENSON. That's correct.

Mr. MARTIN. The fact that there were more than 400,000 arrests nationwide last year, 420,000, for the simple possession of marihuana, has been interpreted as signifying that our law enforcement authorities are engaged in some kind of national manhunt for pot smokers. Do you think there has been such a manhunt?

Mr. JENSON. No; I disagree completely.

I think that sometimes that is misleading. When the people that are referred to, the 400,000—when the cases are actually examined, quite often the charge is simple possession, but in fact those persons were engaged in more than simply possessing marihuana. But it just happened that the only chargeable offense at the time they were arrested was the possession charge. It's extremely difficult to actually penetrate these organizations, or to actually get a direct hand-to-hand purchase of evidence from many of these individuals, because they only deal with people that they know. And so, the cases that are built on these people are built on a basis of surveillance. Agents conduct lengthy surveillances. They see individuals in the business of

transferring drugs. But the actual arrest, quite often, is for the possession part of the offense, as opposed to the actual transfer or sale of the drug.

Mr. MARTIN. Your own agency is concerned primarily with discouraging use by disrupting and discouraging traffic. Is that correct?

Mr. JENSON. That is correct.

Mr. MARTIN. Do you feel that the laws governing cannabis traffic are adequate as they stand today? For example, are cannabis traffickers treated as stringently as traffickers in other drugs?

Mr. JENSON. No; the penalties as they relate to cannabis under the Controlled Substances Act are one-half that of those applicable to the so-called hard drugs, such as heroin and cocaine. The sentence for the violation involving marihuana would be 5 years and a $15,000 fine, whereas with heroin it would be double that.

Mr. MARTIN. Why do they make this distinction?

Mr. JENSON. The reason why is that the penalty structure relating to marihuana at the time that this law was enacted was designed with the idea that the penalties applicable to marihuana should be less than those that would be applicable to the hard drugs inasmuch as marihuana was not considered as serious a problem as, say, heroin.

Mr. MARTIN. Is it considered a narcotic drug?

Mr. JENSON. Not under the Controlled Substances Act. It is considered a hallucinogenic drug. However, under the Single Convention of the United Nations Single Convention, it is classified as a narcotic.

Mr. MARTIN. Doesn't this put the Controlled Substances Act in conflict with the Single Convention on the definition of marihuana?

Mr. JENSON. Yes, it does.

Mr. MARTIN. I would like to jump here at this point to one of our next witnesses, Dr. Coy Waller. I will not ask you for your statement at this point, Dr. Waller. You are the director of the Institute for Pharmaceutical Sciences of the University of Mississippi and have had a lot of experience in cannabis research. Would you consider cannabis to be a narcotic drug?

Dr. WALLER. If we are looking really at the pharmacological effects on the central nervous system, it does somewhat fit the pattern of a narcotic drug. It has analgesic and soporific type of action.

Mr. MARTIN. And is this view shared by other pharmacologists with whom you have been associated in your research?

Dr. WALLER. I am mainly a chemist working closely with them, and by osmosis and so forth I do have feeling for the data. The data does say that it has a central nervous system action, very much like a narcotic.

Mr. MARTIN. Thank you. We will come to your presentation a bit later, Dr. Waller.

What about the sentences being imposed by our courts, Mr. Jenson? From what I know of your operations, you had some really massive cases involving 10,000 pounds, 20,000 pounds, 30,000 pounds of marihuana, and one case involving 11,000 pounds of hashish. Now, are the courts throwing the book at these major traffickers when they are convicted?

Mr. JENSON. By no means. To the contrary, for the most part they are very light sentences that are being handed out by the courts. We have seen sentences of 2 and 3 years, and quite often probation, for

cases involving significant quantities of drugs being not only distributed, but smuggled into the country.

Mr. MARTIN. Why do you think the judges are so disposed to be so lenient in the case of marihuana traffickers? Would you be prepared to venture an answer to that?

Mr. JENSON. It is difficult to say what is in the minds of the judges, but I think to a great extent they are, like the general public, not fully informed as to what the true facts are with respect to marihuana, how serious a threat it is, what problems it really does present to society. As a result, some of them are taking the position that, when in doubt, it is better to hand out a rather soft sentence or a light sentence as opposed to handing out the more severe or longer sentences.

Mr. MARTIN. Do you think many of the judges believe the scuttlebutt which is pretty widespread that it is a relatively harmless drug?

Mr. JENSON. I could not say what they actually believe. Again it would be difficult to determine what they are thinking about it, but it is my opinion that they have been influenced by this proliferation of information from various organizations and movements over the past years that try to say that marihuana is a harmless substance.

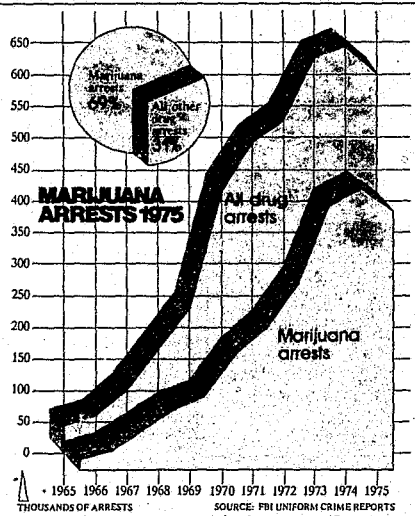
NATIONAL ORGANIZATION FOR THE REFORM OF MARIJUANA LAWS
2317 M STREET, NW, WASHINGTON, DC 20037



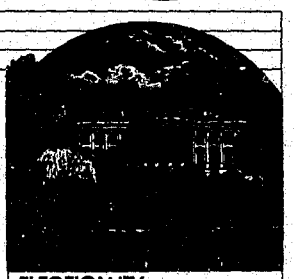
FEWER MARIJUANA ARRESTS IN 1975

Marijuana arrests, which peaked at nearly one-half million in 1974, declined last year for the first time in more than a decade. The FBI's Uniform Crime Reports, released in August, show 416,100 arrests for marijuana related offenses in 1975, compared with 445,600 in 1974.

It is too early to measure the effects of the new marijuana decriminalization laws. But changing public attitudes and enforcement priorities have already helped reverse the trend in arrests. Many local jurisdictions now routinely treat minor marijuana infractions with small fines or use diversion programs to get offenders out of the criminal justice system. (See story page 3).

California's new marijuana law didn't become effective until January, 1976. Still, 1975 figures dropped almost 14,000 with a reported 85,757 arrests across the state.

Yet, there is little reason to start cheering about the decline. The annual arrest figures are hefty, averaging 1,140 each day in 1975. That works out to nearly 35,000 arrests a month. The nationwide total for 1965 only reached 18,815. An even more sobering fact is that 7 out of every 10 drug arrests in this country are for marijuana. While society is clearly concerned about hard drug problems, police resources remain concentrated on pot smokers. What is the American tax payer's tab for all of this? Over one-half billion dollars a year.■



ELECTION '76: CARTER AND FORD ON MARIJUANA

by Larry A. Schott

Where do the Presidential candidates stand on marijuana decriminalization? On the record, Jimmy Carter supports it and Gerald Ford doesn't. But their private feelings may not be so far apart.

After all, they share something in common with millions of parents across the country: their children have smoked grass. Jack Ford, 24, readily admits he has smoked it and his brother Michael, 26, a theology student, says he's tried it too. Carter's sons Jack, 29, Chip, 26, and Jeff, 24, have also smoked pot. All say they no longer use the stuff.

Not surprisingly, Jimmy Carter and Gerald Ford each are quick to point out that they have never tried marijuana and don't intend to. Moreover, both nominees say they will work hard to stop the flow of all illegal substances into the U.S. ☞ 5

DEA Administrator, Peter B. Bensinger

U.S. Senator Birch Bayh

BAYH SAYS NO DRUG BILL WITHOUT DECRIMINALIZATION

Senator Birch Bayh. (D-Ind.) has announced that marijuana decriminalization will be part of a major drug enforcement package to be introduced in Congress early next year. Bayh is Chairman of the Senate Subcommittee to Investigate Juvenile Delinquency, which is writing the legislation. The bill's main thrust is aimed at top-level narcotics traffickers and will substantially increase the risk of being in the heroin business.

Bayh said the Subcommittee will include a provision similar to the Oregon law, and will call for the possession of small amounts of marijuana under federal law to be changed from a criminal to a civil offense. The maximum fine would be $100 with traffic-like citations replacing arrest. Criminal penalties for selling marijuana, however, would remain intact. Bayh wants the bill to serve as a model for states that will decriminalize marijuana in the future.

Hearings were held last summer by Bayh on the bill that President Ford requested in his drug abuse message to Congress. Ford's bill (S. 3411) would require minimum mandatory sentences for persons convicted of selling heroin and narcotic drugs. But Bayh is not satisfied with the administration's proposal and thinks that it uses the wrong approach for limited federal resources. What is needed, he said, are tough mandatory penalties for the kingpins of hard drug trafficking, not street level addicts. Moreover, Bayh wants to send the tax collector after big time heroin dealers.

> "I'm uneasy with the way criminal statutes deal with marijuana."
> Sen. Birch Bayh

Legislation to fight drug abuse, Bayh pointed out, should also take into account the reality that drugs such as marijuana are not as dangerous as others. "I am uneasy with the way criminal statutes deal with marijuana," he said.

Peter Bensinger, head of the U.S. Drug Enforcement Administration, told the Subcommittee that marijuana is not a federal priority. When asked about his views on decriminalization, Bensinger ignored five years of government reports failing to link marijuana and serious health threats. "I don't think we have enough knowledge medically," he said.

"Do you think we will ever get enough information so it won't be a political hot potato?" Bayh shot back. "I think we better stand up and face realities," he said. "If we're going to go after the heroin kingpins, we are going to have to summon up all the prosecutorial and law enforcement resources we can. As long as we have the statutory temptation in other areas, I fear we are not going to do as good a job as we could."

Later in the hearings, Dr. Robert DuPont, Director of the National Institute on Drug Abuse, said that he concurred completely with Bayh on marijuana. DuPont also added that the available evidence suggests there has been no increase in marijuana consumption associated with decriminalization.

US DRUG AGENCY UNDER FIRE . . . AGAIN

A Senate Subcommittee report has called federal efforts to combat illicit drug traffic a failure. The report was released in July by the Permanent Subcommittee on Investigations, a unit of the Government Operations Committee. It has strong words for the U.S. Drug Enforcement Administration, scoring the beleaguered agency for concentrating on street level undercover "buy-bust" techniques instead of going after top level narcotics dealers.

"DEA's track record has not been good," the report said.

It is the second government report in less than a year to criticize DEA. In September, 1975, a special task force of the White House Domestic Council charged that U.S.

drug enforcement efforts suffered from DEA's misplaced priorities and internal problems. One of its recommendations: de-emphasize anti-marijuana efforts.

The DEA was created three years ago not by an act of Congress but as a reorganization plan of the Nixon administration, to consolidate federal drug enforcement functions. Since then, it has been plagued by bad judgment, corruption, mismanagement, and bickering with other agencies. All the while, the nation's drug abuse dilemma steadily worsened.

John R. Bartels, the agency's first administrator, was fired by Attorney General Edward H. Levi last year amid an embarassing Justice Department investigation. At least a dozen other senior DEA officials have been reassigned or transferred. The latest to get the axe is Vince Promuto, an ex-pro football player who was once paid $32,000 a year as Director of Public Affairs. He was fired in July, after being charged by internal DEA auditors with "dishonest conduct" involving government credit cards and travel. Promuto was a central figure in the Bartels affair and had been under investigation for ties to organized crime figures. Shortly before Bartels was canned, Promuto was demoted and exiled to DEA's New York regional office.

The Permanent Investigations Subcommittee is continuing its examination and the hearings may well decide what future, if any, is in store for the DEA.

THE PRESIDENT'S MEN AND MARIJUANA

Two familiar names recently returned to Capitol Hill and had a few words to say about marijuana. Watergate alumni John Ehrlichman and Egil Krogh came back to Washington to testify before the Permanent Investigations Subcommittee's hearings on the problem-prone Drug Enforcement Administration.

They talked about the Nixon blueprint for drug enforcement. Drug suppression is a "very sexy political issue," Ehrlichman said, and it usually has high media visibility. The White House wanted to be involved, he recalled.

Ehrlichman has mellowed since he faced the Watergate Committee three years ago. At the White House he was one of Nixon's closest advisors. Now, living in New Mexico, his lifestyle is different and, so it seems, are his views. Responding to a question by Senator Charles Percy, (R-Ill.), Ehrlichman said, "Marijuana policy should be left up to the states, a local option. It probably doesn't even belong as a federal matter."

Krogh agreed. Once the youngest member of Nixon's cabinet (an Undersecretary of Transportation at 33), he was given responsibility for drug matters after joining the White House. He told Percy that he too supported marijuana decriminalization. "It is wrong to jail young people for possessing pot," he insisted. Percy concurred.

Back in 1969, Krogh was the architect of "Operation Intercept," the ill-fated marijuana blockade on the U.S.-Mexican border. He was also head of the White House plumbers, and later served 4 months and 17 days in prison for his role in Watergate. Now he works for an ice cream company in San Francisco.

For Ehrlichman, prison will have to wait. He recently won a reprieve on his 20 month to 5 year prison sentence while he appeals his Watergate conviction to the Supreme Court.

After the hearing, Ehrlichman was asked by a reporter if he had smoked marijuana. He smiled broadly and said, "No comment."

LOCAL GOVERNMENTS AND DECRIMINALIZATION

While eight states have dropped criminal penalties for minor marijuana offenses, several local governments have also acted. In 1971, Ann Arbor, Michigan, led the nation with the first traffic-ticket marijuana ordinance. Over the past few years, other villages, cities, and counties have also adopted ordinances decriminalizing the possession of marijuana.

There are now at least fifteen such ordinances that call for only a fine, and no jail sentence. In four cities, the maximum possible fine is $5.

This local action reflects a separate yet parallel movement within communities to adopt common sense laws dealing with marijuana. The ordinances were passed by City or County Councils and in some cases, by voter referendum. About one-half of the states have some provision in their constitutions giving municipalities the option to adopt lower penalties for offenses of local concern.

NO ARRESTS. The Ann Arbor ordinance was originally passed by the City Council, repealed, and later permanently restored by voter referendum. It provides for a maximum $5 fine for the use, possession or sale of any quantity of marijuana. Instead of arresting an offender, the ordinance requires police to give a parking-ticket citation. It also requires that the city's parking violation procedures be used for collecting the fine. Moreover, the ordinance expressly forbids city police officers and prosecutors from referring a marijuana case to the state police for prosecution under the tougher state law.

Much of the push for the Ann Arbor ordinance came from students at the city's University of Michigan campus. Three other university towns have also adopted marijuana ordinances—East Lansing, home of Michigan State; Ypsilanti, home of Eastern Michigan University; and Oxford, Ohio, home of Miami University.

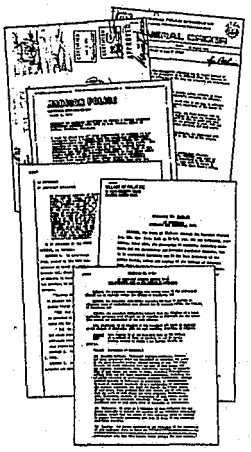
The Ypsilanti ordinance, adopted in 1974, and the Oxford ordinance, adopted in 1975, call for a maximum $5 fine for first and subsequent offenses. The East Lansing ordinance, passed in 1971 and later amended, provides for a $5 fine for the first time, $10 for the second offense and $100 for a third offense.

Though jail penalties are gone, the fines of some local laws can be stiff. Earlier this year, two villages in Illinois adopted marijuana ordinances and in each case the maximum fine can range up to $500. In Deerfield, possession of up to 30 grams of marijuana (slightly more than 1 ounce), is subject to this fine as is possession, sale or cultivation of up to 10 grams of marijuana in Palantine. Seattle, Washington, also has a $500 maximum fine for possession of marijuana which it adopted in 1974.

The fines actually assessed, however, generally are lower than the maximum allowed. In Seattle, Roger Roffman, a professor at the University of Washington and NORML State Coordinator, compared the dispositions of a random sample of 30% of adults given marijuana citations by the city police in 1975. He found 39% of the group had the case dismissed or dropped without any fine being imposed, and 42% were given a small fine, usually about $50-$75.

In other areas, Atlanta, Georgia, adopted an ordinance earlier this year containing a maximum $250 fine for possessing up to one ounce of grass. Six municipalities in Wisconsin also have marijuana ordinances, including Brookfield, Cudahy, Shorewood, South Milwaukee, St. Francis, and West Allis. Their maximum fines range from $200 to $250. In Milwaukee County, the Board of Supervisors adopted an ordinance last year making possession of up to an ounce of pot on county property subject to a fine of $50-$200, or informal probation.

INFORMAL POLICIES. In many states, local prosecutors and police departments have instituted policies which can operate informally without an ordinance. Aimed at conserving law enforcement time, the policies generally call for citations instead of arrest, and diversion programs instead of prosecution, for minor marijuana cases. For example, the police chief of Austin, Texas, has established a "field release citation program" for persons possessing up to four ounces of marijuana. Dozens of other cities and counties, including Washington, D.C., Sacramento, California, and Cook County, Illinois, have procedures for diverting persons arrested on marijuana charges out of the criminal justice system and into an education program.



There is one local law which has a greater marijuana penalty than the state law. In 1974, the Denver City Council passed an ordinance making possession of ½ ounce of pot punishable by up to 90 days in jail and a possible fine of $300. This was significantly lower than the state penalties at the time, but the new Colorado law, which took effect July 1, 1975, has a maximum fine of only $100 for possession of up to one ounce. Unfortunately, the Denver Police Department opposes the new state law and continues to use what is now a harsher city ordinance.

The Ann Arbor approach is still the best of the local ordinances. And it even provides for its own "self-destruction" if the Michigan state legislature adopts anything less than a $5 grass law.■

CALIFORNIA REDUCES MORE PENALTIES; EXPANDS RECORD DESTRUCTION

by Gordon S. Brownell, West Coast NORML Coordinator

Two bills recently passed in California reduce penalties for felony marijuana offenses, and expand the record destruction procedures of California's new marijuana law.

Indeterminate sentences, which could range to life imprisonment, were abolished and several felony marijuana penalties changed by S.B. 42, a bill authored by state senator John Nejedly (R-Contra Costa). The law will become effective July 1, 1977.

Under the current penalty system, cultivation and possession of marijuana with intent to sell can land an offender up to 10 years in prison for a first offense and up to life for a third conviction. Under the new law, the judge will set a fixed term of imprisonment, either 16 months, 2 years, or 3 years. Sale of marijuana, which now carries 5 years-life, will be either 2, 3, or 4 years under the new law. And the most severe marijuana offense in California, furnishing to a minor, will be a maximum sentence of 5 years instead of 10 years-life for a first offense. The maximum sentence for possession of "concentrated cannabis" was reduced from 5 years to 3 years though it can be treated optionally as a misdemeanor.

The legislation is intended to be retroactive and will have a definite impact on the release dates of individuals now serving felony sentences in California state prisons.

Another important bill (A.B. 3050) by state assemblyman Alan Sieroty (D-L.A.), revises record destruction procedures for persons convicted of marijuana possession prior to January 1, 1976, and enables persons convicted of a number of other minor marijuana offenses to have records of their prior offenses destroyed. It becomes effective January 1, 1977.

A key provision of the bill forbids an employer from asking about specified marijuana convictions more than two years old. Persons effected by the change can state that they have not been arrested or convicted of those offenses when responding to questions concerning a prior criminal record.

The California Department of Justice estimates that it has 806,000 entries of marijuana arrests which would be eligible for destruction under A.B.3050, involving approximately 460,000 persons.

NORML supported the enactment of both S.B. 42 and A.B. 3050.■

US EASES PAROLE GUIDELINES FOR POT

The U.S. Parole Commission, in response to a petition filed by NORML, has revised its guidelines for paroling prisoners in federal correctional institutions. The guidelines indicate the "customary" time an inmate must serve before release on parole, and are based in part on a six-level "severity" rating system of the offense committed.

The change, effective October 4, 1976, lowers simple possession of marijuana, hashish, and other non-narcotic drugs into the least serious category of offenses. This means that persons convicted of these offenses will generally be released on parole earlier.

Also changed by the Commission were their guidelines involving immigration law violations and offenses involving explosives, increasing the severity rating of each.

While the new guidelines treat marijuana and hashish the same for offenses involving simple possession of small amounts, the Commission rejected NORML's proposal to also treat marijuana and hashish the

same for offenses involving possession with intent to distribute and sale. The guidelines continue to define hashish as a "soft drug," a classification which has higher severity levels than marijuana for offenses other than simple possession. "Soft drugs" include the amphetamines, barbiturates, LSD, and hashish. The "hard drugs" category, which has higher severity levels, is defined to include heroin, morphine, opiate derivatives or substitutes. The Commission also chose to include cocaine in this category.

SOME AMBIGUITY. There is some ambiguity in the guidelines as to whether the decreased levels for possession offenses apply to prisoners who have already received their initial parole hearing. NORML has petitioned the Parole Commission for a clarification, requesting that the decreased levels for possession offenses be made fully retroactive.

The Parole Commission was created by Congress earlier this year as an independent agency within the Department of Justice. It repiaces the U.S. Parole Board. The nine Commissioners are appointed by the President and approved by the Senate.

The Commission proposed new parole guidelines in May, and called for public comments before taking final action. NORML's comments were filed by Peter H. Meyers, Chief Counsel, and Judith L. Klein, a legal intern in the National office. The Association for the Advancement of Psychology, 14 prisoners, and a number of probation officers, prosecuting attorneys and other individuals also filed comments.

Of the 22,191 prisoners now in federal institutions, 1,184 were convicted for marijuana offenses and 508 were convicted for other nonnarcotic drug offenses. Since neither the Parole Commission nor the U.S. Bureau of Prisons keeps statistics breaking down offenses into simple possession and sales categories, it is impossible to determine the exact number of inmates who would be effected by the lowered severity levels if they were made fully retroactive.

More men and women are in prison today than at any time in this nation's history. There were 249,716 persons in federal and state prisons on January 1, 1976, more than one-half of whom were under 30 years old. The number of prisoners this year was 10% more than last year.■

ELECTION '76 continued

CARTER MONDALE

STRONG ADVOCATE. Jimmy Carter was an early supporter of marijuana decriminalization in the campaign. Responding to NORML's presidential candidate survey in January, Carter said he "favors a modified form of marijuana decriminalization, along the lines of the Oregon law." He feels "this legislation should be left up to the individual states themselves." In a direct mail funding appeal before the Florida primary in March, Carter told potential contributors, "you and I will agree on some issues, disagree on others . . . I favor decriminalization of marijuana." Vice-Presidential candidate Walter Mondale shares Carter's views.

Rosalynn Carter, like Betty Ford, was the one to reveal to the press that her sons had tried marijuana. In an interview with Lynn Olson of Associated Press in September, Mrs. Carter added that she didn't worry about the behavior of her children as long as they confide in her. "The only time I worry about my children doing something like smoking marijuana," she said, "is if I thought they were slipping around and doing it and not letting me know about it." At a press conference the next day, Carter remarked that he wished his sons hadn't tried grass, but said he thinks "it's something most teenagers go through." The Carter's three sons are all married.

Ford Dole

PROBABLY MODERATE. Betty Ford first talked about her family and marijuana in 1974. "I'm sure the children have tried it," she told a reporter. At the same time, Mrs. Ford was asked if she thought the law for smoking grass should be softened. "I think that is a possibility," she said. A year later, she speculated on CBS's "60 Minutes" that if marijuana had been prevalent when she was young, she probably would have tried it herself.

Ford's position on marijuana is probably moderate, but he did shift to a harder line with the emergence of Ronald Reagan's candidacy. The Ford-Dole campaign office declined to issue an updated statement on marijuana. Still, the President has expressed support for lower possession penalties, and has been characterized as having an "open mind." Asked about decriminalization during the New Hampshire primary, Ford said:

"Personally, I do not approve of the use of marijuana and believe that it's use should be strongly discouraged as a matter of national policy. I do not support decriminalization because I believe that this would be interpreted by potential users and by other nations as a signal that the U.S. government no longer opposes marijuana use. I do, however, support reduced federal penalties for simple possession, such as those contained in the proposed Criminal Justice Reform Act of 1975 (which would reduce penalties to a maximum of 30 days)."

President Ford has said that he's been influenced by his children's beliefs. In his words, they have given him a "new perspective, a broader view." Jack Ford, who calls for decriminalization when campaigning, believes his father is all right on the marijuana issue. "Don't worry, Dad's a pretty cool guy," he told Illinois NORML's Dave Samber. "Give him some time."

WILD CARDS. Don't count out the impact of the alternative presidential candidates. Independent Eugene McCarthy, who at last count was favored by 6% of the voters, may be on the ballot in 40 states. He has long been a supporter of marijuana decriminalization. So has Roger MacBride of the Libertarian Party, as has the People's Party candidate, Margaret Wright.

Over all, the marijuana question hasn't come up much this election year. For example, only once in a swing through 17 communities was Jimmy Carter asked his position, and this came from a college audience. His answer was a stock reply that he's for decriminalization, but against legalization. Most recently, Rosalynn Carter told the same thing to a national TV audience on NBC's "Meet the Press." Ford is infrequently asked about marijuana. But the issue that haunted George McGovern four years ago no longer sparks campaign controversy. "People aren't as afraid of marijuana any more," one professional political observer recently noted. "They all suspect their own kids have been using it and nothing much has happened to them. They're more worried about booze these days."■

In the Courts

Peter H. Meyers
Chief Counsel

US SUPREME COURT WEAKENS SEARCH AND SEIZURE PROTECTIONS

The U.S. Supreme Court ended its 1975-76 Term in July with five separate decisions significantly weakening the Fourth Amendment's protection against unreasonable search and seizure. The Court:

Ruled 5-4 that police officers can constitutionally search the unlocked glove compartment of a car impounded for traffic violations, as part of a routine "inventory" of the car's contents. In this case, police had found a bag of marijuana in the glove compartment, and the defendant had been convicted of possession. The Court's opinion appears to leave open the question of whether a search of a *locked* glove compartment or trunk as part of a routine "inventory" would also be constitutional. *South Dakota* v. *Opperman*, 44 U.S.L.W. 5294 (July 6, 1976).

Ruled 7-2 that a heroin suspect observed by police as she stood in the open doorway of her home could be arrested without a warrant because the doorway of a house which is open to public view from the street is equivalent to any other "public place." *U.S.* v. *Santana*, 44 U.S.L.W. 4970 (June 24, 1976). The Court held earlier this Term that a warrantless arrest in a public place upon probable cause would not violate the Fourth Amendment.

Ruled 5-3 that the Fourth Amendment's exclusionary rule does not forbid the use in a federal civil proceeding of evidence seized unconstitutionally, but in good faith, by state police officers. *U.S.* v. *Janis*, 44 U.S.L.W. 5303 (July 6, 1976). The Court specifically left open the questions of whether evidence seized unconstitutionally by state police could be used in a state civil proceeding, and whether evidence seized unconstitutionally by federal police could be used in a federal civil proceeding.

Ruled 6-3 that "where the State has provided an opportunity for full and fair litigation of a Fourth Amendment claim, a state prisoner may not be granted federal habeas corpus relief on the ground that evidence obtained in an unconstitutional search or seizure was introduced at his trial." *Stone* v. *Powell*, 44 U.S.L.W. 5313 (July 6, 1976). This decision means that, except in very rare instances, only the Supreme Court, and not the lower federal courts, can consider whether evidence obtained in an unconstitutional search was introduced in a state trial. With the Supreme Court's heavy caseload, it will hear only a small number of these cases.

Ruled 7-2 that Border Patrol officials at fixed checkpoints on U.S. highways near international borders may stop a vehicle and question its occupants about their right to be in this country, even without a reasonable suspicion that the vehicle contains illegal aliens. *U.S.* v. *Martinez-Fuerte*, 44 U.S.L.W. 5336 (July 6, 1976). Last Term, the Court held that *roving* border patrols could not stop a vehicle without a reasonable suspicion that it contained illegal aliens.

Herblock in The Washington Post

"We Were Told They Were 'Strict Constructionists'"

CALIFORNIA NORML ESTABLISHES AMICUS BRIEF PROGRAM

With the adoption of a new marijuana law last year, California NORML has been focusing more of its attention on the courts. A new program was established earlier this year for submitting *amicus curiae*, or "friend-of-the-court," briefs in cases involving the interpretation of the new law and on other important marijuana-related issues.

A committee was formed in April to select appropriate cases for the program. It consists of Gordon Brownell, West Coast NORML Coordinator, along with Bay Area attorneys Leo Paoli, Arthur Sohcot and Mark Soler. Working with six other attorneys, the *amicus* committee has begun selecting cases and filing briefs on behalf on NORML. The participating attorneys donate their services, with NORML paying the necessary expenses.

A top priority has been given to cases involving the record destruction provisions of the new marijuana law. This section, effecting about 500,000 persons convicted for marijuana possession who could now have their arrest records destroyed, has come under strong constitutional attack by the State Attorney General. The lower courts have split on the constitutionality of this section, and the issue has now reached the California Supreme Court. NORML has filed briefs supporting the section's constitutionality in a number of lower courts, and is representing several petitioners before the Supreme Court.

Amicus briefs have also been filed on behalf of persons who remain in state prison because of possession convictions under California's old marijuana laws. In one case involving an old possession arrest, NORML's brief helped get the prosecution dropped. An *amicus* brief has also been filed in the California Supreme Court in a case involving a school teacher who was dismissed for "moral turpitude" after a marijuana possession conviction. Another *amicus* brief was filed supporting the Right of Privacy in a case involving an old arrest for possession of 1.8 grams of marijuana in the home. Several other briefs are currently being prepared.

This important new legal program demonstrates how a state affiliate can effectively use the courts to

protect and expand upon legislative victories, and to provide support in other significant marijuana cases. For additional information, contact West Coast NORML, 2964 Fillmore Street, San Francisco, CA 94123.

PENNSYLVANIA MARIJUANA LAWS CHALLENGED

A constitutional challenge to Pennsylvania's marijuana laws was filed in September in Blair County, Pa., with the assistance of NORML and the American Civil Liberties Union.

The Blair County Courthouse is located in Holidaysburg, the home of the late Harry Anslinger. As Commissioner of the Federal Bureau of Narcotics between 1930 and 1962, Anslinger is credited for much of the misinformation and hysteria which swept the country and led to the adoption of the early marijuana laws. A plaque honoring Anslinger's contributions is displayed prominently inside the Courthouse.

Brought on behalf of a man charged with sale of $55 worth of marijuana to a police informant, this test case seeks to have the marijuana laws declared unconstitutional on a number of grounds, including a denial of equal protection because marijuana is classified with far more dangerous substances, including the amphetamines and barbiturates. The penalties contained in the law for marijuana offenses are also challenged as cruel and unusual punishment. Similar motions will shortly be filed for more than 20 other defendants who have been arrested on minor sales charges as part of a Blair County drug crackdown.

Alan Ellis, of State College, Pennsylvania NORML Legal Counsel, is the main attorney in the suit. *Commonwealth* v. *Dillon*, Cr. Act. No. 689-76, Court of Common Pleas for Blair County.

IN BRIEF

AUTOMOBILE FORFEITURE

● The South Dakota Supreme Court has interpreted that state's forfeiture law, which is similar to the laws in many other states, as authorizing the forfeiture of automobiles only when they contain felony amounts of marijuana or other controlled substances. Cars which contain misdemeanor amounts of controlled substances, such as the .4 oz. of marijuana involved in this case, are not subject to forfeiture to the state. Under present South Dakota law, possession of up to 1 oz. of marijuana is a misdemeanor, but the new marijuana law which will become effective April 1, 1977, makes possession of up to 1 lb. of marijuana a misdemeanor.

The South Dakota Supreme Court's decision also indicated that to justify forfeiture, the state would have to show that the vehicle was being used to "facilitate" the drug offense, and not merely that the drug was "contained in the vehicle at the time it was stopped." *State* v. *One 1972 Pontiac Grand Prix*, 19 Cr. L. Rep. 2236 (1976).

"PRESENCE" LAWS

● The Nebraska Supreme Court has held that the state's law which makes it a crime for any person "to visit or be in any room, dwelling house, vehicle, or place where any controlled substance is being used . . . [with] knowledge that such activity is occurring," is unconstitutionally vague and overbroad. The Court stated that:

"It is evident that the statute as written is broad enough to encompass entirely innocent behavior. Individuals may find themselves in situations such as at parties, theaters, dance halls, hotel lobbies, buses, apartments, taxis, or even private automobiles, where their conduct has no relation to the acts of others who may be disposed to use controlled drugs." *State* v. *Adkins*, 19 Cr. L. Rep. 2197 (1976).

Similar "presence" laws are in effect in about a dozen states, and courts in three states—California, Massachusetts, and Florida—have upheld the constitutionality of their law only after interpreting additional requirements into the law, such as control of the premises, or aiding and abetting the illegal activity.

PRETRIAL DIVERSION PROGRAMS

● The New Jersey Supreme Court has ordered major changes in the state's pretrial intervention programs (PTIs), which are used by local prosecutors to divert certain offenders out of the criminal justice system into rehabilitation programs, in lieu of prosecution. The Court announced that it would shortly adopt uniform statewide guidelines for these programs, but in the interim, the Court ordered all PTIs to change a number of their procedures, including: decisions on entrance into the PTIs must take into account the individual's potential responsiveness to rehabilitation, not just the nature of the offense charged; and, prosecutors must state their reasons for refusing an individual's request for diversion. Marijuana offenders are eligible for a number of these diversion programs. *State* v. *Leonardis*, 19 Cr. L. Rep. 2427 (1976).

● The D.C. Court of Appeals has upheld the constitutionality of the D.C. prosecutor's policy which requires that all persons who enter the "first offender" diversion program waive their rights to challenge their arrest or challenge any other aspect of the case. *United States* v. *Smith*, 19 Cr. L. Rep. 2015 (1976). The District of Columbia's "first offender" program covers possession of small amounts of marijuana and other non-violent misdemeanors.

RECORD EXPUNGEMENT

● The Florida Supreme Court has declared unconstitutional a portion of the state's law which requires the expungement (physical destruction) of arrest records when there is no conviction in the case. The Court called this provision "an unconstitutional encroachment by the legislative branch on the procedural responsibilities granted exclusively to this Court." The dissent responded that "minor interferences with a court's business . . . are clearly an insufficient basis upon which to invalidate a statute."

The Supreme Court did, however, uphold another section of the law which it saw as conferring the "substantive" right upon non-convicted defendants of having their records protected from public inspection. The Court ordered the records in this case, involving a marijuana defendant whose charges were dropped, to be sealed and retained by the lower court. These records can be reopened, the Court stated, "for good cause shown" when the "ends of justice might require it." *Johnson* v. *State*, 19 Cr. L. Rep. 2406 (1976).

MILITARY

● The U.S. Court of Military Appeals has held that it is a violation of equal protection for an Army private to be prosecuted for possession of marijuana under Article 134 of the Uniform Code of Military

LEAFLET/PAGE 7

Justice, rather than Article 92, which has lesser penalties and which has been used for most marijuana cases prosecuted in the private's division. *U.S. v. Courtney*, 19 Cr. L. Rep. 2316 (1976).

The U.S. Court of Military Appeals has also held that a "health and welfare" team sent to inspect the living conditions in the barracks exceeded their authority in searching a soldier's clothing for drugs, and ordered the drugs found in the search to be suppressed. *U.S. v. King*, 19 Cr. L. Rep. 2231 (1976).

DEA

The U.S. District Court for Colorado has held that the Drug Enforcement Administration's (DEA's) surreptitious monitoring of a heroin defendant's conversations with her attorney was a "reprehensible" act which "irretrievably prejudiced" the defendant's Sixth Amendment right to assistance of counsel, and required dismissal of the indictment. *U.S. v. Orman*, 19 Cr. L. Rep. 2423 (1976).

The U.S. District Court for Massachusetts has dismissed a cocaine defendant's indictment because of the "bad faith" actions of DEA agents who were part of a federal-state Task Force. The agents destroyed notes of an interview with the defendant after he had subpoenaed them, and then prepared a back-dated report on the notes. *U.S. v. Pollack*, 19 Cr. L. Rep. 2421 (1976).

The U.S. Court of Appeals for the Ninth Circuit has held that the DEA's policy of shredding diaries and other records of paid informers is unreasonable, and the failure to produce the diary prepared by an informer who testified against a heroin defendant required reversal of the conviction. *U.S. v. Carrasco*, 19 Cr. L. Rep. 2302 (1976).

The U.S. Court of Appeals for the D.C. Circuit has held that the DEA's loss of a tape recording of a phone conversation between a cocaine defendant and an undercover agent does not require dismissal of the case. The Court stated that: "Although we cannot condone negligence of this sort, we do not believe it requires dismissal of the indictment." *U.S. v. Quiovers*, 19 Cr. L. Rep. 2285 (1976).

SEARCH AND SEIZURE

The Massachusetts Supreme Judicial Court has held that a search warrant for a drug suspect's apartment which authorized the search of "any person present" in the apartment was not overly broad. *Commonwealth v. Smith*, 19 Cr. L. Rep. 2282 (1976).

The U.S. Court of Appeals for the Ninth Circuit has held that Customs agents can make a border search of a boat if they have a "reasonable certainty" that the boat came from foreign waters, even without probable cause to believe the boat contains contraband. In this case, 880 pounds of marijuana were found aboard a boat in San Diego Bay. *U.S. v. Tilton*, 19 Cr. L. Rep. 2146 (1976).

The U.S. District Court for Massachusetts has held that police officers acted unconstitutionally in attaching a "beeper" to a drug suspect's car, without first getting a warrant. *U.S. v. Bobisink*, 19 Cr. L. Rep. 2355 (1976). Another recent case has upheld the warrantless attachment of a "beeper" to a car on the basis of probable cause and exigent circumstances. *U.S. v. Frazier*, 19 Cr. L. Rep. 2372 (8th Cir. 1976).

The Florida Supreme Court has upheld the constitutionality of a state statute which authorizes police officers to take blood samples from unconscious persons involved in automobile accidents to test for alcohol intoxication. *Filmon v. State*, 19 Cr. L. Rep. 2343 (1976).

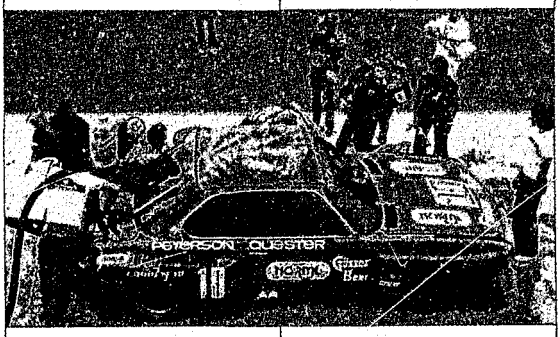
The U.S. District Court for Southern Texas has held that the University of Houston's policy for searching students entering the school's stadium and auditorium for bottles containing alcoholic beverages violates the Fourth Amendment. *Collier v. Miller*, 19 Cr. L. Rep. 2292 (1976).

OTHER CASES

The U. S. Court of Appeals for the D.C. Circuit has held that a convicted narcotics defendant was entitled to the return of $2,550 which was seized in his apartment but not linked to the drug offense or any other crime. *U.S. v. Wilson*, 19 Cr. L. Rep. 2349 (1976).

The Michigan Court of Appeals has held that a trial judge acted unconstitutionally in revoking the probation of an indigent person for failure to meet the $20-per-month payments on his $400 fine. *People v. Terminelli*, 19 Cr. L. Rep. 2396 (1976).

The U.S. Court of Appeals for the Seventh Circuit has held that a heroin defendant's convictions for engaging in a continuing criminal enterprise and for conspiracy to distribute narcotics, a lesser included offense of the criminal enterprise charge, were not barred on double jeopardy grounds. *U.S. v. Jeffers*, 19 Cr. L. Rep. 2128 (1976).



RACING TO A DIFFERENT DRUMMER. NORML logo's and marijuana leafs turned this Schnitzer BMW into a show-stopper. The car, driven by Ronnie Peterson and Dieter Quester, proved it was more than a pretty face. It finished 5th out of 34 qualifying entries in a 6-hour "Championship of Makes" running on July 10, at the Watkins Glen (N.Y.) Grand Prix Race Course.

Bob Randall

A NEW SERIES

CASUALTIES OF THE MARIJUANA LAWS

The outdated marijuana laws which are still on the books in most states are causing very real and unnecessary suffering for many people. Whenever possible, NORML is helping the victims of these laws. With this issue, THE LEAFLET begins a new series of reports on cases where the heavy hand of the law has been excessive and severe. In this edition, three cases are examined: Bob Randall, who stands to lose his eyesight and could go to jail; Roger Davis, a black man from a southern town who is serving forty years in prison; and, Jerry Mitchell, a 19-year old college student who was recently sentenced to twelve years by an Ozark circuit judge.

BOB RANDALL faces this dilemma: be a criminal or go blind. Randall, who is 28, has glaucoma. He is functionally blind in one eye and has seriously impaired vision in the other. He is being prosecuted in the District of Columbia for possession of a few marijuana plants that his doctors have certified he needs to keep from going totally blind.

The doctors say flatly that Randall's condition can no longer be adequately controlled by conventional medications. Randall has tried them all. In fact, he faces rapid blindness unless he is allowed to use marijuana, or chances a risky surgical procedure, which is not always successful and may even aggravate the condition.

> "All I'm asking is for the maintenance of my sight for as long as possible."

An estimated 1 million Americans suffer from glaucoma, an incurable eye disease that ranks as one of the leading causes of blindness in the U.S. Glaucoma increases the fluid pressure within the eye and eventually shuts off all sight. In many cases, the progress of the disease can generally be controlled by miotics, but, as in Randall's case, they often diminish in effectiveness over time. Some preparations can themselves cause eye damage through retinal detachment. In the past few years, however, marijuana has been found to be a significant new treatment. The tragic irony is that while the government hails the new treatment as "promising" it will not allow its legitimate medical use.

Before any research findings were published on marijuana and glaucoma, Randall began smoking marijuana in college. After smoking, he noticed something curious: the hazy rings seen around lights by glaucoma sufferers disappeared. He then participated in a marijuana research project on glaucoma at UCLA and got the same welcome results. Unfortunately, there were no similar research projects for him to enter in the Washington, D.C. area, where he moved to teach speech and rhetoric part-time at near-by Prince Georges Community College.

Randall has asked the federal government to exempt him from the drug laws so that he can use marijuana for his glaucoma. Three separate federal agencies are involved: the Food and Drug Administration, the Drug Enforcement Administration, and the National Institute on Drug Abuse. Officials of the agencies have indicated that an exemption might be granted if he would agree to smoke marijuana only in his doctor's office. But since Randall would need about five joints each day, it would require a burdensome rescheduling of his life for him to smoke only in his doctor's office, rather than at home.

"All I'm asking," Randall says, "is for the maintenance of my sight for as long as possible."

Earlier this year, Randall was arrested and charged with possessing a few marijuana plants found growing on his back porch. At his trial in the D.C. Superior Court in July, he admitted possession of the plants, but Randall's attorney, John Karr, argued that it was justified by his medical necessity. The trial judge has not yet issued his decision. NORML and the Playboy Foundation are assisting in Randall's case.

Until 1941, marijuana was listed in the U.S. Pharmacopeia, a standard physicians' drug reference, and was prescribed for a variety of illnesses. Under present federal law, marijuana is listed with drugs which are deemed to have no "currently accepted medical use." NORML has been petitioning the federal government since 1972 to recognize legitimate medical uses for marijuana. The petition is currently before the U.S. Court of Appeals for the second time.

The most recent report by the Department of Health, Education and Welfare, *Marihuana and Health* (1975), stated that the "most promising therapeutic applications" of marijuana are in the treatment of glaucoma and as an anti-emetic for cancer patients receiving chemotherapy and possibly in the treatment of asthmatics. Other therapeutic uses which are currently being investigated include its use as a sedative-hypnotic, as an anticonvulsant, and an alternative in treating alcoholics.

ROGER DAVIS is 30 years old and black. He was sentenced in 1974 to 40 years in the Virginia penitentiary

Roger and Carol Davis

and fined $20,000 for sale of 4 ounces, and possession with intent to distribute of about 6 ounces of marijuana. His story reads like a Southern Gothic novel, with elements of community hysteria, racial prejudice, and judicial insensitivity.

Davis grew up in Wytheville, a small town nestled in rural southwestern Virginia. Being black in the South has long been a reality for him. When he was 8, his father, a railroad worker, died after being savagely beaten. The white man charged with the killing received 3 years probation.

After graduating from high school, he held a variety of jobs and took some courses at the Wytheville Community College. But he also threatened the town's strict southern manners and morals, as he openly dated white girls and eventually married one. In one local view, he was "a black hippie leader, with the charm of a Pied Piper." The town's hostility to Davis included insults, deliberately picked fights, and finally, the burning of a cross one

"... Nobody gets 40 years for reefer!"

night on the lawn of his mother's small frame house.

Then, in 1973, the "drug menace" came to Wytheville. The only local newspaper, *The Enterprise*, began an anti-drug crusade, reminiscent of the "reefer madness" of the 1930's. Virtually every issue carried sensationalized stories and editorials. One front page editorial referred to the "sickening picture of terror and suffering" caused by marijuana and warned that "the use of marijuana by young Americans is a tremendous help to the Communists." Another issue emblazoned a page one picture of the local sheriff about to publicly burn a few ounces of marijuana which had been seized. The caption read: "Thousands of dollars worth of marijuana goes up in smoke."

The campaign whipped up the sleepy town's emotions. Citizens packed town meetings, the mayor issued statements of concern, and the town council passed an anti-drug resolution. And, in the midst of this frenzy, Roger Davis was arrested for allegedly selling about $10 worth of LSD. He was promptly convicted. But soon after, he was arrested again. This time the charge was marijuana.

At the trial, Danny Eads said he had bought the grass from Davis. A convict sentenced to 5 years for breaking into a gas station, Eads had been released from prison temporarily to make the "buy." He is 21 and white, and while in prison had been gang-raped by a group of black inmates. He had tried suicide and testified that he would have done "anything" to get out of prison.

Davis denied he sold marijuana to Eads, but was nevertheless found guilty by an all-white jury after a two-day trial. The Virginia Supreme Court denied him an appeal and Governor Mills Godwin rejected requests for a pardon or sentence reduction.

With the assistance of NORML and the ACLU, Davis filed a petition for habeas corpus in the federal courts earlier this year. Dr. Dorothy Whipple, a NORML Advisory Board member, was called as an expert witness for Davis at a hearing on the petition. Davis' appeal is being handled by Edward Hogshire, of Charlottesville. The judge has taken the case under advisement and is expected to reach a decision shortly.

Roger Davis still waits in prison. He recently told a Washington Star reporter:

"I look around me and see men serving 10, 15, 20 years, at the most for murder and rape and other crimes. They ask me how long I'm in for and when I tell them 40 years, they say 'Hey man, what did you do?' And when I tell them, they don't believe me. They say 'Hell, we've been smoking reefer for years

Jerry Mitchell (l.) and Mike Stepanian

and nobody gets 40 years for reefer.' And I tell them I did, but they don't believe me."

JERRY MITCHELL is a 19-year old college student from West Plains, Missouri, a small farming town whose main street is named for country singer Porter Waggonner. Like Wytheville, the townspeople worry that a drug problem may creep into the community.

Mitchell graduated from the local high school with a good record and reputation. Last fall, he entered college. Then everything changed. Earlier this year, he pleaded guilty to the sale of 11 grams of marijuana (about 1/3 ounce) for $5 to an undercover Highway Patrol officer. There was no profit involved and the exchange was made only as a favor and at the insistence of a neighborhood friend. He turned out to be an informer.

For this offense, Mitchell was sentenced to 12 years in the state penitentiary. He could have gotten life. The Missouri law is one of the harshest in the nation, providing for 5 years to life for the sale of any

He could have gotten life.

amount of marijuana, no matter how small.

When NORML was alerted to what happened, National Director Keith Stroup asked noted San Francisco criminal lawyer Michael Stepanian to meet him in West Plains. The first order of business: urge the court to reduce Mitchell's

sentence and allow him to be free pending his appeal. At a hearing in July, Stroup and Stepanian argued that the 12-year sentence was way out of proportion to the offense committed. The judge agreed to some extent, saying that he now saw a "ray of hope" for Mitchell. He then reduced Mitchell's sentence to 7 years and released him on bond.

Howard Eisberg, of Kansas City, NORML's Assistant State Coordinator, is the principal attorney working on the appeal to the Missouri Supreme Court. The appeal argues that the penalties contained in the Missouri law and the sentence given Mitchell violate the cruel and unusual punishment clauses of the federal and state constitutions. Moreover, the appeal asserts that the law denies equal protection because marijuana offenses are subject to the same penalties as offenses involving truly dangerous drugs, including the narcotics, amphetamines, and barbiturates. The state Supreme Courts in Illinois and Michigan, and a lower court in Connecticut, have declared their laws unconstitutional on this equal protection ground. NORML and the Playboy Foundation are funding Mitchell's appeal.

Mitchell, meanwhile, is back at his studies in political science and philosophy at Missouri State College.■

TEXAS JURY ACQUITS ON MOST MEXICAN JAILBREAK CHARGES

Three persons prosecuted for their participation in the raid last March on Piedras Negras jail, in Mexico, have been acquitted by a Federal Court of most of the charges against them after a three-day trial in Del Rio, Texas.

In the jailbreak, Mexican guards were held at gunpoint while cell doors were opened. Fourteen American men and women, most being held on drug charges, fled across the Rio Grande River into Texas.

Mike Hill, 32, was acquitted on the two most serious charges against him and convicted on two minor ones involving an unregistered sawed-off shotgun, even though Hill admitted all four charges from the witness stand. One of the other defendants, Billy Blackwell, was acquitted on two charges against him and the third defendant, Sterling Davis, was convicted on one of two charges.

Testimony at the trial described the horrible conditions at Piedras Negras jail, where 13 people were squeezed into an 8' x 7' cell, not even large enough for everybody to lie down and sleep in at the same time. Some persons freed in the jailbreak had been held in prison for more than 2 years. One woman had been arrested by the Mexican police for "conspiring" after visiting a friend in the jail.

Hill was represented without charge by Gerald Goldstein, of San Antonio, and Ed Mallett, of Houston, both members of the Texas NORML Policy Committee. The National office paid the expenses of three former prisoners, called by Hill as witnesses on the conditions at Piedras Negras. Hill is free on bail pending the appeal which will be filed shortly after sentencing in mid-October.■

POTPOURRI

NOTES

● One of the nation's toughest drug laws has flopped, says a U.S. government sponsored study. Three years ago, New York State's "get tough" law took effect with much fanfare. Now, after costing $55 million to administer, it hasn't worked. Not only has the law had no effect on drug traffic, the report by the New York drug law evaluation project suggests that it may have even made things worse.

The study found that "None of the key indicators of successful implementation have been evidenced: the risk of punishment facing offenders did not increase noticably; the number of drug offenders sentenced to prison declined; and the speed with which cases were processed did not improve".

● Alcohol and the tranquilizer Valium are responsible for the greatest amount of drug-related illness in the U.S., according to a federal report released last summer. The figures come from the government's $7 million Drug Abuse Warning Network (DAWN) and compare for the first time the ill-effects of both legal and illegal drugs. Marijuana showed up in about 4% of the incidents reported by emergency rooms, drug crisis centers, and other treatment facilities across the country. While the study broadens the nation's drug abuse focus, it has two deficiencies. First, incidents are reported without an indication of seriousness; and, alcohol is reported only when it shows up in combination with other drugs. So, while even phone inquiries about marijuana would be tabulated, cases of common drunkenness would not.

● Two privately sponsored studies have concluded that the U.S. government's Law Enforcement Assistance Administration (LEAA) has accomplished very little and should be abolished. A Twentieth Century Fund task force and the Center for National Security studies have both charged that LEAA has had no significant effect on crime despite having spent more than $4 billion. Even a $2.4 million evaluation conducted by the Mitre Corporation and paid for by LEAA itself, reported earlier this year that program results in 8 key cities have fallen considerably short of expectations. Established in 1968, LEAA provides high level federal funding for state and local crime fighting projects, including controversial drug enforcement strike forces. Dismantling of LEAA in the near future seems unlikely, however, since the many regional bureaucracies it has created can be expected to wage an intensive battle for survival.

● More changes in foreign drug laws have been reported. The Netherlands Senate gave final approval earlier this year to legislation that reduces penalties for possessing small quantities of marijuana, hashish and hard drugs for personal use. The penalties for trafficking in hard drugs, however, double when the new law takes effect. And Italy is reported to have dropped penalties for the possession of small amounts of marijuana or hashish for personal use.■

ROSE FIRST, POT SECOND

Don't expect to be able to order marijuana delivered with a card any time soon, but a poll taken by the Florists Telegraph Delivery (FTD), to help determine the national flower, shows grass as the leading write-in candidate. The rose was the unsurprising winner.■

POTPOURRI

FIFTH ANNUAL NORML CONFERENCE

Hunter S. Thompson and Dr. Peter Bourne will be among the program participants at NORML's Fifth Annual Conference. The Conference will be held at Washington's new Hyatt Regency Hotel, Dec. 10-12, 1976.

Thompson, who will give the Conference's opening remarks, has been called "irreverent" and "inspired". Author Kurt Vonnegut, Jr., thinks he's the "most creatively crazy" of the New Journalists. Be there and find out for yourself. Dr. Bourne is one of Jimmy Carter's closest advisors, and Deputy Campaign Director. He established Carter's Georgia Mental Health and Drug Abuse Programs, and later served with the White House Special Action Office for Drug Abuse Prevention.

Featured at the Conference will be a review of the marijuana issue and a look ahead, plus a check of the new laws and how they are working. In addition, the latest medical research, legislative programs, and legal strategies will be examined. The discussion panelists will include NORML Advisory Board members, State Coordinators, and nationally-known experts.

Registration for members is $55. Included are Friday night's Keynote Dinner, two additional meals, and all Conference sessions. Non-members will be charged an additional $15.

Register before December 1, 1976, and avoid a $5 late fee.

Write now for further information and registration materials to: NORML Conference, 2317 M Street, NW, Washington, DC, 20037.

Come to Washington for a weekend and help kick off NORML's Campaign '77!■

SHORT SUBJECTS

●Call back the "plumbers". According to *Newsworks*, a Washington, D.C., alternative publication, White House staffers can get choice pot from the diplomatic corps who pass through customs unchecked. The source of the leak? Someone called "Dope Throat".

SURPRISE PACKAGE. Keith Stroup, National Director of NORML, smiles approvingly at a $10,000 contribution left at the Washington office last August by an unknown benefactor. The mystery began when Stroup, who often can be found at his desk on weekends, answered a Sunday morning knock at the office's front door. The caller's request, commonly enough, was for some information about the marijuana issue. As he left, the visitor handed Stroup a note, remarking that a sizable donation had been placed in a close-by briefcase while Stroup had momentarily stepped away to select pamphlets. Brushing aside the comment, Stroup nevertheless checked his case and discovered ten neatly bound packs of $10's and $20's. The cryptic note suggested it might have come from a group of grass dealers. Stroup, however, believes the note may be the playful intrigue of a well-healed contributor who prefers anonymity. In any event, the unexpected help is most welcome. Maybe it will start a trend.■

●And there's a rumor that hospitals and other medical facilities around the country are finding a lot of hemostats have been disappearing at a rapid rate. It seems that the stainless steel plyers device is the latest chic way to hold a short joint. If this is true, and supply runs out, will doctors have to resort to "roach clips" in the operating room?

●High school football coaches in Ft. Lauderdale, Florida, recently found out through a local newspaper survey that 50% of their players smoked marijuana. Some coaches have resorted to lectures and others say they will probably not dwell on the matter. But a coach at Cooper City High has taken a stern view and now has required his players to sign a contract which reads in part: "I will not smoke, drink alcoholic beverages, or take any illegal drugs while a member of the Cowboy football team. Note: first offense you are finished with playing football at Cooper City *forever*."

●Multimillionaire W. Clement Stone has had his caretaker and another man arrested for allegedly growing marijuana in an area of his 400 acre Barrington estate near Chicago. Stone is known for his generosity to Republican party causes.■

Part 3—Decriminalization of Marijuana

[From the Crime Control Digest, June 23, 1975]

FORMER DEA/BNDD TRAINING CHIEF URGES REDUCED PENALTIES FOR POSSESSION OF MARIJUANA

CITIES DRAIN ON CRIMINAL JUSTICE SYSTEM AND HARM TO INDIVIDUALS

Perry A. Rivkind, former director of the Drug Enforcement Administration's National Training Institute, said last week he favors lessening penalties for possession and use of marijuana in the United States.

In an exclusive interview with Narcotics Control Digest, Rivkind said he would be opposed to legalization of marijuana.

Rivkind established the DEA training institute while he was a top official with the now defunct Bureau of Narcotics and Dangerous Drugs. He is currently Assistant Director of the Law Enforcement Assistance Administration for Operations Support and Training.

Rivkind said he "subscribed to" the 1972 recommendations of the National Commission on Marijuana and Drug Abuse, which found that the personal, private use of marijuana should not be a crime. He said a number of his law enforcement friends share his view.

Rivkind's reasons for advocating lesser penalties for marijuana possession, he said, include concern over the "enormous amount of manpower and other resources that are required to deal with (the vast number of marijuana arrestees) input into the criminal justice system."

He also cited the serious harm being done to the hundreds of thousands of people arrested each year for marijuana possession. He said the practice is "alienating, perhaps even destroying, people by the hundreds of thousands in order to enforce laws that obviously are unenforceable."

"It seems to me that in a nation where the rising crime rate is of grave concern—and I'm talking about the alarming increase in predatory crimes—we cannot afford to continue to try to enforce marijuana possession laws."

Rivkind said that next to alcohol, marijuana is the second most abused drug in the U.S. But he said present scientific knowledge about the possible harmful effects of cannabis do not justify the "vast resources this nation expends on arresting or prosecuting people for personal, private marijuana use."

The former DEA official said that even with the knowledge that alcohol and tobacco are harmful to the health, these products have not been outlawed. This makes it very difficult, he said, to convince the thousands arrested for marijuana use every year that their arrests are justified.

When asked if he thought the states should consider changing their laws to reduce marijuana use and possession to a misdemeanor instead of a felony, Rivkind said some states are already discussing this possibility.

He said that the federal government, in the 1970 Dangerous Substances Act, reduced marijuana possession from a felony to a misdemeanor and gave courts discretion to expunge individual records after certain probationary requirements were met.

The federal enforcement effort, Rivkind said, has never been directed at the user or the possessor of marijuana, but rather at the suppliers and dealers.

Rivkind said he thinks it is possible that, if the penalties for possession were reduced, marijuana smoking would lose its appeal to many.

The Justice Department official said he is opposed to legalization of marijuana, or its use in public.

He said it would create too many problems and make it too easy for young people to obtain marijuana cigarettes. And he said he didn't think it would help reduce smuggling of marijuana into the U.S.

"I feel that legalization is the wrong approach," Rivkind told Narcotics Control Digest. "I think we should continue to research the scientific effects of marijuana, and openly and honestly disseminate information about that scientific and social research to the American public, much in the same way we now do with alcohol, tobacco and other drugs."

He said one of the problems in discussing decriminalization of marijuana is that it is a very emotional and controversial subject. This is due largely to the myths about cannabis which were circulated for years, he said.

But he said that alcohol, as injurious as it is known to be, and tobacco, "have not destroyed America" and he doesn't feel that reducing penalties for marijuana possession would cause the collapse of the nation.

Rivkind, who in 1972 received the Attorney General's Exceptional Service Award, said he feels that the nation should continue enforcement efforts aimed at smuggling and distribution of marijuana and all other illegal narcotics and drugs.

But he said it is "time we considered the harm that is being done to many of our citizens in our efforts to enforce what are obviously unenforceable laws regarding the personal and private use of marijuana."

"The criminal justice systems throughout the U.S. must commit their resources to the priority areas of crime," he said, adding that he considers it a "matter of urgency."

Selected California Statistics Concerning the Enforcement of Marijuana Laws from the California State Bureau of Crime Statistics

Crime and Delinquency in California 1972

Introduction

Obtaining accurate quantitative estimates about marijuana law enforcement, court and prison activities is just about impossible. Records keeping systems are inadequate, interpretation difficult, and conclusions dangerous.

The following representations illustrate the substantial diversion of enforcement, judiciary and correctional services caused by the present public policy approach (i.e., criminal justice system) to marijuana use.

"...the fact that nearly one-fifth of all California felony arrests pertain to marijuana charges indicates that marijuana enforcement costs constitute a significant portion of all California law enforcement and correctional expenditures." (from a letter from A. Alan Post, Legislative Analyst to Dr. Tod H. Mikuriya, April 26, 1972)

Tod H. Mikuriya, M.D.

for his helpful corrections and suggestions.

A. 1972 Total Adult Felony Arrests: 240,321
1972 Total Adult Felony Marijuana Arrests: 52,027

21.6% of all Adult Felony Arrests are for Marijuana Crimes

PRETRIAL

Complaint Filed	41,927
Felony Complaint	20,176
Convicted	8,310
Sec. 17, Penal Code	6,531
Misdemeanor Reduction	12,185
Not Convicted	3,875

TRIAL

Total: 7,991

Convicted	6,540	Not Convicted	1,451
Felony Conviction	3,590	Misdemeanor Conviction	2,950

PENALTY

Prison	150
CYA	52
Jail	314
Jail & Probation	2,073
Probation	3,741
Fine	164
Civil Committment	46

Total Incarcerated: 2,589
Total Not Incarcerated: 3,591

Cost Statistics

On page 62 of Crime and Delinquency in California 1972 it is stated that total California Criminal Justice Agency expenditures rose by 67% from the 1967-1968 fiscal year to the 1971-1972 fiscal year. Therefore, in using the Calof method to arrive at costs, that total will have to be increased by at least 67%. Cost figures for the Public Defender were arrived at by multiplying the total Public Defender budget for 1971-1972 by Calof's 8.94% of Public Defender time spent on marijuana cases. The disposition statistics were arrived at by multiplying the 1971-1972 budgets by the percent of marijuana dispositions as compared with the total dispositions for each agency.

1. 52,027 arrests x $29.89	$1,555,087.00
2. 41,921 complaints filed x $63.92	2,679,590.00
3. Pretrial jail costs @$1,388.67/person for average of 123 days before disposition 52,027 x 22.7% = 11,810 11,810 x $1,388.67	16,400,192.00
4. Prosecution	
A. Arraignment: 20,176 x $2.30	46,404.00
B. Preliminary Hearing: 20,176 X $61.40	1,238,806.00
C. Trials: 1510 X $933.95	1,410,264.00
D. Motions to Suppress: Estimate of 1/3 of those without an original plea of guilty: 6,147 X $48	295,056.00
Total:	23,625,399.00
67% of Total:	15,829,018.00
Total + 67%:	$39,454,416.00
E. Public Defender $21,784,607.00 X 8.94%	1,829,906.00
Prison----------$123,229,741 X 2.6%	3,203,980.00
CYA ---------- 53,009,396 X 3.4%	1,802,319.00
Probation ---------- 141,050,644 X 21.3%	30,043,863.00
Probation and Jail----- 141,050,644 X 6%	
76,218,927 X 6%	13,036,195.00
Jail---------- 76,218,927 X 7.7%	5,868,857.00
Total:	$95,239,536.00

COSTS OF CALIFORNIA MARIJUANA LAW ENFORCEMENT

A PRELIMINARY STUDY

by

Michael R. Aldrich, PhD
Barbara Schneider
Tod H. Mikuriya, MD
Gordon S. Brownell, JD

Presented to the California Senate Select Committee on Control of Marijuana, 14 February 1974

HIGHLIGHTS:

1. The cost of California marijuana law enforcement in 1972 is estimated at around $100 million. The lowest estimate we calculated was $52 million, but that did not include adult Lower-Court sentencing costs or any juvenile court disposition costs. The highest estimate was $119 million, but even that remains conservative because it does not include peripheral costs such as government funds expended on welfare for families of those incarcerated, etc.

2. Previous enforcement cost estimates beginning in 1966 are presented to acquaint legislators with the methods used. Of particular interest is Legislative Analyst A. Alan Post's method of determining costs of the first stage of marijuana law enforcement only: investigation and arrests. Applying this method to the 1972 data gives an estimated cost per arrest of $171.36, or $13.1 million spent arresting 76,561 marijuana offenders in 1972.

3. Legislative and reporting-system changes relevant to enforcement cost statistics are presented and discussed critically. A recent legislative change which resulted in a "minor" change in the reporting forms used by the Bureau of Criminal Statistics starting in 1974, will have disastrous effects on all future study of drug use trends unless it is returned to its original form immediately. We strongly recommend that this Select Committee investigate this matter and cooperate with the Bureau of Criminal Statistics to correct the situation at once.

4. Adult Misdemeanor Marijuana Arrests were not broken out for 1972, though they had been for the years 1968—1971. Based on past percentages of total marijuana arrests, we estimate about 3500 Adult Misdemeanor marijuana arrests in 1972. This figure, combined with the reported Adult Felony Marijuana Ar[illegible] (52,027) and the reported 21,034 Juvenile marijuana arrests, give a total of approximately 76,561 marijuana arrests in Califo.nia in 1972. A similar breakdown for all California marijuana arrests from 1960 to 1972 is given in Table 1.

5. Contrary to public impressions, most marijuana arrests are of adults rather than juveniles. In addition, Adult Felony marijuana arrests constitute over one-fifth (21.7%) of all adult felony arrests in the state. Finally, a surprisingly large number of persons convicted on marijuana charges in Superior Court serve time in prison, jail, or CYA: 40% of those convicted in 1972 were incarcerated.

PRELIMINARY NOTES ON ENFORCEMENT COSTS

by Michael R. Aldrich, Ph.D.
Research Director, AMORPHIA
14 February 1974

1. Calof figures applied to 1972 Adult Felony and Juvenile Marijuana Arrests: $119,133,674.24
   1972 Adult Felony Marijuana Arrests, 52,027
   1972 Juvenile Marijuana Arrests, 21,034
   Total, 73,061
   73,061 is four times the 18,243 arrests in 1966. Calof's $29,783,418.56 X 4 = $119,133,674.24

2. Calof method applied to 1972 Adult Felony Dispositions by Barbara Schneider: $95, 239,536
   See enclosed "Cost Statistics" sheet.

3. Post method to determine Marijuana Arrest Costs (not Dispositions Cost), 1972: $13,119,508.
   See enclosed "Previous Marijuana Enforcement Cost Estimates," page 3.
   76,561 total arrests X $171.36 cost per marijuana arrest = $13,119, 508.21

4. Use the Post method ARREST Costs in Barbara Schneider's Calof-method, 1972: $105,762,049
   a) ARRESTS 76,561 total X $171.36 cost/unit = $13,119,508
   b) Complaints, $2,679,590
   Pretrial Jail, 16,400,192
   Arraignment, 46,404
   Prelim. Hearings 1,238,806
   Trials 1,410,264
   Motions to suppress 295,056
   Total 22,070,312
   67% of Tot. 14,787,109
   Total + 67% 36,857,421
   Public Defender 1,829,906 (b) Subtotal $38,687,327
   c) Sentences:
   Prison 3,203,980
   CYA 1,802,319
   Probation 30,043,863
   Prob. + Jail 13,036,195
   Jail 5,868,857 (c) Subtotal $53,955,214

   Total a, b, c = $105,762,049

NOTE: In the 1973-1974 Governor's Budget, page 20, are the following Dept. of Justice budgets:

	1971-72 Actual Budget	1972-73 Estimated Budget	1973-74 Proposed Budget
Total	$31,067,218	$42,580,563	$44,880,408
Law Enf.	19,293,335	28,024,697	28,761,459

If marijuana law enforcement costs about $100 million a year, apparently if we stopped punishing marijuana possession we could fund the entire Department of Justice for at least 2 years, or fund all state law enforcement agencies including criminal justice information, organized crime program, state bureau of narcotics, and the bureau of criminal statistics for 4 years.

5. Using the McGlothlin Method to Determine 1972 Enforcement Costs, $52,225,390.60
Not Counting Lower Court Sentence Costs!

	Number	Cost/Unit	Total Cost
1. ARRESTS (All Adult & Juvenile)	76,561	(Post) $171.36	$13,119,508.21
2. COMPLAINT FILED (Adult)	41,927	(Calof) 63.92	2,679,973.80
3. PRETRIAL JAIL COSTS			
22.7% of 51,131 =	11,607	(Calof) 1388.67	16,118,292.00
4. LOWER COURT COSTS			
Preliminary Hearings	20,176	(Calof) 61.40	1,238,806.40
Plea & Setting	20,176	(Calof) 2.30	46,404.80
TRIALS			
Fel. Complaints Terminated	12,346	(McG) 250.00	3,086,500.00
CONVICTED	8,310	Information Not Yet Available	
5. SUPERIOR COURT COSTS			
TRIALS	7,991	(Calof) 934.00	7,463,534.00
Public Defender			
38.7% of 7991 =	3093	(Calof) 266.94	825,645.42
6. SENTENCES			
CONVICTED, 6650			
Prison	154	(Gov)* 4,396	676,984.00
CYA	54	(Gov)* 8,201	442,854.00
Jail	309	(McG) 1,500	463,500.00
Jail and Probation	2122	(McG) 1,500	3,183,000.00
Probation	3816	(McG) 708	2,701,728.00

*Actual 1971-72 Per Capita Prison and CYA costs given in 1973-74 "Governor's Budget" pages 180, 187. Estimated 1972-73 costs are higher: Prison, $5025, and CYA, $9072.

Does Not Include Costs of Sentencing Those 8,310 Convicted in Lower Courts.

Superior Court Felony Sentences Costs are Determined above for 1 Year only.

NOTE: *Decriminalization of Marijuana "would not result in increased state or local costs. It should result in a reduction in cost of state and local law enforcement and judicial activities relating to the personal use and possession of marijuana."* A. Alan Post, Analysis of Prop. 19

PRELIMINARY NOTES ON ENFORCEMENT COSTS

by Michael R. Aldrich, Ph.D.
Research Director, AMORPHIA
14 February 1974

1. Calof figures applied to 1972 Adult Felony and Juvenile Marijuana Arrests: $119,133,674.24
   1972 Adult Felony Marijuana Arrests, 52,027
   1972 Juvenile Marijuana Arrests, 21,034
   Total, 73,061
   73,061 is four times the 18,243 arrests in 1966. Calof's $29,783,418.56 X 4 = $119,133,674.24

2. Calof method applied to 1972 Adult Felony Dispositions by Barbara Schneider: $95, 239,536
   See enclosed "Cost Statistics" sheet.

3. Post method to determine Marijuana Arrest Costs (not Dispositions Cost), 1972: $13,119,508.
   See enclosed "Previous Marijuana Enforcement Cost Estimates," page 3.
   76,561 total arrests X $171.36 cost per marijuana arrest = $13,119, 508.21

4. Use the Post method ARREST Costs in Barbara Schneider's Calof-method, 1972: $105,762,049
   a) ARRESTS 76,561 total X $171.36 cost/unit = $13,119,508

b) Complaints,	*$2,679,590*	
Pretrial Jail,	*16,400,192*	
Arraignment,	*46,404*	
Prelim. Hearings	*1,238,806*	
Trials	*1,410,264*	
Motions to suppress	*295,056*	
Total	*22,070,312*	
67% of Tot.	*14,787,109*	
Total + 67%	*36,857,421*	
Public Defender	*1,829,906*	*(b) Subtotal $38,687,327*
c) Sentences:		
Prison	*3,203,980*	
CYA	*1,802,319*	
Probation	*30,043,863*	
Prob. + Jail	*13,036,195*	
Jail	*5,868,857*	*(c) Subtotal $53,955,214*

Total a, b, c = $105,762,049

NOTE: In the 1973-1974 Governor's Budget, page 20, are the following Dept. of Justice budgets:

	1971-72 Actual Budget	1972-73 Estimated Budget	1973-74 Proposed Budget
Total	$31,067,218	$42,580,563	$44,880,408
Law Enf.	19,293,335	28,024,697	28,761,459

If marijuana law enforcement costs about $100 million a year, apparently if we stopped punishing marijuana possession we could fund the entire Department of Justice for at least 2 years, or fund all state law enforcement agencies including criminal justice information, organized crime program, state bureau of narcotics, and the bureau of criminal statistics for 4 years.

PREVIOUS MARIJUANA ENFORCEMENT COST ESTIMATES

by Michael R. Aldrich, Ph.D.*

CALOF ESTIMATE, 1966 TOTAL ARRESTS AND ADULT DISPOSITIONS: $29.7 MILLION.
In 1968, Stanford law student Lawrence Calof took the available 1966 marijuana arrests and dispositions data and applied the fiscal year 1967-1968 cost figures to arrive at a "hybrid" enforcement cost estimate of $29,783,418.56 for the 18,243 total adult and juvenile marijuana arrests. Based on extensive interviews and a careful sampling of Los Angeles County dispositions, Calof followed each of the 14,209 Adult Felony Marijuana Offenders as much as possible through the criminal justice process to determine per capita costs at each stage, and then added in relevant fixed costs in the disposition system. Reference: "The Cost of Enforcing the Marijuana Laws in California," July 8, 1968.

KAPLAN ESTIMATE, 1968 ADULT FELONY ARRESTS & DISPOSITIONS: $72 MILLION.
Stanford Law Professor John Kaplan used his student Calof's method to determine the 1968 enforcement costs for Kaplan's book Marijuana: The New Prohibition. *Adult Felony Marijuana Arrests for 1968 were 34,323, which is 2.42 times the Adult Marijuana Arrest figure (14,209) used by Calof. Kaplan multiplied Calof's 29.7 million dollar figure by 2.42 for an estimated 1968 cost of $72,074,860. This is a conservative estimate because it does not include arrest or disposition costs for adult misdemeanor or any juvenile marijuana arrests. Had Kaplan used the total adult and juvenile arrest figure, 53,314 is 2.92 times the 1966 total adult and juvenile arrest figure of 18,243, for a resulting cost of $86,966,360 in 1968.*

MCGLOTHLIN ESTIMATE, 1969 ADULT FELONY ARRESTS & DISPOSITIONS: $43.1 MILLION.
In 1971, UCLA researcher William McGlothlin prepared an analysis of marijuana use and distribution for BNDD and included his own variation on Calof's method, using 1969 marijuana arrest and disposition data and either his own or Calof's cost/unit estimates. McGlothlin's $43.1 million estimate is extremely conservative: where Calof had found the cost per arrest to be near $1500, McGlothlin's is only $780 per arrest. The difference is partly accounted for by differences in estimating CYA costs (Calof, $8 million; McGlothlin, $1.8 million) and partly by McGlothlin's having excluded certain costs that Calof included, such as appeals costs, State Bureau of Narcotics costs, and the costs of processing motions to suppress evidence. Although McGlothlin's estimate is probably too conservative, it is nevertheless true that enforcement costs probably decreased due to the "Wobbler" bill and the increasing use of adult probation for marijuana offenses.

MIKURIYA ESTIMATE, 1970 ADULT FELONY & JUVENILE ARRESTS: $106 MILLION.
Adult Felony and Juvenile marijuana arrests in 1970 totalled 64,878 (excluding the 4141 Adult Misdemeanor marijuana arrests reported that year), which is 3.56 times the 1966 Adult Felony and Juvenile marijuana arrest figure (18,243) used by Calof. Thus National Marijuana Commission consultant Tod H. Mikuriya, M.D., multiplied Calof's $29.7 million estimate by 3.56, for a 1970 total of $106,028,968.08 estimated costs of Adult Felony and Juvenile Arrests and (like Calof) Adult Felony Dispositions in 1970.

---

*Research Director, AMORPHIA, Inc., 2073 Greenwich Street, San Francisco, California 94123.

A. ALAN POST ESTIMATE, 1971 MARIJUANA ARRESTS (Not Dispositions): $8.9 MILLION

The Bureau of Criminal Statistics and the office of Legislative Analyst A. Alan Post in 1973 invented a new method for determining the cost of marijuana arrests only— not dispositions through the system— in 1971. This estimate was developed by taking the percentage of all felony and misdemeanor arrests which were for marijuana offenses and applying that percentage to local law enforcement expenditures which related to "detection and suppression of criminal activity"— an estimated 25% of all expenditures by local police and sheriffs' offices (not CHP, and not State Bureau of Narcotics expenditures).

The 64,597 adult felony, adult misdemeanor, and juvenile marijuana arrests were found to be 6% of all California felony and misdemeanor arrests (1,139,121).

Expenditures for criminal activity (¼ of police and sheriffs' expenditures) were estimated at $148,416,401, and 6% of that is $8,904,984, *or $138 per pot arrest.*

The A. Alan Post method was concerned only with LOCAL marijuana law enforcement expenditures, and left out a portion of the California Highway Patrol expenditures. Because 63% of CHP felony arrests involve drugs, however, I have modified Post's calculations to include CHP expenditures for arrests. This is shown in Section 2 of Table A on the next page and brings the estimate of 1971 marijuana arrest costs up to $10,731,929, or $166 per pot bust.

In addition, I have plugged the 1972 arrest data into the Post Method, to show comparable estimates for 1972 marijuana arrests— approximately $171 per pot arrest. This is shown in Sections 3 and 4 of Table A on the next page.

An important criticism of the Post Method is that using total marijuana arrests (including 3,398 adult misdemeanor marijuana arrests) and comparing them to total felony and misdemeanor arrests in the state is misrepresentative. Misdemeanor marijuana arrests annually account for less than one-half of one percent of total misdemeanor arrests, while misdemeanor arrests in general account for over half of all arrests. If misdemeanor arrests are not considered, then adult felony and juvenile (major) marijuana arrests account for about 18%, not 6%, of all 1971 adult felony and juvenile (major) arrests.

Interestingly, extrapolation of the Post Method (based on the above criticism) to apply to Adult Felony and Juvenile (Major) marijuana arrests as they are disposed of throughout the system, provides an estimate of total marijuana enforcement costs astonishingly similar to estimates obtained by updating the Calof method. The Post Method Extrapolated gives a $106 MILLION cost estimate for total 1971 Adult Felony and Juvenile Arrests and Dispositions.

Step One: Adult Felony and Juvenile marijuana arrests are 18%, not 6%, of total state Adult Felony and Juvenile Major arrests. 18% is three times 6%, therefore multiply Post's $8.9 million marijuana arrest cost by three = $26,714,952.

Step Two: Marijuana arrests and dispositions affect the entire criminal process, not merely investigation and arrest, so multiply the marijuana arrest cost from Step One, by 4 to reproduce the whole system (remembering Post obtained arrest costs by dividing law enforcement costs by 4). 4 x 26.7M = $106,859,808.

This is remarkably similar to Mikuriya's 1970 cost of enforcement estimate.

TABLE A

A. Alan Post Method of Determining Cost of Marijuana Arrests

1. 1971 Arrest Data, with California Highway Patrol not included in Criminal Activity budget. Expenditures for Criminal Activity were determined by taking One-Fourth of the Amount spent by local police agencies and sheriffs' offices in FY 1970-1971. This is precisely the information reported by A. Alan Post to Senator Nicholas C. Petris, February 7, 1973.

	Total California Felony and Misdemeanor Arrests	Total Marijuana Felony and Misdemeanor Arrests	% Mj. of Total	Expenditures for Arrests Crim. Activity (for Arrests)	Marijuana Arrests	Cost/ Mj. Arr.
1971	1,139,121	64,597	6	$148,416,401	$8,904,984	$138

2. 1971 Arrest Data, Post's calculations modified to include California Highway Patrol in the Expenditures for Criminal Activity, because according to the S. F. Examiner, Feb. 23, 1973, two-thirds (63.4%) of all CHP felony arrests involved drugs.

	Total Arrests	Marijuana Arrests	%	Crim. Activity	Mj. Arrests	Cost/Mj
1971	1,139,121	64 597	6	$178,865,483.50	$10,731,929	$166

3. 1972 Arrest Data, plugged into Post Method (including CHP in Criminal Activity budget).

	Total Arrests	Marijuana Arrests	%	Crim. Activity	Mj. Arrests	Cost/Mj
1972	1,154,325	76,561 (3500 misd.)	6.6	$198,780,428.50	$13,119,508.21	$171.36

4. 1972 Arrest Data, using only Adult Felony and Juvenile Marijuana Arrests in Post Method.

	Total California Felony and Misdemeanor Arrests	Adult Felony and Juvenile (Major) Marijuana Arrests	% Mj. of Total	Crim. Activity Expenditures	Mj. Arrest Expenditures	Cost/ Mj. Arr.
1972	1,154,325	73,061	6.3	$198,780,428.50	$12,523,167	$171.41

Budget Figures for Expenditures are taken from p. 66,
CRIME AND DELINQUENCY IN CALIFORNIA 1972.

This Table Compiled 12 February 1974 by Michael R. Aldrich, Ph.D., Research Director, AMORPHIA, Inc.

Previous Enforcement Cost Estimates, page 4

SF CHRONICLE 2/23/73

CHP Leads In Felony Arrests

In between stopping speeders and helping all those stranded motorists, the California Highway Patrol made more felony arrests last year than any law enforcement agency in the state outside of Los Angeles county.

In a report issued yesterday by the agency, the Highway Patrolmen were said to have made 13,890 felony arrests in 1972.

Of those arrests, 8803 involved narcotics and other illegal drugs, 3932 were for auto theft, 604 for receiving stolen property, 555 for possessing dangerous weapons, 276 for robbery and 238 for burglary.

The felony arrests also included an additional 237 for vehicular manslaughter, 29 for counterfeiting motor vehicle registration papers — and 33 for kidnaping, 31 for murder, 24 for rape and 15 for prison escapes.

In San Francisco, the Highway Patrol made 311 felony arrests.

Arrests in individual categories added up to more than the total felony arrests reported because some individuals were charged with more than one crime

While comparable figures for previous years were not reported, California Highway Patrol Commissioner Walter Pudinski said the 1972 total represented "an all-time high."

Historically, only the Los Angeles city police and the Los Angeles sheriff's office have made more felony arrests than the Highway Patrol in California, Pudinski said

Page 18—S.F. Examiner
Fri., Feb. 23, 1973 ☆

CHP Drug Arrests Rocketing

The California Highway Patrol made a record number of felony arrests last year and two-thirds of them involved narcotics and dangerous drugs, the CHP announced today.

CHP Commissioner Walter Pudinski said highway patrolmen made 13,890 felony arrests and that drugs were a factor in 8803 of them. = 63.4%

The patrol also arrested 95,667 drinking drivers in 1972 and issued 1,962,816 misdemeanor citations.

Only the Los Angeles police department and the Los Angeles County sheriff's office make more arrests than the patrol, Pudinski said.

Also arrested were 3932 auto thieves, 604 receivers of stolen property, 555 persons with dangerous weapons, 276 robbers, 238 burglars, 33 kidnapers, 31 murderers and 24 rapists. Vehicular manslaughter was the charge in 237 arrests. The patrol also arrested 15 escaped prisoners and 29 people with counterfeited motor vehicle registration papers.

In the San Francisco area, according to area commander Capt. J. S. Hughes, CHP officers made 311 felony arrests. Marijuana possession accounted for 139 of them, stolen vehicles, 86, and possession of dangerous drugs, 56.

LEGISLATIVE AND REPORTING SYSTEM CHANGES

Relevant to Statistics on Cost of Enforcing California Marijuana Arrests 1960-1973

by Michael R. Aldrich, Ph.D. *

1960–1967 Individual Reporting System

In response to public demand for factual data on drug offenders, the Bureau of Criminal Statistics began an intensive scrutiny of drug arrests and dispositions statewide in 1959. This data was also needed in order to evaluate current drug legislation, to suggest appropriate new legislation, and to test the efficacy of new programs.

The Individual Reporting System used between 1959 and 1967 showed in detail the drug careers of all persons arrested for drug offenses. This individual accounting was performed by registering each person on a 5 x 8 record card the first time the individual was arrested for any drug offense, and subsequently posting each further drug arrest on the card along with the disposition of each case. Data collected included: the specific offense charged, drug usage, prior criminal and drug history, probation or parole status, disposition of each case, and sentencing commitments– for all persons reported by any agency for any drug offense in California.

A substantial part of this information came from "rap sheets" maintained by the Bureau of Criminal Identification and Investigation (CII) which gave an identification number to each newly arrested individual and showed a chronological record of all arrests for which the person was fingerprinted. The rap sheets were not necessarily a complete arrest record because they did not reflect any conflict with the law for which the person was not fingerprinted; and, for instance, might not show prior juvenile arrests if the person was first fingerprinted during an adult arrest. To supplement this information, the Bureau of Criminal Statistics methodically compiled arrest reports from each of the 500 or so criminal justice agencies, and other auxiliary information. All this data was published annually in *Drug Arrests and Dispositions* by the Bureau.

1960–1967 Legislative Changes

In 1961, penalties for all narcotic law violations, including marijuana, were toughened by making all such violations felonies with minimum mandatory sentences. Possession of marijuana drew a minimum of 1 year, and up to 10 years, in state prison, with no parole available until at least a year had been served. A new offense, Possession of Marijuana for Sale, drew 2 to 10 years. Sale of marijuana drew a mandatory 5 years to life imprisonment and persons convicted of sale had to serve 3 years before the possibility of parole.

In 1962, the *Robinson* decision held that addiction per se was not a crime. This greatly reduced the number of addict-user arrests. In the same year, California marijuana arrests reached an all-time low: a total of 3,743 adult and juvenile marijuana arrests. From 1962 on, the number of all-drug arrests and particularly the number of marijuana arrests began increasing drastically. In late 1965 many dangerous drug offenses were raised from the misdemeanor to the felony level, and several major enforcement agencies changed their previous policy of booking all drug offenders on "suspicion of narcotic felony" to booking on exact misdemeanor or felony charges. In 1966, new legislation making LSD and hallucinogens illegal went into effect.

All of these legislative and social changes greatly increased the workload of the Bureau of Criminal Statistics and made the Individual Reporting System progressively more difficult and more expensive. In 1966 certain auxiliary sources of information used in screening drug offenders had to be discontinued, with less careful screening of drug usage, particularly marijuana usage, as a prominent result. At one point almost one-fourth of the entire BCS staff was involved in the

*Research Director, AMORPHIA, Inc., 2073 Greenwich Street, San Francisco, California 94123

collection of drug statistics, at a cost of upwards of $150,000 a year. As arrests continued to double or triple each year, it became obvious that the Individual Reporting System could not continue. But while it lasted, it was one of the finest drug information systems in the world. The 1966 *Drug Arrests and Dispositions* manual is the most complete drug offender analysis available in any state: in it, BCS even compiled the exact quantities of drugs seized by police agencies in the state, and broke out the dispositions of arrestees with more clarity than in any other document. In addition, in 1966 a pilot project was undertaken in three counties which produced Offender-Based Transactional data following all arrestees through each stage of the criminal process from point of arrest to final disposition. These models of drug statistic data collection deserve to be mentioned because it was on these books of statistics that the first, and in many ways still most comprehensive, analysis of enforcement costs, was based.

1968– Present: Summary Reporting Systems

Thus in 1968 a new reporting system based on a 30% sample of all drug arrests reported to BCS was begun. This involved extrapolating the percentages (for example, the percent of arrestees on whom complaints were filed in Superior Court) used in determining the final data from the percentages obtained in a 30% sample of all data reported. This had the immediate effect of downgrading the value of the statistics and making it more difficult to follow each arrestee through the entire criminal process. Moreover, "Because a large increase in arrest volume was expected in 1969, the sampling fraction was reduced to 20 percent. This reduction necessitated scaling the prior year data down to 20 percent. This operation did not change the percentages shown in any of the tables." (*Drug Arrests and Dispositions, 1969*, page 5.)

The Summary Reporting System which has been used since 1968 calls for each of the 500 or so enforcement agencies in the state to send in arrest information on report forms each month; disposition data is collected from the appropriate court or agency on similar forms. In some cases, particularly at the dispositions end of the criminal justice process, information is submitted which breaks out sentences by specific convicted offense (marijuana possession, sale, furnishing to minor, etc.) but at the beginning of the process, the point of arrest where the largest amount of data must be submitted, the forms simply have spaces for general offense charged: how many were arrested for all marijuana offenses, how many for burglary, etc. This significantly reduces the information available for study and makes detailed analysis by specific code violation charged almost impossible.

The Summary Reporting System also makes it difficult to break out meaningful statistics on Misdemeanor arrests, particularly on drug offenses. Adult Misdemeanor marijuana arrests, for example, were reported between 1968 and 1971 but the system could not distinguish with any clarity whether marijuana was the specific drug involved in the misdemeanor arrest. Officials at BCS felt that the Summary System was not successful in getting meaningful statistics on misdemeanors: "possession of narcotic paraphernalia" could refer to marijuana pipes or to opium pipes; "being under the influence of drugs" might refer to any drug; and even "Visiting premises" where drugs were found, a misdemeanor which agencies were asked to report from 1967 on up, did not provide specific information as to whether marijuana was involved, because the summary reporting forms did not specify the distinction. Thus starting in 1972, Adult Misdemeanor Marijuana Arrests are not broken out at all: which skews the Total Marijuana Arrest statistics by about 3500 a year and makes meaningful comparison with previous year totals very difficult.

Another difficulty posed for the serious researcher by the Summary Reporting System is the fact that only one offense is shown on the reporting sheet sent in by the agency. If a person

is arrested on multiple charges, only the most serious charged offense is shown. Thus someone arrested for Furnishing Marijuana to a minor, and Loitering around the schoolyard, would be shown as a marijuana arrest only (though the charges might be reduced to loitering later through plea bargaining); but if someone is arrested for Armed Robbery and Possession of Marijuana, it would be shown as an armed robbery arrest only. This creates an undetermined amount of "slippage" in the arrest information: all marijuana arrests are not reported each year by the Summary Reporting System. Thus, unlike the Individual Reporting System, California has no real count of the number of marijuana arrests in the state. Secondly, it appears that a significant number of people originally arrested on a marijuana charge as the most serious offense, have the charges reduced to a lesser charge which may or may not be a marijuana charge: this creates a serious lacuna in the dispositio· information available. For example, in 1972 approximately 41,927 adults originally arrested on marijuana charges had Complaints Filed on them either on marijuana charges or some other charge. Of these, 2248 Complaints were dismissed before filing in Superior Court, and 21,230 were processed through either the Lower or the Superior Courts: but that leaves 18,449 people (44% of the original 41,927) unaccounted for in any of the BCS tables of dispositions. Unless we can determine what happened specifically in the disposition of those 18,449 people who had Complaints of some sort filed against them, it is very difficult to calculate the enforcement costs. BCS is not at fault: the Summary Reporting System is at fault.

1968– Present: Legislative Changes

In 1968, the "Wobbler" bill came into effect and began to have significant impact on marijuana dispositions. This law specifies that at the Court's discretion, the penalty upon conviction of a 1st offense marijuana possession felony charge can be reduced by the Judge to a misdemeanor sentence of up to one year in county jail, with a possibility of parole; or, if the Judge decides that the offense is quite serious, he can hand out the felony sentence of 1 to 10 years in state prison. This vastly increased the number of misdemeanor sentences given for marijuana possession and BCS began showing the proportions of misdemeanor and felony sentences in their final disposition tables in 1969. Probably because of the Wobbler law, BCS also for the first time in 1969 began to show lower court drug case dispositions separately from Superior Court adjudications. These are quite valuable in following lower-court dispositions but the lacuna mentioned above still exists. It would be of extreme value to have information on Preliminary Hearings in lower courts.

In late 1969, Section 17 of the Penal Code was modified in regard to criminal complaint filing policy. Section 17b4 PC now allows prosecutors to file misdemeanor complaints involving offenses which, like possession of marijuana, carry alternate prison-jail sentences; and Section 17b5 PC now allows lower court judges to adjudicate certain felony offenses, including marijuana offenses, as misdemeanors instead of transferring the case to Superior Court for trial. This resulted in a further drop in Superior Court prosecutions from 1970 onward, and probably involves a substantial saving in the cost of processing marijuana cases through the courts. Unfortunately it is very difficult to determine how much money is saved thereby, because there is a paucity of information on pre-trial hearings and dispositions at the lower court level. The BCS Summary Reporting System works adequately for Felony Complaints and Superior Court dispositions, but does not provide sufficient information on Misdemeanors, preliminary hearings, and the lower court process.

Because of the above legislative changes, and the state Probation Subsidy program enacted in 1965 (which gives a subsidy per defendant to those counties which reduce the proportion of criminal defendants sentenced to state institutions), straight probation and probation with jail have been used increasingly with those convicted of marijuana charges. Section 17 adjudication of felony offenses in

lower rather than Superior Courts has increased the statewide adult probation caseload to an all time high of 143,183 in 1972, as lower courts significantly increased the number of adults placed on probation and Superior Courts actually decreased the number placed on probation. (*Adult and Juvenile Probation, 1972,* page 1). Vastly increased use of Section 17 PC in Los Angeles in 1972 created a relatively large drop in statewide Superior Court prosecutions, 1972.

Increased use of probation in lower courts, and decreasing prosecution in Superior Court, have also had the probably unintended effect of downgrading the quality of information on drug dispositions, because the present Summary Reporting System is really geared to record Felony prosecutions in Superior Courts.

DEBASEMENT OF DATA COLLECTION
Caused by Legislative Change in Statistic Reporting Forms

Finally, a legislative change made in 1973 threatens to debase the Summary Reporting System even more than it has already been downgraded. Until this year (1974), the reporting forms which local agencies returned each month to BCS contained spaces in which to report each different drug arrest or law enforcement disposition according to four categories of substances: Heroin and other narcotics, Marijuana, Dangerous Drugs, and Other Drug Offenses. Beginning this year, BCS will be receiving information on only two categories of drug offenses: Marijuana, and Other Drug Offenses all lumped together. (See Forms enclosed.)

This means that from now on, it will be progressively more difficult to get good information on trends in drug use, comparative relationships between different drug offenders, and identification of individuals arrested on various drug charges as they proceed through the criminal justice system. It will no longer be possible to evaluate the effectiveness of treatment programs or law enforcement programs. Budgeting considerations cannot be made because not enough data will be provided from which to determine the cost of various programs. The soundness or ineffectiveness of recent legislation in this field cannot be evaluated unless concrete information is available about the specific workings of the programs which the laws set in action. As long as this debasement of the Summary Reporting System continues, the only information available, in effect, will be marijuana information; and future researchers will find their efforts to determine simple arrests and dispositions— not to mention costs of enforcement— frustrated in regard to opiates, dangerous drugs, and other substances which certainly are of concern to society.

RECOMMENDATION: It is imperative that reporting forms be returned immediately to their 1973 design, if not an even more detailed design, by legislative action as soon as possible. Without an immediate return to a more complete Summary Reporting System, all future drug information on offenders and drug law enforcement will be irreparably garbled and it will soon be impossible to determine specific trends in drug use, enforcement, or the costs of enforcement. The members of this Committee should consult with the Bureau of Criminal Statistics and cooperatively draft a more detailed reporting form to specify offenses charged by exact Health and Safety Code violation; such a form should be incorporated into a legislative bill and supported for passage as soon as possible.

Additionally, it is recommended that more attention be paid to lower court disposition data in the Summary Reporting System, including information on preliminary hearings; and it is further recommended that the OBT (Offender Based Transactions) reporting project be continued and expanded, as it has perhaps the greatest potential for providing information on offenders at each stage of the criminal process, which is necessary to determine enforcement costs.

Mrs. Eva Nelson, Secretary
Senate Select Committee on
Control of Marijuana
State Capitol
Sacramento, California 95814

Dear Mrs. Nelson:

On December 31, 1973, there were 606 men and 15 women in prison whose most serious commitment offense was violation of some law pertaining to marijuana. On this same date there were 817 men and 41 women on parole on similar charges.

That compares with a total of 19,794 felons in prison on that same date and 12,996 felons on parole. (In addition, the Department had in its custody in institutions and on parole several thousands of other persons on civil commitments, etc.)

Actual cases, both in the institutions and on parole are handled individually according to their needs, so some individuals may have taken a great amount of staff time to resolve various problems while others took relatively little. On a mass basis, however, the marijuana offenders represent 4½% of the felony workload.

In agreement with the Legislative Analyst, various per capita cost figures are used in accord with circumstances. For example, a reduction of one inmate in the population would make virtually no difference in departmental costs, but if you reduced the institution population by 1,500 you might be able to close an entire institution. In any event in terms of the numbers involved in marijuana we would estimate their cost to the Department at approximately $900,000 a year.

Sincerely,

WALTER L. BARKDULL
Assistant Director
Legislative Liaison

March 7, 1974

Honorable George R. Moscone, Chairman
Senate Select Committee on Control of Marijuana
Ninth and L Building, Room 153
Sacramento, California 95814

Attention: Mr. Jesus Genera, Consultant

Dear Senator Moscone:

Thank you for your letter of February 7, 1974, in which you requested information on what portion of the Health and Welfare Agency's budget, and what level of manpower is expended in the processing of marijuana law offenders.

The Departments of Health, Corrections, and Youth Authority do not budget their respective narcotic and drug abuse programs by drug or substance but rather by treatment and rehabilitation modalities. While statistics are available for wards and inmates convicted of marijuana law violations, they cannot reflect the true overall extent to which these offenders absorb our resources. The data base for marijuana law-involved clients in Department of Health supervised local programs does not directly capture the sort of information you requested. Thus, the breakdown shown below represents our best interpolation of available data.

Department	Dollars (%)	Man years (%)
Corrections	$1,085,000 (0.7%)	44.0 (0.5%)
Youth Authority	1,656,000 (2.6%)	51.9 (1.4%)
Rehabilitation	N.A.	N.A.
Employment Development	-0-	-0-
TOTALS	$2,741,000	95.9

I hope this information will be useful to you and the Select Committee. Please feel free to contact Mr. William Wilder, Director of the State Office of Narcotics and Drug Abuse, if you have any questions.

Sincerely,

TOM J. ELKIN
Assistant to the Secretary,
Legislation

As I explained on the telephone, we list commitments for statistical purposes on the basis of the most serious (as determined by the statisticians, generally on the basis of the penalty) and, therefore, it is possible there may be persons not shown in the above tables who are in on multiple commitments, one of which is more serious than the marijuana offense.

I had occasion some time ago to make manually a case-by-case study of 19 of the 27 men committed in the first half of 1972 on simple possession. The cases, a substantial sample, were selected randomly.

In 11 of the cases the offender had been placed on probation for the marijuana offense and then got into further trouble with the result the probation was revoked and he was committed to prison. The further troubles included such conduct as being convicted for burglary, escape and a bomb plot and arrests for robbery, assault on a peace officer, possession of marijuana and dangerous drugs, etc.

In three additional cases, the offender was on probation for possession of dangerous drugs when he was convicted of possession of marijuana and sentenced to prison on that charge.

Three others were on federal parole or state out-patient status when convicted of a marijuana offense and wound up in state prison.

Of the other two, one was a fringe member of a big narcotics ring broken by the State Bureau of Narcotic Enforcement involving a sale of some 2,000 blocks and the other was a burglar who escaped and when reapprehended had marijuana in his possession.

Turning from commitments to prison to release from prison we find that 317 persons were paroled for the first time in 1972 from a commitment for a marijuana offense. Two tables are enclosed showing the release by offense, and the time served broken down between those who were narcotic addicts and those who were not addicted.

I hope this information is helpful to the Committee.

Sincerely,

WALTER L. BARKDULL
Assistant Director-
Legislative Liaison

Attention: Ms. Lorraine Reynon

Dear Ms. Reynon:

The two tables below show the commitments to the Department of Corrections by various classes of marijuana offenses for the first and second halves of 1972 and the first half of 1973:

MEN	1972		1973
Offense	1st	2nd	1st
Sale to minor by adult	1	-	-
Possession of marijuana	27	29	24
Possession with one prior	1	1	-
Possession for sale	19	20	18
Possession for sale with one prior	-	1	-
Possession for sale with two priors	-	-	1
Sale	36	25	26
Sale with one prior	1	-	1
Sale with two priors	-	-	1

WOMEN	1972		1973
Offense	1st	2nd	1st
Possession	3	2	-
Possession for sale	1	1	2
Sale	1	1	-

State of California — Department of Justice

Memorandum

To : Eva Nelson
Senate Committee on Control of Marijuana
1116 Ninth Street, Room 153
Sacramento, CA 95814

Date : February 7, 1974

File No.:

From : **Bureau of Criminal Statistics**
Wayne Knutila, Assistant Chief

Subject: Marijuana Data

Here are the data you requested based on a study made by the Bureau last year. Also enclosed is a copy of our 1972 "Crimes and Arrests Reference Tables."

The 1971 total of felony and misdemeanor arrests for adults and juveniles was gleaned from the Bureau's 1971 "Crime and Delinquency in California, Crimes and Arrests Reference Tables." The 1971 total felony and misdemeanor marijuana arrests for adults and juveniles was subtracted from the total 1971 arrests. Marijuana arrests were posted from the 1971 "Crime and Delinquency in California, Drug Arrests and Dispositions Reference Tables."

Based upon scanty available data, it was determined that approximately 25 percent of a police officer's time is devoted to the detection and apprehension of criminals. Therefore, it was concluded that 25 percent of the county's law enforcement budget is expended on criminal activity.

The percentage of total marijuana arrests of the total arrests was computed for each county. This percentage was applied to that activity. Thus, a rough approximation was constructed of what it costs California county law enforcement agencies to effect marijuana arrests. Estimates were also provided on the average costs per arrest for total felony and misdemeanor arrests and marijuana arrests by county. Expenditure data were obtained from the State Controller's publication entitled "Annual Report of Financial Transactions Concerning Cities and Counties in California, 1970-1971."

FOREWORD

John Kaplan*

Professor Herbert Packer in his very recent but already classic work on the criminal process has written of the enforcement of the drug laws.

> To the difficulties of apprehending a criminal when it is known that he has committed a crime are added the difficulties of knowing that a crime has been committed. In this sense, the victimless crime always presents a greater problem to the criminal process than does the crime with an ascertainable victim. But this problem may be minimized if the criminal process has at its disposal measures designed to increase the probability that the commission of such offenses will become known. If suspects may be entrapped into committing offenses, if the police may arrest and search a suspect without evidence that he has committed an offense, if wiretaps and other forms of electronic surveillance are permitted, it becomes easier to detect the commission of offenses of this sort. But if these measures are prohibited and if the prohibitions are observed in practice, it becomes more difficult, and eventually there may come a point at which the capacity of the criminal process to deal with victimless offenses becomes so attentuated that a failure of enforcement occurs.[1]

It has remained for the editors of the *UCLA Law Review* to bring these words to life with a careful empirical study of the enforcement of California's marijuana laws.

As the editors point out, whether or not the marijuana laws are justified depends at least in some part on how effective the laws are in reducing marijuana use, and upon whether marijuana use leads to violent crime, to heroin addiction, or to physical or psychological damage to the user, as well as upon the costs we incur by attempting to enforce these laws. The editors, however, have wisely taken the view that they cannot treat all these complex questions carefully in the relatively short space available to them. As a result they have contented themselves merely with pointing out both that the marijuana laws, at best, are not very effective in making marijuana unavailable and that many of the purported serious dangers of marijuana rest upon an empirical foundation which is, to say the least, questionable. Moreover, in concentrating on the enforcement of the marijuana laws, the editors have undertaken to examine only one of the complexes of costs entailed in our present criminalization

* Professor of Law, Stanford University.

[1] H. PACKER, LIMITS OF THE CRIMINAL SANCTION 151-52 (1968).

of marijuana. Although, after reading their work, no one can fail to appreciate either the enormous amount of law enforcement effort or the essential arbitrariness of enforcement of the marijuana laws, we should not forget that there are serious costs not directly associated with the enforcement of these laws.

Thus, who can compute the social cost of a law which turns approximately 30 percent of the population of the state between the ages of 16 and 25 into serious criminals? Nor can we find any calculus of the alienation from societal values that occurs when young people who, rightly or wrongly, feel that marijuana is no more dangerous than alcohol are told that their vice is a felony while that of their elders is at most an indiscretion. And, though we cannot estimate the amount of criminality attributable to this alienation, it is hardly unreasonable to believe that the second crime comes easier —that those who are made criminals by laws which they firmly believe to be wrong will thereby find it easier to commit other crimes, less restrained perhaps by the feeling that it is wrong in itself to commit a criminal act.

Even where the alienation caused by our marijuana laws does not result in the commission of further crimes it may have a profound effect upon law enforcement. Police departments throughout the country are coming more and more to appreciate that their task can only be performed with the cooperation of a citizenry which sees the police as their friends and protectors rather than as their oppressors. Indeed, great efforts have been made toward educating the young to picture the policeman as someone to whom they can turn for help rather than as a danger. At least to the 30 percent of youths who have used marijuana, however, the policeman is most clearly not a friend. Each one of these knows that had the police found out about his use of marijuana he would have been arrested and charged with a felony.

Since their focus is on the actual enforcement of the marijuana laws, the Law Review editors make no effort to consider the profound educational problems with which our marijuana laws have saddled us. Whether or not marijuana is dangerous, it is quite clear that there are several far more dangerous drugs in relatively common use in California. Indeed, it is often argued that a major reason for the marijuana laws is to curb use of these more dangerous drugs. The result, however, according to many drug educators, is exactly the opposite. Drug educators, by and large, do their very best to avoid the subject of marijuana in talking with students. They emphasize the dangers of the amphetamines, LSD, the opiates and various more exotic drugs and mention only in passing that marijuana possession is a felony. Sooner or later, however, a student brings up the

issue and the drug instructor then finds himself talking to a group in which many of the members, at least in some sense, know more about the drug than he. His dilemma is this: If he tells them that, pharmacologically speaking, marijuana is not the least bit more dangerous than alcohol, they may believe what he has to say, but he runs a strong risk of being accused of encouraging the commission of a felony and of losing his job. On the other hand, if he tells them stories of the terrible dangers of marijuana, whether he is right or wrong, they will not believe him, and, with the sometimes regrettable capacity for generalization common to the young, not believe him about anything else either. It is not uncommon for psychiatrists to report that a youth after suffering serious consequences from abuse of amphetamines, LSD or opiates has said that he didn't really believe those drugs were dangerous because "they lied to me about marijuana and I figured they were lying about this, too."

The editors of the Law Review, in restricting their effort to learning more about those costs of the marijuana laws associated with our actual enforcement of these laws, have made a great contribution toward providing information on one of the least studied costs of our marijuana laws. Even if we were completely convinced about the value of criminalizing marijuana, we might well hesitate before diverting such massive amounts of law enforcement energy from the area of crime against the person and against property. According to the latest statistics from the California Department of Justice Bureau of Criminal Statistics, arrests of juveniles and adults for marijuana violations in the first half of 1968 were running at a yearly rate of 50,000. When one considers that the good majority of these arrests were for simple possession of small amounts of marijuana untainted by any commercial dealing, the issue becomes even more stark. Whether or not the importance of shutting off the supply of marijuana justifies a continuing use of scarce law enforcement resources to prevent the trafficking in the drug, it is hard indeed to justify the expenditure of these resources on the huge number of mere possessors.

Moreover, entirely apart from whether the law enforcement energies could better be used elsewhere, there is reason to believe that the application of these resources to marijuana does a good deal of harm. Not only does the very existence of the law tend to bring otherwise non-criminal users into contact with considerably more anti-social drug peddlers, but for the unfortunate few (at least as compared to the total number of marijuana users in our population) who are caught, it is likely that both their criminality and drug use will be increased rather than decreased by the experience. First, even if the case against them is dropped—as we find that it often is—they

are left with an arrest record which makes it harder for them to get employment. Also, they will often have spent a short time in jail awaiting release or bail. As a result, in the majority of cases they will have had to pay a bondsman and they may have been exposed to police practices which tend to increase their feeling that their constitutional rights are, in practice, a very chancy thing.

Finally, where the criminal process is not aborted and the marijuana user is sent to jail, he will be incarcerated in a place where he will come in contact with others far more anti-social and deeply imbedded in the drug culture than he. In some sense, we do not send people to jail to reform them; we send them there as a lesson to others. When others do not seem to be getting the lesson, we are not only forced to send too many of them to jail but, at least where the "criminal" is not otherwise anti-social, we may find that we have increased crime more than we have decreased it.

Moreover, those processed by the marijuana laws may be exposed to another phenomena which certainly cannot help their development into law abiding citizens. While it is not pleasant to talk about, we should recognize that one of the costs of our marijuana laws—like those against most consensual crime—is that they tend to produce an entirely different crime which in the long run can cause more harm to the nation. The policeman, caught between society's demands that, on the one hand, he enforce the laws against crimes for which no witnesses exist and, on the other hand, that he respect the constitutional imperative of probable cause before search may take the easy way out and simply make the arrest and lie about the probable cause. This type of perjury is regrettably not uncommon. Many criminal lawyers know that police officers who would not dream of fabricating evidence to make the defendant look more guilty, take a very different attitude toward "fudging a little" on a search and seizure point. The effect of this upon both the defendant, who will know even if no one else does, and, probably more importantly, upon the policeman himself are most unhealthy both for the individuals concerned and for society.

However, by far the most impressive social cost documented by the Law Review is the erratic nature of each step in the enforcement of the marijuana laws. To some extent, of course, this is a problem with all law enforcement. Violators may not be detected; those who are detected may not be prosecuted; those who are prosecuted may not be convicted; and those who are convicted may not receive appropriate sentences. Yet with respect to marijuana it seems that at each step of the way the uncertainty is magnified. Marijuana possession is almost certainly the most common felony in the state of California. Still, we have approximately 50,000 arrests as against.

by a fairly conservative estimate, some 10 million separate uses of the drug. At the very least, then, one's chances of being caught using marijuana on any given occasion are one in 200. Of course, for most segments of the population, this is a gross overstatement of the risk. And indeed the Law Review study shows this. The typical marijuana arrest occurs by chance. A policeman stopping a car for a defective taillight is able by one means or another to discover small amounts of marijuana on an occupant. Typically, however, this happens to lower-class, or alienated, youth. For the more cautious member of the middle class, marijuana possession arrests occur usually because of some freak occurrence. He may be injured in an automobile accident, and when taken to the hospital have the green leafy substance discovered in his pocket. In one case, policemen received a mistaken report of a kidnapping from a home. Entering the building they found neither clues to the kidnapping nor any of the occupants. They did, however, find a can of marijuana on the kitchen table.[2] In another very recent case, a bank president and former supervisor of a suburban Bay Area county was arrested when, because of the failure of a babysitter to arrive, his children were left alone at home and a worried seven-year-old called the police.[3] When rates of arrest get as low as they are in the marijuana area, those arrested tend neither to respect the majesty of the law which has caught them, nor to realize that, after all, they did take their chances. Rather, they tend to chalk it up as a very bad break.

The arbitrariness in the enforcement of the marijuana laws by no means ends with the arrest. At each further stage of the prosecution there is a decision which may be arbitrary. And although this is also true to some extent of most other crimes, for marijuana offenses the arbitrariness of the process appears to be greater for several reasons. Since there are many more cases involving marijuana than most other serious crimes, more prosecutors have to handle the cases and tend to apply varying standards in judging whether they are fit for prosecution. Moreover, the usual crime, possession of marijuana, leads to such tenuous concepts as "joint possession," "constructive possession," and "usable amount," which seem to give an especially wide play to prosecutorial standards. Furthermore, since such a large percentage of marijuana offenders have been in no previous trouble with the law, the varying weights this factor is given by different prosecutors introduce an extra element of uncertainty into the entire process. Finally, determinations as to all of the previous issues necessarily reflect what the individual prosecutor happens to think about the propriety of the marijuana laws. Since, as the Law

[2] People v. Kampmann, 258 Adv. Cal. App. 629, 65 Cal. Rptr. 798 (1968).
[3] S.F. Chronicle, Nov. 14, 1968, § 1, at 3, col. 1.

Review indicates, there is a considerable disparity in the views of prosecutors, especially concerning the marijuana possessor, it is hardly surprising that the prosecution of a marijuana offender will depend to a large extent on which prosecutor has received the case.

Nor does the arbitrariness inherent in the enforcement of the marijuana laws stop with the exercise of prosecutorial discretion. The preliminary hearing and the trial will often reflect what the judge feels about the marijuana laws and about the constitutional guarantees of freedom from unreasonable search and seizure. And finally, at the sentencing level, there appear to be disparities wider even than those to which we are accustomed in the case of other serious crimes and based in great part on the feeling of the sentencing judge.

Of course, the enforcement of the marijuana laws illustrates the problem common to many other areas of our criminal law, the adjusting of discretion with the operation of the law. In the marijuana area the differences at each step of the criminal process—except perhaps for the step from commission of the crime to arrest, which is so enormous as to be a qualitative difference—are differences merely in degree, rather than in kind. On the other hand, the differences of degree are there and they are striking. Moreover, the chances are that they will become more so in future years as a higher percentage of government officials lose confidence in the criminal law as the major method of regulating marijuana use. And when the present generation of young users reaches the age at which they may sit on juries it is not unreasonable to expect the enforcement of the marijuana laws to collapse as completely as did alcohol prohibition. In short, the problems revealed by the Law Review study will remain with us. They are not problems of poor administration or of weak leadership in law enforcement. Rather they are the result of relying on the criminal law to coerce a morality that more and more of the informed citizenry are coming to feel is not worth its cost.

MARIJUANA LAWS: AN EMPIRICAL STUDY OF ENFORCEMENT AND ADMINISTRATION IN LOS ANGELES COUNTY*

PART I: INTRODUCTION

Man has historically had an affinity for substances that alter his state of consciousness. For centuries substances like opium[1] and alcohol[2] have been used to escape from reality, for relief from physical or mental distress, for the simulation of mystical experiences or merely to induce a pleasurable feeling. Marijuana[3] is one of the oldest of these mind-altering substances.[4] It was first used in China over 3,000 years ago, where it was called "the Delight Giver."[5] Ganja,[6] a concentrated variety of marijuana, has been associated with Hindu religious practices since before the birth of Christ.[7] Recently the use of marijuana has spread throughout the Western world.[8]

The use of marijuana has been attacked in the United States with a vehemence unequaled in any other society. To a great extent

1 *See* W. ELDRIDGE, NARCOTICS AND THE LAW 3 (1962). For a concise review of the history of opium see Macht, *The History of Opium and Some of Its Preparations and Alkaloids*, 64 J.A.M.A. 477 (1915).

2 It is estimated that approximately 70 million Americans consume alcohol. J. COLEMAN, ABNORMAL PSYCHOLOGY AND MODERN LIFE 421 (3d ed. 1964). It is also estimated that roughly five million people may be classified as alcoholics—about six percent of the adult population. *Id.*

3 This spelling of marijuana will be used throughout the project. An alternative spelling, "marihuana," will be retained in those citations using it.

4 For a short but highly readable history of marijuana see Taylor, *The Pleasant Assassin: The Story of Marijuana*, in THE MARIHUANA PAPERS 3-17 (D. Solomon ed. 1966).

5 *Id.* at 7.

6 Ganja is a "specially cultivated and harvested grade of the female plants of Indian hemp." *Id.* at 10. It is of a much higher quality than the marijuana most commonly used. *Id.* at 9. In our society all extracts of the hemp plant are known as marijuana. However, there are several different grades. Hashish, for example, is composed exclusively of the resin from the tops of the female hemp plant, and is a far more potent substance than other types of marijuana. Because it is expensive to produce, its use is relatively rare in the U.S. *Id.* at 9. For a clear discussion of the different varieties of products of the hemp plant, see *id.* at 9-10.

7 *See id.* at 9-10.

8 *Cf.* A. LINDESMITH, THE ADDICT AND THE LAW 225-26 (1965). It has been estimated that over 200 million people currently use marijuana throughout the world. McGlothlin, *Cannabis: A Reference*, in THE MARIHUANA PAPERS 402 (D. Solomon ed. 1966).

this reaction is based on a morality rooted in our Puritan heritage—a scheme which glorifies the industrious and frowns on the idle.[9] Marijuana, a drug causing a torporific pleasure among its users, is an evil when judged by this scheme. The overwhelming response to this evil has been the attempt to legislate marijuana out of existence through laws prohibiting its sale or possession.[10] These laws have been adopted under pressure generated by various federal and state law enforcement officials[11] who have consistently argued that "pot" leads to crime, violence, and heroin addiction.[12]

The current laws in California are noteworthy in two respects. First, they typify the attitude that marijuana constitutes a grave social evil.[13] For example, a judge has the option of punishing a first offense of marijuana possession as a felony and sentencing the offender to one to 10 years in prison.[14] A second offense is punishable solely as a felony by a two to 20 year sentence.[15] Possession of marijuana for the purpose of sale carries a two to 10 year penalty, with a requirement that the convicted felon serve a minimum of two years before becoming eligible for probation. A second offense is punishable by five to 15 years and carries a three year minimum term.[16] Selling, furnishing or transporting marijuana brings a sentence of five years to life, with a minimum term of three years.[17] By contrast, the punishment provided for voluntary manslaughter[18] or grand theft[19] in California is a prison term not exceeding 10

---

[9] For a general analysis of Puritan society and culture see P. MILLER & T. JOHNSON, THE PURITANS (1938) and H. SCHNEIDER, THE PURITAN MIND (1930). The legacy of our Puritan heritage can also be seen in other areas of legislation. For example, laws proscribing "unnatural" sexual activities between consenting adults are prevalent in every state. For a summary of these provisions see Project, *The Consenting Adult Homosexual and the Law: An Empirical Study of Enforcement and Administration in Los Angeles County*, 13 U.C.L.A. L. REV. 643, 657-85 (1966).

[10] For a detailed examination of past and current legislation, both federal and state, *see* Appendix *infra*.

[11] *See, e.g.*, H. ANSLINGER & W. TOMPKINS, THE TRAFFIC IN NARCOTICS 20-26 (1953); Testimony of Mr. Harry Anslinger, in *Hearings on the Taxation of Marijuana Before the House Ways and Means Comm.*, 75th Cong., 1st Sess. 23-26 (1937); Sterba, *The Politics of Pot*, ESQUIRE 58 (Aug. 1968).

[12] *See generally* sources cited in note 11 *supra*; E. STANLEY, MARIHUANA AS A DEVELOPER OF CRIMINALS (1937). Many of these arguments were echoed by other writers of the period. *See* E. ROWELL, ON THE TRIAL OF MARIHUANA: THE WEEDS OF MADNESS (1939); R. WALTON, MARIHUANA: AMERICA'S NEW DRUG PROBLEM (1938). These arguments are still made today, particularly by the Federal Bureau of Narcotics. *See* Giordano, *The Prevention of Drug Abuse*, HUMANIST 20 (Mar.-Apr. 1968).

[13] *See* Appendix *infra*.

years. Thus it is apparent that the California Legislature considers marijuana crimes as serious and dangerous as these other crimes.[20] This approach is reflected in the statutes of every state and in the federal marijuana tax laws.[21]

The second noteworthy aspect of the California laws is the recent legislative action in granting a judge the discretion to punish first offenses of simple possession as either a misdemeanor or felony depending on the circumstances of the case. This new law may indicate a trend towards regarding marijuana use as a less serious danger than it has been thought to be in the past.

Several different theories have been offered to justify the imposition of criminal sanctions for marijuana violations.[22] These theories can be summarized into four basic categories:

(1) Marijuana produces physical and psychological harm to the user.

(2) It is a stepping stone to harder narcotics such as heroin.

(3) Marijuana use leads to criminal and violent acts.

(4) Its use is immoral and will lead to a diminishing of the individual's potential productivity and energy.

Any discussion of the physical or psychological harm produced by marijuana must proceed from a description of its immediate effects upon users.[23] One fairly impartial account can be found in the report of the President's Crime Commission:

> Its effects are rather complicated, combining both stimulation and depression. Much of its effect depends on the personality of the user. The drug may induce exaltation, joyousness and hilarity, and disconnected ideas; or it may induce quietude or reveries. In the inexperienced taker it may induce panic. Or, one state may follow the other. Confused perceptions of space and time and hallucinations in sharp color may occur; the person's complex inteilectual and motor functions may be impaired. These effects may follow within minutes of the time the drug is taken. The influence usually wears off within a few hours but may last much longer in the case of toxic dose. The immediate

---

[20] It should be noted that whereas manslaughter and theft are crimes directed against third persons, most of the harm contemplated by the marijuana statutes is cast primarily upon the user himself.

[21] Cantor, *The Criminal Law and the Narcotics Problem*, 51 J. CRIM. L.C. & P.S. 512, 516-19 (1961).

[22] A summary of these theories can be found in PRESIDENT'S COMMISSION ON LAW ENFORCEMENT AND ADMINISTRATION OF JUSTICE, THE CHALLENGE OF CRIME IN A FREE SOCIETY 224-25 (1967) [hereinafter cited as PRESIDENT'S CRIME REPORT].

[23] It should be noted that because of the prohibitory legislation, little research has been conducted on the effects of marijuana. For the need for intensive research see *id.* at 225.

> *physiological* effects may include nausea and vomiting, but there are no lasting physical effects, and fatalities have not been noted. Tolerance is very slight if it develops at all. Physical dependence does not develop.[24]

Although it has been shown that marijuana does not produce physical dependence[25] or tolerance,[26] it is argued that it generates psychological dependence. The proponents of this theory claim that by using marijuana the user comes to depend on it as a crutch in his efforts to resolve his inner conflicts and face up to reality.[27] In opposition to this theory, several proponents of marijuana use have claimed that it helps them to understand and resolve their problems.[28] No conclusive evidence is available corroborating either view.[29] Although this issue is open to empirical investigation, it is

---

[24] *Id.* at 213 (emphasis added).

[25] Physical dependence is defined as "a state of latent hyperexcitability, [which] develops in the cells of the central nervous system of higher mammals following frequent and prolonged administration of morphine-like analgesics, alcohol, barbiturates, and other depressants. It becomes apparent in specific subjective and objective symptoms and signs—the *abstinence syndrome* or the *withdrawal illness*—upon abrupt termination of drug administration." WHITE HOUSE CONFERENCE ON NARCOTICS AND DRUG ABUSE 278 (1963) [hereinafter cited as WHITE HOUSE CONFERENCE].

[26] "*Tolerance* is a fundamental survival mechanism which permits body cells to be exposed continuously to toxic substances without evoking possibly dangerous responses. This is manifested by the phenomenom that successive doses of the same amount of drug produce lesser effects and that, conversely, larger and larger doses are necessary to achieve the effects of the first dose." *Id.* at 277.

Even Harry Anslinger, a vociferous opponent of marijuana use, has accepted the notion that marijuana is not physically addictive. *See* H. ANSLINGER & W. TOMPKINS, *supra* note 11, at 20-26.

[27] "The real harm that results from the chronic use of marijuana is the development of the *habit* of escaping all discomfort and all unpleasantness by the use of some substance . . . . When discomforts are not met realistically, when the solution of troublesome problems is sidestepped or consciousness of them destroyed, by the use of some substance, we have the foundation of a *habit-formation* that may lead to regression and to the destruction of the personality." Reichard, *Some Myths About Marihuana*, 10 FED. PROBATION 21 (Oct.-Dec. 1946). *See also* Becker, *Becoming a Marihuana User*, 59 AM. J. SOCIOLOGY 235 (1953); Cal. [28] Interview with Dr. Lewis Yablonsky, Chairman of the Sociology Department of San Fernando Valley State College, in Los Angeles, Feb. 14, 1968. Dr. Yablonsky has done extensive fieldwork among the hippies and is the author of a forthcoming book on them. The effects of marijuana use on personal creative activity are discussed in Burroughs, *Points of Distinction Between Sedative and Consciousness-Expanding Drugs*, in THE MARIHUANA PAPERS 388 (D. Solomon ed. 1966).

[29] For further discussions of the psychological effects of marijuana use see Allentuck & Bowman, *Psychiatric Aspects of Marihuana Intoxication*, in THE MARIHUANA PAPERS 361 (D. Solomon ed. 1966); Bromberg, *Marihuana: A Psychiatric Study*, 113 J.A.M.A. 4 (1939); Mayor's Committee on Marihuana, *The Marihuana*

a task for trained medical and psychological researchers and has not been undertaken by this project.

Currently, it is widely accepted that marijuana leads to heroin addiction[30] or experimentation with hallucinogenic drugs.[31] Supporters of this theory cite to the few available studies which tend to show that a large number of heroin addicts have, at some time, smoked marijuana.[32] On the other hand, many scientists have pointed out that a direct cause and effect relationship has not been demonstrated.[33] While this theory is also badly in need of empirical study, it lies within the realm of sociological and medical expertise and has therefore been excluded from study in this project.

It is frequently claimed that marijuana use leads to the commission of crimes and violent, anti-social behavior.[34] This view was

---

Problem in the City of New York, in THE MARIHUANA PAPERS 285-335 (D. Solomon ed. 1966); Murphy, *The Cannabis Habit: A Review of Recent Psychiatric Literature*, 15 BULL. ON NARCOTICS 15 (Jan.-Mar. 1963).

It has been suggested by several psychologists that marijuana may have an adverse psychological effect upon young people. The processes of maturation and emotional development occurring during youth are often beset with tension and conflict. Using marijuana as a refuge from facing up to these conflicts may hinder the development of emotional maturity. As yet, little evidence is available supporting this view. In any event, this argument would go only toward keeping marijuana out of young hands, as is presently done with alcohol. *See generally*, Chein & Rosenfeld, *Juvenile Narcotics Use*, 22 LAW & CONTEMP. PROB. 52 (1957); Winick, *Marijuana Use by Young People*, in DRUG ADDICTION IN YOUTH 19 (1965). For a general discussion of the use of marijuana and other drugs by young people see ILLINOIS INSTITUTE FOR JUVENILE RESEARCH AND THE CHICAGO AREA PROJECT, DRUG ADDICTION AMONG YOUNG PERSONS IN CHICAGO (1953); LAPD, YOUTH AND NARCOTICS: A STUDY OF JUVENILE ADDICTION IN LOS ANGELES (1953).

30 "That is the great problem and our great concern about the use of marijuana, that eventually, if used over a long period it does lead to heroin addiction." Testimony of Mr. Harry Anslinger, in *Hearings on S. 3760 Before the Subcomm. on Improvements in the Federal Criminal Code of the Senate Comm. on the Judiciary*, 84th Cong., 1st Sess., pt. 5, at 16 (1955). *See* CAL. BUREAU OF NARCOTICS ENFORCEMENT, THE NARCOTIC PROBLEM 12 (4th ed. 1965); *cf.* Chein & Rosenfeld, *supra* note 29; Winick, *supra* note 29, at 28-30. For a general discussion of this argument see PRESIDENT'S CRIME REPORT, *supra* note 22, at 225.

31 Yablonsky Interview, *supra* note 28. In his investigation of the hippie communities, Dr. Yablonsky found an integrated use of LSD and marijuana. He circulated a questionnaire to over 600 hippies. 70% of them reported that the first drug they ever used was marijuana. Over 95% reported that they had taken LSD.

32 A summary of these studies can be found in the PRESIDENT'S CRIME REPORT, *supra* note 22, at 225. *See also* note 31 *supra*.

33 There is no pharmacological basis for the charge that marijuana leads to heroin addiction. L. GOODMAN & A. GILMAN, THE PHARMACOLOGICAL BASIS OF THERAPEUTICS 300-01 (3d ed. 1965). *See also* PRESIDENT'S CRIME REPORT, *supra* note 22, at 225.

TOMPKINS, *supra* note 11, at 20-26; Andrade, *The Criminogenic Action of Cannabis and Narcotics*, 16 BULL. ON NARCOTICS 23 (Oct.-Dec. 1964); Munch, *Marihuana and Crime*, 18 BULL. ON NARCOTICS 15 (April-June 1966). For a contrary position see Blum, *Mind-Altering Drugs*

originally promoted in the 1930's by Harry Anslinger, director of the then newly formed Federal Bureau of Narcotics.[35] Statistics and files from various law enforcement agencies throughout the country have been used to support the connection between marijuana and crime.[36] The validity of this evidence, however, is questionable because of the untested assumptions upon which it rests[37] and the highly unscientific manner in which it was gathered.[38] The President's Ad Hoc Panel on Drug Abuse concluded that the evidence is inadequate to substantiate the correlation between marijuana and anti-social acts.[39] Upon this theory, the President's Crime Commission reported:

> One likely hypothesis is that, given the accepted tendency of marijuana to release inhibitions, the effect of the drug will depend on the individual and the circumstances. It might, but certainly will not necessarily or inevitably, lead to aggressive behavior or crime. The response will depend more on the individual than the drug.[40]

Marijuana has also been condemned by those who claim that its use is immoral.[41] Such a view reflects the Puritan ethic of sobriety and self-restraint. Whether marijuana is moral or not and whether the criminal law is the proper vehicle for controlling morality[42] are essentially philosophical questions which are outside the province of an empirical project.

---

and Dangerous Behavior: Dangerous Drugs, in PRESIDENT'S COMMISSION ON LAW ENFORCEMENT AND ADMINISTRATION OF JUSTICE, TASK FORCE REPORT: NARCOTIC AND DRUG ABUSE 21, 24-25 (1967); Bromberg & Rogers, *Marijuana and Aggressive Crime*, 102 AM. J. PSYCHIATRY 825 (1946); Mayor's Committee on Marihuana, *supra* note 29, at 227; Murphy, *supra* note 29, at 16; Reichard, *supra* note 27, at 17-18.

[35] *See* notes 11-12 *supra*, and accompanying text.

[36] One report, originating from the District Attorney of New Orleans, claimed that 125 of 450 men convicted of major crimes in 1930 were regular marijuana users. Stanley, *Marihuana As a Developer of Criminals*, 2 AM. J. POLICE SCI. 252 (1931). This report is critically commented on in Winick, *supra* note 29.

[37] These assumptions are: (1) that the defendant was a marijuana user, (2) that he was under the influence of marijuana at the time he committed the crime, and (3) that the crime would not have been committed but for the use of marijuana. *See* PRESIDENT'S CRIME REPORT, *supra* note 22, at 224.

[38] For a critique of the techniques employed by law enforcement officials in the gathering of evidence linking marijuana with crime see Mayor's Committee on Marihuana, *supra* note 29.

[39] WHITE HOUSE CONFERENCE, *supra* note 25, at 286.

[40] PRESIDENT'S CRIME REPORT, *supra* note 22, at 225.

[41] *See, e.g.*, H. ANSLINGER & W. TOMPKINS, *supra* note 11, at 20-25; Reichard, *supra* note 27, at 21.

[42] Proponents of marijuana use generally agree with John Stuart Mill's formulation: "That the only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant." Mill, *On Liberty*, in THE UTILITARIANS 484 (1961). The opposing viewpoint would permit society to wield its power over the individual in order to preserve and protect the practice of moral virtue. *See* H. DAGGE, CONSIDERATIONS ON CRIMINAL LAW 245-46 (1772);

Thus, in dealing with the enforcement of marijuana laws, this project is not designed to investigate the justifications cited for marijuana legislation. Nonetheless, enforcement practices must be considered in any assessment of the effectiveness and desirability of substantive law. One important factor, for example, is whether the laws actually deter people from using marijuana. Despite the current stringency of the laws, statistics show that the number of people using marijuana is substantially increasing.[43] It has been estimated that 20 percent or more of certain college populations have smoked marijuana at least once.[44] Arrests of juveniles in California for marijuana offenses have increased over 400 percent in the past five years.[45] Moreover, the type of individual using marijuana has changed over the last 25 years. Originally, marijuana smoking was limited to the lower socioeconomic classes;[46] today, it has also become frequent among the middle and upper-class youth.[47] This increase in marijuana use indicates that the laws are not deterring large numbers of people and raises serious questions about the efficacy of those laws.

The institutional, social and financial costs of enforcing the law must also be taken into consideration in evaluating the marijuana laws. Institutional costs include the diversion of police time and energy from the investigation of other crimes and the mounting frustrations of the police caused by uncontrollable marijuana use and judicial leniency towards marijuana offenders. Possible social costs of the present laws include exposing a rapidly increasing number of young offenders to the criminal process and to the stigma of arrest and felony conviction.[48] In addition, police techniques necessary to uncover violators often involve serious intrusions on individual privacy. Financially, the enforcement of the marijuana

[46] A. LINDESMITH, *supra* note 8, at 226-27.

[47] PRESIDENT'S CRIME REPORT, *supra* note 22, at 213; Yablonsky Interview, *supra* note 28.

[48] In 1967 a total of 8,371 juveniles under the age of 19 with no prior criminal record were arrested by California law enforcement agencies. An additional 5,557 with no prior record were between the ages of 20 and 24. There were a total of 16,161 individuals with no prior record arrested for marijuana violations in 1967. Unpublished statistics obtained from the Cal. Dep't of Justice; Bureau of Criminal Statistics.

laws is very expensive. Thousands of hours of police time are consumed in apprehending marijuana offenders;[49] many more hours are spent by the police in court;[50] and our criminal courts, already plagued by oppressive caseloads, are ill equipped to handle the staggering increase in marijuana trials.

An empirical project can be of significant value in exploring such conditions. This project has gathered data relating to the enforcement of the marijuana laws in Los Angeles County. At the pre-arrest level, it will describe the special techniques used in uncovering marijuana users and pushers. At the post-arrest level, the project will concentrate on the use of prosecutorial and judicial discretion in the application of the laws. Such an empirical study will hopefully add a needed perspective to the body of information which will be used by legislators and other concerned citizens in evaluating the desirability of the present laws.

---

[49] By the time a two man patrol team has arrested an individual, taken him to the station to be booked and returned to their patrol, two to three hours have usually passed. Interview with Joe Reichmann, Deputy District Attorney of Los Angeles County, in Los Angeles, June 11, 1968.

[50] *See* note 14, Part II *infra*.

PART II: ENFORCEMENT TECHNIQUES

I. INTRODUCTION

Enforcement of the marijuana laws suffers from the same difficulties encountered in the enforcement of laws concerning other consensual crimes.[1] There is no victim to complain and there is little social pressure to conform to the law within the various subcultures involved.[2] The police compensate for these difficulties by developing aggressive techniques designed to ferret out the illicit activity, including the use of informants, undercover operators, and field surveillance.[3]

The effectiveness of enforcement can be measured only by determining the ratio of arrests to violations. But the effectiveness of enforcement of the marijuana laws is particularly difficult to determine because marijuana use is increasing so rapidly.[4] The police readily admit that total enforcement of the marijuana laws is impossible.[5] However, the heavy penalties placed on marijuana use by the legislature plus community concern place considerable pressure on the police to close the ever widening gap between violations of the law and actual arrests. At some point increased police efficiency in uncovering violations is going to clash with

---

[1] For a general discussion of the problems involved in enforcing consensual crimes *see* E. SCHUR, CRIMES WITHOUT VICTIMS (1965); L. TIFFANY, D. MCINTYRE, & D. ROTTENBERG, DETECTION OF CRIME 208-13 (1967) [hereinafter cited as TIFFANY]; Project, *The Consenting Adult Homosexual and the Law: An Empirical Study of Enforcement and Administration in Los Angeles County*, 13 U.C.L.A. L. REV. 644, 686 (1965) [hereinafter cited as *Homosexual Project*].

[2] A subculture may be loosely defined as a "culture-within-a-culture, with its [own] distinctive values and behavior norms . . . ." E. SCHUR, *supra* note 1, at 85. Schur indicates that legal repression of some activities, such as homosexuality or the use of addictive narcotics, may in fact directly stimulate the creation of subcultures centered on those activities. *Id.* at 141-45. Marijuana, however, has been incorporated into the life style of existing subcultures such as those of the ghetto Negro and the Sunset Strip "hippie," rather than being the cause behind the creation of those subcultures.

[3] Jerome Skolnick notes that the police enjoy narcotics work because it requires skillful and efficient detective work initiated by the policeman himself. J. SKOLNICK, JUSTICE WITHOUT TRIAL 117 (1966).

[4] To the extent that arrests are an indication of increased illegal activity the record is striking. During the period 1960 through 1966 adult arrests for marijuana violations in Los Angeles County increased 217% from 2,704 in 1960 to 8,564 in 1966. Juvenile arrests in the county increased from 694 in 1960 to 2,636 in 1966, a gain of 280%. CAL. DEP'T OF JUSTICE, BUREAU OF CRIMINAL STATISTICS, DRUG ARRESTS AND DISPOSITIONS IN CALIFORNIA 6-7 (1966) [hereinafter cited as DISPOSITIONS 1966].

[5] Chief Thomas Reddin of the Los Angeles Police Department admits that all the police can do is try to keep marijuana under control. L.A. Times, Dec. 4, 1967, § 2, at 6, col. 1.

court-imposed barriers on investigation.[6] The police response is pressure for relaxation of these barriers[7] and the development of means to work around them.[8] These efforts, however, have been largely ineffective. At present, the police still depend largely on fortuity in apprehending marijuana violators.

Another factor which complicates the enforcement of marijuana laws is the increased geographical range of the problem. In the past, the police could isolate particular problem areas because the traditional users were Mexican-Americans, Negroes, and "artists" who lived within particular areas.[9] Now, the rapid increase in use among 15 to 24-year olds[10] has spread the problem far beyond its traditional neighborhoods,[11] and there are no longer any local police agencies which deny having a marijuana problem.[12]

---

[6] This results from two alien views on what should be the primary emphasis of the criminal process. The police believe the process should be geared to efficiency in the discovery of those violating the law. The courts, interpreting the law, emphasize the rights of an individual to be free from certain police tactics even if this means a reduction in police efficiency. *See* Packer, *Two Models of the Criminal Process*, 113 U. PA. L. REV. 1 (1964).

[7] Police pressure resulted in the passage of a new evidence code section allowing the judge discretion in deciding whether to require the police to reveal their informant where probable cause to arrest or search is the sole issue. CAL. EVID. CODE § 1042 (West 1965). *See* STATE OF CALIFORNIA, FINAL REPORT OF THE SPECIAL STUDY COMMISSION ON NARCOTICS 43-47 (1961) [hereinafter cited as SPECIAL STUDY].

[8] This does not necessarily mean illegal actions by the police, but includes techniques not prohibited by law designed to circumvent informant disclosure or probable cause requirements. *See* Section IV *infra*.

[9] *See* testimony of Luke McKissick, in *Hearings on Marijuana Laws Before the Cal. Senate Pub. Health & Safety Comm.*, Oct. 18, 1967, at 87 [hereinafter cited as *Hearings*]. The percentage of adults arrested for marijuana offenses in Los Angeles County of Negro descent has remained fairly constant during the period from 1960 to 1966. In 1960, 33.6% of adult arrestees were Negro; in 1966, the figure was 31.0%. However, the corresponding figures for Whites and Mexican-Americans have changed significantly. In 1960, the percentage of arrestees who were White was 44.3%; in 1966, 53.6%. During the same period the equivalent percentages among Mexican-Americans declined from 21.0% to 14.6%. *Compare* DISPOSITIONS 1966, *supra* note 4, at 56, *with* CAL. DEP'T OF JUSTICE, BUREAU OF CRIMINAL STATISTICS, NARCOTIC ARRESTS AND THEIR DISPOSITIONS IN CALIFORNIA 17 (1960).

[10] This age grouping represents a consensus drawn from responses of local enforcement agencies when asked what age group was primarily responsible for the increase in marijuana arrests.

[11] The traditional marijuana problem areas were the Watts area with its high Negro population, the East Los Angeles area with its high Mexican-American population, and the Hollywood and Venice areas with a high percentage of "artists" and fellow-travelers as residents. While these areas still provide the most arrests, there has been a spectacular increase in arrests, particularly among juveniles, in the traditionally respectable White middle-class areas. For example, the Covina Police Department reports a 700% increase in arrests within a one year period (1966-67). This is a fairly typical suburban community.

Juvenile arrests also increased dramatically in two Los Angeles Police Division located in the predominately white San Fernando Valley. Arrests by the West Valley Division went from 32 in 1965 to 430 in 1967 while arrests by the Van Nuys Division increased from 28 in 1965 to 278 in 1967.

Arrest reports probably do not give an entirely accurate picture of the relative use of marijuana in particular areas. For example, although there are considerably more arrests in the Hollywood area than in West Los Angeles,[13] the difference may not be due entirely to greater incidence of marijuana use in Hollywood. Part of the difference may be due to heavier police patrols in the Hollywood area, and part to the overt use of marijuana by the "hippie-type" youth in Hollywood (as opposed to more covert use by the student and young adult population of West Los Angeles).

Given the current spread of marijuana use, both numerically and geographically, and the limitations placed upon investigatory techniques, the primary means of increasing the percentage of apprehensions is to devote more manpower to the task. However, the investigation required to uncover consensual activities such as marijuana possession and sale requires great amounts of time[14]—time which must be taken away from the investigation of other more violent crimes. This time commitment, along with the other social costs involved, should reflect a rational measure of the comparative importance of present marijuana laws.

II. The Distributional System

Los Angeles is a distribution center from which marijuana flows to the rest of the country.[15] Over 90 percent of the marijuana in Los Angeles County is grown in Mexico[16] and about 72 to 80

Lieutenant William Pettit of the Manhattan Beach Police Department estimates that 30% of the students of Manhattan Beach High School have tried marijuana. Interview in Manhattan Beach, Jan. 16, 1968 [hereinafter cited as Pettit Interview]. Attorney Marvin Cahn makes a similar estimate of 90% of the students at Hollywood High School. Interview in Los Angeles, Jan. 3, 1967 [hereinafter cited as Cahn Interview]. In a recent poll of students at UCLA, 3377 of the 9589 responding claimed to have tried marijuana at least once. UCLA Daily Bruin, Jan. 4, 1968, at 3, col. 3.

[12] Of the enforcement agencies responding, the percentage of marijuana arrests to total arrests ranged from 1% in Culver City to 16% in Pasadena. Pasadena has a separate narcotics unit which may account, in part for the higher percentage.

[13] Of the 738 adult arrests studied, 90 were made by the Hollywood Division of the Los Angeles Police Department and 13 by the West Los Angeles Division. In 1967 (through November) 368 juveniles had been arrested by the Hollywood Division as compared with 228 by the West Los Angeles Division.

[14] *See* J. Skolnick, *supra* note 3, at 139. Not only is this time spent on patrol and investigation, but it includes time spent by the police in court pursuant to a marijuana prosecution. Police responses indicated that the successful prosecution of the average marijuana case requires from four to eight hours of court attendance by the arresting officer.

[15] The Van Nuys News and Valley Greensheet, Sept. 12, 1967, at 16-a, col. 5 (central ed.).

[16] Special Study, *supra* note 7, at 19.

percent of this amount is shipped to Los Angeles by a group of separate, loosely knit syndicates that are organized particularly for this purpose.[17] It is purchased by Mexican-based members of the syndicate for five to eight dollars a kilogram, processed locally, and shipped over the border by plane, boat, or special vehicles known as "mules."[18] After arriving in Los Angeles, the transporter calls a designated telephone number for instructions. He is told to deposit the cargo in a particular spot, such as a service station restroom, or he may be told to park the vehicle on a side street where the dealer will pick it up later. At no point is there any contact between the transporter and the stateside dealer.[19] Once the dealer receives his shipment he "stashes" it in a concealed place. The stash is later divided into smaller quantities for distribution to local pushers or for transportation out of Los Angeles.

Marijuana not shipped by these syndicates comes across the border in the possession of small-scale pushers, usually individuals who have purchased the marijuana primarily for their own use and who bring back some extra to make a small profit by selling to their friends.

The last link in the distributional chain is the pusher. In the past, most marijuana use was in heavily patrolled low income areas where the pusher had a firsthand knowledge of police procedures. With the currently expanding market, however, the dealers have recruited "amateurs" from middle or upper income areas[20] whose previous contact with the police has been minimal and who are thus less circumspect in their dealings.

There is some dispute whether marijuana pushers also sell heroin and other hard narcotics. Some enforcement agencies, not-

---

[17] The bulk of the information presented in this section was obtained from an interview with Mr. John Warner, Field Supervisor of the California Bureau of Narcotic Enforcement, in Los Angeles, Jan. 9, 1967. His assertion that continuing operations account for most of the imported marijuana is disputed by others, including attorney Marvin Cahn and sociologist Jerry Mandel. They claim that marijuana is too bulky and the eventual profit too low to make a continuing organization possible. Cahn Interview, *supra* note 11. Mandel, *Myths and Realities of Marihuana Pushing*, in MARIHUANA MYTHS AND REALITIES 58, 76 (J. Simmons ed. 1967).

[18] The "mule" is an ordinary truck or automobile which has been specially outfitted to transport up to 1100 kilograms of marijuana.

[19] The precautions are so elaborate that the transporter may park an empty car, observe who gets in it and follow him to be sure he isn't a police plant. Warner Interview, *supra* note 17.

[20] This is necessary because a successful pusher must be integrated into the community in which he sells. Narcotics users will seldom buy from a total stranger and few experienced pushers desire to sell to total strangers. The new breed of pusher is typically a student, who started as an occasional user and began picking up extra money by selling to acquaintances.

ably the Federal Bureau of Narcotics, claim that the marijuana pusher often switches to selling heroin.[21] However, this claim is disputed by defense attorneys and other enforcement agencies who state that marijuana is usually sold exclusively.[22] The claim of exclusivity is supported by the negative connotation heroin has to the marijuana user and pusher. Heroin users form a separate subculture and rarely come into contact with casual marijuana users.[23] There appears, however, to be an increasing connection between the use of marijuana and the use of pills, such as the amphetamines, particularly among juveniles.[24] Since both pills and marijuana are used by the same groups for similar purposes, it is reasonable to infer that the same pushers may be supplying them both.

III. Organization Against the Problem

Each law enforcement agency concerned with marijuana is organized to combat a particular aspect of the overall narcotics flow from importation down to use: the Federal Bureau of Narcotics and the California Bureau of Narcotics Enforcement combat the flow at the importation and major traffic levels; the various special narcotics units of local enforcement agencies are organized to uncover the local dealers and pushers; and the individual patrolman has the responsibility of apprehending the individual user.

The Federal Bureau of Narcotics (FBN) is vested with the broad authority to enforce all of the laws of the United States pertaining to marijuana and narcotic drugs.[25] In point of fact it is

---

[21] Interview with an agent of the Federal Bureau of Narcotics, in Los Angeles, Mar. 19, 1967 [hereinafter cited as FBN Interview].

[22] Cahn Interview, *supra* note 11; Interview with Luke McKissick, Attorney, in Hollywood, Mar. 13, 1968; Warner Interview, *supra* note 17.

[23] Interviews with enforcement agencies indicate that, even in areas where there is a high incidence of both marijuana and heroin use, undercover agents are advised to deal in one drug or the other, since an agent buying both heroin and marijuana would be suspect.

[24] Statistics compiled on juvenile arrests in 1967 by the Los Angeles Police Department, Juvenile Narcotics Division, indicate a rapid increase over 1966 in both dangerous drug arrests and marijuana arrests. As of December, arrests through the first 11 months of each year were:

	1966	1967
Dangerous Drugs	397	1062
Marijuana	1522	2910

Interviews with high school teachers indicate that the use of amphetamines and other dangerous drugs is becoming as severe a problem as marijuana use among high school students.

In our sample of 204 juvenile cases, 58 of those arrested had pills as well as marijuana.

[25] 26 U.S.C. § 7607(2) (1964). As this project was being prepared, President Johnson submitted a government reorganization plan which abolished the Federal

concerned only with major traffic, its policy being to stop the flow of marijuana at its source.[26] To accomplish this end the FBN has agents spread throughout the world and has been the influential force behind the present international control agreements.[27] The FBN claims to work closely with local and state agencies, but this claim is disputed by some of those agencies. They claim that the Bureau prefers to develop its own information and that it is generally uncooperative.

The California Bureau of Narcotics Enforcement is a part of the California Attorney General's Office.[28] Ostensibly given the duty of enforcing all of California's narcotics laws, its function has been narrowed by directives from the Attorney General's Office assigning it the "detection and apprehension of major traffic."[29] This Bureau depends primarily on arrestees of local agencies to supply it with information.[30]

Both the Federal and California Bureaus work with the United States Bureau of Customs and the Border Patrol in attempting to apprehend marijuana importers at the Mexican border. Border searches are a particularly useful enforcement device in view of the fact that they need not be accompanied by probable cause.[31] The border patrolmen receive instructions from state and federal

---

Bureau of Narcotics and the Bureau of Drug Abuse Control as separate agencies, and combined them into a new organization, The Bureau of Narcotics and Dangerous Drugs, under the Department of Justice. This reorganization became effective April 8, 1968. Sterba, *The Politics of Pot*, ESQUIRE 119 (Aug. 1968).

[26] FBN Interview, *supra* note 21.

[27] The present United Nations Treaty is known as the Single Convention on Narcotic Drugs. It urges member nations to take measures to control marijuana, but not necessarily to prohibit it. The former commissioner of the Federal Narcotics Bureau, Harry Anslinger, continually sought to keep the United Nations committed to the position that marijuana is an addictive drug. *See* McGlothlin, *Toward a Rational View of Marihuana*, in MARIHUANA MYTHS AND REALITIES 191-93 (J. Simmons ed. 1967).

[28] CAL. HEALTH & SAFETY CODE §§ 11100-07 (West 1964). The Code denominates the organization "Division of Narcotic Enforcement" but most people, including those within the organization, refer to it as the "Bureau of Narcotic Enforcement."

[29] The other assigned functions are to prevent the unauthorized use of licensed narcotics (which has nothing to do with marijuana since there is no authorized use for which it can be licensed) and to aid local agencies in narcotics enforcement (which the Bureau does not have the manpower to do anyway). Warner Interview, *supra* note 17.

[30] *See* text accompanying note 79 *infra*.

[31] The fourth amendment's prohibition against unreasonable searches has been held not to forbid border searches made without probable cause. The standard applied is one of mere suspicion that the vehicle might be carrying contraband goods. 19 U.S.C. § 482 (1964). *See* Carrol v. United States, 267 U.S. 132, 138 (1925); King v. United States, 348 F.2d 814 (9th Cir. 1965); Witt v. United States, 287 F.2d 85 (9th Cir. 1961), *cert. denied*, 366 U.S. 950 (1961). For a detailed discussion of border searches see Comment, *Intrusive Border Searches—Is Judicial Control Desirable?*, 115 U. PA. L. REV. 276 (1966); 18 W. RES. L. REV. 1007 (1967).

agents to search particular vehicles coming over the border. This information is usually obtained from informants inside the United States.[32] The FBN also claims to get considerable cooperation from Mexican authorities.[33] The California Bureau, however, admits that it gets little assistance from Mexican officials and the FBN's claim is disputed by other commentators.[34]

The larger police departments and the Sheriff's Department in Los Angeles County have special narcotics units which concentrate on uncovering local dealers and pushers.[35] In addition, these same agencies have separate juvenile narcotics divisions concerned with all juvenile offenders and with adults who supply them.[36] In the smaller agencies, responsibility for all narcotics enforcement usually lies with a couple of officers who devote only part of their time to the task.[37]

There appears to be a lack of any coordinated attack on marijuana traffic. Each of the law enforcement agencies involved operates at its designated level with only occasional contact with agencies at higher or lower levels. The California Bureau of Narcotics Enforcement does depend on local agencies for much of its information but can offer little help in return. The smaller police forces occasionally use undercover agents from the Sheriff's department and get the Sheriff's help in training their individual patrolmen. There is also some inter-agency cooperation in the chemical testing of seized marijuana for its presentation as evidence. Both the State Bureau and the smaller police forces depend on the Los Angeles Police Department or the Sheriff to do their testing.[38]

The training and selection procedures of the various narcotics units tend to perpetuate the existing bias against marijuana already present in the unit. The training is done by the present agents and

---

[32] Warner Interview, *supra* note 17.

[33] FBN Interview, *supra* note 21.

[34] Mandel, *supra* note 17, at 75. Mandel describes the various payoffs and concessions which must be made to the Mexican *Federales* to get them to show much interest in stopping the flow north.

[35] Of those agencies contacted three had special narcotics units. These were the Los Angeles Police Department, the Los Angeles County Sheriff, and the Pasadena Police Department.

[36] Interview with Sergeant Gene Zappey, Los Angeles Police Department Juvenile Narcotics Division, in Los Angeles, Jan. 11, 1967.

[37] The smaller agencies indicated that they often try to keep one man continually on narcotics matters but because of manpower shortage, this is difficult. If a large "bust" is planned practically the whole department may be used.

[38] The two tests used are the *Duquenois* and the *Bouquet* tests which indicate the presence of tetro-hydro cannabinal, the active ingredient present in marijuana, hashish, and other derivatives of the hemp plant (*cannabis sativa*). A positive result from the test is presumptive evidence that the material being tested is marijuana.

the medical evidence presented is generally on the side of the anti-marijuana lobby.[39] Those individuals selected for the special units of the police must have considerable experience in law enforcement and a desire to become members.[40] Thus they have generally formed their attitudes prior to becoming narcotics officers.

The individual patrolman is the last link in the enforcement chain. He is responsible for the detection of the individual user. This job comes to him by default through the inability of any of the other organizations to afford the time and the manpower to actively seek out the individual user. He is given training on how to identify marijuana by sight and smell[41] and learns to recognize the characteristics of someone under the influence of the drug. As marijuana use has increased, this training has been given greater emphasis with the result that the individual patrolman has developed a heightened awareness of marijuana use. This awareness has been a partial factor in the increase in marijuana arrests.[42]

The attitudes of patrolmen toward marijuana users are harder to assess than those of narcotics agents. They are not interested primarily in narcotics and thus probably have a less definite view on marijuana. Of those patrolmen interviewed only one expressed any doubts as to the validity of the stiff marijuana laws and he stated this had no effect on his enforcement of them.

IV. Methods of Enforcement

A. *Informants and Other Informational Sources*

Before a narcotics unit can justify committing its limited manpower it must first have reliable information on which to proceed.

---

[39] Mr. John Warner of the State Bureau of Narcotic Enforcement said that he gave the lectures on the physical and psychological effects of marijuana to his trainees. The literature used in the talks is all anti-marijuana in nature. It all consists of reputable authorities, including the positions of the American Medical Association, the California Medical Association and the United Nations Committee on Drugs. In a recent speech at U.C.L.A. entitled "The Fuzz Looks at the Grass Problem" Warner concluded that marijuana is psychologically addicting, that it has many deleterious physical effects on the user, and that the use of marijuana leads to heroin addiction.

[40] For example, the Los Angeles Police Department's Juvenile Narcotics Division accepts applicants only if they have five years of service, an outstanding record, plus a strong desire to become a narcotics agent. Zappey Interview, *supra* note 36.

[41] The patrolman learns to identify marijuana by the wrapping used. "Bricks" (kilogram quantities) often come wrapped in tinfoil. "Lids" (ounce quantities) usually come in wax paper bags. "Joints" (marijuana cigarettes) look like handrolled cigarettes, twisted at both ends.

[42] This is a view expressed by both narcotics agents and defense attorneys. It is reasonable to assume that patrolmen more extensively trained to spot marijuana violators will be more perceptive to possible violations while on patrol.

Thus the initial and most important requirement of marijuana enforcement is the development of dependable sources of reliable information. These sources of information may be broken down into the following categories: (1) professional informants; (2) local contacts cultivated by the police who voluntarily provide frequent information concerning marijuana activity within a particular area; (3) individuals arrested for marijuana violations who cooperate in exchange for possible reduced charges or a recommendation of a lenient sentence; and (4) the occasional or one-time source of information.

1. Professional Informants

The professional informant is the most valuable of these four sources to the local narcotics unit.[43] A good informant can make up to $50 a day in Los Angeles.[44] The pay scale is arbitrary depending on the individual agent's view of the quality and quantity of his informant's information. The only agency paying at a fixed rate is the United States Bureau of Customs which scales its compensation to the amount of marijuana uncovered by the information.[45] The narcotics officers interviewed, however, did not feel that money was the sole factor motivating the professional informant. The informant often works for the psychological feeling of importance he gets through cooperating with the police. The police try to find out the motivation of each informant, particularly with unproved sources, in order to avoid the possibility that the informant has planted the marijuana on the suspect for purposes of revenge.

The professional informant is the narcotic unit's eyes and ears within the community. A good professional will be able to provide continually reliable information used by the police for field investigation, and will often introduce police undercover agents to suspected dealers and pushers. Because of his continuing value, the police are careful to protect the professional informer's identity, a task which is hampered by the disclosure rules currently prevailing in California.

The California Supreme Court, in a series of decisions, has laid

[43] Apparently the only agencies who pay informants are those with a separate narcotics unit. Of the nine agencies from whom information was collected, four did not pay their informants. These four were the smaller police departments without a separate narcotics unit.

[44] Interview with Sergeant George Barber, Los Angeles Police Department Narcotics Division, in Los Angeles, Jan. 10, 1967. The Los Angeles Police Department pays its informers out of a special fund budgeted for this purpose. Both the Federal Bureau of Narcotics and the State Bureau are allotted funds to pay their informers.

[45] FBN Interview, *supra* note 21.

down rules requiring the police to disclose the identity of their informant whenever he is a material witness to an issue of the defendant's guilt.[46] This rule has been applied to require disclosure if the informant introduced an undercover agent to the defendant, even though the informant was not present when the illegal transaction occurred. The theory is that the informant is aware of the defendant's identity which is a "material issue."[47]

Until 1967, the police in California were required to reveal their informant's identity whenever his information was the sole basis of probable cause to arrest or search.[48] Section 1042 of the California Evidence Code now gives the judge discretion to require disclosure under these circumstances.[49] The police officers interviewed claimed that judges usually require disclosure, while defense attorneys claimed the opposite. The police feel that the disclosure requirements have scared off many valuable professional informants, especially since police policy is to warn all prospective informants that their identity may be subject to disclosure at trial. If the police feel that the informant is particularly valuable or that his life might be in danger because of disclosure, they will refuse to identify him even though it might cost them the case.[50]

One method of protecting the informant's identity is the so-called "double duke-in" sale. The informant introduces undercover agent *A* to the suspect and then drops out of the picture. *A* makes several buys and then introduces agent *B* to the suspect. *B* makes several buys with *A* dropping out of the picture. The only sales charged to the suspect are those made to agent *B*. Although an alert defense attorney may trace back through the entire transaction, thus requiring the police to reveal their original informant, many defenders fail to probe beyond agent *A* thereby leaving the informant protected.[51]

The informant's identity may also be protected by arresting him (or the police undercover operator) along with the pusher. This decreases the possibility that the seller will be able to identify the informant as a police operative.[52]

The police claim that no immunity is granted to informants working for them. This claim is roundly disputed by defense

attorneys who assert that the police allow their better informants to use marijuana without fear of arrest as long as they supply information.[53]

2. Local Contacts

A second source of information comes from local sources the police have cultivated who frequently come into contact with marijuana users and pushers. Through experience the police have learned that certain groups of individuals can provide reliable information about marijuana activity in a particular area and the police respond immediately to any proferred information from a member of these groups. They include prostitutes,[54] hotel and motel owners, bartenders, theatre operators, and generally any individual who deals with a transient clientele. Since these sources are not paid, their motives vary considerably: some want to curry favor with the police;[55] some are attempting to keep their establishments free of undesirables; some are genuinely concerned citizens; and others merely get a psychological kick out of participating in a police arrest.[56]

One of the most profitable of these regular sources is the school official. The juvenile narcotic units attempt to nurture a close working relationship with school principals, encouraging them to report any students under the influence of drugs and to report any suspicious individuals lurking near the school grounds.[57] The

---

[53] There is little doubt that this is so with regard to heroin informants. *See* Goldstein, *Police Discretion Not to Invoke the Criminal Process: Low-Visibility Decisions in the Administration of Justice*, 69 YALE L.J. 543, 565-67 (1960). However, it seems less likely with marijuana informants since an individual does not become dependent on marijuana to the extent he does on heroin. What probably happens is that the narcotics unit will ignore use of marijuana by one of its informants as long as he is working for it. But if he is arrested separately by an individual patrolman, he is not given immunity.

[54] The information from prostitutes comes by way of the vice squad. Some attorneys claim that the police let prostitutes operate unmolested in return for narcotics information. The police, of course, deny this. Jerome Skolnick indicates that the police are willing to trade the arrest of a common prostitute for the arrest of a marijuana pusher, since the pusher has a higher moral culpability in the policeman's eye. J. SKOLNICK, *supra* note 3, at 118.

[55] Most owners of public establishments feel that it is smart to stay on the good side of the police by scrupulously avoiding any reputation of catering to a questionable clientele, which might result in the loss of their licenses.

[56] The police find that after turning in someone, the informant will often insist on being on the scene to witness the arrest. Participating in a live arrest gives an informant a feeling of importance which is psychologically gratifying. Barber Interview, *supra* note 44.

[57] The school officials usually call in directly to the juvenile narcotics office and the juvenile officers will give official advice on how to handle an unruly student, until the police arrive. Zappey Interview, *supra* note 36. Out of 110 juvenile arrest reports studied, eight of the arrests were initiated by school authorities.

success of this police encouragement varies from school to school depending on the attitude of the individual principal. The principals of schools in smaller communities and in low income areas seem to report use of marijuana by students to the police more often than principals of higher income, urban schools, although use in some of the latter is the highest in the county.[58] It is claimed that the high school principal is also authorized to search student lockers[59] and the police encourage this as a means of uncovering marijuana. However, while school authorities are likely to report the student who comes to class obviously under the influence of narcotics, they apparently do not fully exercise their authority to search lockers.[60]

3. Arrestee Informants

A third type of informant is the arrestee who cooperates with the police in an attempt to obtain a recommendation for leniency from them. There is no lack of such potential cooperators since the first reaction of most marijuana arrestees is to ask what they can do to get off.[61] The police claim not to make any specific promises, but they do tell the arrestee that any assistance he gives will be reported to the district attorney or the probation officer and thus to the court. The police generally will not release an individual merely because he has promised to cooperate with them; he must first make bail.[62] Once out of jail the would be informant is on his own. He is told only to let the police know when he can give them some positive assistance. Such assistance requires that the arrestee inform against somebody who is actually selling marijuana and usually someone who is more than a minor pusher.[63] The arrestee

---

[58] Estimates of marijuana use among high school students at Palos Verdes High (an upper-class Los Angeles suburb) range from 50% to 75% of the student body. TIME, Aug. 30, 1968, at 44.

[59] This was the claim of the juvenile narcotics authorities. In actuality, there is no specific authorization for such a search under rules set down for the administration of the Los Angeles City Schools; but since there is no prohibition against it, the authority is assumed.

[60] A check with principals in the West Los Angeles area indicated that none of them ever search their students' lockers.

[61] The police claim that they do not bring up the subject of "finking"; they only respond when an arrestee asks if he can do anything to help his case. However, defense attorneys claim that arrestees who are believed to have valuable information are encouraged by the police to cooperate. This is more likely to happen in small towns where the police have no special narcotics unit and where any one arrestee may be able to tie the police in with most of the marijuana activity in town.

[62] This is the announced policy of the Los Angeles Police Narcotics Unit.

[63] This would follow from the claims of the narcotic units that they are interested only in the professional pusher or dealer. Defense attorneys, however, claim that the police will try to get the arrestee to "turn" anyone he knows. It is possible that this happens in some of the smaller cities where the local police may view any use of

is told that the more information he gives the better it will go for him. This practice has aroused much criticism since it places pressure on young arrestees to inform on their friends.[64] The police tend to obtain as much information as possible from such an informant before giving any favorable recommendation. The Federal Bureau of Narcotics, for example, requires that the arrestee set up a transaction between the police and the individual on whom he is informing before it will give any recommendation. Such an initial "turn" by the arrestee may start a chain of successive arrests followed by more "turns" leading eventually to the ultimate desired end, the apprehension of a major dealer.

The arrestee informant is employed by the police in a variety of ways to initiate the transaction necessary for an arrest for the sale of marijuana. The informant will introduce an undercover agent to a pusher or will make the buy himself. The latter method, called a "witness sale," requires the informant to be stripped and searched, sent to make the purchase, and stripped and searched again when he returns. This procedure prevents any possible frame-up by the informant or any successful challenge in court when the marijuana is sought to be admitted as evidence.[65] The police maintain as close a surveillance as possible at all times during the sale, often through the use of field glasses in an adjoining building, or through the use of an electronic eavesdropping device attached to the informant.[66]

The police will often use a witness sale to provide probable cause for a subsequent search of the seller's apartment, rather than charging him with that particular sale. There are two possible reasons for this. The first is that using the information solely for probable cause permits the judge to exercise his statutory discretion to protect the informant's identity, which he could not do if the informant was a material witness to the sale.[67] The second reason

---

marijuana as a serious offense. One of the defense attorneys interviewed had an affidavit taken from a 19-year old arrested by a small southern Los Angeles County community. The youth claimed he had been required to "turn" several of his friends, none of whom were regular pushers, in return for police recommendation of a reduced sentence. Cahn Interview, *supra* note 11.

[64] The pressures placed on arrestees to cooperate can be extremely severe in the hands of some police. For example, the police can threaten the arrestee with exorbitant bail if he does not cooperate. *See* testimony of Luke McKissick, in *Hearings*, *supra* note 9, at 78.

[65] The use of women informants is inconvenient for this purpose since the vagina can be used as a hiding place. Thus the skin search must be done with female personnel. TIFFANY, *supra* note 1, at 255.

[66] Barber Interview, *supra* note 44.

[67] There is still a possibility, however, that the informant may be held to be a material witness to the defendant's guilt. *See* text accompanying note 46 *supra*.

is that the judge may be less sympathetic to a possible claim of entrapment against the informant where the only issue is probable cause.[68]

The police allow the arrestee informant to set up buys[69] without supervision.[70] The possibility of entrapment here is greater than where a purchase is set up by another type of informant or by a police undercover agent. This is so for two reasons: (1) the arrestee is under great pressure to set up a transaction in order to obtain a reduced charge or a more lenient sentence; and (2) the arrestee is likely to make the purchase from a personal friend and use the friendship as a lever to extract a sale which the friend might not ordinarily make.

Entrapment is an affirmative defense to a criminal charge based on the rationale that the police have induced an individual into committing a crime which he would not have otherwise committed.[71] Although arrestees and any other type of informants working for the police are subject to entrapment rules,[72] the defense is an extremely hard one to prove. The defendant is required to show that the intent to commit the crime originated in the mind of the police, *i.e.*, the informant.[73] The prosecution can rebut this defense by showing a willingness on the part of the defendant to make the sale.[74] Because of the difficulties of proof involved, the doctrine of entrapment is rarely used by defense attorneys.[75]

---

[68] It is doubtful whether the defendant can raise the issue of entrapment to defeat probable cause, since theoretically entrapment is an implied defense to the substantive crime and is therefore inapplicable when sought to be invoked to defeat probable cause. *See* text accompanying note 78 *infra*.

[69] Five of the nine agencies responding stated that they do not use cooperating informants to actually make purchases. However, these informants are used to set up transactions where an undercover agent makes the purchase.

[70] None of the agencies interviewed indicated that they gave a potential informant instruction on how to set up a transaction.

[71] Sorrels v. United States, 287 U.S. 435 (1932); People v. Benford, 53 Cal. 2d 1, 345 P.2d 928 (1959); People v. Adams, 213 Cal. App. 2d 536, 29 Cal. Rptr. 57 (1963).

[72] People v. Perez, 62 Cal. 2d 769, 775, 401 P.2d 934, 937 (1965) ("someone acting in cooperation with the authorities"). *See* Comment, *The Defense of Entrapment in California*, 19 HASTINGS L.J. 825 & n.2 (1968). The issue of just who is a police agent for purposes of applying entrapment rules has never been adequately discussed. Courts have treated, without discussion of their status, paid informers and those acting under promises of immunity, as government agents. *See* Donelly, *Judicial Control of Informants, Spies, Stool Pigeons, and Agent Provocateurs*, 60 YALE L.J. 1091, 1109 (1951).

[73] People v. Jackson, 42 Cal. 2d 540, 547, 268 P.2d 6, 11 (1954); People v. Cordero, 240 Cal. App. 2d 826, 829, 49 Cal. Rptr. 924, 926 (1966). *See* Comment, *The Defense of Entrapment in California*, *supra* note 72, at 842.

[74] People v. Sweeney, 55 Cal. 2d 27, 49, 357 P.2d 1049, 1062, 9 Cal. Rptr. 793, 806 (1960); People v. Harris, 210 Cal. App. 2d 613, 26 Cal. Rptr. 850 (1962).

[75] None of the enforcement agencies responding felt the entrapment laws were

When the purchase of marijuana is made by an undercover agent from an on-the-street pusher, there is a sound argument for placing the burden of proof on the defendant to show lack of intent. A rigid entrapment rule applied in this case would make the apprehension of pushers aware of the work of undercover agents extremely difficult.[76] However, where an arrestee is involved, because of the intense personal pressure on him to make a purchase, the inference of preexisting intent to sell is less. In order to acknowledge this difference, the entrapment rules might be altered by placing the burden of proof on the prosecution to show preexisting intent where the purchase was made by an arrestee. Such a burden could be discharged by showing possession of a large amount of marijuana by the defendant, by having the arrestee make more than one purchase, or by other circumstantial evidence. The issue of prexisting intent is usually met by having the agent or informant make two to three purchases.[77]

It is not clear whether the defendant can use entrapment for sale to negate a separate charge of possession.[78] If not, the police have a powerful weapon since they can entrap a suspect into a sale, and even if the sale is thrown out, still successfully prosecute him for possession.

Unlike local agencies, the California Bureau of Narcotics Enforcement depends primarily on information from arrestees.[79] Although it has a limited number of regular informants, it does not have the manpower nor the proximity to the problem to develop a more extensive network. It gets cooperation from individuals it has arrested, but relies primarily upon arrestees of local agencies. The local agencies contact the State Bureau whenever they have an

---

a barrier to enforcement. Out of 738 arrest reports studied, only three defendants were acquitted because of entrapment.

[76] There is probably more justification for a liberal entrapment rule in narcotics transactions than in homosexual solicitations. The narcotics laws are aimed at the availability of the narcotic and police solicitation may be the only way to eliminate that availability. However, homosexual laws are aimed largely at *unprovoked* solicitations and the entrapment doctrine should be applied more strictly to prevent solicitations provoked by the police. *See Homosexual Project*, *supra* note 1, at 701-02.

[77] Barber Interview, *supra* note 44; FBN Interview, *supra* note 21; Warner Interview, *supra* note 17.

[78] Probably not, since entrapment in theory is treated as an implied defense to the particular crime for which the defendant is charged. United States v. Kaiser, 138 F.2d 219 (7th Cir. 1943), *cert. denied*, 320 U.S. 801 (1944); Donelly, *supra* note 72, at 1110. However, if it can be shown that but for the illegal police conduct (entrapment), the marijuana would not have been discovered, then it is arguable that the marijuana is "tainted" evidence and therefore inadmissible against the defendant, to show possession. *See* Wong Sun v. United States, 371 U.S. 471 (1963); Silverthorne Lumber Co. v. United States, 251 U.S. 385 (1920).

[79] Warner Interview, *supra* note 17.

arrestee who has information on major traffic. Like the local agencies, the state claims that it gives no guarantees to cooperating informants.

4. One-Time Informants

The final source of information comes from random calls from people within the community. The police tend to ignore these calls unless there is some indication that the caller can provide a solid lead.[80] The police must be especially careful in this situation to look for the possibility of marijuana planted by someone with a grudge to settle. One informant who is not ignored, however, is the parent who reports finding marijuana in his child's possession. This is a large source of juvenile contacts.[81]

B. *Field Operations*

1. Field Investigation Units

Most police forces do not have a field investigation unit because of limited manpower.[82] The Los Angeles Police Department's Special Field Investigation Unit is composed of five two-man teams, all sergeants with extensive experience in narcotics enforcement. They operate out of the Central Division and, unlike the average investigator, they do not respond to information coming into the office, but instead are engaged in continuous independent field investigation. The key to such an operation is the investigator's ability to evaluate and connect pieces of information, insignificant alone, into a picture of a major dealer and how he operates. The investigators work continuously at developing a network of reliable informants. One informant, for example, may have information that an individual is receiving and dispersing large shipments of marijuana. If this information is corroborated by other informants, the individual may be put under surveillance. If he is a major dealer, he will usually establish a systematic pattern, such as visiting places like a supermarket or a gas station with greater regularity than the average individual. While the suspect is under surveillance the investigators are continuously rechecking with their informants. After what may be an extensive period of time, the investigation

[80] The police get a surprising number of calls from people who have "heard that someone down the street is smoking marijuana," from people who won't give their names, and from obvious cranks. The State Bureau gets numerous calls from sheriffs and concerned citizens of small communities who have found one of the local youths with a marijuana cigarette and demand that the Bureau do something to eradicate the problem.

[81] Out of 204 juvenile arrests studied, 22 were initiated by the juvenile's parents.

[82] Of the nine enforcement agencies responding, only the Los Angeles Police Department and the Los Angeles County Sheriff had a special field investigation unit.

will have uncovered enough information to give the investigator probable cause to make a "bust." However, the investigator will usually wait until he believes the dealer has just received a shipment in order to arrest him before he unloads it. Because of the precise timing involved, the investigators ordinarily do not obtain a search warrant.[83]

2. Undercover Agents

Most agencies at some time employ undercover agents, although many of the smaller forces borrow them for a limited period from the Los Angeles Police Department or the Los Angeles Sheriff.[84] Prior to 1950, undercover work usually involved a disguised agent making two or more purchases with marked money from a suspect, who was then arrested. This limited the use of the good undercover worker, since once the arrest was made his name became known throughout the neighborhood and his effectiveness was destroyed. In 1950, the Los Angeles Police Department organized their present "buy program" which has been widely copied by large agencies all over the country. In this program the police send an agent into the field for a period of approximately three months, during which time he makes buys from numerous individuals. None of these people are arrested until "roundup day" at the end of this particular agent's period of work. This extended period enables the agent to become integrated into the community and facilitates the apprehension of a great number of pushers.

Undercover agents are recruited directly from the police academy without any prior patrol experience. Their appearance is made to conform to that of the average narcotics user in the community they will infiltrate. Agents placed in Watts will be goatee-wearing Negroes; agents on the Sunset Strip will be young looking and dressed in hippie garb; while agents in Hollywood will often wear homosexual attire. Although some agents are instructed to uncover both marijuana and heroin pushers, this is unusual since heroin users seldom buy marijuana and such a combination of purchases would immediately arouse suspicion.[85]

The good undercover agent will attempt to become an integral part of the marijuana subculture he is infiltrating. He will hang out at the local gathering spots, go to the homes of his new found

---

[83] In only 25 of the 738 adult cases studied was a search warrant used.

[84] Of the nine enforcement agencies responding, seven used undercover operators at some time. Three of these agencies—the Los Angeles Police Department, the Los Angeles County Sheriff, and the Pasadena Police Department—used their own personnel. The other four agencies occasionally used agents supplied by the Sheriff.

[85] *See* text accompanying note 22 *supra*.

friends, and participate in "pot parties." Technically an agent who goes to a party and participates in the ritual passing around of a marijuana cigarette is as guilty as those he arrests. Of course the police never file charges against him, even though he may sometimes be arrested along with the rest of the participants to protect his identity.[86]

The key element in the "buy program" is the agent's ability to identify the pusher from whom he made his purchases. This identification is crucial to the success of the program because it provides the exclusive basis for probable cause to make the arrest, and the judicial determination that such an identification constituted probable cause hinges largely on the reputation of undercover agents for accuracy. One case of mistaken identity proved at trial might have a deleterious effect on the whole program. Thus, if there is any doubt in the agent's mind about the identity of his supplier, the police prefer to drop the case. To aid in identification each agent is given a thorough briefing on identifying features to look for, such as scars and tattoos. He also is required to come to police headquarters after each transaction and record the details of the sale. This document is dated and later used to corroborate the agent's testimony for purposes of probable cause or proof of the charge.

The undercover agent makes three or four buys from each pusher. He then goes through police mug books and other sources attempting to identify the pusher by name. The police obtain arrest warrants on those the agent identifies and on "roundup day" they are arrested. In order to apprehend those pushers that the agent could not identify by name, the police take the agent through the area he worked in an unmarked car. The agent points out any pusher he recognizes and usually verifies his identification by approaching the pusher and calling him by the name he used when making the sale. On the strength of this identification, the suspect is immediately arrested without a warrant. A "roundup" results in the arrest of approximately 80 percent of the individuals from whom the agent purchased marijuana.[87]

C. *Enforcement Through Patrol*

A third means of enforcement involves arrests of marijuana users by the patrolman or traffic officer. This category of enforcement provides the overwhelming majority of marijuana arrests, particularly those for possession. These arrests do not result from systematic attempts to uncover marijuana violators, but are a

---

[86] TIFFANY, *supra* note 1, at 258.
[87] Barber Interview, *supra* note 44.

by-product of routine police investigation. In areas of high marijuana use, however, patrolmen are specifically on the lookout for marijuana users.

The patrol arrest usually occurs as a consequence of one of the following police actions: (1) the stopping of a vehicle for a traffic violation; (2) confrontation of allegedly underage juveniles for curfew violations; (3) the investigation of a loud party; and (4) the "frisk" of an individual stopped under the "stop and frisk" doctrine. The nagging question in all these situations is whether the police are truly interested in the conduct justifying the investigation or whether they are using that conduct merely as an excuse for investigating some other activity for which they have no legal basis. To the extent that the police use these procedures as a subterfuge to uncover marijuana use, they have effectively created a new "method" of marijuana enforcement.

1. Stopping of Vehicles

A large percentage of the arrests for marijuana possession results from the stopping of automobiles for minor traffic violations, with the subsequent discovery of marijuana either in the car or on the person of one of the passengers.[88] The most common of these stops are for a missing taillight or for an unilluminated rear license plate. The police do not have probable cause for any search of the car based on the traffic violation alone. To justify the search they must have independent evidence indicating that contraband may be found in the vehicle.[89] This requirement, however, may be waived if the driver voluntarily consents to the search.[90] It is common for many drivers to grant such consent with full knowledge that the car contains marijuana, undoubtedly because of the natural impulse to avoid arousing police suspicions.[91]

The police may avoid the necessity of searching the automobile if one of the passengers tosses marijuana out of the window of the

---

[88] Out of the 658 arrests studied in which this information was available, 230 were initiated through automobile traffic violations.

[89] *See* People v. Burke, 61 Cal. 2d 575, 579, 394 P.2d 67, 69, 39 Cal. Rptr. 531, 533 (1964); People v. Terry, 61 Cal. 2d 137, 152, 390 P.2d 381, 391, 37 Cal. Rptr. 605, 615 (1964). A citation for a traffic violation of itself does not justify a search of the car. People v. Anders, 167 Cal. App. 2d 65, 67, 333 P.2d 854, 856 (1959).

[90] People v. Michael, 45 Cal. 2d 751, 753, 290 P.2d 852, 854 (1955); People v. Weire, 198 Cal. App. 2d 138, 142, 17 Cal. Rptr. 659, 661 (1961). A suspect's consent may be implied from his opening of a car door which jammed when the officer tried to open it from the outside. People v. Williams, 148 Cal. App. 2d 525, 307 P.2d 48 (1957).

[91] There were 24 consensual automobile searches among the 658 arrest reports studied in which this information was available.

car as it is being stopped.[92] This happens quite often as the instinctive reaction of most people is to get rid of any incriminating evidence the instant they see the red light of a police vehicle. Once they find the tossed marijuana, however, the police must connect it with one of the passengers in order to show possession.

In the absence of either consent or tossed marijuana, the police must establish probable cause to search the automobile. This may be obtained by one of the passengers making a "furtive motion," the odor of burnt marijuana coming from the car, marijuana being in plain sight inside the car, or one of the occupants of the car displaying the characteristics of intoxication associated either with alcohol or narcotic use.

The furtive motion authorizing a search usually results as the officer is pulling a car over for a minor traffic violation. The arrest reports typically state that as he shined his lights on the back of the car, the patrolman saw one of the occupants make a "furtive motion" as if to hide or throw away something. A few appellate decisions indicate that something additional, such as evasive action by the driver, must be present before the police have probable cause to search.[93] Usually, however, the judge accepts the furtive gesture alone as being sufficient.[94] This provides the police officer with an almost irrefutable method to "write-in" probable cause,[95] although some attorneys have successfully gone to great lengths to prove that the officer could not have seen inside the car from his vantage point.[96] Even accepting that the policeman did see the furtive motion, however, a sudden movement inside a car is open to a variety of interpretations and references. It is thus questionable

---

[92] Out of 658 adult arrests, 38 were initiated because of marijuana being thrown out of an automobile window. *See* text accompanying notes 25-28, Part III *infra*.

[93] People v. One 1958 Chevrolet Impala, 219 Cal. App. 2d 18, 20, 33 Cal. Rptr. 64, 66 (1963); People v. Tyler, 193 Cal. App. 2d 728, 732, 14 Cal. Rptr. 610, 612 (1961).

[94] The leading case on the matter, People v. Blodgett, 46 Cal. 2d 114, 293 P.2d 57 (1956), appears to sanction the use of a "furtive motion" as sole grounds for probable cause to search. This is the usual interpretation. *See* People v. Shapiro, 213 Cal. App. 2d 618, 28 Cal. Rptr. 907 (1963) (defendant lowered her head as if to hide something); People v. Sanson, 156 Cal. App. 2d 250, 319 P.2d 422 (1957) (police noticed defendant withdraw his left hand from seat).

[95] The suspicion that this does occur is heightened by the almost total uniformity of the arrest reports. The traffic officer appears to be aware that if he tailors his report to a certain style with certain facts, he will almost certainly have it accepted by the court.

[96] One of the attorneys interviewed took the jury outside the courtroom to view the defendant's car from the same vantage point as the arresting officer. The car was an early model coupe with a small rear window, and the attorney was able to demonstrate that no one could see a "furtive motion" through the rear window.

whether such a movement satisfies the high degree of probability which has been required for probable cause in other areas.

Another basis for establishing probable cause to search a stopped automobile is that the officer detected an odor of burnt marijuana coming from the car.[97] While it is true that the traffic patrolman is given brief instruction on what marijuana smells like, there is considerable dispute as to his actual ability to detect marijuana by this method. However, as in the case of a furtive motion, the policeman's testimony is usually accepted by the court as a valid basis for the search.[98]

The police also search a stopped automobile if they see marijuana in plain view inside the car. This usually occurs when the officer shines his flashlight into the automobile, ostensibly to check the car registration, and sees marijuana on the seat or on the floorboard.[99] Defense attorneys claim that many police "look for registration" throughout the car and that the marijuana does not become "clearly visible" until after the police relocate it from some location which was not initially in view. Occasionally, the visible marijuana used as a basis for the search consists solely of seeds. It is questionable whether a full scale search is justified merely on this evidence alone, since marijuana seeds do not differ radically in appearance from common garden variety seeds.

Another basis for the search of an automobile is the intoxication of the driver or passengers. The arrest reports usually state that the subject was intoxicated with no odor of alcohol on his breath and that his eyes became pinpointed under light—both characteristics of one under the influence of narcotics.[100] Under such circumstances the inference of recent drug use is regarded as sufficient probable cause for a search.[101] Also, since any intoxication justifies a search, if the driver or passenger is obviously drunk the police can search the car for alcohol and if they find marijuana it can be admitted as evidence on the theory of lawful discovery.

---

[97] Out of 658 arrest reports studied, there were 30 instances of the police smelling burnt marijuana.

[98] People v. One 1961 Ford Falcon, 215 Cal. App. 2d 149, 30 Cal. Rptr. 110 (1963).

[99] *See* People v. Galceran, 178 Cal. App. 2d 312, 316, 2 Cal. Rptr. 901, 903 (1960). Out of 658 adult arrest reports studied, there were 42 instances where the police discovered marijuana in this manner.

[100] There were 68 instances of adults being under the influence of marijuana in the 658 adult arrest reports studied. However, there were only two instances in the entire adult sample where the defendant was charged with driving under the influence of narcotics. CAL. VEHICLE CODE § 23105 (West 1960).

[101] People v. Di Blasi, 198 Cal. App. 2d 215, 18 Cal. Rptr. 223 (1961).

2. Curfew Violations

A great many juvenile arrests, and some adult arrests, result from the police stopping youthful looking pedestrians for possible curfew violations.[102] The procedure is to stop the suspect, sometimes shining a search light on him. This confrontation will often cause the person to throw away a marijuana cigarette or make a furtive motion in an attempt to hide one. In the first situation, the police merely retrieve the discarded cigarette and arrest the individual. In the situation where the individual attempts to hide the cigarette, the police have probable cause to search him. The furtive motion theory in this situation is harder to attack than when the person is in a moving automobile since the individual is totally visible and his actions are not as capable of various interpretations.

There may be a high degree of discriminatory enforcement of curfew ordinances insofar as they are used for the apprehension of marijuana users. The police know that the teenager with long hair dressed in "mod" attire is more likely to be using marijuana than the "straight" appearing youth who looks about the same age. Thus, it is tempting for the officer in an area of high marijuana use to confront the youthful "hippie" with the hope that he will find more than a curfew violator.[103] There is also a thinly veiled hostility on the part of the average patrolman to the so-called "hippies" with their natural antipathy towards authority of any type, including police authority.[104] It is difficult to prove any conscious discrimination in enforcement by the police, since they do not, of course, admit to such discrimination.

3. Complaints of Marijuana Use and Loud Parties

A third source of arrests results from an investigation, sometimes by the narcotics division, of a complaint by a tenant or neighbor that marijuana is being used or that there is a loud party on the

---

[102] Five out of 658 adult arrests and 54 out of 204 juvenile arrests were initiated by stops for suspicion of curfew violation.

[103] It is difficult for the patrolman to see anything wrong in stopping a "hippie" type youth where he would not stop a "straight" youth under the same circumstances. An experienced patrolman realizes that the possibility of a "hippie" type youngster possessing marijuana is much greater than a "straight" looking young person. Therefore, he feels that the efficient way to discover marijuana violations is to stop those likely to be committing them. The fact that the law does not always openly sanction the officer's experience as a basis for probable cause is another example wherein police feel that due process undercuts efficiency. *See* Packer, *supra* note 6.

[104] The police officers interviewed made no attempt to hide their dislike of the long haired "hippie" type. There was a particular contempt for the older hippies (generally in their 20's) who the police believe introduce many high school age juveniles to drug use.

premises.[105] The police usually station one man outside a window of the residence. The others go to the door and announce themselves as required by statute.[106] To escape arrest the residents will often toss the marijuana out of the window where the officer is waiting. He shouts this information to the other officers which establishes probable cause to enter the residence.[107] They also have probable cause to enter if they hear a toilet flushing or any other indication that the occupants are attempting to dispose of contraband,[108] or if they observe marijuana through an open window.

If the occupants open the door without giving the police cause to enter, the police may attempt to get consent to search the apartment. If this is refused they still have probable cause to enter if they smell burning marijuana.

4. Stop and Frisk

A final major source of arrests for possession is the "frisk" performed by the patrolman under the "stop and frisk" doctrine. In California, an individual can be stopped for questioning as long as the prudent officer would consider such a step necessary to discharge his duties.[109]

The usual justification for the stop is the presence of the suspect late at night under "suspicious circumstances."[110] These circumstances may include individuals parked in a car in a residential area or pedestrians on foot who appear to be engaged in some sort of suspicious activity. What constitutes "suspicious circumstances" seems to depend largely on the experience of the individual officer involved. For example, one officer may consider a parked car on a dark residential street with youths inside as being suspicious. Another officer, under the same circumstances, may require an addi-

105 There were 28 instances of neighbors' complaints leading to apartment busts in the 658 adult arrest reports studied.

106 Police, with probable cause to arrest or with a search warrant, can break into the premises, after they have announced who they are and their reason for being there, if they are refused admission or if there is no answer. CAL. PENAL CODE §§ 844, 1531 (West 1956).

107 People v. Padilla, 240 Cal. App. 2d 114, 49 Cal. Rptr. 340 (1966).

108 People v. Fisher, 184 Cal. App. 2d 308, 7 Cal. Rptr. 461 (1960).

109 People v. Mickelson, 59 Cal. 2d 448, 450, 380 P.2d 658, 660, 30 Cal. Rptr. 18, 20 (1963); People v. Currier, 232 Cal. App. 2d 103, 106, 42 Cal. Rptr. 562, 564 (1965); People v. Hilliard, 221 Cal. App. 2d 719, 723, 34 Cal. Rptr. 809, 811 (1963); People v. Ellsworth, 190 Cal. App. 2d 844, 846, 12 Cal. Rptr. 433, 435 (1961). *See* Note, *Stop and Frisk in California*, 18 HASTINGS L.J. 623, 625 (1967); Comment, *Constitutional Limitations on Pre-Arrest Investigations*, 15 U.C.L.A. L. REV. 1031, 1031-46 (1968).

110 There were 72 adult arrests out of 658 studied where the individuals were stopped because of "suspicious circumstances."

tional element before his suspicion is aroused. These highly individual judgments of the police are traditionally encompassed in general phrases such as "present under suspicious circumstances in a high crime rate area." This phrase appears time and time again in the arrest reports studied, with the judge usually accepting it as being sufficient to justify the stop.[111] There has, as yet, been no real definition of either the phrase "under suspicious circumstances" or "high crime rate area."[112]

Incidental to a valid police stop, the officer often submits the suspect to a brief "pat-down" search, known as a "frisk," for the purpose of uncovering concealed weapons. The frisk is designed solely to protect the officer. Defense attorneys, however, claim that if the officer believes he might find marijuana, the frisk strains the limits of its definition. For example, in confronting a "hippie" type youth after curfew, if the police fail to establish grounds for a full scale search, they allegedly will submit him to a frisk in which every thread of his clothing is carefully gone over. If during this frisk the police feel what appears to be a cigarette, then, depending on the circumstances surrounding the stop, they may have probable cause to reach inside the individual's pocket and extract the suspected marijuana cigarette.[113]

It is difficult to distinguish between a valid frisk for weapons and an illegal search for marijuana under the guise of a frisk. If the recent Supreme Court "stop and frisk" decisions[114] are applied carefully by the lower courts much of this problem will be avoided. Those cases require the policeman to be able to point to particular facts that led him to believe the person was armed and dangerous.[115] In addition, the scope of the search must extend only to the extent necessary to uncover dangerous weapons.[116] But if these safeguards

112 *But see id.* at 1040 n.35.

113 People v. Machel, 234 Cal. App. 2d 37, 44 Cal. Rptr. 126, *cert. denied*, 382 U.S. 839 (1965). The court ruled that the circumstances surrounding the questioning and frisk of the defendant gave the police probable cause to believe he was in possession of marijuana. Those circumstances included the officer's knowledge that the defendant was a known narcotics user, the fact that the defendant came to the apartment where the officer had just arrested two other individuals for marijuana possession, the defendant's failure to answer when asked what was in his pocket, and the fact that he sweated profusely. It is unclear whether the mere feeling of a cigarette during a frisk, without the suspicious circumstances present in *Machel*, would give the police probable cause to reach inside the suspect's clothing.

114 Terry v. Ohio, 392 U.S. 1 (1968); Sibron v. New York, 392 U.S. 40 (1968); Peters v. New York, 392 U.S. 40 (1968).

116 *Id.* at 65.

fail to deter the police from making searches for marijuana under the guise of a frisk for weapons, only two solutions remain. One, which is clearly undesirable, would be to do away with the frisk altogether. The other would be to refuse to admit as evidence any contraband found as a result of the frisk.[117]

V. Selective Enforcement

Selective enforcement results from conscious police decisions not to invoke the criminal process against certain classes of violators. These decisions, in marijuana enforcement, are premised on the realization that it is not possible to enforce the laws against all violators.[118] Selective enforcement of the marijuana laws, unlike that of homosexual offenses, does not appear to be conditioned on the undesirability of enforcing the laws under certain circumstances.[119]

All enforcement agencies interviewed indicated that marijuana enforcement was, by necessity, selective. This selectivity stems from police determinations regarding the necessity of uncovering one type of narcotics offense rather than another; police discretion in the geographical distribution of patrolmen resulting in de facto discrimination against some groups; police discretion in the arrest of juvenile offenders; and attempts by the police to persuade the courts to deal more severely with some individuals.

Because of manpower limitations the police must decide which type of narcotics offender they are going to place the highest priority on uncovering. This decision may vary from agency to agency. For example, one agency may place the highest value on the apprehension of a major marijuana dealer, while another agency would favor the apprehension of a heroin pusher. This type of decision is in-

[117] For an exposition of both sides of this argument *see* Comment, *Constitutional Limitations on Pre-Arrest Investigations*, *supra* note 109, at 1047-48.

The Supreme Court has yet to decide the issue of the admissibility of evidence other than weapons found through a frisk. *Peters* raised the issue, but the Court dodged it by finding probable cause for arrest. 392 U.S. at 65.

[118] Professor Joseph Goldstein of Yale divides police enforcement of any law into three levels: total enforcement, which occurs when the police successfully apprehend all violators; full enforcement, where the police actively follow every lead up to the full level of their authorization; and actual enforcement. Goldstein, *supra* note 53. Obviously total enforcement of the marijuana laws is impossible because of the extent of the problem and the legal boundaries placed on investigative techniques, such as search and seizure and interrogation. Interviews with police officials indicate a general consensus that actual marijuana enforcement operates at a level considerably below what Professor Goldstein would class as full enforcement. This is the result of numerous factors such as manpower limitations and financial considerations, but apparently not from any reluctance to enforce the law.

[119] *See Homosexual Project*, *supra* note 1, at 734.

fluenced by four factors: (1) the type of activity involved (*e.g.*, sale or possession); (2) the volume of the drug or narcotic involved; (3) the individuals involved; and (4) the drug or narcotic involved.

The Federal Bureau of Narcotics, the California Bureau of Narcotics Enforcement, and the police narcotics investigation units claim to be solely interested in professional marijuana importers, dealers and pushers rather than the individual user.[120] It is clear that this is true for the federal and state agencies. But some defense attorneys claim that the police special units use informants to entice ordinary users to commit sales.[121] The smaller police departments, without special narcotics squads, generally have the same priority of sale over possession, although the smaller the community, the more likely it is to respond to any reported activity.[122] The state and federal narcotics bureaus are solely interested in major traffic and do not respond to other types of leads.[123] The local units attempt to apprehend all pushers, although they are primarily interested in the regular pusher who is a consistent link in the overall traffic.[124]

It is apparent that small pushers are pursued more vigorously if juveniles are involved. While both the Los Angeles Police Department's Narcotics Division and Juvenile Narcotics Division do field investigations, the latter is more likely to engage in a full scale investigation to apprehend a small scale pusher than is the former.[125]

Finally, the decision of an agency to follow up a lead may depend on whether the narcotic is heroin or marijuana and this, in turn, depends on the individual agency. The California Bureau admits that all other things being equal, it would prefer to get two ounces of heroin rather than 10 kilos of marijuana.[126] But this feeling is not shared by the majority of local police forces who generally consider marijuana an equal or greater threat than heroin.[127] In fact, since heroin comes in smaller amounts than marijuana and is easier to destroy, the police may prefer to concentrate on making marijuana arrests.[128] The attitude of the smaller police forces depends on the attitude of the individual primarily responsible for

127 This feeling was particularly prevalent among police forces in smaller communities where a heroin problem is virtually nonexistent.

128 McKissick Interview, *supra* note 22.

narcotics enforcement. Generally, although there are some notable exceptions, these smaller communities have little problem with heroin.

The juvenile narcotics officer likes to view himself as part policeman, part juvenile counselor. His implementation of this latter role is especially important since it affects his decision whether to exercise his statutory discretion to counsel and release an arrested juvenile, or to file a formal arrest report, requiring the juvenile to attend a hearing with a probation officer.[129] His decision will be based on how effective he believes a simple lecture to the juvenile on the evils of marijuana will be toward deterring future use.[130] The factors going into this decision are generally the same as those considered by a juvenile court judge in deciding whether to release a juvenile to his parents.[131] They include past record, family stability, school record, and general willingness to cooperate.[132] The type of case most amenable to counsel and release occurs when the parent reports the juvenile's activity and comes with him to the police station for consultation.[133] In other cases the narcotics officers will go to the juvenile's home to inform his parents of the problems and observe firsthand the potential for rehabilitation. The juvenile officer's role as a counselor might be attacked as an undesirable encroachment upon the probation officer's field of concern. But it seems desirable to avoid exposing the juvenile to the entire criminal process if it doesn't appear necessary. This may be particularly true in small communities where the police often know the juvenile personally and have a more thorough familiarity with the family situation than any probation officer could obtain.[134] It is difficult to judge the effectiveness of the counsel and release since there are no accumulated statistics showing the number of juveniles released who are later arrested for drug use.

The police decision on where to concentrate their routine patrol activities, although not necessarily motivated by marijuana usage,[135] nevertheless may cause greater enforcement in one area than another. Since the majority of arrests come from routine patrolling,

133 Despite the alleged antipathy of minority groups toward the police, the Los Angeles Police Department claims to get as many calls from Negro and Mexican-American parents as it does from White parents. Zappey Interview, *supra* note 36.

134 Pettit Interview, *supra* note 11.

135 The only area where heavy police patrolling is partially attributable to marijuana usage is in the Hollywood area. The usual cause for heavy police patrolling of a particular area is a high incidence of violent crime. Barber Interview, *supra* note 44.

the heavier patrolling of areas with higher incidences of violent crime will undoubtedly result in a higher percentage of marijuana arrests in proportion to actual use than in more lightly patrolled areas. This may be part of the reason for the high percentage of Negroes and Mexican-Americans arrested.[136]

There is no evidence of any conscious discrimination against one group based solely on marijuana use, with the possible exception of the aforementioned "hippie" type youth.[137]

There is no evidence that the extent of the arrestee's marijuana involvement affects a decision whether to arrest. The police, however, often try to influence the court's disposition of convicted offenders. This is usually done by police contribution to the probation report to encourage the judge to give a stiffer sentence to the professional pusher.[138] The police may also attempt to influence the court's disposition by refusing an offer of cooperation by an individual they desire to see given a stiff sentence.[139]

---

136 Out of 738 arrests studied, Negroes and Mexican-Americans accounted for 402 (304 Negroes, 98 Mexican-Americans), a percentage far higher than their respective percentages of the Los Angeles County population.

PART III: POST-ARREST DISPOSITION

I. INTRODUCTION

Post-arrest disposition consists of a number of procedural steps leading from the arrest of the marijuana pusher or user to his imprisonment. At any one of these stages, the arrestee may be freed from having to proceed to the next step.[1] The district attorney may refuse to file a complaint against him; the judge at the preliminary hearing may refuse to "hold the defendant to answer" a complaint that has been filed; the trial judge (or jury) may find the defendant innocent; and finally, even if found guilty, the defendant may be released on probation.

There are two types of factors which influence the district attorney and the judge in deciding whether to release the arrestee at any of the above stages. The first type of factors are those which the law requires the trier of fact to consider in determining guilt and which the district attorney must, by necessity, consider in filing a complaint. In marijuana offenses these include the legality of a search, sufficiency of the evidence, and knowledge on the part of the arrestee that he possessed marijuana. If all such factors are resolved against the defendant, theoretically he should be found guilty.

There are, however, other factors which either the judge or district attorney may consider in making his decision to release. These include the defendant's age, his attitude, his previous contact with the law, his family situation, and what the judge or district attorney believes to be his moral culpability. The consideration of such discretionary factors is officially sanctioned only for the judge in sentencing. But it is an undeniable fact that in all crimes prosecutors and judges will release some individuals at earlier stages in the process because of the above mentioned factors. The amount of weight given to each of these factors varies with the individual judge or district attorney involved.

In marijuana cases there has been great pressure on both the judge and district attorney to invoke this discretion at the lower stages of the conviction process. This has been due largely to the legislative classification of marijuana possession as a felony. For example, many district attorneys and judges are reluctant to impose a felony conviction on an 18-year old first offender found with one marijuana cigarette. The recent legislation in California granting a

[1] Of those cases sent to the district attorney for possible filing by the police, approximately 12% are rejected outright; an additional 14% are dismissed at the preliminary hearing.

judge discretion to punish first offenses of simple possession as either a misdemeanor or felony[2] will undoubtedly have an impact on the exercise of discretionary devices at earlier stages in the conviction process. Where district attorneys and judges have in the past employed various other devices to avoid felony conviction, it may well be that they will now rely on the ability of the judge to treat the offense as a misdemeanor in sentencing.

This section is designed to show empirically how district attorneys and judges handle both legal and discretionary factors in deciding whether to release an arrestee.

II. Filing the Complaint

When a defendant has been arrested and booked, the police will seek to have the district attorney issue a felony complaint.[3] The deputy in charge of complaints has three alternatives open to him: he can file a felony complaint; he can refer the case to the city attorney for misdemeanor filing; or he can reject the case completely.

The deputy's decision is based upon information gained from a written arrest report and from conversations with the investigating officers.[4] Normally, the deputy does not have a defendant's prior record before him and thus does not consider it in making his decision.[5] However, in some instances the police will inform the deputy of a suspect's bad record or reputation in urging the issuance of a complaint.[6] A very weak case may be filed to satisfy the desires of the police. One district attorney stated that when he first joined the office the police were concerned with securing convictions, but now they only insist that complaints be filed. They apparently feel that their duty ends when a complaint is filed.[7]

The district attorney must decide whether the legally required elements of the offense were present and whether there is sufficient

[5] Interview with Harvey Hassen, Deputy District Attorney for Los Angeles County, in Los Angeles, Jan. 11, 1968. In some borderline cases a deputy may examine the suspect's record in deciding whether to file. However, a person's record is more influential in the determination of bail and in sentencing.

[6] Interview with Keith Glazer, Deputy District Attorney for Los Angeles County, in Los Angeles, Jan. 17, 1968.

[7] Reichmann Interview, *supra* note 4.

evidence to prove the defendant guilty. The decision whether to file or reject a case is usually based upon the deputy's estimation of the probability of success in securing a conviction.

A. *Filing on Possession Cases*

The great majority of felony complaints allege possession of marijuana.[8] To prove possession the prosecution must show that the defendant exercised dominion and control over the marijuana and had knowledge of its presence and narcotic nature.[9] Knowledge of its presence may be presumed from the fact of possession. The district attorney will usually file unless he is unable to connect the marijuana with the defendant, the defendant possessed an insufficient quantity of marijuana, the search for the marijuana was made without probable cause, or the police refuse to identify their informant.[10]

1. Lack of Connecting Evidence for Constructive Possession

Possession of marijuana does not require that the defendant have marijuana on his person at the time of his arrest;[11] it is sufficient that the marijuana can be connected with him. Lack of such connecting evidence is the leading cause for the rejection of complaints by the district attorney.[12] Constructive possession is shown by demonstrating that the marijuana was deposited in a place[13] or on a person[14] under the control of the defendant. The doctrine can be used to make two or more individuals liable for the joint possession of a single amount of marijuana,[15] providing one is sufficiently connected with the unlawful possession of the other.[16]

---

[8] CAL. HEALTH & SAFETY CODE § 11530 (West 1964). *See* Appendix C *infra*. Of the 441 felony complaints studied, 350 contained a possession charge. In some instances a possession charge may be attached to a charge of sale (§ 11531) or possession for sale (§ 11530.5).

[10] Reichmann Interview, *supra* note 4.

[11] People v. Blinks, 158 Cal. App. 2d 264, 322 P.2d 466 (1958).

[12] Of 297 rejections, 180 were for lack of sufficient evidence.

[13] *See* People v. Luke, 233 Cal. App. 2d 793, 43 Cal. Rptr. 878 (1965), where a defendant was observed taking packages out from under an abandoned car on four occasions during one evening. The police officers who searched under the car found similar packages that contained marijuana. The court concluded that the car and the area around it were under the control of the accused and that he constructively possessed the marijuana.

[14] *See* People v. White, 50 Cal. 2d 428, 325 P.2d 985 (1958), where a defendant was found guilty of constructively possessing a narcotic when his agent was arrested for possession.

[15] If there is an admission that the marijuana belonged to one of the defendants the district attorney will file on that individual even though the marijuana was found on the other person. Reichmann Interview, *supra* note 4.

[16] *See* People v. Basco, 121 Cal. App. 2d 794, 264 P.2d 88 (1953). In this case

Constructive possession may also be shown by: (1) a statement or admission,[17] (2) an attempt to hide the marijuana,[18] (3) an attempted escape coupled with actual possession of marijuana debris,[19] or (4) proprietorship of an automobile or dwelling in which marijuana was found. The district attorney looks at a number of factors in deciding whether he can connect marijuana found in a dwelling with the proprietor or owner of that dwelling. The proprietor is often charged with constructive possession if he was present at the time of the discovery. However, ownership of a house does not constitute possession of everything in the house; some additional incriminating evidence is required to secure a conviction.[20] Finding the marijuana intermingled with personal effects or hidden in the house is usually considered sufficient proof of constructive possession by the owner.[21]

Another instance where the district attorney must find the connection necessary to prove constructive possession is where marijuana is found during the "bust" of a private pot party. Normal procedure at a pot party is for a group of people to smoke a pipe or small number of cigarettes. In this situation the district attorney will file only against someone who was in close proximity to the marijuana. If there are an equal number of people and cigarettes, with each person within reaching distance of a cigarette, a felony complaint will usually be issued against all those present. However, if there is only one cigarette which no one person was observed to possess, and several people are within reaching distance of it, the deputy will not file against each person.[22] This is primarily because there is little likelihood of successful prosecution. First, it is very difficult to prove possession when there are no incriminating factors other than presence.[23] Second, many judges do not like to find a defendant guilty of joint possession of a small amount of

---

joint possession of heroin was evidenced by the fact that the defendant was a user of narcotics, that he had possessed some of the narcotic that was found on the co-defendant, and that the amount found on the co-defendant was large and the defendant had knowledge of that amount. Ordinarily the district attorney will require more connecting evidence than existed in the *Basco* case unless a large amount of marijuana was confiscated.

17 People v. Reese, 164 Cal. App. 2d 737, 331 P.2d 210 (1958).

22 Hassen Interview, *supra* note 5.

23 *See* People v. Perez, 213 Cal. App. 2d 436, 439-40, 28 Cal. Rptr. 751, 753 (1963); People v. Foster, 115 Cal. App. 2d 866, 253 P.2d 50 (1953).

marijuana which was equally accessible to several people.[24] The district attorney will usually refer these rejections to the city attorney for possible prosecution as a misdemeanor.

Dismissals for lack of connecting evidence also often occur in cases involving vehicles—the major source of marijuana arrests.[25] The mere fact that a person was in a car in which marijuana was found or from which marijuana was thrown is not sufficient to support a conviction where there were several persons in the vehicle.[26] The district attorney will consider how many people were in the car, where they were sitting, where the marijuana was found and the accessibility of each person to it. For example, if the marijuana was found in the back seat, the deputy will probably file on the persons in the back seat and the driver, but will reject complaints on passengers in the front seat. If the marijuana is locked in the glove compartment or in the trunk of the automobile, the district attorney will file on the owner or driver of the vehicle. If the glove compartment is open, he may also file on the person sitting in the front seat.[27] In many instances the marijuana is thrown out of the car when the police officer approaches.[28] In those cases, the district attorney will file against the person who was observed to discard the marijuana or against the persons who were sitting on the side from which it was thrown.[29] When it cannot be determined who threw the marijuana or from which side it was thrown, the case will be rejected.[30]

2. Possession of an Insufficient Quantity of Marijuana

The basis for rejection on the ground that an insufficient quantity of marijuana was involved stems from the case of *People v. Leal*[31] in which the California Supreme Court ruled that a person cannot be convicted for the possession of a narcotic where the amount possessed is not enough to sell or consume.[32] The court,

---

[24] These cases are not dismissed on the rationale that only a minimal amount of marijuana was present. *See* text accompanying notes 31-35 *infra*. Instead, the grounds for dismissal are usually based on a lack of connecting evidence.

[30] *Id.*

[31] 64 Cal. 2d 504, 413 P.2d 665, 50 Cal. Rptr. 777 (1966).

[32] Since the arrest reports studied covered the entire year of 1966, the *Leal* decision (handed down in May of 1966) only affected those arrests in the latter part of the year. Of the 297 adult arrest reports studied which were rejected by the district attorney, only 14 were rejected on the basis of the *Leal* decision. However, 58

however, did not designate the numerical quantity which would be the minimum amount necessary for prosecution.[33] There is no formal policy of the district attorney's office as to the minimum amount of marijuana necessary for prosecution. Some deputies will set a minimum quantity below which they will not file.[34] Others will file in a case in which knowledge of the presence and narcotic nature of the substance is shown regardless of the quantity involved.[35]

It is common for some deputy district attorneys to reject cases where the defendant possessed one roach,[36] although a roach is consumable and thus apparently outside the *Leal* exemption. These deputies base their decision on the awareness that the particular judge handling the case will employ *Leal* to dismiss a case where for some reason he does not want to convict the defendant.[37] This may happen where the defendant has no previous record or where the judge thinks the penalty does not fit the crime. Such a use of the *Leal* doctrine is highly individualized depending on the attitude of the particular judge in question.

There is a need for a uniform application of *Leal* to avoid the present unpredictability at both the prosecutorial and judicial levels. One solution may be to reduce the judges' discretion by statutorily defining a de minimis quantity. A clear standard would require all defendants to be treated the same with respect to similar quantities of marijuana.

---

were rejected on the basis of the pre-*Leal* de minimis rule, which was based on the inability of the defendant to be consciously possessing such a small amount of marijuana. *See* Appendix C *infra*.

33 Of the 14 cases rejected, the amount of marijuana present varied from a few seeds to one roach (one burnt marijuana cigarette).

34 Deputy District Attorney Hassen does not usually file a case when less than 150 milligrams is involved. Often he will not file a case for possession of one roach However, special circumstances may induce a deputy to file a case that he might normally reject. Thus Mr. Hassen reported filing a one-roach case in which the defendant admitted smoking four marijuana cigarettes a day. Hassen Interview, *supra* note 5.

35 Deputy District Attorney Reichmann believes that *Leal* requires rejection only if it can be demonstrated that the suspect had no knowledge of the marijuana or if the amount involved is so minute that knowledge cannot be inferred by its presence He once filed on a person who, after attempting to swallow marijuana, had the debris scraped from his tongue. He stated that he did not believe a de minimis rule was beneficial because it encouraged destruction of evidence and resistance to the police. Reichmann Interview, *supra* note 4.

36 Hassen Interview, *supra* note 5.

37 Of the 441 arrest reports studied where the district attorney did file a complaint, 11 were dismissed by the judge, either at the preliminary hearing or at trial, on the basis of the *Leal* decision or the pre-*Leal* de minimis rule.

3. Illegal Search

Another possible grounds for rejection is that the search for the marijuana was made without probable cause. Even though this is a major reason for dismissal at the preliminary hearing and trial levels, rejection by the filing deputy on search and seizure grounds is rare.[38] The district attorney will normally leave this decision to the court and will fail to file only in the case of a blatantly illegal search.

4. Refusal of Police to Identify Informant

In very rare instances, a case will be rejected for refusal of the police to give an informant's identity.[39] Normally, since the police are aware of the occasions which necessitate the disclosure of an informant, they will not request that a complaint be filed unless they have sufficient independent evidence or unless they intend to reveal the identity of the informer. However, sometimes the police believe they have sufficient corroborating evidence (*e.g.*, the defendant was seen in the company of a known narcotics user), but the deputy will disagree and will reject the case upon a refusal to disclose the informer's identity.

B. *Filing on Possession for Sale*

The offense of possession for sale[40] involves stiffer penalties than those for simple possession, and is designed to allow the courts to differentiate between those individuals caught with small amounts of marijuana they are using themselves and those individuals apprehended with large amounts which they had intended to sell. The possession for sale charge allows the police to apprehend large dealers whom they cannot entice into a sales transaction. Arrests for possession for sale, like those for sale, are often the result of police undercover work. Because of this, the police are able to present the district attorney with a stronger case, resulting in fewer rejections,[41] than in possession cases.

Normally the charge of possession for sale is only made if the suspect has been found with a large quantity of marijuana. Cases

---

[38] Out of 297 rejections studied, only 35 were rejected because of lack of probable cause to search.

[39] None of the 297 rejections studied occurred for this reason.

[40] CAL. HEALTH & SAFETY CODE § 11530.5 (West 1964). *See* Appendix C *infra*.

[41] Of the 441 complaints studied, 42 were issued for § 11530.5 violations. Of the 297 rejections studied only five were cases in which the police had charged the arrestees with possession for sale.

involving small amounts of marijuana will not be filed unless circumstances indicate that the defendant actually possessed the marijuana for sale.[42] One factor which a deputy takes into consideration is how the marijuana was packaged.[43] Division of the marijuana into individually wrapped "lids"[44] is an indication that the suspect contemplated selling it, even though the total amount of marijuana, if found in bulk, would ordinarily only support a possession charge. A large amount of cash on the suspect or an incriminating statement by him can also indicate that the marijuana was held for sale.[45]

C. *Filing on Sale of Marijuana*

Cases that involve sales[46] of marijuana are rarely rejected[47] due to two major factors. First, the police usually have a strong case resulting from undercover activity. The arrests typically are made by narcotics experts who are careful to secure sufficient evidence before requesting a complaint.[48] Their reports are very complete and frequently contain information from both the arresting officer and the undercover agent. Second, the sale of marijuana is regarded by the police and district attorney's office as a much more serious offense than mere possession;[49] they see the seller as the root of the drug problem and are determined to secure his conviction. Thus, the district attorney may file even when he has a weak case, realizing that the likelihood of conviction is not great, but believing that all efforts must be made to ensure the protection of society from marijuana pushers. Judges are less sympathetic towards a defendant charged with sale of marijuana than towards one charged with possession. This increases the probability of conviction and is another factor which encourages the district attorney to file in sale cases.[50]

---

[42] Of the 42 § 11530.5 complaints filed, the largest amount of marijuana involved was 125 pounds; the smallest amount was two ounces.

[43] The presence of packaging equipment and packaged marijuana can be sufficient to convict for possession of marijuana for sale. *See* People v. Foster, 248 Cal. App. 2d 715, 56 Cal. Rptr. 872 (1967).

[44] A "lid" or "can" is 1-1½ ounces of marijuana which is often wrapped in small plastic sandwich "baggies." A lid will sell for from $10 to $15. The average pusher buys a "key" (kilogram) of marijuana for about $100 and breaks it down into about thirty lids. Thus, he makes about $200 profit on the average kilogram.

[45] Hassen Interview, *supra* note 5.

[46] CAL. HEALTH & SAFETY CODE § 11531 (West 1964). *See* Appendix C *infra*.

[47] Of the 297 rejections studied, only four were instances where the police had charged the arrestee with sale. However, 62 of the 441 cases actually filed were § 11531 charges.

[48] *See* text accompanying note 120, Part II *supra*.

[49] The opinion that sale of marijuana is a much more serious offense was shared by everyone interviewed including police, district attorneys and judges.

[50] Of the 37 filings under § 11531 where final disposition was available, 22 de-

Health and Safety Code § 11531 includes the crime of transporting marijuana as well as selling it. Although no minimum amount is required by the statute, a major factor in deciding whether to file transportation charges is the quantity involved. If a large quantity is found the deputy will charge the defendant with sale and transportation. If a small quantity is involved the deputy will usually not file a complaint charging transportation because most judges are not sympathetic to the charge.[51] They believe that section 11531 and its stiffer penalties are intended to apply only to individuals who are distributing marijuana for sale. Since the district attorney bases his decision to file upon the likelihood of conviction, he will refrain from filing for transportation and instead charge the defendant with possession. However, one deputy indicated that sometimes it was a good technique to file for transportation even if there was a small amount involved, since it would encourage the defendant to plead guilty to a possession charge which has less severe penalties.[52]

D. *Sale of Marijuana to Minors*

Very few complaints are filed charging a violation of Section 11532 of the California Health and Safety Code.[53] Section 11532 declares it to be a crime for an adult to sell, furnish, or offer to furnish marijuana to a juvenile.[54] A sale to an undercover agent does not usually result in a violation of section 11532 because most agents are over 21.[55] Those that are filed are the result of information gathered from a person arrested for possession who is under 21 and who informs the police of the origin of the marijuana. Often, rather than file a complaint alleging a violation of section 11532, the district attorney will submit a section 11531 complaint because it is considered too much trouble to prove the ages of the seller and buyer.[56]

---

fendants were convicted of sale, 12 defendants were found not guilty of the § 11531 charge, and three defendants had the charge reduced to possession.

51 However, one judge reported an instance of a transportation charge being filed when two suspects were arrested for possession of two marijuana cigarettes while riding on a motorcycle. The judges interviewed expressed the opinion that the statute should be applied only to those who transport large quantities of marijuana, but not to defendants such as those who were arrested while on the motorcycle.

52 Reichmann Interview, *supra* note 4.

53 Only one of the 297 complaints filed contained a § 11532 charge. The defendant was convicted.

54 *See* Appendix C *infra*.

55 All of the police agencies interviewed required their recruits to be over 21. Thus unless the police use an informant who is a minor to make the purchase, there is no way to set up a sale which would violate § 11532.

56 Reichmann Interview, *supra* note 4.

E. *Maintaining a Place Where Narcotics Are Used or Sold*

The deputy may also file a complaint under Section 11557 of the Health and Safety Code.[57] This is rarely done because of the quantum of proof necessary for conviction.[58] The crime involves maintaining a place where narcotics are used or sold, but to establish guilt it must be proven that there has been a continuity of such maintenance on the premises. A single instance of the proscribed conduct is not sufficient for conviction, since maintenance has been interpreted to mean the establishment of a place over a period of time.[59] Thus, there must be evidence that narcotics were sold or used on another occasion besides the time of arrest. A "place" would be usually a house or an apartment, although an automobile could qualify. Generally, if marijuana is present the district attorney will file for possession or for possession for sale.

F. *Driving Under Influence of a Narcotic*

It is also a felony for a person to drive while under the influence of narcotics.[60] Again, however, evidentiary requirements preclude filings in most marijuana cases[61] since it is difficult if not impossible to prove that one is under the influence of marijuana.[62] Normally, the complaint will merely allege possession of marijuana. However, if the seemingly intoxicated suspect passes the blood and breath tests which measure the alcohol in his body, and the officer smells marijuana smoke and observes a cigarette in the automobile, the district attorney may file a complaint charging violation of section 23105 in addition to section 11530 or 11531.[63]

G. *Misdemeanor Complaints*

Misdemeanor complaints are filed by the city attorney. In some cases the complaints are based upon felony rejects referred by the district attorney; in other cases they are based upon police

---

57 There were seven instances out of 297 complaints where the district attorney filed a § 11557 charge. Since in only one of these instances did the police initially charge the defendant with a § 11557 violation upon arrest, it appears likely that most of the § 11557 filings are the result of a negotiated plea. *See* text accompanying note 88 *infra*.

58 *See* Appendix C *infra*.

59 People v. Horn, 187 Cal. App. 2d 68, 9 Cal. Rptr. 578 (1960), *cert. denied*, 368 U.S. 846 (1961).

60 CAL. VEHICLE CODE § 23105 (West 1960).

61 Among the 441 complaints studied four were filed charging a § 23105 violation.

62 There is no conclusive medical test that can be administered at the time of the arrest as there is for detection of alcohol in the human system.

63 Reichmann Interview, *supra* note 4.

reports made directly to the city attorney. The vast majority of misdemeanor filings are the result of felony complaint rejects. The city attorney, like the district attorney, will examine the arrest report and reject some of the cases for illegal search and seizure or insufficient connecting evidence. However, the city attorney will normally file a larger percentage of cases than the district attorney. This is due to several factors. First, the police policy of filing virtually all cases with the district attorney[64] results in many cases that are properly misdemeanor cases being filed with the district attorney and subsequently being rejected.[65] Secondly, it is usually easier to secure a plea to a misdemeanor than to a felony and it is easier to secure a conviction. Finally, the city attorney cannot refer the case to someone else. Since the decision to reject completely dismisses the case, there is a certain pressure to file which is not felt in the district attorney's office.

Cases filed in the city attorney's office are usually for violation of Section 11556 of the Health and Safety Code.[66] This section provides that it is illegal for a person to be present in a place where marijuana is smoked or used with the knowledge that such activity is taking place. In deciding whether to file on a suspect arrested in an apartment or a house, the deputy must determine his location at the time of arrest. If he was in the room where the marijuana was being smoked, the city attorney will file.[67] However, since section 11556 requires that there be knowledge that marijuana was being smoked or used, the city attorney may reject the case if the suspect was in another room or if other circumstances indicate that the suspect was not aware that the marijuana was being smoked.[68]

The city attorney will also examine the report to determine whether the officer smelled marijuana smoke. He will do this for two reasons. First, he will want to know if it can be proven that marijuana was being smoked. It is not a crime to be in a room where marijuana is merely present. Second, the smelling of the smoke may have been used for probable cause to enter the house.[69]

Although it is a misdemeanor to be under the influence of a narcotic, complaints alleging a violation of Health and Safety Code

---

[64] It was estimated that only a dozen misdemeanor complaints are filed directly with the city attorney each year.

[65] Out of 242 rejections in which referral or non-referral was indicated, 27 were referred to the city attorney.

[66] Information for this section was obtained from interviews with John L. Denny and Robert O. Young, Los Angeles Deputy City Attorneys, in Los Angeles, Feb. 9, 1968.

[68] *Id.*

[69] Young Interview, *supra* note 66.

§ 11721 are rarely filed in marijuana cases. It is too difficult to prove that a suspect is under the influence of marijuana and, therefore, section 11721 filings are confined to heroin and other "hard narcotics."[70]

III. Preliminary Arraignment

If a felony complaint is issued, the defendant is brought before a magistrate[71] to be charged with the crime, to have bail set[72] and to have the date for the preliminary hearing determined. Normally the defendant will not plead guilty at the preliminary arraignment.

Bail is set by the magistrate upon the recommendation of the district attorney. Although a bail schedule exists to guide the deputy, he is not bound by it and he may consider several factors in determining his recommendation. The major considerations are the defendant's prior record and his ties to the community.[73] Since the primary purpose of bail is to guarantee the presence of the suspect at trial, the district attorney is lenient in possession cases where it seems probable that the defendant will appear. Bail for possession is usually set between $500 and $1000.[74]

Some deputies will recommend release of a defendant on his own recognizance if he has no prior record, if he is employed or in school and, in the case of a young offender, if he resides in his parents' home.[75]

The defendant can request that the judge reduce bail to an amount lower than the deputy's recommendation. Even though the district attorney knows that the defendant will usually request a lower bail, there is no policy of recommending very high bail with the expectation that the judge will reduce it. In fact, most deputies will attempt to gauge the amount the judge feels is fair, so that when they do set a high bail the judge will respect their recommendation.[76] In deciding whether or not to reduce bail the judge will take into account the same factors that were considered by the deputy. One judge stated that he would frequently grant release on one's own recognizance if only one cigarette was involved.[77]

70 *Id.*

71 Cal. Penal Code § 807 (West 1957).

72 Cal. Penal Code §§ 1274-76 (West Supp. 1966).

73 Reichmann Interview, *supra* note 4.

74 In the arrest reports studied bail ran from $250 to $2,000 in possession cases.

75 Out of 306 arrest reports studied, there were 39 releases on the defendant's own recognizance, all in possession cases.

76 Hassen Interview, *supra* note 5.

77 Interview with the Honorable Mark Brandler, Judge of the Los Angeles County Superior Court (Criminal Division), in Los Angeles, Feb. 9, 1968.

Bail is set higher for felonies other than possession. The scale for possession for sale is five thousand, seven thousand five hundred, and 10 thousand dollars for the first, second and subsequent offenses respectively. These amounts are also subject to the discretion of the district attorney and the judge. The scheduled amounts are recommended for the "classic case of a person running kilos into the state."[78] If the possession involved a small amount of marijuana and the defendant is a good risk, the bail will be much less than the scheduled amount.[79] Similar discretion applies to other offenses such as sale where the bail can be set as high as $100,000.[80]

IV. Preliminary Hearing

A preliminary hearing is held before a municipal court judge to determine whether the prosecution has established a prima facie case against the defendant.[81] The attorney for the defense will utilize the hearing as a discovery device. If he discovers that the district attorney lacks significant evidence or if he can exclude essential evidence on the basis of an illegal search, he will attempt to have the case dismissed.[82] Unlike the rejections, the most common cause for dismissal in a preliminary hearing is lack of probable cause for the search. Cases are also dismissed for insufficient evidence (usually lack of connection between the defendant and the marijuana), the *Leal* de minimis rule, in rare instances entrapment, and upon the motion of the district attorney, when he receives some information which he believes would make it pointless to continue the action.[83]

---

[78] This information was obtained from a Superior Court judge who desires to remain anonymous.

[79] Reichmann Interview, *supra* note 4.

[80] The highest bail discovered in the arrest reports studied was $11,500 in the case of a woman dealer.

[81] "The purpose of the preliminary hearing is to weed out groundless or unsupported charges of grave offenses, and to relieve the accused of the degradation and expense of a criminal trial." Jaffe v. Stone, 18 Cal. 2d 146, 150, 114 P.2d 335, 338 (1941).

[82] Interview with Marvin Cahn, Attorney, in Los Angeles, Jan. 3, 1968.

[83] There were 70 cases studied where the complaint was dismissed at the preliminary hearing. In 35 of these cases the dismissal was due to lack of probable cause to search; in 22 cases the basis for dismissal was lack of sufficient evidence; 9 cases were dismissed under the *Leal* de minimis rule or its predecessor; 3 cases were dismissed because of entrapment; 8 cases were dismissed on the motion of the district attorney; and 2 cases were dismissed for other reasons. The total adds up to more than 70 because in some cases more than one reason was given for dismissal by the judge.

Motions to dismiss by the district attorney are usually made because the defendant is already in jail or is about to be tried for a more serious offense. However, a number of cases are dismissed "in the interest of justice" for a variety of reasons. For example, one case was dismissed where the defendant had volunteered for the

V. Dismissal on 995 Motions

If a prima facie case is established at the preliminary hearing, the defendant is held to answer and an information is filed. The information is the prosecution's accusatory pleading in felony cases; it includes the crimes with which the defendant is charged. At this stage of the proceeding the defendant can request that the information be set aside and the case dismissed on the grounds that he was not indicted for probable cause. This is done through the vehicle of a "995 motion" to the superior court.[84] Dismissals on 995 motions occur for the same reasons as dismissals at the preliminary hearing.[85]

On January 1, 1968, Section 1538.5 of the California Penal Code went into effect. This section authorizes a special hearing to be held if the defendant moves to suppress evidence alleged to have been secured through an illegal search. This procedure is designed to expedite cases by having search and seizure issues determined prior to trial. It is advantageous to the prosecution because it grants them the right to an immediate appeal from a determination that the search was illegal, rather than delaying the appeal until completion of the trial. Motions to suppress evidence are often made in conjunction with 995 motions. If the evidence is excluded (*i.e.*, the motion to suppress is sustained), there may no longer be probable cause to hold the defendant and the case will be dismissed on the 995 motion.

VI. Negotiated Pleas

Very few people plead guilty to felony charges in marijuana cases.[86] This is due primarily to the extreme sanctions that can be imposed as the result of a felony conviction. However, these penalties do create a very real pressure to plead guilty to a misdemeanor charge if the opportunity presents itself.[87]

A negotiated plea, obtained by bargaining between the defense and prosecuting attorneys, allows the defendant to plead guilty to a

---

Marine Corps and the Marines had indicated to the district attorney that they would still take him if the case was dismissed.

[84] Cal. Penal Code § 995 (West 1957).

[85] In the arrest reports studied there were 43 § 995 motions granted and 58 denied. The motion was granted 14 times because of an illegal search, twice because of the *Leal* rule, eight times because of insufficient evidence, once because of entrapment and twice for other reasons. In 16 instances no reason was given.

[86] The defendant pleaded guilty in only 55 of the 425 cases where a felony complaint was filed.

[87] In 1967 there were 12,708 marijuana arrestees in California with no prior criminal record. This was an increase from 5,084 in 1966. These statistics were obtained from the California Bureau of Narcotics Enforcement.

lesser crime than that for which he was charged. The prosecution will allow such a plea for several reasons: it may have a weak case; it may wish to expedite the case; or it may deem it to be in the interests of justice.[88] Prosecutorial discretion based on factors such as age, prior record, and the deputy's own attitude toward the stiff penalties involved is more commonly exercised in the decision to negotiate a plea than on the decision to reject the filing of a complaint.[89] One explanation for this might be that police pressure on the deputy is greater at the filing level since the police base their own performance evaluation on the number of cases filed rather than those successfully prosecuted.

Until recently, negotiated pleas in marijuana cases did not appear to be any more common than such pleas in other criminal offenses. However, the increasing number of defendants with no prior record,[90] particularly youthful defendants, appears to be causing prosecutors to exercise more readily their discretion to negotiate.

Many attorneys will arrange a negotiated plea and advise their clients to plead guilty to the lesser charge, even though there may be a chance of acquittal at trial.[91] These attorneys feel that a felony conviction and its attendant penalties are too severe to risk the chance of being found guilty. One public defender said that although he would advise his clients to plead guilty to a misdemeanor in many cases, this procedure generates disrespect for our criminal process, especially among those people who believed themselves to be innocent but who accepted his advice rather than risk a felony record. Not all attorneys advise their clients to plead guilty to a misdemeanor; however, and some will not attempt to negotiate a case if they believe their client to have a better than even chance of being acquitted.[92]

A plea to a misdemeanor must be approved by the district attorney. The district attorney has no definite policy, but such pleas are usually accepted only in possession cases. The particular circumstances of each case are examined; if a young defendant with a good record and a small amount of marijuana is involved, the deputy will be more inclined to allow a negotiated plea. However, since there is

---

88 Interview with Mr. Dino Fulgoni, Deputy District Attorney of Los Angeles County, in Los Angeles, Feb. 11, 1968.

89 This information was obtained from a member of the Los Angeles Public Defender's Office, who desires to remain anonymous.

90 Reichmann Interview, *supra* note 4.

91 Out of the 286 cases in which information as to negotiated pleas was available, the defendant pleaded guilty to a lesser charge 29 times.

92 Cahn Interview, *supra* note 82.

no set policy, the decision depends upon the particular deputy handling the case. One said he would not negotiate a plea if he had a strong case regardless of the defendant's age or record or the quantity involved.[93] Another confidentially stated that he would allow a plea to the lowest possible misdemeanor if the defendant's age, record or the quantity involved made a felony charge undesirable. One deputy district attorney stated that he would rather move for dismissal in the interest of justice than negotiate a plea, if he believed that the defendant's background warranted the use of prosecutorial discretion.

Whether either side will attempt to negotiate a plea is sometimes affected by the holding of a hearing to suppress evidence. For example, counsel for the defense may refrain from negotiating until after the hearing in the hope that the case will be dismissed. He realizes that even if the evidence is allowed, he will have an opportunity before trial to negotiate a plea. Of course, if the evidence is not suppressed he will be in a weaker bargaining position. The district attorney may also wait, hoping that the search will be sustained and the case prosecuted as a felony. On the other hand, the deputy may feel because of the new law that the case will be dismissed and will offer to negotiate before a section 1538.5 hearing is held.[94]

There are two instances where a defendant may be willing to plead guilty to a felony charge. First, a defendant may agree to plead guilty to one count of possession when he has been charged with several counts or when he has been charged with sale or with possession for sale.[95] Second, he may plead guilty with the "guarantee" that probation will be granted.

Most negotiated cases are submitted on the transcript of the preliminary hearing to a "short cause court." Cases that are decided by such a court are restricted to those that can be decided within one hour. Both parties must get the agreement of the presiding judge to accept the negotiated plea. Ordinarily this presents no complications, since the judge usually will go along with the district attorney's recommendation. However, one judge indicated that he would accept a negotiated section 11556 plea (being present in a place where marijuana is being smoked) only if the facts of the case fit precisely within the statutory language.[96]

---

[93] Fulgoni Interview, *supra* note 88.

[94] Interview with a representative of the Los Angeles Public Defender's Office who desires to remain anonymous.

[95] Five of the 24 negotiated pleas involved a defendant pleading guilty to a possession charge. In each instance this occurred where he had been charged with one or more counts of sale.

[96] Interview with the Honorable Vernon P. Spencer, Judge of the Los Angeles County Superior Court (Criminal Division), in Los Angeles, Feb. 11, 1968.

The defendant who negotiates a plea usually pleads guilty to either California Health and Safety Code § 11556 or 11557 (maintaining a place where narcotics are used). Section 11557 is preferred by both the district attorney's office and judges because it provides for alternate misdemeanor or felony sentencing. Such sentencing allows the judge to find the defendant guilty of the crime, but gives him the opportunity to wait until he has read the probation report before deciding whether to grant a misdemeanor or felony sentence. This procedure protects the judge from agreeing to a straight misdemeanor plea (*i.e.*, section 11556) and then later discovering that because of the defendant's record or some other circumstance he would have found him guilty of a felony. The defendant is usually willing to agree to a section 11557 conviction because only in rare cases will the judge give a felony sentence.[97]

The recent legislation in California allowing alternate felony-misdemeanor sentencing for first offenses in possession cases will undoubtedly decrease the incidence of negotiated pleas. Insofar as prosecutors have been persuaded to negotiate pleas on the basis of discretionary factors such as age and background, such factors would seem to favor a defendant most often in first offenses for possession. Under the new law, since discretion in such cases is expressly reserved for the court, prosecutors will undoubtedly be reluctant to usurp this function by negotiating. If the prosecutor has a weak case, however, he may still attempt to negotiate the plea rather than risk losing the case at trial. If the case involves a first offense for possession, it will be easier under the new law for a defendant to refuse the offer to plead guilty to a misdemeanor because, even if convicted, there is the possibility of the judge treating the offense as a misdemeanor in sentencing. In other cases, however, the defendant must still face the difficult decision whether to accept a lesser offense or gamble that he will be acquitted at trial.

VII. Cases Submitted on the Transcript

Negotiated pleas are not the only type of cases that are submitted on the transcript of the preliminary hearing. Submission on the transcript may also occur when the defendant has either a very weak case or a rather strong case.[98]

Submission of the case may signify a "slow plea" of guilty. A slow plea may be desirable where the defendant expects to be found guilty but would rather not plead guilty. The value of this

---

[97] Reichmann Interview, *supra* note 4.
[98] *Id.*

tactic is that it does not preclude the possibility that the case may later be reversed because of a subsequent change in the law; or the defendant may simply desire to avoid the stigma of a guilty plea. In marijuana cases, some attorneys do not invoke this procedure because they feel that their client has a much better chance for acquittal or leniency if the case is taken to trial and tried before a jury.

Sometimes defense attorneys will submit a case on the transcript when they have a particularly strong case. This prevents any further evidence which may be prejudicial to the defense from being brought into court. For example, if a case involves a questionable search and seizure, an attorney would want the trial court to rule on the issue of probable cause with the least amount of testimony available.

Before a case may be submitted on the transcript, both parties must approve. Where the prosecution has an "open and shut case" it is clearly understandable that the district attorney would want to save the time and expense of having to introduce further evidence. Submission on the transcript may also occur when the prosecution has a weak case if there is not much hope that new information will be adduced at a trial. Sometimes, in very weak cases, the district attorney will submit a case on the transcript rather than move for dismissal because he does not want to risk upsetting relations with the police or because he does not wish to justify the validity of a motion to dismiss.

VIII. Trial

Most defendants prefer to have their case tried before a judge rather than a jury.[99] Many jury members are appalled by narcotics users, fail to differentiate between marijuana and hard narcotics cases, and have a tendency to find a defendant guilty. Judges, on the other hand, try several marijuana cases per week and are not shocked by a suspect who is apprehended with marijuana.

Some judges are generally more lenient in marijuana cases than in other types of felonies. Some, of course, do not believe that possession of marijuana warrants classification as a felony with its subsequent harsh penalties. Others believe that while some cases should be prosecuted as felonies, there are many situations

[99] Out of 252 cases in which the information was available, 245 were tried by the judge and only seven by a jury. Of the seven jury trials only two resulted in acquittal. One of the trials resulted in a hung jury and the district attorney declined to refile the case.

where a misdemeanor conviction would be proper. In these situations, such judges will strain to find a legitimate reason for dismissing a case if the defendant possessed only a small quantity of marijuana and had a good record.[100] One judge stated his belief that a young defendant who had no prior record and had been picked up with one cigarette had already been punished sufficiently by being arrested, placed in jail and subjected to criminal prosecution. This exercise of discretion has been termed the "one cigarette rule." The judge in such cases will justify dismissal on grounds of search and seizure or insufficient evidence.[101] Such dismissal is, of course, not automatic in one cigarette cases; some judges will never dismiss such cases, while others will do so only on rare occasions. However, this unpredictability along with the stiff statutory penalties, encourages court tried cases rather than jury trials or guilty pleas.

The differing attitudes of judges also encourage defense attorneys to try whatever means available to get into a lenient judge's court. Some will attempt to secure continuances indefinitely if they are sent to a judge who is harsh on marijuana offenders. Such "shopping" is probably greater in marijuana cases than with other crimes, since the judges differ on the desirability of the present laws rather than merely on the sentence to be meted out. Thus, while a burglary suspect may wish to go before a certain judge because he may get a lighter sentence, a marijuana suspect may do so in hopes of being acquitted entirely.

If a defendant is convicted with a prior narcotics felony on his record, the judge cannot grant probation[102] and the penalties are much stiffer. However, if the prior is "struck" from the pleading (upon a motion of the district attorney and with approval of the judge) or if there is no "finding on the priors," the defendant will not be subjected to the added penalties. When a small amount of marijuana is involved, most judges do not like to convict a defendant with a prior felony conviction for possession because they consider the five year minimum penalty excessive. Thus, if the

---

100 In 56 cases where the defendant possessed one cigarette or less, *e.g.*, a roach or seeds, the judge found the defendant not guilty 19 times, dismissed the case at the preliminary hearing 10 times, and granted a § 995 motion twice. The defendant in 12 of these 31 exonerations had either no previous record or had only committed one or more misdemeanors. In the 25 cases where the defendant was eventually found guilty, there were only two instances where he either had no previous record or had previously only committed a misdemeanor.

101 This information was obtained in an interview with a judge of the Los Angeles County Superior Court (Criminal Division), who prefers to remain anonymous.

102 CAL. HEALTH & SAFETY CODE § 11715.6 (West 1964).

district attorney does not offer evidence to prove the prior, the judge may make no finding and the defendant will be treated as a first offender. Also, some judges will encourage the deputy not to offer evidence of priors in possession cases. Other judges, however, feel duty bound to make a finding on the priors and subject the defendant to the more stringent penalties, even if the deputy does not present any evidence on the matter. Still others may make a finding but will then find the defendant not guilty if only a small amount of marijuana was in his possession.[103]

Most judges are lenient with regard to priors only in possession cases. If a sale is involved, the judges will usually make a finding on the prior. One judge reported that he would never strike a prior conviction in a sale case.[104]

IX. Sentencing

If a defendant is found guilty, the judge is required to sentence him according to the statute. Much of the judge's decision on what sentence to give is based upon a probation report which includes a summary of the defendant's family history, criminal record, and school and employment levels.

The most important factors considered by the court when determining the sentence are the nature of the offense, the defendant's prior dealings with the law, and his present scholastic or employment status. In possession cases, if the defendant has a good record and is in school or has a steady job, the judge will invariably grant probation.[105] Probation may be conditioned upon the payment of a fine or upon spending a small amount of time in county jail. Most judges will not sentence such a defendant to prison for two reasons. First, some do not believe that the offense of possession warrants spending a year in prison. Second, and most important, many judges do not believe that there is any rehabilitative value in sending a person with no criminal record to prison where he will come into contact with "hard" criminals. If the defendant has had extensive contact with the police or the case involves possession for sale or actual sale, however, the judge is more likely to sentence the defendant to prison.[106]

---

103 This information was obtained in an interview with a Judge of the Los Angeles County Superior Court (Criminal Division), who prefers to remain anonymous.

104 *Id.*

105 These are generally the same factors used by a juvenile court judge in deciding whether to grant probation or release the juvenile. Reichmann Interview, *supra* note 4.

106 Of 49 adult cases involving sale or possession for sale wherein the final dis-

The length of the sentence is influenced by the same factors which the judge takes into account in deciding whether to grant probation. Also, if the defendant seems to be involved in selling marijuana on a large scale, the judge will undoubtedly be more harsh than if merely a single sale or a small quantity was involved.

For the most part, middle-class offenders receive probation or are allowed to plead guilty to a misdemeanor.[107] The factors—a clean record, steady employment, and a successful school record—that are taken into consideration by the judges and district attorney when deciding whether to grant probation or allow a defendant to plead to a misdemeanor, all favor those with a middle-class background. Since the penalties are considered extreme by many judges and deputy district attorneys, they will be lenient with those whom they think are a good risk.

This is not a conscious discrimination based on economic class. It merely reflects the unfortunate reality that a resident of the ghetto or other low income area is likely to have a background which discourages judicial leniency. He is more likely to be unemployed, to have a poor scholastic record and to have had previous contact with the police than similarly situated middle-class offenders.

X. Juveniles

The procedures for dealing with juveniles arrested for marijuana possession are more flexible than those for dealing with adults. The police have an initial option to either counsel and release the juvenile or turn him over to a probation officer for further action.[108] If the latter course is followed, the juvenile can be detained up to 48 hours in an Intake Detention and Control Center, while it is determined whether a petition, similar to the information used in an adult proceeding, will be filed.[109] Even if the suspect is counseled and released by the police, they may later ask that a petition be filed. If so, the local probation office will decide whether or not to file.

Juveniles arrested for marijuana violations are brought within the jurisdiction of the Juvenile Court through the filing of a peti-

---

position was given, 14 defendants were sentenced to state prison, 11 were given probation with a period of time in the county jail (varying from one year to 90 days), 14 were given probation with a fine (ranging from $50 to $1,000), five received straight probation (usually from three to five years), four were committed to the California Youth Authority, and one was sent to Department 95 for a mental test.

107 *See* note 114 *infra*.

109 *Id.* § 631.

tion to make the juvenile a "ward of the court," usually under Sections 601 or 602 of the Welfare and Institutions Code.[110] It is important to the juvenile whether the probation officer decides to file either a section 601 petition or a section 602 petition. If a section 602 petition is filed and approved, the juvenile can be committed to the California Youth Authority for a first offense, a disposition not possible under a section 601 petition.[111] Also, if a section 602 petition is filed, the juvenile court can bind the juvenile over for the institution of general criminal proceedings if he is 16 or above.[112] Finally, the judge can deny the section 601 petition even if the juvenile has obviously violated the law, since approval is required only if the juvenile is in danger of leading an "idle, dissolute, lewd, or immoral life."[113] Under section 602, if the probation officer proves that the juvenile has committed the crime charged, the judge is required to approve the petition.

If a petition is filed a detention hearing is held to determine whether the suspect will be detained or released pending the adjudication hearing. The guilt or innocence of the defendant is determined at the adjudication hearing. If the defendant is found guilty, a disposition hearing is held in two weeks.

The police decision whether to release the juvenile, the probation officer's decision on whether to file a section 601 or 602 petition, the probation officer's recommendation, and the final disposition of the offender are all conditioned on certain factors in the juvenile's background relative to his rehabilitative potential. These factors include the juvenile's past record, attitude, and family situation. For example, the ideal subject for probation would be a juvenile with no prior record, a repentant attitude, two concerned parents, and "A" grades in school.

This personal background information is collected by the probation officer and put into a report which forms the basis for the judge's disposition. The report contains a recommended disposition which the judge will ordinarily follow. If the juvenile is found to be a "ward of the court" under section 601, the judge can grant him probation or send him to county juvenile camp. Under section 602 the judge can also commit the juvenile to the California Youth Authority. Disposition of juvenile cases depends not on the

---

110 *Id.* §§ 601-02. Section 601 permits the juvenile court to adjudge a juvenile a "ward of the court" if that juvenile is in danger of leading an immoral or dissolute life. Section 602 permits the same finding if the juvenile has broken any California or United States law.

111 CAL. WELF. & INST'NS CODE §§ 727-31 (West Supp. 1967).

112 *Id.* § 707.

113 CAL WELF. & INST'NS CODE § 601 (West 1966).

offense charged, but on what the court believes will be the future conduct of the juvenile and his parents, based on the aforementioned factors.[114] Thus, a juvenile found guilty of selling marijuana may receive more favorable treatment than one convicted of possession.

---

[114] A study of the files of 204 juveniles on whom a petition had been filed revealed that the following had been either given probation or had their petition denied and been subsequently released:

25 Negroes out of 69 arrested
59 Whites out of 101 arrested
16 Mexican-Americans out of 30 arrested
46 juveniles with no prior police contact out of 61 arrested
52 juveniles with one or more non-narcotic prior arrests out of 129 arrested
4 juveniles with one or more arrests for a non-marijuana narcotic offense out of 14 arrested
7 juveniles with one or more prior arrests for marijuana violations out of 24 arrested
73 students out of 127 arrested
13 employed non-students out of 30 arrested
14 non-employed non-students out of 37 arrested
5 juveniles living with neither parent out of 15 arrested
48 juveniles living with both parents out of 93 arrested
48 juveniles living with one parent out of 89 arrested
5 juveniles with both parents unemployed out of 18 arrested.

PART IV: CONCLUSION

The ultimate question underlying any discussion of the marijuana laws is whether the harm caused by marijuana justifies the prohibitions against it. This project has made no attempt to answer that question. Rather, it has dealt solely with the effects of the enforcement of these laws upon our criminal system.

One effect of the substantial rise in marijuana use has been a significant increase in the time and resources allocated by the police to marijuana enforcement. An officer may spend up to eight hours in arresting and booking a suspect and in later having to appear in court to testify. This time must be subtracted from time available for the discovery and prevention of violent crimes.

The resources allocated to the enforcement of the marijuana laws may be used in a number of ways. At present, the investigative machinery is directed primarily at the sale of marijuana. The theory underlying this practice is that without a source of marijuana there can be no use, and since a single seller serves many users, the apprehension of a seller will be much more valuable than the apprehension of a user. This theory can also be extended to the importation of marijuana from Mexico. The amount of marijuana being handled is greater at the border than at any other point in the distribution process. Increasing the present number of border guards and providing a continuing organization which would coordinate the activities of the various federal, state, and local enforcement agencies could stem the present traffic considerably.

The enforcement of marijuana laws necessitates the use of informants, undercover agents, and other surreptitious enforcement techniques. While these are the most effective of the presently available methods for discovering violators, they have made little headway in halting the spreading use of marijuana. Moreover, these enforcement methods risk intrusions into the privacy of individuals who are not involved with marijuana. The more widely these methods are used, the greater this risk becomes.

There are three types of factors which may be responsible for the use of discretion by police officer, prosecutors and judges in the treatment of offenders. First, there are factors which the law requires the trier of fact to consider in determining guilt, such as the legality of a search and sufficiency of the evidence. Second, there are personal characteristics, such as age, attitude, and previous criminal record, which may indicate the risk of future violations. Finally there is the element of disagreement with either the terms of punish-

ment for the offense or with making the acts in question an offense at all.

With regard to the first of these factors, police officers, prosecutors, and judges all legitimately exercise discretion where they feel that the chances for legally establishing guilt are insufficient to warrant further proceedings. Discretion related to the other two factors is seldom exercised by either policemen or prosecutors. Judges, by contrast, are authorized to consider individual circumstances in sentencing. This Project also found, however, that the disagreement of judges with the legislative range of penalties influenced, in numerous instances, their disposition of a case. Informal rules, such as the "one-cigarette rule" and the stretching of evidentiary and search and seizure requirements to acquit a defendant, evidence this practice. Undoubtedly, much of this judicial "discretion" is related to the tremendous increase in the arrests of educated, middle-class youth without prior records who, except for their marijuana activity, appear to be law-abiding citizens. Faced with the alternatives of a felony conviction or acquittal, a significant number of judges have chosen to acquit such defendants. Recent legislation in California has attempted to alleviate this problem by allowing the judge to treat first time possession cases alternatively as misdemeanor or felony cases.

Despite reforms of both enforcement procedures and the laws themselves, it is possible that the use of marijuana may become so widespread that prohibitory laws would be useless. If that happens, then, as in other cases where society's morals have outstripped its laws, either the present laws will be repealed and a rational scheme of regulatory laws substituted or the present laws will become like many of the old Sunday blue laws still on the books today: an anomaly for future generations to ponder.

Possession of Marijuana in San Mateo County: Some Social Costs of Criminalization*

This Note is built around an empirical study of the present California marijuana laws as applied to the 129 defendants charged with felony violations in a single jurisdiction during a recent 12-month period. The first section places the study in context and outlines its assumptions. The next presents the findings, following the defendants from arrest to final disposition and commenting on the observable roles and practices of those persons involved. Costs that society incurs during this process and ways in which these costs might be reduced by shifting the resources utilized by the criminal process from the "problem" of marijuana possession to the "problem" of marijuana sale are then discussed.

I. Background

The marijuana, or "hemp," plant[1] was introduced to the United States under the most respectable auspices. The settlers of Jamestown planted the first crop in 1611 at the behest of King James I, who wanted hemp to be made into rope for the British navy.[2] Marijuana was also prized as a medicinal agent, and there is evidence that George Washington cultivated it at Mount Vernon for that purpose.[3] For many years, until 1937, it was a prescription drug, listed in the official *Pharmacopoeia of the United States of America* as *Extractum Cannabis*,[4] and was available from both large drug companies and vendors of patent medicines. Although its psychoactive properties have been known and enjoyed elsewhere for almost 5000 years,[5] it was not used as a recreational drug in this country until the beginning of the 20th century. About 1910,

> Mexican immigrants brought marijuana into Texas and California and from there it seems to have made its way very quickly to New Orleans, where its use was established among Negroes, especially jazz musicians, by the early 1920s. From there it spread as Negroes immigrated to the urban centers of the North . . . where it

* The author wishes to thank Professor John Kaplan of the Stanford Law School, who suggested this study and guided it during its early stages, and Wilbur R. Johnson, Chief Criminal Deputy District Attorney for San Mateo County, without whose counsel and assistance this study could not have been completed.

> was introduced to whites on a large scale as a result of contact with Negroes in lower-class, racially mixed neighborhoods and in clubs frequented by bohemian jazz enthusiasts.
>
> Marijuana was soon adopted by many deviant groups, those considered somewhat beyond the pale of respectability . . . .[6]

As use became more widespread, the Federal Bureau of Narcotics and the popular press mounted a propaganda attack depicting marijuana as a sinister and dangerous drug responsible for a host of violent crimes and leading to a life of idleness and insanity.[7] In 1937, following hearings[8] at which only one witness opposed the measure, Congress passed the Marijuana Tax Act of 1937, requiring disclosure and taxation of all transfers of marijuana.[9] By 1938 almost every state legislature had made possession of marijuana a crime.[10] Although a 1944 medical study of the dangers of marijuana discredited many of the assertions made by proponents of the various marijuana laws,[11] the Federal Bureau of Narcotics continued to press its viewpoint on legislators, and the laws remained in force. So long as the use of marijuana and the effects of its proscription were confined to a relatively small and powerless minority and the enforcement of these laws placed no untoward burden on the criminal process, there was little pressure on legislators to reconsider the wisdom of the marijuana legislation.

The 1960's, however, witnessed a radical increase in the number of people using marijuana and, consequently, in the burden of enforcing laws against its use.[12] Numerous recent studies confirm that a large percentage of the white middle-class student population has experimented with marijuana, and that a significant number use it on a regular basis.[13] In California from 1960 to 1968 the annual number of adult arrests for marijuana violations

12. The results of a recent Gallup Poll indicate that 10 million Americans, age 21 or older, have used marijuana, and that another 5 million would do so if it were offered to them. N.Y. Times, Oct. 26, 1969, § 1, at 75, col. 1.

13. In a 1969 study of high-school students in San Mateo County, 50.1% of the senior boys and 37.6% of the senior girls reported having used marijuana within the last 12 months. Of that group, 67.7% of the boys and 59.3% of the girls reported that they had used it 10 or more times within the past 12 months. RESEARCH & STATISTICS SECTION, SAN MATEO DEP'T OF PUBLIC HEALTH & WELFARE, FIVE MIND-ALTERING DRUGS 20 (1969) (report prepared at the request of the Narcotics Advisory Committee of the Juvenile Justice Commission). *See also* 2 R. BLUM, STUDENTS AND DRUGS 7–28 (1969).

increased seven times to 33,573 and the number of juvenile arrests some 21 times to 16,754.[14]

These dramatic changes have reopened the whole question of the wisdom of criminalizing the use and possession of marijuana. Some students of the problem have concluded, with Professor Herbert Packer, that "[a] clearer case of misapplication of the criminal sanction would be difficult to imagine."[15] Others argue that a "policy of vigorous law enforcement" continues to be "necessary not simply because of the harmful effects of the drug on consuming individuals but also because of the antisocial conduct which it engenders."[16] In the same week that the President of the United States declared an all-out war on marijuana smuggling, complete with elaborate electronic detection equipment,[17] the Wall Street Journal reported discussion in the business world on the profit potential in legalized marijuana.[18]

Whether or not the original decisions to criminalize the use and possession of marijuana were rational is not now important. A rational society will attempt to control an activity by making it a criminal offense only if the anticipated benefits of criminalization exceed the anticipated costs. It will also periodically review the instituted system, checking expectations against results. If the costs in practice outweigh the benefits, there are two alternatives: modify the law and the enforcement pattern in ways better calculated to yield net benefits, or repeal the law. The evolution of the law of homicide in England illustrates the first approach, the history of prohibition in the United States the second.

Calculation of the total costs and benefits of criminalizing marijuana use and possession will involve a host of determinations outside the lawyer's competence.[19] This Note does not purport to perform that calculation. It simply seeks to define some of the costs.

II. The Study

1968, 137 alleged violations of the California marijuana laws.[20] These 137 complaints form the basis of the study. The data were obtained from the records of the San Mateo County Municipal and Superior Courts, the reports of the County Probation Department, and the Office of the District Attorney. The sample comprises 129 individuals charged with a total of 133 offenses.[21] For most of these defendants, data were available concerning age, race, sex, current occupation, educational background, and previous criminal record.[22]

The sample includes a total of 92 different arrest situations,[23] the circumstances of which were recorded with particular attention paid to the types and amounts of drugs seized. The counts of each complaint were traced through the judicial process to the point where the case was dismissed, passed from the jurisdiction of the adult courts, or terminated in sentencing in the superior or municipal court.

B. *Findings*[24]

1. *Enforcement pattern.*[25]

In the study jurisdiction, responsibility for enforcing the marijuana laws is shared between patrolmen and drug-law-enforcement specialists. The

---

Marijuana in Man, 162 SCIENCE 1234 (1968), *with* Hollister, Richards & Gillespie, *Comparison of Tetrahydrocannabinol and Synhexyl in Man*, 9 CLINICAL PHARMACOLOGY & THERAPEUTICS 783 (1968).

20. Complaints alleging violations of § 11,556 of the California Health and Safety Code (being present in a place where a narcotic is being unlawfully used with knowledge of such use—a misdemeanor) are on file with the clerk of the municipal court in chronological order together with all other misdemeanor complaints, including traffic offenses. Because it would have been very difficult to locate all of them, no § 11,556 violations are included in the sample except those filed after a felony charge had been dismissed.

Defendants under the age of 18 are within the jurisdiction of the juvenile court and are not included in this study.

21. Four of the complaints were refilings of complaints appearing earlier in the sample which had erroneously been dismissed. In almost every case in which a complaint alleged violation of the marijuana laws on several counts, all counts were based on the same supply of marijuana or the same sales transaction. Thus, for purposes of this study, each complaint stated a single "offense." Four of the defendants were arrested and charged for two distinct offenses during the study period.

22. *See* Tables 1–3 *infra*. The defendant's age, sex, and race were available in almost every case. Information on prior arrest record, current occupation, and educational background was unavailable only for some of those defendants not held to answer in the superior court. Where available, the data as to prior criminal record were taken from the official "rap sheet" (a record of all of a person's arrests maintained by the State of California Bureau of Criminal Investigation and Identification). Because this often listed arrests without showing any subsequent disposition, it was impossible to tell in every case if the defendant had been convicted as charged. Since the extent of the defendant's previous contact with the criminal system was particularly relevant to this study, each prior arrest was recorded and each of the defendants for whom data were available was assigned to one of five classes. *See* Table 2 *infra*. Where the rap sheet listed a conviction for a drug offense, this was also recorded; statements in the text referring to a defendant's "drug record" are based on these data.

23. The arrest of several defendants at the same time, under the same circumstances, and by the same police officers was treated as a single "arrest situation." In 24 cases two defendants were arrested together, and six arrest situations involved more than two defendants.

24. This section of this Note parallels to some degree parts of Project, *Marijuana Laws: An Empirical Study of Enforcement and Administration in Los Angeles County*, 15 U.C.L.A.L. REV. 1499, 1515–63 (1968) [hereinafter cited as U.C.L.A. STUDY]. In many respects the enforcement patterns and the significant steps from arrest to trial are similar in the two jurisdictions studied. In other respects,

specialists consist of a 3-man unit in the county sheriff's office and special officers in some municipal police departments. Their efforts are directed primarily toward the apprehension of persons involved in selling drugs.[26] In a typical case as described in police reports, an informer introduces an undercover agent to a suspected seller, a sale takes place, and arrest ensues. Often these arrests are cooperative ventures involving both municipal and county authorities.[27]

Most narcotics-unit arrests for mere possession fall into one of two categories.[28] Often the marijuana is found during a search made incident to an arrest related to some other drug-sales investigation. In other cases suspects are brought to the attention of a narcotics officer by a parent or neighbor who has discovered what he believes to be marijuana in or near the suspect's home. Specialized narcotics agents accounted for only 20 of the 92 arrest situations in the sample. The remainder were made by ordinary patrolmen—members of the county sheriff's department and the police departments of four municipalities.

In almost every case, the ordinary patrolman's discovery of marijuana results from police work unrelated to drugs: peace-keeping and investigations or arrests for nondrug crimes. Typically officers will stop an automobile, either for a vehicle-code violation or because they find its presence or occupants "suspicious," and will discover marijuana during a search of the vehicle or its occupants. Searches of suspects incident to nondrug-related arrests also yield marijuana; this category includes searches made in the field as well as more thorough searches made when suspects are booked at the county jail.[29] Finally, some marijuana turns up in the course of investi-

---

however, they are not; and for purposes of coherence this Note traces the process through its consecutive stages in the context of the Southern District of San Mateo County. The composition of the defendant samples in the two studies differed considerably. *Compare* U.C.L.A. STUDY, *supra* at 1578 (Appendix D), *with* Tables 1–3 and text accompanying notes 36–44 *infra*. Certain other significant differences are noted *infra*. This section of this Note also presents findings in a number of areas that the *U.C.L.A. Study* does not discuss—notably the correlations between the characteristics of defendants and the methods used to apprehend them, and the kinds and amounts of drugs seized incident to the arrests which led to marijuana prosecutions.

25. The information for this section was drawn from the actual police and crime-laboratory reports for the 92 arrest situations in the sample.

26. *See* CAL. HEALTH & SAFETY CODE § 11,531 (West 1964) (transport, sale, or giving away of marijuana—a felony).

27. For a detailed description of enforcement techniques used by narcotics agents in connection with marijuana see U.C.L.A. STUDY, *supra* note 24, at 1530–32.

28. CAL. HEALTH & SAFETY CODE § 11,530 (West 1964) (unauthorized possession). During the study's sample period, § 11,530 provided for imprisonment in the state prison for a year or more—a felony. After the close of the sample period the section was amended, providing alternatively for "imprisonment in the county jail for not more than one year . . . ." CAL. HEALTH & SAFETY CODE § 11,530 (West Supp. 1968). Where such alternative sentencing is provided, "in the discretion of the court, it shall be deemed a misdemeanor for all purposes after a judgment other than imprisonment in the state prison . . . ." CAL. PENAL CODE § 17 (West 1955).

Possession for the purpose of sale is a separate and more serious offense. CAL. HEALTH & SAFETY CODE § 11,530.5 (West 1964).

29. In several cases in the sample, the marijuana was found some time after the suspect was incarcerated, during a search of his home or car.

gations conducted for other purposes. For example, officers sometimes have occasion to enter a private home to search for a suspect or a missing person or to investigate a reported disturbance. Upon their unexpected arrival they may find marijuana in plain view, or may discover it while searching the premises at least ostensibly in the expectation of finding something else.

Marijuana was seized in 88 of the 92 arrest situations in the sample, and 77 of these 88 cases led to charges of possession only.[30] In 46 of these 77 cases, marijuana was the only drug seized. In all but one of the remaining 31 arrests the amounts of other drugs seized suggest that they were the defendant's personal supply and were not intended for sale. In only nine of the 77 cases did the amount of marijuana seized exceed 100 grams.

Of the 88 arrest situations in which marijuana was seized, 11 led to complaints charging sale of marijuana. Other drugs were also found in connection with six of these 11 cases; in only one were the other drugs also being sold. Three cases involved the sale of a single "lid."[31] In the other eight, the amount of marijuana seized ranged from about 350 grams (three instances) to 20 kilograms (44 pounds; one instance).

The only drugs other than marijuana that turned up with any frequency were amphetamines.[32] Amphetamines were found in 16 of the 92 arrest situations; hypodermic needles, used to inject some types of amphetamines, were found in an additional 13 cases.[33] Other drugs were found in 18 cases: hallucinogens, barbiturates, codeine, hashish,[34] sedatives, tranquilizers, and diet pills each appeared in the sample three or four times.[35]

2. *The defendants.*

Analysis of the defendants' biographical information clearly indicates that the impact of the marijuana laws in San Mateo County falls overwhelmingly on young persons.[36] The median age of the sample was just over 20, and 95 percent of the defendants were under 30. Seventeen percent were

30. Where several defendants were arrested together, it was usually impossible to determine which drugs were taken from which defendant. Therefore all of the following findings are cast in terms of "arrest situations."

31. A "lid," the common unit of sale to consumers, is one ounce (28 grams) of marijuana.

32. The most common amphetamine found was methadrine, commonly known as "speed."

33. Hypodermics are also used to inject heroin. However, in only one case in the sample was any heroin seized, and there is no indication anywhere in the records that any of the defendants were addicted to narcotics.

34. Hashish consists of the resins collected from the flowering top of the marijuana plant. Although California law does not distinguish it from regular marijuana (the ground-up leaves of the same plant) hashish is more potent.

35. Only two cases involved opiates. One defendant had three capsules of Demerol, a synthetic narcotic, and one had one-tenth of a gram of heroin and a trace of raw opium. (The latter defendant was a walking pharmacopoeia. The arresting agents found in his possession—besides the heroin and the opium—one-half gram of marijuana, a hypodermic needle, 59 amphetamine pills, 13 barbiturate pills, two codeine pills, 47 grams of hashish, and a quantity of the hallucinogen known as DMT.) Taken as a whole, these data provide remarkably little support for the theory that marijuana use leads to heroin addiction.

36. *See* Table 1 *infra.*

black, a percentage slightly greater than the percentage of blacks in the 18-to-30 age group of the jurisdiction's general population.[37] Although available studies for the jurisdiction's younger student population indicate that marijuana use is only slightly more common among males than females,[38] males outnumbered females in the San Mateo defendant sample four to one.

As a group, the 100 defendants for which we have information were less well educated[39] and less stably employed[40] than the average for their age group in the jurisdiction. Forty-four were unemployed. Of the 45 who had jobs, seven were self-employed on a part-time basis as babysitters, musicians, or makers of handcraft goods. Five held white-collar or professional positions, while the remaining 33 were blue-collar workers. Only 11 of the defendants for whom information was available were currently in school. Of the nonstudents, 56 percent had dropped out of high school after completing an average of 2 years, and another 17 percent had dropped out of college.[41]

Forty-four percent of the defendants for whom information was available had had no significant prior contact with the criminal process. Another 31 percent had been involved with the police before but had never been incarcerated. Sixteen percent had been sentenced to the county jail on one or two occasions; 9 percent had had repeated contact with the criminal system and had spent over 6 months in either the county jail or state prison. Three-quarters of the defendants in the sample had no prior drug records whatsoever.[42]

A representative defendant from the sample would be a 19-year-old white male who had dropped out of high school in the 10th grade, who had no regular employment, and whose previous contact, if any, with the police was minor and did not involve drugs. Certain methods of marijuana-law enforcement[43] resulted in the apprehension of groups of defendants differing significantly from this norm. Defendants who first came to the attention of the police because of their involvement in drug traffic were older

37. It has been estimated, based on a recent special census of the study jurisdiction, that 12% to 14% of the 18-to-30 age group are black. Interview with Marion D. Boat, Urban Planning Economist, San Mateo County Planning Commission, in Redwood City, Calif., Oct. 6, 1969.

38. *See* note 13 *supra*.

39. In 1960 the median level of education in San Mateo County for persons 25 years old and over was 12.4 years of school completed. BUREAU OF THE CENSUS, U.S. DEP'T OF COMMERCE, COUNTY AND CITY DATA BOOK 1967, at 33 (1967). Current dropout rates in the county's high schools reveal that the majority of students continue to graduate from high school. *See* note 41 *infra*.

40. The percentage of the work force unemployed in San Mateo County is generally below the 4% average for the San Francisco Bay Area. Interview with Mrs. Rita Thomen, Occupational Analyst, California Dep't of Employment, in San Mateo, Calif., Nov. 3, 1969.

41. One estimate places the dropout rate in the San Mateo County high schools at 10% to 15%. Interview with Arnim Weems, Assistant Superintendent of Schools, San Mateo County, in Redwood City, Calif., Nov. 3, 1969.

42. *See* note 22 *supra*.

43. *See* text accompanying notes 26–29 *supra*.

and had more experience with the criminal system. Those whose marijuana arrests were connected with serious nondrug criminal activity were likewise older and had more extensive criminal records; nearly one-half of this group was black. At the other extreme, those defendants who had been apprehended through "freak" circumstances[44] were older, had almost no previous contact with the police, and were all white. By far the largest group—approximately 40 percent of the sample—were arrested as a result of (1) a search of an automobile stopped on the pretext of a vehicle-code violation or of "suspicious circumstances" or (2) a search of a "hippie" or communal-style living arrangement. This group was somewhat younger than the sample average—75 percent were between the ages of 18 and 21. Over one-half of them had no significant previous police contact.

3. *From arrest to trial.*

After a suspect is arrested and booked, the police submit his case to the District Attorney's office, which determines whether or not to file a felony complaint. In the study jurisdiction, if the Deputy District Attorney concludes that on the facts as stated by the arresting officer the search was clearly illegal under current search-and-seizure doctrine,[45] he will not file a complaint.[46] In virtually all cases, however, complaints are filed.[47] The defendant against whom a complaint has been issued is arraigned before a magistrate (usually a municipal-court judge) who sets bail. Shortly thereafter the defendant makes a second appearance before the magistrate, at which he enters a plea and at which a date is set for his preliminary hearing.

In a sizable number of cases that get this far, no preliminary hearing is ever held. Defendants between the ages of 18 and 20 may petition the court to suspend the adult proceeding and have the case referred to the juvenile court.[48] Cases are also dismissed on the motion of the District Attorney. At this point, some aspects of prosecutorial discretion are first exercised. The prosecution of a marijuana case may be dropped altogether at this point if, after reviewing the record, the Deputy District Attorney decides that there is insufficient evidence to link the defendant to the marijuana seized. The

44. In one case, a couple went out for the evening, and their babysitter, looking for a cookie, found their supply of marijuana instead and called the police.

45. *See* text accompanying note 81 *infra*.

46. This occurs in "approximately 20 cases per year." Interview with Wilbur R. Johnson, Chief Criminal Deputy District Attorney for San Mateo County, in Redwood City, Calif., Oct. 6, 1969.

47. *Id.* The U.C.L.A. investigators report that prosecutors in Los Angeles County exercise a substantial amount of discretion prior to filing a complaint in a marijuana case, and that generally a complaint will not be issued unless a Deputy District Attorney first ascertains that the available evidence will support a conviction and that the amount of marijuana seized and the defendant's background merit a felony prosecution. *See* U.C.L.A. STUDY, *supra* note 24, at 1544–54. In San Mateo County these aspects of prosecutorial discretion are deferred to a later stage. *See* text accompanying notes 48–49 *infra*.

48. CAL. WELF. & INST'NS CODE § 604(b) (West 1966).

case may also be dropped if the defendant agrees to plead guilty to an equally serious charge in another jurisdiction, or if it appears certain that he will be convicted of another felony and dual prosecution will serve no useful purpose. In most cases, however, when the District Attorney moves to dismiss a complaint it is because the defendant has agreed to plead guilty to some other, less serious offense in the jurisdiction.[49]

A variety of situations prompts such "plea bargaining."[50] The prosecution may choose to obtain a certain conviction on a lesser charge in some cases, rather than risk dismissal of the original charge on grounds that the legally admissible evidence fails to establish all of the elements of the offense. In exceptional cases the charges are reduced because the defendants agree to cooperate in apprehending other violators.

If the defendant is not certified to juvenile court and does not plead guilty and if the District Attorney decides to prosecute the case as a felony, the next step is a preliminary hearing in municipal court. At the preliminary hearing the judge decides whether the prosecution's legally admissible evidence warrants holding the defendant to answer in superior court. This provides the defense attorney with his first opportunity to challenge the legality of the police officer's conduct and exclude any evidence seized in a constitutionally invalid search.[51] Alternatively, the defense attorney may argue that the marijuana seized was not a "usable amount" as required by *People v. Leal*.[52] In cases where several persons have been arrested for possession of the same supply of marijuana, the defense may also argue that the evidence fails to establish possession by a particular defendant.

Slightly less than half the cases in the sample were disposed of in mu-

49. This lesser offense, if it had not already been charged as an additional count on the original felony complaint, was charged on a misdemeanor complaint after an agreement had been reached. Typically the plea accepted was one to the misdemeanor marijuana offense of being in a place where marijuana was being smoked. CAL. HEALTH & SAFETY CODE § 11,556 (West 1964). Where other drugs or paraphernalia had been seized in addition to marijuana, the typical result of bargaining was a plea of guilty to either § 4143 of the California Business and Professions Code, which makes unauthorized possession of a hypodermic needle a misdemeanor, or § 11,910 of the California Health and Safety Code, which, during the study period, made possession of dangerous drugs a misdemeanor. This pattern will undoubtedly be affected by recent California legislation making possession of dangerous drugs either a felony or a misdemeanor. *See* Stats. 1968, c.1465, p.2392, § 3.

50. The following generalizations, derived originally from the study data, were confirmed in the interview with Wilbur R. Johnson, *supra* note 46. Compare these findings with those of the U.C.L.A. investigators, U.C.L.A. STUDY, *supra* note 24, at 1556–59.

51. *See* text accompanying notes 81–91 *infra*.

52. In *Leal* the California supreme court held that "in penalizing a person who possesses a narcotic the Legislature proscribed possession of a substance that has a narcotic potential; it condemned the commodity that could be used as such. It did not refer to *useless* traces or residue of such substance. Hence the possession of . . . residue of [a] narcotic useless for either sale or consumption . . . does not constitute sufficient evidence in itself to sustain a conviction." 64 Cal. 2d 504, 512, 413 P.2d 665, 670, 50 Cal. Rptr. 777, 782 (1966). There is no judicial rule as to what constitutes a "usable amount." The sheriff's office in the study jurisdiction will not now make an arrest for possession of less marijuana than the minimum amount needed to make a single cigarette (0.2 gram). Interview with Sergeant Coslett, Narcotics Enforcement Bureau, San Mateo County Sheriff's Office, in Redwood City, Calif., Oct. 6, 1969.

nicipal court;[53] in the remainder the defendants were held to answer in the superior court.[54] If the District Attorney elects to file an information in the superior court against a defendant who has been held to answer,[55] the defense has a second chance both to challenge the sufficiency of the prosecution's prima facie case[56] and to contest the legality of the search and seizure.[57] For a variety of reasons, including a plea bargain, the prosecution may move to dismiss some or all of the counts alleged in the information.[58]

Once the defense attorney is convinced that the prosecution's evidence will be admitted, that it fairly clearly establishes the defendant's guilt, and that the District Attorney will not accept a plea to a lesser offense, his client has very little incentive to go to trial.[59] At this point the vast majority of those defendants against whom the most serious charge is possession plead guilty. In return, the District Attorney will move to dismiss any lesser counts charged in the information and will not oppose granting probation.[60]

Of the 133 offenses in the sample, only four went to trial in the superior court.[61] The three offenses tried before a judge resulted in convictions; a jury returned the only acquittal.[62]

---

53. Of the 133 felony complaints filed, 14 were certified to juvenile court and 37 were dismissed (18 in consideration of other guilty pleas, eight for lack of sufficient evidence, one under the *Leal* rule, and 10 for unspecified reasons). Ten defendants pleaded guilty—five as charged, four to the lesser of two marijuana offenses charged, and one to a nondrug felony charged on the same complaint.

54. Seventy-one were held to answer for marijuana offenses and one for a nonmarijuana drug offense.

55. Informations were filed pursuant to all but three of the complaints for which defendants in the sample had been held to answer. Of these three complaints, two were dropped for lack of sufficient evidence and one because the defendant faced certain conviction of a more serious marijuana offense in another jurisdiction.

When he files an information the district attorney must also decide whether to allege any prior felony convictions for narcotics or marijuana offenses. If such convictions are alleged and proved, the judge may not grant probation or suspend the defendant's sentence. CAL. HEALTH & SAFETY CODE § 11,715.6 (West 1964). Although four of the defendants in the sample had previously been convicted of felony marijuana violations, in no case was this alleged on the informations filed against them.

56. California Penal Code § 995 provides that the superior court must set aside an information when "the defendant has been held to answer without reasonable or probable cause."

57. California Penal Code § 1538.5(i) provides for a special hearing in the superior court to determine the legality of the search and seizure. The hearing takes place after the defendant has been held to answer, but before trial.

58. Of the 69 informations filed, 16 were dismissed on all counts: Six for insufficient evidence; two in consideration of the defendant's plea in another case; three on motion of the District Attorney "in the interest of justice"; four because the defendants were certified to the juvenile court; and one because the defendant died in an automobile accident.

In eight cases where the information alleged offenses involving sales of marijuana, the District Attorney accepted a plea to a lesser felony marijuana offense and dismissed any remaining counts. In 12 cases where the most serious offense alleged was possession of marijuana, the District Attorney accepted a guilty plea to a misdemeanor and dismissed any remaining counts.

59. The elements necessary for a marijuana conviction are relatively simple. "Unlawful possession of narcotics is established by proof (1) that the accused exercised dominion and control over the contraband, (2) that he had knowledge of its presence, and (3) that the accused had knowledge that the material was a narcotic." People v. Groom, 60 Cal. 2d 694, 696, 388 P.2d 359, 361, 36 Cal. Rptr. 327, 329 (1964) (citations omitted).

60. In 27 of the 33 remaining cases where possession was the most serious offense alleged, the defendants pleaded guilty to that count, and the District Attorney moved to dismiss any remaining counts and did not oppose the recommendations of the probation officer.

61. Each of these four offenses involved a different defendant.

62. At the close of the data-gathering stage of this study, two cases were still pending.

4. *Sentencing.*

When a defendant is convicted, the judge refers his case to the Adult Division of the County Probation Department.[63] Based on interviews with the defendant and confirmation from outside sources, the Probation Department prepares an extensive report that includes information on the defendant's family, education, military service, employment experience, health, previous criminal record, and an account of the circumstances of the present offense.[64] The report usually includes the probation officer's subjective evaluation of the defendant's personality and attitudes, and a recommendation as to whether and on what conditions probation should be granted. Conditions may include incarceration in the county jail, a fine, payment of court costs and the costs of appointed counsel (if any), psychiatric treatment, or any combination of these.

The probation officer's objective in imposing conditions seems to be not only to punish the defendant but also to direct his life toward goals the officer considers constructive.[65] Where the defendant's attitude is considered poor, particularly where he continues to assert that there is nothing wrong with using marijuana, the probation officer will often recommend a short term in the county jail so that the defendant will be suitably impressed with the seriousness of his offense. If, however, the defendant is working or going to school or has definite plans to do either, the probation officer may conclude that a jail sentence would only impede progress, and he will recommend a fine instead. A frequently asserted rationale for a substantial fine ($250 to $500) is that it will pressure a previously unemployed defendant to find a paying job.

Of the 57 defendants in the sample who were sentenced for violations of the marijuana laws, 46 were recommended for probation.[66] Time in the county jail was recommended as a condition of probation in 17 cases, a fine in 12 cases, and both in three cases. Psychiatric treatment was proposed as an additional condition in six cases. In five cases no conditions were recommended.

Clearly, these recommendations carry great weight with the judges. In a third of the cases for which information was available, the actual sentence was the same as that recommended by the Probation Department; in a third

63. Defendants who plead guilty to a felony in municipal court are certified, under California Penal Code § 859(a), to superior court for sentencing. The superior-court judge then refers the case to the Probation Department.

64. These reports were available to the study in almost every case where the defendant was sentenced in either superior or municipal court.

65. The generalizations in the text are based upon the author's reading in their entirety of all of the available probation reports. In many cases the probation officer explained in the report his reasons for recommending each condition.

66. In two cases the Probation Department recommended that probation be denied. No information was available as to the recommendation in the remaining nine cases.

the actual sentence was only slightly harsher, and in a third slightly more lenient. In no case did a judge deny probation where it was recommended or grant it where it was not. In several cases the judge suspended fines on the condition that the defendants enroll in school.

Of the 40 defendants finally sentenced for possession of marijuana, two went to prison, 20 were placed on 3 years' probation and sentenced to between 60 and 90 days in the county jail, and the remaining 18 received less severe sentences, usually a period of probation plus a fine or a suspended jail sentence.

III. Costs

The most obvious costs of enforcing the law prohibiting possession of marijuana are the resources expended in apprehending offenders,[67] processing them through the judicial system,[68] and supervising their probation.[69] While no attempt was made in this study to calculate these costs in dollar terms, one recent study has estimated the statewide cost of enforcing all the California marijuana laws in 1968 at 75 million dollars.[70]

Subtler but equally significant costs of the decision to criminalize possession of marijuana derive from the effects of that decision on those who are asked to enforce it, on those against whom it is enforced, and eventually on the community at large. The extent of any police misconduct and any alienation of defendants attributable to the criminalization of possession would be difficult to measure under the best of circumstances. Any conclusions as to such costs drawn on the basis of the records left in the wake of actual prosecutions must necessarily be highly tentative. Such conclusions are advanced here for two reasons: They are consistent with the findings of other investigators, and they contribute to what is presently a very small stock of data of the kind on the basis of which rational decisions respecting the marijuana laws may be made.

---

67. Little police time is devoted specifically to the apprehension of marijuana possessors. *See* text accompanying notes 26–28 *supra*. Once violations are discovered, however, police time is consumed in arresting and booking the defendants, filing arrest reports, and (in many cases) testifying in court proceedings, especially preliminary hearings.

68. Although marijuana cases constituted 22.6% of the felony complaints filed in the study jurisdiction, it is unclear whether they consumed an equivalent portion of the resources devoted to judicial administration. There were very few actual marijuana trials in the study jurisdiction; however, in Los Angeles a higher proportion of marijuana complaints goes to trial. U.C.L.A. STUDY, *supra* note 24, at 1560. Nor is the infrequency of trials likely to be a permanent phenomenon. As an increasing percentage of the adult population uses marijuana, and as juvenile users mature, users will appear with greater frequency on jury panels. If this leads more frequently to hung juries in marijuana cases, more defendants may be expected to carry their cases to jury trial.

69. According to the Adult Probation Division of San Mateo County, in 1968 "it cost $150.80 to investigate each case and $110.13 to supervise same." ADULT DIVISION, SAN MATEO COUNTY PROBATION DEP'T, RESUME OF STATISTICAL REPORT FOR 1968, at 21 (1969).

70. L. Calof, unpublished study (1969) on file with the *Stanford Law Review*.

A. *Police Misconduct*

Jerome Skolnick, author of an empirical study that sought to establish relationships between the kinds of tasks policemen are called upon to perform and their attitudes toward the criminal process,[71] concludes that most policemen view the criminal process in terms of what has been described elsewhere as the "Crime Control Model."[72] Under this model, the basic task of the criminal process is repression of criminal conduct. The complementary Due Process Model[73] postulates a high value on individual liberty and heavy protection against error in the criminal process. Policemen resent the assumptions in the Due Process Model that their own professional standards and skills and their estimates of priorities are inadequate, and that their conduct must be subject to judicial checks and sanctions.[74]

The problems posed by police hostility toward judicial intervention are most acute with respect to those laws whose large-scale enforcement is most difficult within the framework of present search-and-seizure law. "Victimless" crimes,[75] such as the possession of marijuana for personal use, exert a special strain on the criminal process. As Professor Packer has noted, these offenses

> do not result in anyone's feeling that he has been injured so as to impel him to bring the offense to the attention of the authorities. . . . To the difficulties of apprehending a criminal when it is known that he has committed a crime are added the difficulties of knowing that a crime has been committed.[76]

---

71. J. SKOLNICK, JUSTICE WITHOUT TRIAL: LAW ENFORCEMENT IN DEMOCRATIC SOCIETY (1966).

72. The Crime Control–Due Process dichotomy is Professor Packer's. *See generally* H. PACKER, *supra* note 15, at 149–73. Professor Packer notes: "The [Crime Control Model], in order to operate successfully, must produce a high rate of apprehension and conviction, and must do so in a context where the magnitudes being dealt with are very large and the resources for dealing with them are very limited. There must then be a premium on speed and finality. . . . By the application of administrative expertness, primarily that of the police and prosecutors, an early determination of probable innocence or guilt emerges. Those who are probably innocent are screened out. Those who are probably guilty are passed quickly through the remaining stages of the process." *Id.* at 159–60. Implicit in the assumption that actual guilt can be reliably determined at the early, administrative, factfinding stages is the view that "the subsequent stages are relatively unimportant and should be as truncated as possible. . . . The pure Crime Control Model has very little use for many conspicuous features of the adjudicative process. . . ." *Id.* at 162. After there has been a determination of probable guilt, the favored way of concluding a case "is the plea of guilty; through its use, adjudicative fact-finding is reduced to a minimum." *Id.*

73. Professor Packer's Due Process Model derives in part from an appreciation of the possibilities for error in an informal factfinding process. Its adherents insist on "formal, adjudicative, adversary fact-finding processes in which the factual case against the accused is publicly heard by an impartial tribunal and is evaluated only after the accused has had a full opportunity to discredit the case against him." *Id.* at 163–64. On this model, society's interest in efficient crime control must be weighed against the value of individual liberty, and particularly against the individual's desire to be free from arbitrary arrest and unreasonable searches and seizures of his person, home, and effects, as guaranteed by the Bill of Rights and specifically the fourth amendment. Further, adherence to this concept is to be secured within the criminal process itself by excluding any evidence obtained in violation of due process norms, even if this prevents the successful prosecution of a person who has clearly committed an offense.

74. J. SKOLNICK, *supra* note 71, at 212–29.

75. For a general discussion see E. SCHUR, CRIMES WITHOUT VICTIMS (1965).

76. H. PACKER, *supra* note 15, at 151.

The law prohibiting possession of marijuana presents the enforcement agent with serious tactical problems. To verify to his own satisfaction that a violation has been committed and to facilitate proof of that fact in court, the agent must catch the suspect "holding."[77] Normally this entails a search of the suspect's person, home, or automobile, and a seizure of the goods. But the search-and-seizure prerogatives of the police are limited—in principle at least—by the provisions of the fourth amendment. Two means of satisfying the constitutional requirements—obtaining a search warrant from a magistrate and obtaining informed consent from the person to be searched—are rarely available in a marijuana-possession case.[78] Thus, in practice, the authorities can count on sustaining a prosecution against a constitutional challenge only where they can persuade a judge that the officers were able to discover the marijuana without a "search," that they had "probable cause" to believe that the automobile they searched contained marijuana,[79] or that their search was made incident to a lawful arrest.[80]

In California an arrest is lawful if it is made pursuant to an arrest warrant, if the arresting officer has reasonable cause to believe that the person to be arrested has committed a public offense in his presence, or if the officer has reasonable cause to believe that the person has committed a felony.[81] Because probable cause and reasonable cause can be very exacting standards, the policeman may find himself uncomfortably constrained in the performance of his job. Thus, as Professor John Kaplan has noted,

> [t]he policeman, caught between society's demand that, on the one hand, he enforce the laws against crimes for which no witnesses exist and, on the other hand, that he respect the constitutional imperative of probable cause before search, may take the easy way out and simply make the arrest and lie about the probable cause. This type of perjury is regrettably not uncommon.[82]

Skolnick reports on the approach taken by narcotics officers in a large northern-California city:

---

77. A person who has drugs in his possession is often referred to as "holding."

78. Search warrants were used in only three of the 92 arrest situations in the sample. In one case the defendant's parents had advised the police that there was marijuana hidden in their home. In the other two cases drugs had been observed in plain view, once by a building inspector and once by a hitchhiking deputy sheriff. Only two searches were made with the defendant's consent, although in several cases parents, having discovered some drugs, invited policemen to make further searches.

79. *See* Carroll v. United States, 267 U.S. 132 (1925). In *Carroll* the court noted that "the guaranty of freedom from unreasonable searches and seizures by the Fourth Amendment has been construed, practically since the beginning of the Government, as recognizing a necessary difference between a search of a store, dwelling house or other structure in respect of which a proper official warrant readily may be obtained, and a search of a ship, motor boat, wagon or automobile, for contraband goods, where it is not practicable to secure a warrant because the vehicle can be quickly moved out of the locality or jurisdiction in which the warrant must be sought." 267 U.S. at 153.

80. Ker v. California, 374 U.S. 23 (1963). *But see* Chimel v. California, 395 U.S. 752 (1969). In *Chimel* the court held that a search without a warrant, incident to a lawful arrest, was "unreasonable" under the fourth and fourteenth amendments where the search "went far beyond the petitioner's person and the area from within which he might have obtained either a weapon or something that could have been used as evidence against him." *Id.* at 768.

81. CAL. PENAL CODE § 836 (West Supp. 1968).

82. Kaplan, *Foreword*, U.C.L.A. STUDY, *supra* note 24, at 1504.

> The practice of making an unlawful exploratory search of the room of a suspected criminal is, so far as I could tell on several occasions, accepted by both the Westville police and the state police. As one policeman commented: "Of course, it's not exactly legal to take a peek beforehand. It's not one of the things you usually talk about as a police technique. But if you find something, you back off and figure out how you can do it legal. And if you don't find anything, you don't have to waste a lot of time."[83]

A policeman who is unwilling to lie about probable cause or to conceal a prior illegal search may still be inclined to make an arrest for possession of marijuana, even if he is aware that it will not stand up under judicial scrutiny. At a minimum he will have confiscated a supply of an illegal drug. The defendant will be jailed and have to post bail, and in many cases will have to hire a lawyer; these alone serve as forms of punishment. Finally, there is always the possibility that the defendant will plead guilty to a lesser offense rather than risk a felony conviction.[84]

Of the 92 arrest situations in the study, 80 were examined to assess the possibility of police misconduct.[85] The analysis was made on the basis of the arresting officer's sworn testimony at the preliminary hearing, or, where no testimony was available, on the basis of the officer's own reports. In at least one-fifth of the 80 cases, the data raise serious questions for the critical observer as to whether the officer had probable cause either to search or to arrest. The most common situation involved officers investigating an automobile at night for a vehicle-code violation or because they found its presence or occupants "suspicious." Neither alone gives the officer probable cause to search a car; but a search has been held to be justified by "probable cause to believe that an automobile contains articles which by law are subject to seizure."[86] Probable cause based on the existence of contraband provides an extremely convenient bootstrap justification for an officer's search: If a search uncovers marijuana, the court is likely to believe that the officer rightly suspected its presence before he undertook the search. The data suggest that the convenience of this bootstrap may have led to its widespread invocation by arresting officers.

In one case officers stopped to question four young men parked at night in an exclusive residential area. One officer stated that when he requested identification from one occupant, "as he was leaning to one side to abstract his wallet from his pocket, I was able to notice vegetable-botanical material underneath his foot on the floor-boards." Twenty grams of marijuana were discovered when the car was searched. This was one of five cases in which

83. J. SKOLNICK, *supra* note 71, at 144.

84. *See* text accompanying note 50 *supra*.

85. No investigation for police perjury was made in the cases involving sales to undercover agents; the fact situations were so complex as to preclude reliable inferences.

86. People v. Burke, 61 Cal. 2d 575, 579, 394 P.2d 67, 69, 39 Cal. Rptr. 531, 533 (1964). *Accord*, Carroll v. United States, 267 U.S. 132 (1925).

officers claimed that from outside a car at night they were able to observe marijuana seeds, marijuana debris, or a single "roach"[87] inside the car on the floor. In assessing the officers' explanations, it should be noted that the interior of an automobile is lit dimly (if at all), that the floor is generally covered with dark carpeting or rubber mats, that dirt and other debris are usually present, and that seeds and particles of marijuana rarely exceed one-sixteenth of an inch in any dimension.

In another case an officer stopped a vehicle for having an unlit license plate. He observed a regular tobacco pipe with a hinged metal cover. He asked to see it, and his examination revealed burnt residue which he later stated he could tell was from marijuana. At the preliminary hearing he testified that this type of pipe was used to "keep seeds from popping out" and that the only persons he had ever seen with this kind of pipe used it to smoke marijuana. The legality of the search was upheld.

In another case officers investigating an unlocked parked car stated that they observed an open purse on the back seat containing a rolled envelope with a message written on it. Upon handling the envelope and feeling a "crunchy material," they looked inside and found marijuana. It is hard to see how the officers could have believed they had probable cause to make such a search. The court agreed, and the case was dismissed.

In four instances in the sample, the case for probable cause was based in part on the officers' testimony that they detected the odor of burning marijuana. That odor *is* distinctive. In one of these cases, however, the officer claimed to have detected it in an open park; and in another it was claimed that the smoke came billowing out of an automobile in "great amounts" when a window on the passenger's side was lowered, even though this occurred some time after the door on the driver's side had been opened.

Another group of cases involved probable cause based on "furtive gestures." The Supreme Court of California has held that where an officer "saw defendant's furtive action in getting out [of a cab] he had reasonable grounds to believe that [defendant] was hiding contraband and the search of the cab was therefore reasonable."[88] As other investigators have noted:

> The furtive motion authorizing a search usually results as the officer is pulling a car over for a minor traffic violation. The arrest reports typically state that as he shined his lights on the back of the car, the patrolman saw one of the occupants make a "furtive motion" as if to hide or throw away something. . . . This provides the police officer with an almost irrefutable method to "write-in" probable cause . . . .[89]

Where an officer searches a car without pausing to puzzle about constitutional probable cause and finds what he thought he might find, he may not

87. The unburned end, or "butt," of a marijuana cigarette.
88. People v. Blodgett, 46 Cal. 2d 114, 117, 293 P.2d 57, 58 (1956) (citations omitted).
89. U.C.L.A. STUDY, *supra* note 24, at 1534 (footnote omitted).

have much trouble "recalling" a furtive gesture. In four cases in the San Mateo sample, officers stated that at night from outside the vehicle, they observed suspects inside the vehicle make "furtive gestures" as if to hide contraband.

Since a search may be made incident to a lawful misdemeanor arrest, officers who desire to search for drugs may be tempted to make arrests for offenses that they would ignore under other circumstances.[90] In one case in the sample, a search was made after the adult occupants of an automobile were arrested for contributing to the delinquency of a minor present in the car by permitting him to remain out past the juvenile curfew time. In a second case a young man found asleep in his Volkswagen bus was placed under arrest for disorderly conduct because he was unable to produce any personal identification. Marijuana was found during a search incident to each of these arrests.[91]

Three things are clear: (1) In most cases marijuana is found only after the police make a search; (2) some policemen, at least, feel there is nothing wrong in "getting around" the fourth amendment; (3) the physical characteristics of marijuana provide ample opportunities for policemen so inclined to fudge on the issue of probable cause.[92] The information available for the arrest situations in the sample suggests that in some cases these three elements coalesced in police misconduct.

Police misconduct of this kind has several undesirable results. The invasions of privacy themselves will disturb those citizens who value the right to be free from unreasonable police intrusions. The resentment of those actually searched, especially those who are innocent, can only further the general deterioration of police-community relations. As a practical matter, the courts cannot effectively supervise the police.[93] If due process is ever achieved at the initial-enforcement level, it will be because the police have

90. Although *Chimel v. California*, 395 U.S. 752 (1969), prohibits general searches of the suspect's home, its impact on marijuana enforcement is likely to be limited, since in many cases the marijuana is found on the suspect's person. Further, since marijuana is often found during the search of an automobile incident to the arrest of one or more of its occupants even where there is no probable cause to believe that the automobile contains contraband, a search of the automobile may be held to be within the scope permitted under *Chimel*.

91. The sample contains several other cases of the same kind. In one instance an officer observed a Negro male talking with two white females in the vicinity of a freeway on-ramp. The officer investigated because he thought the girls were under 18. When asked for identification the man gave his name and said he was over 18 but had no identification. The officer ran a radio check and was advised that the suspect was a known marijuana user. He then asked the suspect for identification a second time and asked him to empty his pockets. This produced a pipe and a package of cigarette papers. The officer testified later: "I could observe the material of a plastic—a waxed paper bag sticking out [of the defendant's pocket]—approximately, oh, a quarter-inch to a half-inch. The pocket was bulging." The officer removed a bag which did indeed contain marijuana. Although the evidence was admitted at the preliminary hearing, it was suppressed in superior court prior to trial.

92. Not only is the marijuana itself relatively more bulky per dose than other drugs, but its use usually involves distinctive paraphernalia: cigarette papers, water pipes, and "roach clips" (used to hold a roach while it is smoked to the very end). Burning marijuana produces a distinctive odor. If the user is not tidy while rolling "joints" or filling his pipe, he may leave traces of marijuana which judges are apparently prepared to believe can be identified as such with the naked eye.

93. *See* text accompanying note 83 *supra*.

come to consider respect for due process rights to be as important a part of their job as efficient crime control. Society cannot reasonably expect policemen to develop this attitude so long as it calls on them to enforce laws the thorough enforcement of which is incompatible with the fourth amendment and with due process.

Arguably, even in the absence of the marijuana laws the abuses outlined would continue to occur at the current level, but in connection with enforcement of the dangerous-drug laws. There is good reason to believe that this is not the case. Since dangerous drugs are generally easier to conceal, do not produce any residue such as seeds or "roaches," and have no distinctive odor, they present fewer opportunities for policemen to persuade courts that evidence of contraband was in open view. Moreover, absent the laws against marijuana, so long as the level of dangerous-drug use remained significantly lower than that of marijuana use,[94] the chances that searches on mere suspicion would yield contraband might well drop to the point where policemen would conclude that to search was not worth the effort.

B. *Effects on Defendants*

There is good reason to suspect that the processing of many marijuana users as criminals affects their attitudes and their behavior in ways that are healthy neither for the defendants nor for the larger community. This section explores the possible implications of the sample data for this proposition.

It has been argued from a number of different standpoints that enforcement of the marijuana laws contributes significantly to the alienation of those against whom they are enforced.[95] An "alienated" person, for purposes of the discussion in this Note, is "one who has been estranged from, made unfriendly toward, his society and the culture it carries."[96] Alienation is a process by which attitudes change. Of particular concern are attitudes toward the legal system. The suggestion that criminalization of marijuana possession results in the alienation of defendants generally or of certain groups of them means that as a result of the treatment they receive they become: (1) less inclined to value adherence to the law for its own sake, (2) less inclined to favor the political process underlying the existing legal system as a means of ordering society, (3) more inclined to view the society whose interests the law serves as corrupt, and (4) more skeptical about the

95. Dr. Roger O. Egberg, Assistant Secretary of Health, Education, and Welfare for Medical and Scientific Affairs, has said the marijuana laws could "alienate a whole generation of Americans." San Jose Mercury, Sept. 26, 1969, at 21, col. 2. *Accord*, H. PACKER, *supra* note 15, at 340–41.

96. Nettler, *A Measure of Alienation*, 22 AM. SOCIOL. REV. 670, 672 (1957).

value of applying their energies to tasks which are "constructive" in the general view.

If indeed these attitudinal changes occur, society almost certainly will bear some costs as a result. At a minimum, to the extent that alienated marijuana defendants dissociate themselves from society, society loses the contributions they might otherwise have made as workers and citizens. And additional expenditures of resources may be required to combat tendencies within the alienated group toward criminal activity, including illegal forms of political participation.

Ascertaining the extent to which costs of this kind are attributable to the marijuana laws is an important factor in a rational reassessment of these laws. Judging from the current state of the literature, no one has yet undertaken to measure them directly. The most helpful study would compare the attitudes and behavior of marijuana defendants before and after their experience with the criminal system. But a serious practical obstacle to such a study is the near impossibility identifying and testing marijuana arrestees before they are arrested.

This Note presents the case—based on the sample data—that, pending more formal studies, evaluation of the marijuana laws should proceed on the assumption that their enforcement gives rise to significant social costs deriving from the alienation of defendants. That case rests on data about the characteristics of the defendants and the treatment they receive. To summarize the case in advance, defendants whose past experiences and current attitudes render them susceptible to alienation are brought to see the criminal system as one which: (1) punishes certain kinds of conduct without justification, (2) apprehends and convicts people by means that are unjust even by its professed standards, (3) sacrifices, out of simple expediency, the logic by which it apportions punishment to crime, and (4) selects for punishment, among those who commit the same crime, a particular few who pursue "deviant" life styles which are in no sense criminal in themselves. For some defendants, the deleterious effects of criminal treatment end there. Others experience, in addition, (5) intensive exposure at a relatively young age to the prison environment, and (6) a police record destined to interfere with subsequent attempts to reintegrate themselves into society.

1. *Characteristics.*

Not every marijuana prosecution can be expected to lead to socially costly alienation. Some defendants have already adopted a delinquent life style, as evidenced by an extensive record of past criminal activity. Others presumably have long-standing hostility toward society and will not be appreciably affected by a single interaction with the criminal system. Elimi-

nation of the defendants in the San Mateo County sample who apparently fall into one or the other of these categories leaves a large contingent,[97] 67 percent of the sample, for whom the available data suggest neither particularly deep integration into the mainstream of society nor such antisocial feelings that society should have been concerned about exacerbating any tendencies in that direction.

The median age of this group was 20 years. No defendant in the group had ever been sentenced to jail, and only 40 percent had had any prior significant contact with the police. Some 40 percent were out of school and unemployed; 42 percent of the group as a whole had never finished high school, and another 20 percent were college dropouts. And there is additional evidence that the commitments of the group generally to adult middle-class social and moral conventions were partial and conditional at best. All, or nearly all, smoked marijuana; many did other "deviant" things;[98] many looked like, and some presumably were, "hippies."[99] These facts are not conclusive on the issue of whether these defendants were susceptible to alienation through criminal treatment based on their marijuana use. They do suggest that the implications of the decision to smoke marijuana are worth further exploration.

To some extent the very existence of the antimarijuana laws fosters alienation among those who smoke. Respect for the legal and political system is not fostered "when young people who, rightly or wrongly, feel that marijuana is no more dangerous than alcohol are told that their vice is a felony while that of their elders is at most an indiscretion."[100] The law prohibiting possession turns generally law-abiding citizens into serious criminals. Marijuana use becomes of necessity a somewhat clandestine activity, and the user's need to conceal his activity from those who might inform the police prompts him to view the world in terms of "them" and "us." Those whom he considers straight—parents, teachers, employers—will often be spokesmen for social norms which the user rejects in part because of antipathy generated over the marijuana issue. For instance, a drug educator who describes marijuana as a very dangerous drug to students whose personal experience indicates otherwise may not be believed when

97. It is difficult to identify from the available data those "nondelinquent" defendants whose relevant views and values were most likely to be sufficiently stable to withstand the stresses of criminal processing. For purposes of the analysis in text, we have assumed that this kind of stability correlates significantly with age, and have eliminated from the total sample those defendants who were over the age of 26.

98. For example, at least 10% of the defendants were participating in communal living arrangements.

99. Remarks in police and probation reports indicate that a large number, perhaps up to 50%, of marijuana defendants look like "hippies." This was corroborated in conversations with Deputy District Attorneys and by observations during the several months spent gathering data at the municipal and superior courts.

he describes the dangers of amphetamine abuse, which unfortunately are all too real.[101]

2. *Treatment.*

Undoubtedly any previous feeling as to the hypocrisy of the marijuana laws will be felt more strongly when the laws have an immediate and personal impact. For those arrested this impact includes not only the immediate burden of defending a criminal charge but long-term effects as well. The stigma of an arrest record and a criminal conviction may make it more difficult for the defendant to get a job and may label him as an "undesirable" in some circles. Although most convicted offenders in the sample were granted probation, more than half were sentenced to several months in the county jail, with the attendant enforced companionship of some of society's least savory members.

Prosecution for a marijuana crime gives many users their first opportunity to form strong firsthand convictions about the police and the courts. Defendants are probably aware of any police misconduct in their own cases, and some at least will infer that illegal searches and arrests are widespread and well tolerated in the system of criminal justice. A conviction that rests on what the defendant perceives as the abuse and disregard of constitutional freedoms can hardly be expected to engender respect for the criminal system. Similarly, although plea bargaining may in some cases permit a defendant to escape a felony conviction, he may find the practice, based largely on expediency, hard to reconcile with the idealistic notion that it is just to punish a man for what it can be shown he has done, and not simply for what he will admit to out of self-interest. This reconciliation will be especially difficult for those defendants who believe that the district attorney has accepted their lesser plea to avoid a constitutional challenge to the search on which the arrest was based.

Finally, present enforcement patterns may also encourage defendants to believe in the essential unfairness of a legal system that seems to have selected them arbitrarily for punishment from among vast unpunished numbers of users. Even at present high arrest levels it is clear that only a small percentage of marijuana users are ever caught.[102] Since most users are discovered in connection with routine police work, those who have the means and good sense to confine their marijuana possession to places where

101. *Id.* at 1503.

102. A recent Gallup Poll estimates that 10 million adult Americans have used marijuana. *See* note 12 *supra*. In testimony before the Juvenile Delinquency Subcommittee of the United States Senate, John E. Ingersoll, Director of the Federal Narcotics Bureau, placed the number of arrests in 1968 by state and local authorities for narcotics and marijuana violations at 162,177. Of these, 43,000 arrestees were under 18 years old. N.Y. Times, Sept. 16, 1969, § 1, at 34, col. 3.

the police are unlikely to appear are very nearly immune from arrest.[103] Those who carry marijuana on their person in public or in automobiles run a much greater risk, especially if their outward appearance draws attention. Where an officer has discretion, he tends to direct his attention toward those whom his experience tells him are most likely to be doing something illegal.[104] Indeed, this ability to isolate potential lawbreakers from all those he encounters may be in general a very desirable characteristic in patrolmen. But the high visibility of "hippie" types and the widely publicized correlation between the "hippie" life style and drug use mean that they will receive a good deal of police attention.[105] As the sample reveals, they account for a high percentage of those arrested. Defendants in this category may feel, rightly or wrongly, that, because of their life style, the police have singled them out for prosecution from all those who use marijuana. These suspicions may not be unwarranted. According to one investigator who interviewed policemen to discover their attitudes toward marijuana use,

> [t]he main evil and danger which these officers felt was presented by wide-spread use of marijuana was the creation and perpetuation of a life style and set of attitudes and actions which was contrary to the values of the society as a whole. . . . They pictured marijuana as a central tenet and foundation, and in some cases as the cause, of a way of life which they completely disapproved of. For them, marijuana leads to a life characterized by irresponsibility, escapism, long hair, dirty clothes and immoral activity.[106]

Any defendant who harbors the suspicion that police antipathy toward his life style motivated his arrest may find it reinforced by the Probation Department's efforts to channel him along more conventional paths.[107]

If, as the data seem to indicate, a fair percentage of marijuana defendants come away from their experience with the criminal law with increased feelings of alienation, it seems likely that the existence of a drug subculture will amplify that effect.[108] Defendants can be expected to recount their travails to their friends, some of whom will be drug users and perhaps past defendants themselves, and who will empathize with and reinforce the defendant's new attitudes. Thus the defendant's bonds with the drug subculture may be strengthened, and even marijuana users who are never apprehended may experience vicariously the deleterious effects of criminal treatment.

IV. Possibilities for Cost Reduction

This Note has focused on the "costs" resulting from the decision to criminalize the use and possession of marijuana. It has called attention to the obvious cost of processing tens of thousands of defendants through the system of criminal adjudication. It has suggested that there may well be other costs not so apparent: increased alienation of the defendants and the adoption of unhealthy police practices. We turn now to a brief discussion of possible ways to reduce these costs.

Given the apparent desire of the majority of the public to retain restrictions on marijuana use,[109] lawmakers are faced with the dilemma of lowering the demonstrably high cost of the law against possession while at the same time reducing or at least containing present use. Assuming, as the drafters of the major recent proposals in California have done, that selling marijuana should continue to constitute a crime, the important question is how, if at all, the state should punish the person who uses but does not sell. The basic choice is between reducing the penalties for possession and eliminating them altogether.

The California Legislature has recently taken steps to reduce the penalties for possession. Under a recent amendment to section 11,530 of the California Health and Safety Code,[110] a judge now has discretion to sentence a possession violation as a misdemeanor even in cases that were tried as felonies. A Penal Code amendment[111] soon to come into effect will allow the prosecutor, at his discretion, to allege a possession violation as either a felony or a misdemeanor at the beginning of a case, with misdemeanors being tried in the municipal courts. A proposal recently endorsed by the delegates to the convention of the California State Bar Association would go even further and reduce the first offense for possession of up to 5 grams of marijuana[112] to a misdemeanor in every case.[113]

Assuming either that the State Bar proposal is enacted or that district attorneys will routinely prosecute cases of possession of small amounts as misdemeanors, some cost reduction seems certain. Convicted defendants

109. Twenty-six percent of the respondents in a recent copyrighted poll of California adults favored strict enforcement of present marijuana laws, and 49% wanted new laws with more severe penalties. The California Poll, Field Research Corp., Release No. 634, May 21, 1969.

110. *See* note 28 *supra*.

111. Senate Bill No. 1032, ch. 1144, enacted Aug. 30, 1969, *reported in* 1969 West's Calif. Legislative Serv. 2194, *amending* Calif. Penal Code § 17 (West Supp. 1968).

112. Although only about one-half of the defendants in the sample possessed less than 5 grams of marijuana at the time of arrest, if the amount possessed became legally significant presumably most users could adapt their holding pattern to escape felony charges. Thus if a person's entire supply of marijuana exceeded 5 grams, he could conceal that so that the police would not discover it without a search warrant and could withdraw something less than 5 grams for those times when he wanted the drug readily accessible. This assumes that users will take precautions where possible to avoid discovery. However, the arrest situations in the sample reveal that many defendants are quite careless in this respect.

113. San Francisco Chronicle, Sept. 9, 1969, at 1, col. 1.

will not bear the stigma of felony convictions. The less formal nature of proceedings in misdemeanor cases will probably reduce the consumption of judges' and lawyers' time, especially if defendants tend to plead guilty to misdemeanor charges where before they would have contested felony charges. Under the State Bar proposal, there would be very little room for plea bargaining; and under the amendment of Penal Code § 17, while plea bargaining would probably take place in connection with the district attorney's decision whether or not to allege a felony, at least it would be sanctioned by law and will not appear to the defendants as a sub rosa affair. Nothing in the State Bar proposal suggests that it would ameliorate the problem of selective enforcement, whether real or perceived, nor can those who feel that there is nothing wrong with marijuana use be expected to be appreciably less alienated because it is only being punished as a misdemeanor. However, if the actual sentences received become generally less severe, the impact of any alienating treatment and any costs associated directly with incarceration may be significantly diminished.

It is not at all clear that merely reducing the penalties for marijuana possession will cut down either the number of arrests for marijuana possession or the extent of police misconduct related to those arrests.[114] By contrast, legislative action to legalize possession for personal use, retaining the criminal sanction only for commercial dealers, would eliminate the costs of the current law against possession. It is clear, however, that at present such a proposal is not politically viable in California. The law professors commissioned by a joint committee of the state legislature to draft a comprehensive revision of the Penal Code recently incorporated such a proposal into its *Proposed Tentative Draft.*[115] The joint committee reacted to this proposal (among others) as "political suicide," and fired most of the revision staff.[116]

If the scientific demonstration of social costs and benefits from the criminalization of marijuana has any substantial role to play in the politics

114. It is difficult to predict the effect of penalty reduction on police behavior. Officers would still be free to search cars where they had probable cause to believe that marijuana was present, because it would remain a contraband. In other cases probable cause to believe that marijuana was present would probably justify an arrest on the theory either that any possession is a potential felony (under the present law) or that where an officer detects some marijuana he is reasonable in believing that there is more than 5 grams present. Arguably, the abolition of a routine examination of search-and-seizure questions at the preliminary hearing would allow for greater police misconduct; however, defense attorneys could still have those issues adjudicated before trial under Penal Code § 1535.8. And it might well develop that if possession were reduced to misdemeanor status, police would feel less impelled to make unreasonable searches, either because they would conclude that a misdemeanor conviction was not worth the effort or because they would conclude from the fact that the legislature had reduced the penalty that perhaps marijuana use was not as harmful as they had previously thought.

115. STATE OF CALIFORNIA JOINT LEGISLATIVE COMMITTEE FOR REVISION OF THE PENAL CODE, PROPOSED TENTATIVE DRAFT—DRUGS—PART I: MARIJUANA (1968).

116. Moore, *Penal Code Expert Tells Pressure on Revision*, San Francisco Chronicle, Sept. 24, 1969, at 8, col. 1. *See* letter from Professors Herbert L. Packer and Sanford H. Kadish to California State Senator Donald Grunsky, 1969, in 22 STAN. L. REV. 160 (1969).

of marijuana legislation, then clearly there is still important work to be done. Costs deriving from police misconduct and the alienation of young people will not be eliminated, and may not be significantly reduced, merely by lowering the penalties for marijuana use. If further scientific study is a political prerequisite to legalization, these subtle costs should be thoroughly explored.

The data and the interpretation offered in this Note have direct and current relevance, despite the incompleteness of cost studies to date. Unless and until the case is rebutted, those who are responsible for the shaping and the enforcement of the marijuana laws would do well to proceed on the assumption that society is now paying significant costs well beyond the current dollar costs of enforcement—that it is disinvesting in the integrity of its police and the future of its youth.

Report on
Midwest American Assembly
February 9-11, 1975
Illinois Beach State Lodge
Zion, Illinois

PRISONERS IN AMERICA

Sponsored by:
Chicago State University
and
The American Assembly
Columbia University

PREFACE

On February 9, 1975, a group of 60 Americans from 8 midwestern states representing government (federal, state and local), medicine, communications, the legal profession (bench and bar), business, education (faculty, administration and students), the clergy, civic organizations and many other walks of life met at the Illinois Beach State Lodge in Zion, Illinois, for a Midwest American Assembly on corrections. For two days the participants discussed in depth the problems of the American correctional system, and on the third day in plenary session they reviewed the report of recommendations which appears on these pages.

As background reading for this American Assembly, participants were provided in advance with copies of *Prisoners in America,* edited by Dr. Lloyd E. Ohlin, professor of criminology at the Harvard Law School.

The American Assembly, a national, non-partisan educational institution, takes no stand on the subjects it presents for public discussion. The findings in the reports are those of the participants in their private capacities and the opinions in the background volume belong to the authors themselves. Nor is the Ford Foundation, which generously supported this American Assembly program, to be associated with the views in the book or the report.

Clifford C. Nelson
President
The American Assembly

FINAL REPORT
of the
MIDWEST AMERICAN ASSEMBLY
ON CORRECTIONS

At the close of their discussions the participants in the Midwest American Assembly on *Prisoners in America,* at Illinois Beach State Lodge, Zion, Illinois, February 9-11, 1975, reviewed as a group the following statement. The statement represents general agreement; however, no one was asked to sign it. Furthermore, it should not be assumed that every participant subscribes to every recommendation; some participants, in fact, sharply disagree.

I. Public drunkenness should be decriminalized. Alternative support services in the community, such as hospitals, mental health units, detoxification centers and alcoholic rehabilitation centers should be established and made available in place of arrest and confinement. Decriminalization should be coupled with acceptance of personal and public responsibility for referring such persons to programs and/or agencies capable of dealing realistically with the problem. No one should be put in jail solely for drunkenness.

II. The possession for personal use of a small amount of marijuana (less than 1½ oz.) should be decriminalized. Decriminalization of possession of drugs (controlled substances) for personal use should be coupled with legislation controlling distribution of such drugs. Incarceration in a penal institution does not solve the problem.

III. Vagrancy should be decriminalized.

IV. Children who are truant, stubborn, "incorrigible", or in other ways ungovernable, should not be processed by the criminal justice system. Such conduct should not be classified as delinquent. No minor should either be taken into custody or confined for acts that are not defined as criminal for adults. Children who are neglected should have services available to them outside the criminal justice system. Greater emphasis should be placed on holding parents responsible for the acts of their children.

V. The criminal justice system should seek more alternatives to pretrial detention of those accused of crimes, such as the greater use of bail, reduced bail, or release on recognizance. The present system should be modified so as to remove its present discriminations against the poor, and the burden of proof for the necessity for detention should be placed upon the criminal justice system. In minor violations, summons should be used in place of arrest. Courts should speed up the judicial process by holding defense and prosecuting attorneys responsible for delays caused by repeated continuances. This will require a significant increase in the numbers of personnel

involved in the judicial process. Standards should be developed regarding time between arrest and arraignment and between arraignment and trial. Both prosecution and defense should prepare cases for trial on time or the courts should use their powers to cite them for contempt.

There should be court-appointed counsel for indigent individuals at bail or bond hearings. Courts should experiment with methods of reducing pre-conviction detention time, such as greater use of night courts and the use of special closed-circuit television lines between courts and police lock-ups.

VI. There should be state control and regulation of jails and houses of correction to uphold uniform standards and goals, provide for regular inspection and ensure proper care of prisoners. Legislation should provide for the enforcement of state regulations and there should be penalties affixed for failure to abide by the regulations. Local jails should provide correctional services and programs for the accused and convicted. States should develop subsidy programs to encourage and assist cities and counties to upgrade jails and local detention facilities for inmates and staff.

VII. States should be encouraged to develop regional multi-purpose community-based correctional facilities and programs. In order for community-based corrections to be effective, society must reexamine its values, seeking to increase its sense of responsibility for the rehabilitation of the offender.

VIII. Criminal justice agencies should be encouraged to divert non-violent offenders prior to trial on a voluntary basis to specially designed and operated pre-trial diversion centers or other alternative programs. Institutionalization should be a measure of last resort. The burden of proof for the necessity of institutionalization should always rest upon the criminal justice system and the minimum punishment indicated should always be meted out.

The danger of pre-trial diversion as an alternative to conviction and incarceration is that some persons may be coerced into participating in such programs even though they have not been convicted of any crime. Diversional decisions should not be made without defense counsel being present.

IX. Correctional facilities are used to confine offenders as punishment and to protect the public. These institutions should also be designed and used so that they meet the needs of inmates and of society and not solely the needs of the institutions. Imprisonment should be used as little as possible as should incarceration in maximum security facilities. While society clearly requires protections from certain offenders, the dehumanizing effects of imprisonment and its negative effects on the possibilities of rehabilitation make it of questionable value except as a measure of protection in the last resort.

X. Major emphasis should be placed on the use of adequate alternatives to incarceration. The construction of new corrections facilities should

call for total systems-planning with the goal of reducing the number of persons incarcerated. We believe humane conditions are a constitutional right, and existing correctional structures which deny these rights should be renovated or replaced by new structures.

XI. Participation in correctional programs should be voluntary and not a condition for probation and/or parole.

XII. States should try to develop collaborative correctional programs with sentenced offenders, paraprofessionals and community volunteers.

XIII. Grievance procedures to safeguard the rights of prisoners in confinement or under supervision in the community should be developed. Prison systems should have independent ombudsmen with unlimited access to institutions, prisoners and staff to investigate on their own initiative or upon request all matters relating to conditions in prisons and alleged violations of prisoner rights. There should be established by law at every level — city, county and state — citizen's committees reporting directly to the chief executive officer of the jurisdiction to resolve disputes between inmates and correctional agencies which cannot be resolved by other means. Correctional agencies should provide inmates of institutions with public defenders physically situated in prison to review inmate legal needs. Inmates, upon entering an institution, must be informed in writing about the rules and regulations of the institution and they must have their rights clearly explained to them.

XIV. The convicted offenders in the institution should have the right to legal counsel, especially in the case of parole hearings. In addition, persons on parole or probation should be represented by an attorney at all parole and probation revocation hearings.

XV. The management and operation of correctional facilities and services should be made more open and accessible to the public and the media and be subject to inspection and periodic review by accredited agencies, boards and commissions including individuals and groups involved in projects of research.

XVI. Because we believe in abandoning the concept of large institutions, we urge the development of small residential and non-residential community-based facilities for experimental purposes so that the effectiveness of such agencies can be properly tested.

XVII. Local, state and federal governments should establish subsidy programs as a means of reducing prison populations and encouraging the development of community-based services. Parole, probation, community-based services and other alternatives to incarceration should be encouraged.

XVIII. To the greatest extent possible, correctional agencies should purchase educational, vocational, psychological, therapeutic and general correctional services from private organizations and agencies capable of delivering these services.

XIX. (a) There should be much greater attention given to the plight of the victims of criminal acts with concentration on better means of victim compensation and restitution.

(b) The use of the indeterminate sentence should be eliminated.

(c) Serious consideration should be given to shorter sentences.

(d) There should be higher standards for employment of corrections personnel with proper screening procedures to eliminate those who act out their own pathology on prisoners. The training of such personnel also needs to be strengthened and improved.

(e) Correctional facilities should have available to inmates adequate vocational, educational, medical and religious and therapeutic programs.

(f) Uniformity of sentencing should be studied on a nationwide basis.

(g) Federal legislation should require special affirmative action programs for business, industry and the public sector, stating that no employers can refuse to hire persons because of previous conditions of penal servitude.

The above nineteen statements and recommendations represent the best collective thinking and wisdom of the participants in the Assembly, though as earlier noted, it should not be assumed that each individual subscribes wholly to every statement in the report. The participants are mindful of the value of hard data in making judgments in this entire area and to that end strongly encourage the continuation and the enlargement of all responsible research activity by competent individuals in the entire corrections field.

ABOUT THE AMERICAN ASSEMBLY

The American Assembly was established by Dwight D. Eisenhower at Columbia University in 1950. It holds nonpartisan meetings and publishes authoritative books to illuminate issues of United States policy.

An affiliate of Columbia, with offices in the Graduate School of Business, the Assembly is a national, educational institution incorporated in the State of New York.

The Assembly seeks to provide information, stimulate discussion and evoke independent conclusions in matters of vital public interest.

marihuana: a signal of misunderstanding

First Report
of the National
Commission on
Marihuana and
Drug Abuse

March 1972

National Commission on Marihuana and Drug Abuse
801 19th Street N.W.
Washington, D.C. 20006

March 22, 1972

To The President and Congress of the United States:

As Chairman of the National Commission on Marihuana and Drug Abuse, I am pleased to submit to you our first year Report in conformance with the mandate contained in Section 601 of Public Law 91-513, The Comprehensive Drug Abuse Prevention and Control Act of 1970.

This Report "Marihuana, A Signal of Misunderstanding" is an all-inclusive effort to present the facts as they are known today, to demythologize the controversy surrounding marihuana, and to place in proper perspective one of the most emotional and explosive issues of our time. We on the Commission sincerely hope it will play a significant role in bringing uniformity and rationality to our marihuana laws, both Federal and State, and that it will create a healthy climate for further discussion, for further research and for a continuing advance in the development of a public social policy beneficial to all our citizens.

Whatever the facts are we have reported them. Wherever the facts have logically led us, we have followed and used them in reaching our recommendations. We hope this Report will be a foundation upon which credibility in this area can be restored and upon which a rational policy can be predicated.

By Direction of the Commission

Raymond P. Shafer

Raymond P. Shafer
Chairman

J. Thomas Ungerleider, M.D.
Mitchell Ware, J.D.

V
marihuana and social policy

"The difficulty in life is the choice."
George Moore (1900)

A constant tension exists in our society between individual liberties and the need for reasonable societal restraints. It is easy to go too far in either direction, and this tendency is particularly evident where drugs are concerned.

We have guided our decision-making by the belief that the state is obliged to justfy restraints on individual behavior. Too often individual freedoms are submerged in the passions of the moment, and when that happens, the public policy may be determined more by rhetoric than by reason. Our effort has been to minimize the emotional and emphasize the rational in this Report.

Drugs In a Free Society

A free society seeks to provide conditions in which each of its members may develop his or her potentialities to the fullest extent. A premium is placed on individual choice in seeking self-fulfillment. This priority depends upon the capacity of free citizens not to abuse their freedom, and upon their willingness to act responsibly toward others

83-313 O - 77 - 11

and toward the society as a whole. Responsible behavior, through individual choice, is both the guarantor and the objective of a free society.

DRUGS AND SOCIAL RESPONSIBILITY

The use of drugs is not in itself an irresponsible act. Medical and scientific uses serve important individual and social needs and are often essential to our physical and mental well-being. Further, the use of drugs for pleasure or other non-medical purposes is not inherently irresponsible; alcohol is widely used as an acceptable part of social activities.

We do think the use of drugs is clearly irresponsible when it impedes the individual's integration into the economic and social system. A preference for individual productivity and contribution to social progress in a general sense still undergirds the American value structure, and we emphasize the policy-maker's duty to support this preference in a public policy judgment.

At the same time, in light of the emerging leisure ethic and the search for individual meaning and fulfillment noted in Chapter I, we cannot divorce social policy from the questions raised by the recreational use of drugs. Productivity and recreation both have a place in the American ethical system. They are not inconsistent unless the individual's use of leisure time inhibits his productive role in society.

Drugs should be servants, not masters. They become masters when they dominate an individual's existence or impair his faculties. To the extent that any drug, including alcohol, carries with it risks to the well-being of the user and seriously undermines his effectiveness in the society, that drug becomes a matter of concern for public policy.

An essential step in the process of policy-formation is a determination of the circumstances under which use of any given drug poses such risks. For some drugs, the risks may be so great that all permissible measures should be taken to eliminate use. For other drugs, such risks may be present only under certain specific circumstances, in which case society may defer to responsible individual choice on the matter of recreational use but take appropriate steps to minimize the incidence and consequences of dysfunctional use. In our Report next year, for which studies are already underway, we will consider from this perspective the whole range of drugs now used for non-medical purposes.

A Social Control Policy for Marihuana

In formulating a marihuana policy, our strongest concern is with irresponsible use, whether it be too often, too much, indiscriminate, or under improper circumstances. The excessive or indiscriminate use of

any drug is a serious social concern; and this is particularly true of marihuana since we still know very little about the effects of long-term, heavy use. We have little doubt that the substantial majority of users, under any social control policy, including the existing system, do not and would not engage in irresponsible behavior.

In identifying the appropriate social control policy for marihuana, we have found it helpful to consider the following policy options:

I Approval of Use.
II Elimination of Use.
III Discouragement of Use.
IV Neutrality Toward Use.

APPROVAL OF USE

Society should not approve or encourage the recreational use of *any* drug, in public or private. Any semblance of encouragement enhances the possibility of abuse and removes, from a psychological standpoint, an effective support of individual restraint.

For example, so long as this society (not only the government, but other institutions and mass advertising as well) in effect approved of the use of tobacco, the growing medical consensus about the dangers of excessive use did not make a significant impression on individual judgment. With the Surgeon General's Report on Tobacco in 1964, *Smoking and Health*, a very real change has occurred in the way society now thinks about cigarettes.

The institutions of society definitely add their influences to the variety of social pressures which persuade individuals to use any kind of drugs. Rational social policy should seek to minimize such social pressures, whether they come from peers, from the media, from social custom, or from the user's sense of inadequacy. Official approval would inevitably encourage some people to use the drug who would not otherwise do so, and would also increase the incidence of heavy or otherwise irresponsible use and its complications. On this basis we reject policy option number one, approval of use.

ELIMINATION OF USE

For a half-century, official social policy has been not only to discourage use but to eliminate it (option number two). With the principal responsibility for this policy assigned to law enforcement, its implementation reached its zenith in the late 1950's and early 1960's when marihuana-related offenses were punishable by long periods of incarceration. This policy grew out of a distorted and greatly exaggerated concept of the drug's ordinary effects upon the individual and the society. On the basis of information then available, marihuana

was not adequately distinguished from other problem drugs and was assumed to be as harmful as the others.

The increased incidence of use, intensive scientific reevaluation, and the spread of use to the middle and upper socioeconomic groups have brought about the informal adoption of a modified social policy. On the basis of our opinion surveys and our empirical studies of law enforcement behavior, we are convinced that officialdom and the public are no longer as punitive toward marihuana use as they once were.

Now there exists a more realistic estimate of the actual social impact of marihuana use. School and university administrators are seldom able to prevent the use of marihuana by their students and personnel and are increasingly reluctant to take disciplinary action against users. Within the criminal justice system, there has been a marked decline in the severity of the response to offenders charged with possession of marihuana.

In our survey of state enforcement activities, only 11% of all marihuana arrests resulted from active investigative activity, and most of those were in sale situations. For the most part, marihuana enforcement is a haphazard process; arrests occur on the street, in a park, in a car, or as a result of a phone call. Among those arrested, approximately 50% of the adults and 70% of the juveniles are not processed through the system; their cases are dismissed by the police, by the prosecutors or by the courts. Ultimately less than 6% of all those apprehended are incarcerated, and very few of these sentences are for possession of small amounts for personal use.

In the law enforcement community, the major concern is no longer marihuana but the tendency of some users to engage in other irresponsible activity, particularly the use of more dangerous drugs. Official sentiment now seems to be a desire to contain use of the drug as well as the drug subculture, and to minimize its spread to the rest of the youth population. Law enforcement policy, both at the Federal and State levels, implicitly recognizes that elimination is impossible at this time.

The active attempt to suppress all marihuana use has been replaced by an effort to keep it within reasonable bounds. Yet because this policy still reflects a view that marihuana smoking is itself destructive enough to justify punitive action against the user, we believe it is an inappropriate social response.

Marihuana's relative potential for harm to the vast majority of individual users and its actual impact on society does not justify a social policy designed to seek out and firmly punish those who use it. This judgment is based on prevalent use patterns, on behavior exhibited by the vast majority of users and on our interpretations of existing medical and scientific data. This position also is consistent with the estimate by law enforcement personnel that the elimination of use is unattainable.

In the case of experimental or intermittent use of marihuana, there is room for individual judgment. Some members of our society believe the decision to use marihuana is an immoral decision. However, even during Prohibition, when many people were concerned about the evils associated with excessive use of alcohol, possession for personal use was never outlawed federally and was made illegal in only five States.

Indeed, we suspect that the moral contempt in which some of our citizens hold the marihuana user is related to other behavior or other attitudes assumed to be associated with use of the drug. All of our data suggest that the moral views of the overwhelming majority of marihuana users are in general accord with those of the larger society.

Having previously rejected the approval policy (option number one), we now reject the eliminationist policy (option number two). This policy, if taken seriously, would require a great increase in manpower and resources in order to eliminate the use of a drug which simply does not warrant that kind of attention.

DISCOURAGEMENT OR NEUTRALITY

The unresolved question is whether society should try to dissuade its members from using marihuana or should defer entirely to individual judgment in the matter, remaining benignly neutral. We must choose between policies of discouragement (number three) and neutrality (number four). This choice is a difficult one and forces us to consider the limitations of our knowledge and the dynamics of social change. A number of considerations, none of which is conclusive by itself, point at the present time toward a discouragement policy. We will discuss each one of them separately.

1. User Preference Is Still Ambiguous

Alcohol and tobacco have long been desired by large numbers within our society and their use is deeply ingrained in the American culture. Marihuana, on the other hand, has only recently achieved a significant foothold in the American experience, and it is still essentially used more by young people. Again, the unknown factor here is whether the sudden attraction to marihuana derives from its psychoactive virtues or from its symbolic status.

Throughout this Commission's deliberations there was a recurring awareness of the posibility that marihuana use may be a fad which, if not institutionalized, will recede substantially in time. Present data suggest that this is the case, and we do not hesitate to say that we would prefer that outcome. To the extent that conditions permit, society is well advised to minimize the number of drugs which may cause significant problems. By focusing our attention on fewer rather than more drugs, we may be better able to foster responsible use and diminish the consequences of irresponsible use.

The more prudent course seems to be to retain a social policy opposed to use, attempting to discourage use while at the same time seeking to deemphasize the issue. Such a policy leaves us with more options available when more definitive knowledge of the consequences of heavy and prolonged marihuana use becomes available.

2. Continuing Scientific Uncertainty Precludes Finality

In 1933 when Prohibition was repealed, society was cognizant of the effects of alcohol as a drug and the adverse consequences of abuse. But, because so many people wished to use the drug, policy-makers chose to run the risk of individual indiscretion and decided to abandon the abstentionist policy. There are many today who feel that if the social impact of alcohol use had then been more fully understood, a policy of discouragement rather than neutrality would have been adopted to minimize the negative aspects of alcohol use.

Misunderstanding also played an important part when the national government adopted an eliminationist marihuana policy in 1937. The policy-makers knew very little about the effects or social impact of the drug; many of their hypotheses were speculative and, in large measure, incorrect.

Nevertheless, the argument that misinformation in 1937 automatically compels complete reversal of the action taken at that time is neither reasonable nor logical. While continuing concern about the effects of heavy, chronic use is not sufficient reason to maintain an overly harsh public policy, it is still a significant argument for choosing official discouragement in preference to official neutrality.

3. Society's Value System Is In a State of Transition

As discussed in Chapter I, two central influences in contemporary American life are the individual search for meaning within the context of an increasingly depersonalized society, and the collective search for enduring American values. In Chapter IV, we noted that society's present ambivalent response to marihuana use reflects these uncertainties.

For the reasons discussed in the previous Chapters, a sudden abandonment of an official policy of elimination in favor of one of neutrality toward marihuana would have a profound reverberating impact on social attitudes far beyond the one issue of marihuana use. We believe that society must have time to consider its image of the future. We believe that adoption of a discouragement policy toward marihuana at this time would facilitate such a reappraisal while official neutrality, under present circumstances, would impede it.

4. Public Opinion Presently Opposes Marihuana Use

For whatever reasons, a substantial majority of the American public opposes the use of marihuana, and would prefer that their fellow

citizens abstain from using it. In the National Survey, 64% of the adult public agreed with the statement that "using marihuana is morally offensive" (40% felt the same way about alcohol).

Although this majority opinion is not by any means conclusive, it cannot be ignored. We are well aware of the skepticism with which marihuana user, and those sympathetic to their wishes, view the policy-making process; and we are particularly concerned about the indifference to or disrespect for law manifested by many citizens and particularly the youth.

However, we are also apprehensive about the impact of a major change in social policy on that larger segment of our population which supports the implications of the existing social policy. They, too, might lose respect for a policy-making establishment which appeared to bend so easily to the wishes of a "lawless" and highly vocal minority.

This concern for minimizing cultural dislocation must, of course, be weighed against the relative importance of contrary arguments. For example, in the case of desegregation in the South, and now in the North, culture shock had to be accepted in the light of the fundamental precept at issue. In the case of marihuana, there is no fundamental principle supporting the use of the drug, and society is not compelled to approve or be neutral toward it. The opinion of the majority is entitled to greater weight.

Looking again to the experience with Prohibition, when an abstentionist policy for alcohol was adopted on the national level in 1918, its proponents were not blind to the vociferous opposition of a substantial minority of the people. By the late 1920's and early 1930's, the ambivalence of public opinion toward alcohol use and the unwillingness of large numbers of people to comply with the new social policy compelled reversal of that policy. Even many of its former supporters acknowledged its futility.

With marihuana, however, the prevailing policy of eliminating use had never been opposed to any significant degree until the mid-1960's. Unlike the prohibition of alcohol, which had been the subject of public debate off and on for 60 years before it was adopted, present marihuana policy has not until now engaged the public opinion process, some 50 years after it first began to be used. Majority sentiment does not appear to be as flexible as it was with alcohol.

5. Neutrality Is Not Philosophically Compelled

Much of what was stated above bespeaks an acute awareness by the Commission of the subtleties of the collective consciousness of the American people, as shown in the National Survey. There is a legitimate concern about what the majority of the non-using population thinks about marihuana use and what the drug represents in the public mind. The question is appropriately asked if we are suggesting that

the majority in a free society may impose its will on an unwilling minority even though, as it is claimed, uncertainty, speculation, and a large degree of misinformation form the basis of the predominant opinion. If we have nothing more substantial than this, the argument goes, society should remain neutral.

To deal with this contention, one must distinguish between ends and means. Policy-makers must choose their objectives with a sensitivity toward the entire social fabric and a vision of the good society. In such a decision, the general public attitude is a significant consideration. The preferred outcome in a democratic society cannot be that of the policy-makers alone; it must be that of an informed public. Accordingly, the policy-maker must consider the dynamic relationship between perception and reality in the public mind. Is the public consensus based on a real awareness of the facts? Does the public really understand what is at stake? Given the best evidence available, would the public consensus remain the same?

Assuming that dominant opinion opposes marihuana use, the philosophical issue is raised not by the goal but by how it is implemented. At this point, the interests of the unwilling become important. For example, the family unit and the institution of marriage are preferred means of group-living and child-rearing in our society. As a society, we are not neutral. We officially encourage matrimony by giving married couples favorable tax treatment; but we do not compel people to get married. If it should become public policy to try to reduce the birth rate, it is unlikely that there will be laws to punish those who exceed the preferred family size, although we may again utilize disincentives through the tax system. Similarly, this Commission believes society should continue actively to discourage people from using marihuana, and any philosophical limitation is relevant to the means employed, not to the goal itself.

FOR THESE REASONS, WE RECOMMEND TO THE PUBLIC AND ITS POLICY-MAKERS A SOCIAL CONTROL POLICY SEEKING TO DISCOURAGE MARIHUANA USE, WHILE CONCENTRATING PRIMARILY ON THE PREVENTION OF HEAVY AND VERY HEAVY USE.

We emphasize that this is a policy for today and the immediate future; we do not presume to suggest that this policy embodies eternal truth. Accordingly, we strongly recommend that our successor policy planners, at an appropriate time in the future, review the following factors to determine whether an altered social policy is in order: the state of public opinion, the extent to which members of the society continue to use the drug, the developing scientific knowledge about

the effects and social impact of use of the drug, and the evolving social attitude toward the place of recreation and leisure in a work-oriented society. In our second Report next year, we will carefully review our findings to see if our perceptions have changed or if society has changed at that time.

Implementing The Discouragement Policy

Choice of this social control policy does not automatically dictate any particular legal implementation. As we noted in Chapter I, there is a disturbing tendency among participants in the marihuana debate to assume that a given statement of the drug's effects, its number of users or its social impact compels a particular statutory scheme.

Law does not operate in a social vacuum, and it is only *one* of the institutional mechanisms which society can utilize to implement its policies. Consequently, the evaluation of alternative legal approaches demands not only logic but also a delicate assessment of the mutual relationship between the law and other institutions of social control, such as the church, the family and the school.

THE ROLE OF LAW IN EFFECTIVE SOCIAL CONTROL

Social control is most effectively guaranteed by the exercise of individual self-discipline. Elementary social psychology teaches us that restraint generated within is infinitely more effective and tenacious than restraint imposed from without.

One of the participants at our "Central Influences" Seminar observed:

> When people grow up into a society, the principal aim is to internalize drives—that is, I assume they come up with certain drives which can be satisfied in many ways and you're trying to internalize ways of satisfying those drives which will be compatible with life in a community and also satisfying to the individual. The external restraints can only complement this, they cannot possibly substitute for it.

The supplemental effect of external restraints, particularly legal restraints, must also be weighed against the nature of the control sought. It was put this way at our Seminar:

> Think of the social welfare function as a mountain—the hill of the Lords really. Large parts of it are something of a plateau; that is you can be all sorts of places on it and be safe. You don't have to maximize. This is an economist's fallacy. You can have all sorts of

variations, you can be Socialists, Capitalists, Mormons, Adventists and get away with it—even Liberals. But there are cliffs, and you can fall off of them. This is what we are worrying about today. We are nervous about these cliffs.

The "no-no's"—as the kids call them—are the fences on these cliffs. That is, we have set up taboos and say there's a cliff there. Now one of the problems socially is that we set up "no-no's" where there are no cliffs. There are no cliffs and people jump over these [fences] and they say, "No cliffs! See no cliffs!" [Then, over other fences—and] chop-chop-chop-crash! See, it's just as dangerous to set up fences without any cliffs as not have fences where there are cliffs.

To this functional consideration of external restraint, we must also add the philosophical faith in the responsible exercise of individual judgment which is the essence of a free society. To illustrate, a preference for individual productivity underlies this society's opposition to indiscriminate drug use; the fact that so few of the 24 million Americans who have tried marihuana use it, or have used it, irresponsibly, testifies to the extent to which they have internalized that value.

The hypothesis that widespread irresponsibility would attend freer availability of marihuana suggests not that a restrictive policy is in order but rather that a basic premise of our free society is in doubt. We note that the escalation thesis, used as an argument *against* marihuana rather than as a tool for understanding individual behavior, is really a manifestation of skepticism about individual vulnerabilities. For example, one-half of the public agreed with the statement that "if marihuana were made legal, it would make drug addicts out of ordinary people."

At the same time, we do feel that the threat of excessive use is most potent with the young. In fact, we think *all* drug use should continue to be discouraged among the young, because of possible adverse effects on psychological development and because of the lesser ability of this part of the population to discriminate between limited and excessive use.

Social policy implementation in this regard is extraordinarily difficult. For example, although existing social policies toward tobacco, alcohol and marihuana alike oppose their use by the young, those policies are far from being fully effective. For example:

Tobacco

The National Survey (1971) indicates that of young people age 12-to-17,

- 50% have smoked at one time or another;
- 15%smoke now; and
- At least 8% smoke at least a half a pack a day.

In a 1970 sample of smoking habits in the 12-to-18 population conducted for the National Clearinghouse for Smoking and Health, it was found that:

- 18.5% of the boys and 11.9% of the girls were regular smokers; and
- About 8% of the boys and 5% of the girls smoked more than a half a pack a day.

Alcohol

The National Survey also ascertained the drinking pattern during the previous month of young people aged 12-to-17, finding that:

- At least 23% had used beer during that month, at least 14% had used wine and at least 12% had used hard liquor; and
- 6% had used beer five or more days during the month, 3% had used wine five or more days, and 3% had used hard liquor five or more days.

Marihuana

Of the 12-to-17 population, the Survey found that:

- 15% of this population had tried marihuana;
- At least 6% still use it; and
- Less than 1% use it once a day or more

The inclination of so many young people to experiment with drugs is a reflection of a so-called successful socialization process on one hand, and of society's ambivalence to the use of drugs on the other. This entire matter will occupy much of our attention in the coming year, but it is essential that we make a few anticipatory comments now.

This nation tries very had to instill in its children independence, curosity and a healthy self-assurance. These qualities guarantee a dynamic, progressive society. Where drugs are concerned, however, we have relied generally on authoritarianism and on obedience. Drug education has generally been characterized by overemphasis of scare tactics. Some segments of the population have been reluctant to inform for fear of arousing curiosity in young minds. Where drugs are concerned, young people are simply supposed to nod and obey.

This society has always been and continues to be ambivalent about the non-medical (in the strict sense) use of drugs. And this ambivalence does not escape our children. If we can come to grips with this issue, we might convince our youth that the curiosity that is encouraged in other aspects of our culture is undesirable where drugs are concerned.

The law is at best a highly imperfect reflection of drug policy. The laws proscribing sale of tobacco to minors are largely ignored. Prohibitions of sale of alcohol to minors are enforced sporadically. As to marihuana, there are areas throughout this nation where possession laws are not enforced at all. In other sections, such proscriptions are strictly enforced, with no apparent decrease in marihuana use.

As a guiding doctrine for parents and children, the law is certainly confusing when it imposes widely varying punishments in different states, and even in different courts of the same state, all for use of the same substance, marihuana. That marihuana use can be treated as a petty offense in one state and a felony in another is illogical and confusing to even the most sincere of parents.

The law is simply too blunt an instrument to manifest the subtle distinctions we draw between the motivations and the circumstances of use. At the same time, legal status carries a certain weight of its own, and other institutions must take account of the law in performing their functions.

In legally implementing our recommended social policy, we seek to maximize the ability of our schools, churches and families to be open and honest in discussing all drugs, including marihuana. The law must assist, not impede. In this respect, we note with concern the counterproductive tendency in our society to seek simple solutions to complex problems. Since the statutory law is a simple tool, the tendency in our society to look to the law for social control is particularly strong.

We have discussed the four basic social policy objectives of elimination, discouragement, neutrality and approval of marihuana use and have selected discouragement of use, with emphasis on prevention of heavy and very heavy use, as our generalized aim. We have considered three legal responses, each with a wide range of alternatives:

1. Total Prohibition.
2. Partial Prohibition.
3. Regulation.

TOTAL PROHIBITION

The distinctive feature of a total prohibition scheme is that all marihuana-related behavior is prohibited by law. Under the total prohibition response now in force in every state and at the federal level, cultivation, importation, sale, gift or other transfer, and possession are all prohibited acts. In 11 states and the District of Columbia, simply being present knowingly in a place where marihuana is present is also prohibited; and many states prohibit the possession of pipes or other smoking paraphernalia. For our purposes, the key feature of the total prohibition approach is that even possession of a small amount in the home for personal use is prohibited by criminal law.

From the very inception of marihuana control legislation, this nation has utilized a policy of a total prohibition, far more comprehensive than the restrictions established during the prohibition of alcohol.

Until recent years, society was operating under an eliminationist policy. The exaggerated beliefs about the drug's effects, social impact, and user population virtually dictated this legal approach. During this entire period, total prohibition was sought through the use of

heavier and heavier penalties until even first-time possession was a felony in every jurisdiction, and second possession offenses generally received a mandatory minimum sentence without parole or probation. Yet the last few years have seen society little by little abandoning the eliminationist policy in favor of a containment policy.

Under the total prohibition umbrella, this containment policy has been implemented by a unique patchwork of legislation, informal prosecutorial policy and judicial practice. Possession is now almost everywhere a misdemeanor. Although some term of incarceration remains as a penalty for possessors, it is generally not meted out to young first offenders or to possessors of small amounts. Instead, most such offenders are dismissed or informally diverted to agencies outside the criminal system by those within the system who are trying to help them avoid the stigma of a criminal record.

Offenders who are processed within the criminal justice system generally receive fines and/or probation. In many jurisdictions, enforcement officials make little or no effort to enforce possession proscriptions, concentrating instead on major trafficking. Possessors are generally arrested only when they are indiscreet or when marihuana is found incident to questioning or apprehension resulting from some other violation. From our surveys, state and federal, we have found that only minimal effort is made to investigate marihuana possession cases.

Such a tendency is a reflection of the adoption of a containment policy. By acting only when marihuana appears above ground, enforcement officials are helping to keep its use underground. The shift away from the elimination policy has been matched by a similar shift in legal implementation, but the distinctive feature of the total prohibition scheme still remains: all marihuana-related behavior, including possession for personal use within the home, is prohibited by criminal law.

Is such a response an appropriate technique for achieving the social control policy we outlined above? The key question for our purposes is whether total criminal prohibition is the most suitable or effective way to discourage use and whether it facilitates or inhibits a concentration on the reduction and treatment of irresponsible use. We are convinced that total prohibition frustrates both of these objectives for the following reasons.

1. Application of the Criminal Law to Private Possession Is Philosophically Inappropriate

With possession and use of marihuana, we are dealing with a form of behavior which occurs generally in private where a person possesses the drug for his own use. The social impact of this conduct is indirect, arising primarily in cases of heavy or otherwise irresponsible use and

from the drug's symbolic aspects. We do not take the absolutist position that society is philosophically forbidden from criminalizing any kind of "private" behavior. The phrase "victimless crimes," like "public health hazard," has become a rhetorical excuse for avoiding basic social policy issues. We have chosen a discouragement policy on the basis of our evaluation of the actual and potential individual and social impact of marihuana use. Only now that we have done so can we accord appropriate weight to the nation's philosophical preference for individual privacy.

On the basis of this evaluation we believe that the criminal law is too harsh a tool to apply to personal possession even in the effort to discourage use. It implies an overwhelming indictment of the behavior which we believe is not appropriate. The actual and potential harm of use of the drug is not great enough to justify intrusion by the criminal law into private behavior, a step which our society takes only with the greatest reluctance.

2. Application of the Criminal Law Is Constitutionally Suspect

The preference for individual privacy reflected in the debate over the philosophical limitations on the criminal law is also manifested in our constitutional jurisprudence. Although no court, to our knowledge, has held that government may not prohibit private possession of marihuana, two overlapping constitutional traditions do have important public policy implications in this area.

The first revolves around the concept that in a free society, the legislature may act only for public purposes. The "police powers" of the states extend only to the "public health, safety and morals." In the period of our history when the people most feared interference with their rights by the government, it was generally accepted that this broad power had an inherent limitation. For example, early prohibitions of alcohol possession were declared unconstitutional on the basis of reasoning such as that employed by the Supreme Court of Kentucky in 1915 in the case of *Commonwealth v. Campbell:*

> It is not within the competency of government to invade the privacy of the citizen's life and to regulate his conduct in matters in which he alone is concerned, or to prohibit him any liberty the exercise of which will not directly injure society.

Noting that the defendant was "not charged with having the liquor in his possession for the purpose of selling it, or even giving it to another," and that "ownership and possession cannot be denied when that ownership and possession is not in itself injurious to the public," the Kentucky court concluded that:

> The right to use liquor for one's own comfort, if they use it without direct injury to the public, is one of the citizen's natural and in-

alienable rights. . . . We hold that the police power—vague and wide and undefined as it is—has limits. . . .

Even the perceived dangers of opium were not enough to convince some members of the judiciary that the government could prohibit possession. It is historically instructive to consider these words, penned in 1890, by Judge Scott in *Ah Lim v Territory:*

I make no question but that the habit of smoking opium may be repulsive and degrading. That its effect would be to shatter the nerves and destroy the intellect; and that it may tend to the increase of the pauperism and crime. But there is a vast difference between the commission of a single act, and a confirmed habit. There is a distinction to be recognized between the use and abuse of any article or substance. . . . If this act must be held valid it is hard to conceive of any legislative action affecting the personal conduct, or privileges of the individual citizen, that must not be upheld. . . . The prohibited act cannot affect the public in any way except through the primary personal injury to the individual, if it occasions him any injury. It looks like a new and extreme step under our government in the field of legislation, if it really was passed for any of the purposes upon which that character of legislation can be sustained, if at all.

As a matter of constitutional history, a second tradition, the application of specific provisions in the Bill of Rights, has generally replaced the notion of "inherent" limitations. The ultimate effect is virtually the same, however. The Fourth Amendment's proscription of "unreasonable searches and seizures" reflects a constitutional commitment to the value of individual privacy. The importance of the Fourth Amendment to the entire constitutional scheme was eloquently described by Justice Brandeis in 1928 in the case of *Olmstead v U.S.:*

The makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness. They recognized the significance of man's spiritual nature, of his feelings and his intellect. They knew that only a part of the pain, pleasure and satisfaction of life are to be found in material things. They sought to protect Americans in their beliefs, their thoughts, their emotions and their sensations. They conferred, as against the Government, the right to be let alone—the most comprehensive of rights and the right most valued by civilized men.

Although the Fourth Amendment is itself a procedural protection, the value of privacy which it crystallizes is often read in conjunction with other important values to set substantive limits on legislative power. The Supreme Court, in the case of *Griswold v. Connecticut*, held in 1965 that Connecticut could not constitutionally prohibit the

use of birth control devices by married persons. Although the Justices did not agree completely on the reasons for their decision, Justice Douglas stated in the opinion of the Court:

> The present case, then, concerns a relationship lying within the zone of privacy created by several fundamental constitutional guarantees. And it concerns a law which, in forbidding the use of contraceptives rather than regulating their manufacture or sale, seeks to achieve its goals by means of having a maximum destructive impact upon that relationship. Such a law cannot stand in light of the familiar principle, so often applied by this Court, that a "governmental purpose to control or prevent activities constitutionally subject to state regulation may not be achieved by means which sweep unnecessarily broadly and thereby invade the area of protected freedom." (citation omitted) Would we allow the police to search the sacred precincts of marital bedrooms for telltale signs of the use of contraceptives? The very idea is repulsive to the notions of privacy surrounding the marriage relationship.

Four years later, the Supreme Court, in *Stanley v. Georgia*, held that even though obscenity is not "speech" protected by the First Amendment, a state cannot constitutionally make private possession of obscene material a crime. The Court's reasoning is revealed in the following language:

> [The] right to receive information and ideas, regardless of their social worth, (citation omitted), is fundamental to our free society. Moreover, in the context of this case—a prosecution for mere possession of printed or filmed matter in the privacy of a person's own home—that right takes on an added dimension. For also fundamental is the right to be free, except in very limited circumstances, from unwanted governmental intrusions into one's privacy . . .

While the judiciary is the governmental institution most directly concerned with the protection of individual liberties, all policy-makers have a responsbility to consider our constitutional heritage when framing public policy. Regardless of whether or not the courts would overturn a prohibition of possession of marihuana for personal use in the home, we are necessarily influenced by the high place traditionally occupied by the value of privacy in our constitutional scheme.

Accordingly, we believe that government must show a compelling reason to justify invasion of the home in order to prevent personal use of marihuana. We find little in marihuana's effects or in its social impact to support such a determination. Legislators enacting Prohibition did not find such a compelling reason 40 years ago; and we do not find the situation any more compelling for marihuana today.

3. Total Prohibition Is Functionally Inappropriate

Apart from the philosophical and constitutional constraints outlined above, a total prohibition scheme carries with it significant institutional costs. Yet it contributes very little to the achievement of our social policy. In some ways it actually inhibits the success of that policy.

The primary goals of a prudent marihuana social control policy include preventing irresponsible use of the drug, attending to the consequences of such use, and deemphasizing use in general. Yet an absolute prohibition of possession and use inhibits the ability of other institutions to contribute actively to these objectives. For example, the possibility of criminal prosecution deters users who are experiencing medical problems from seeking assistance for fear of bring attention to themselves. In addition, the illegality of possession and use creates difficulties in achieving an open, honest educational program, both in the schools and in the home.

In terms of the social policy objective of discouraging use of the drug, the legal system can assist that objective in three ways: first, by deterring people from use; second, by symbolizing social opposition to use; and finally, by cutting off supply of the drug.

The present illegal status of possession has not discouraged an estimated 24 million people from trying marihuana or an estimated eight million from continuing to use it. Our survey of the country's state prosecuting attorneys shows that 53% of them do not believe that the law has more than a minimal deterrent effect in this regard. Moreover, if the present trend toward passive enforcement of the marihuana law continues, the law ultimately will deter only indiscreet use, a result achieved as well by a partial prohibition scheme and with a great deal more honesty and fairness.

A major attraction of the law has been its symbolic value. Yet, society can symbolize its desire to discourage marihuana use in many other, less restrictive ways. The warning labels on cigarette packages serve this purpose, illustrating that even a regulatory scheme could serve a discouragement policy. During Prohibition, the chosen statutory implementation symbolized society's opposition to the use of intoxicating beverages; yet, most jurisdictions did not think it necessary to superimpose a proscription of possession for personal use in the home.

Finally, prohibiting possession for personal use has no substantive relation to interdicting supply. A possession penalty may make enforcement of proscriptions against sale a little easier, but we believe this benefit is of minimal importance in light of its costs.

The law enforcement goal repeatedly stated at both the federal and state levels has been the elimination of supply and the interdiction of trafficking. These avowed aims of law enforcement make sense,

83-313 O - 77 - 12

since they are the most profitable means of employing its manpower and resources in this area.

Indeed, the time consumed in arresting possessors is inefficiently used when contrasted with an equal amount of time invested in apprehending major dealers. Although a credible effort to eliminate supply requires prohibitions of importation, sale and possession-with-intent-to-sell, the enforcement of a proscription of possession for personal use is minimally productive.

As noted, most law enforcement officials, district attorneys and judges recognize the ineffectiveness of the possession penalty as a deterrent. Its perpetuation results in the making of what is commonly referred to as "cheap" cases that have little or no impact on deterring sale.

The marihuana supply system can be viewed as a pyramid with the major bulk of marihuana entering the system at the top of the pyramid and then descending to the base which represents the user population. Common sense dictates where law enforcement should devote its efforts. To remove the profit from the traffic requires arresting sellers, not users. The oft-heard argument that the police need possession penalties to compel users to reveal their sources is not convincing. "Turning informants" at the base of the pyramid is of marginal value and limited utility in reaching upwards toward the apex. Further, the National Survey showed that 60% of the users don't "buy" marihuana but get it from a friend. The volume of traffic in the drug at these levels is at best minimal.

In short, personal possession arrests and even casual sales, which now account for more than 95% of the marihuana arrests at the state and local level, occur too low in the chain of distribution to diminish the supply very effectively.

In addition to the misallocation of enforcement resources, another consequence of prohibition against possession for personal use is the social cost of criminalizing large numbers of users. Our empirical study of enforcement of state and federal marihuana laws indicates that almost all of those arrested are between the ages of 18 and 25, most have jobs or are in school, and most have had no prior contact with the criminal justice system. The high social cost of stigmatizing such persons as criminals is now generally acknowledged by the public at large as well as by those in the criminal justice system.

According to the National Survey, 53% of the public was unwilling to give young users a criminal record and 87% objected to putting them in jail. The nation's judges expressed an overwhelming disinclination to sentence and convict users for marihuana possession. Of these judges only 13% thought it was appropriate to incarcerate an adult for possession and only 4% would jail a juvenile for marihuana possession. This disinclination is reflected in the low percentage of

arrested users who are convicted, and the even lower percentage who are jailed.

Even among the nation's prosecutors, a substantial majority favor the present trend toward avoiding incarceration for first offenders. Most jurisdictions have devised informal procedures for disposing of cases in lieu of prosecution. Our empirical study shows that 48% of the adult cases, and 70% of the juvenile cases, were dropped from the system at some point between arrest and conviction. The picture displayed is one of a large expenditure of police manpower to enforce a law most participants further along the line are not anxious to apply.

Other disturbing consequences of laws proscribing possession for personal use are the techniques required to enforce them. Possession of marihuana is generally a private behavior; in order to find it, the police many times must operate on the edge of constitutional limitations. Arrests without probable cause, illegal searches and selective enforcement occur often enough to arouse concern about the integrity of the criminal process.

Yet another consequence of marihuana possession laws is the clogging of judicial calendars. President Nixon has noted that one of the major impediments to our nation's efforts to combat serious crimes is the fact that the judicial machinery moves so slowly. Swift arrests, prosecution, trial and sentence would significantly improve the deterrent effect of law. Yet the judicial system is overloaded with petty cases, with public drunkenness accounting for about 50% of all non-traffic offenses.

In his March 1971 address to the National Conference on the Judiciary, President Nixon said:

> What can be done to break the logjam of justice today, to ensure the right to a speedy trial—and to enhance respect for law? We have to find ways to clear the courts of the endless stream of "victimless crimes" that get in the way of serious consideration of serious crimes. There are more important matters for highly skilled judges and prosecutors than minor traffic offenses, loitering and drunkenness.

To this list we would add marihuana possession, which accounts for a rising percentage of judicial caseloads. In Chicago alone, during the last half of 1970, there were more than 4,000 possession arrests.

A final cost of the possession laws is the disrespect which the laws and their enforcement engender in the young. Our youth cannot understand why society chooses to criminalize a behavior with so little visible ill-effect or adverse social impact, particularly when so many members of the law enforcement community also question the same laws. These young people have jumped the fence and found no cliff. And the disrespect for the possession laws fosters a disrespect for all law and the system in general.

On top of all this is the distinct impression among the youth that some police may use the marihuana laws to arrest people they don't like for other reasons, whether it be their politics, their hair style or their ethnic background. Whether or not such selectivity actually exists, it is perceived to exist.

For all these reasons, we believe that the possession offense is of little functional benefit to the discouragement policy and carries heavy social costs, not the least of which is disrespect and cynicism among some of the young. Accordingly, even under our policy of discouraging marihuana use, the better method is persuasion rather than prosecution. Additionally, with the sale and use of more hazardous drugs on the increase, and crimes of violence escalating, we do not believe that the criminal justice system can afford the time and the costs of implementing the marihuana possession laws. Since these laws are not mandatory in terms of achieving the discouragement policy, law enforcement should be allowed to do the job it is best able to do: handling supply and distribution.

A criminal fine or similar penalty for possession has been suggested as a means of alleviating some of the more glaring costs of a total prohibitory approach yet still retaining the symbolic disapproval of the criminal law. However, most of the objections raised above would still pertain: the possibilities of invasion of personal privacy and selective enforcement of the law would continue; possessors would still be stigmatized as criminals, incurring the economic and social consequences of involvement with the criminal law; the symbolic status of marihuana smoking as an anti-establishment act would be perpetuated.

On the other hand, a fine most likely would deter use no more than does the present possibility of incarceration. It would continue to impede treatment for heavy and very heavy use and would persist in directing law enforcement away from the policy's essential aim which is to halt illegal traffic in the drug.

For all these reasons, we reject the total prohibition approach and its variations.

REGULATION

Another general technique for implementing the recommended social policy is regulation. The distinguishing feature of this technique is that it institutionalizes the availability of the drug. By establishing a legitimate channel of supply and distribution, society can theoretically control the quality and potency of the product. The major alternatives within this approach lie in the variety of restraints which can be imposed on consumption of the drug and on the informational requirements to which its distribution can be subject.

We have given serious consideration to this set of alternatives; however, we are unanimously of the opinion that such a scheme, no

matter how tightly it might restrict consumption, is presently unacceptable.

1. Adoption of a Regulatory Scheme at this Time Would Inevitably Signify Approval of Use

In rejecting the total prohibition approach, we emphasized the symbolic aspects. In essence, we do not believe prohibition of possession for personal use is necessary to symbolize a social policy disapproving the use. Theoretically, a tightly controlled regulatory scheme, with limited distribution outlets, significant restraints on consumption, prohibition of advertising and compulsory labeling, could possibly symbolize such disapproval. Our regulatory policy toward tobacco is beginning slowly to reflect a disapproval policy toward cigarette smoking. Nonetheless, given the social and historical context of such a major shift in legal policy toward marihuana, we are certain that such a change would instead symbolize approval of use, or at least a position of neutrality.

The Commission is concerned that even neutrality toward use as a matter of policy could invest an otherwise transient phenomenon with the status of an accepted behavior. If marihuana smoking were an already ingrained part of our culture, this objection would be dispelled. However, we do not believe that this is the case. We are inclined to believe, instead, that the present interest in marihuana is transient and will diminish in time of its own accord once the major symbolic aspects of use are deemphasized, leaving among our population only a relatively small coterie of users. With this possibility in mind, we are hesitant to adopt either a policy of neutrality or a regulatory implementation of our discouragement policy. The law would inevitably lose its discouragement character and would become even more ambiguous in its rationale and its enforcement.

The effect of changing a social policy direction may be seen with tobacco policy. In recent years, society has ostensibly adopted a policy of discouraging cigarette smoking. This new policy has been implemented primarily in the information area through prohibition of some forms of advertising and through compulsory labeling. Yet, the volume of cigarettes used increased last year. We believe that the failure of the new policy results from the fact that it supplants one that formerly approved use. This set of circumstances argues against any policy which would be regarded as approval of use, including a regulatory scheme. It is always extremely difficult to transform a previously acceptable behavior into a disapproved behavior.

2. Adoption of a Regulatory Scheme Might Generate a Significant Public Health Problem

We noted above that institutionalizing availability of the drug would inevitably increase the incidence of use, even though that in-

cidence might otherwise decrease. Of greater concern is the prospect that a larger incidence of use would result in a larger incidence of long-term heavy and very heavy use of potent preparations.

There are now approximately 500,000 heavy users of less potent preparations in this country, representing about 2% of those who ever tried the drug. Even if the prevalence of heavy use remained the same in relation to those who ever used, this at-risk population would inevitably increase under a regulatory scheme. If the emotional disturbances found in very heavy hashish users in other countries were to occur in this country, the adverse social impact of marihuana use, now slight, would increase substantially.

We have acknowledged that society, nonetheless, chose to run such a risk in 1933, when Prohibition was repealed. But alcohol use was already well-established in this society, and no alternative remained other than a regulatory approach. In light of our suspicion that interest in marihuana is largely transient, it would be imprudent to run that risk for marihuana today.

3. Adoption of a Regulatory Scheme Would Exacerbate Social Conflict and Frustrate a Deemphasis Policy

A significant segment of the public on both sides of the issue views marihuana and its "legalization" in a highly symbolic way. Any attempt to adopt a regulatory approach now would be counterproductive in this respect. The collision of values resulting from such a dramatic shift of policy would maintain the debate at a highly emotional level and would perpetuate the tendency to perceive marihuana use as a symbol of the struggle between two conflicting philosophies.

4. Not Enough Is Known About Regulatory Models In This Area

Advocates of legalization of marihuana are often inclined to propose a licensing scheme or an "alcohol model" without offering a specific program of regulation taking all the variables into account. Responsible policy planning cannot be so cursory. Consequently, we have given serious study to the many issues presented by such a scheme and to the nation's experience with other drug licensing schemes. On the basis of our inquiry, we are convinced that such a step should not be taken unless a realistic assessment of the efficacy of existing schemes and their potential application to marihuana indicates it would be successful. Such an assessment raises a number of disturbing questions.

The regulatory approaches which this nation has used in the cases of alcohol and tobacco have failed to accomplish two of their most important objectives: the minimization of excessive use and the limitation of accessibility to the young. Despite the warning and restraints on distribution and consumption, more than 50 million

Americans smoke cigarettes regularly, and more than nine million Americans are "problem" drinkers. We have previously cited data indicating how many of our children begin habits which have been legally forbidden to them. Since the young user and the chronic user of marihuana are of primary concern to our public health officials, the lack of success with alcohol and tobacco discourages an assumption that the regulation of supply would minimize use by the younger generation.

Another important purpose of a regulatory scheme is to channel the product through a controlled system of supply and distribution. In that way the quality and quantity of the substance can be regulated. The efficacy of such a scheme as applied to marihuana is questionable.

Cannabis can be grown easily almost anywhere in the United States with little or no human assistance. Even if a legitimate source of supply were established, it is likely that many persons would choose to ignore the legitimate source and grow their own, the purity of which would not be in question. If such a practice were illegal, the necessity for a concerted governmental eradication program is raised, which would involve a monumental law enforcement effort. According to the U.S. Department of Agriculture, there are presently an estimated five million acres of wild marihuana growing in this country and an undetermined number of acres under cultivation.

Yet, if such a practice were not forbidden, the revenue-raising, product-control and consumption-restriction features of a regulatory scheme would be threatened. Instructive to note is the fact that intensive regulation of alcoholic beverage production has not eliminated illicit production. During 1970, in fact, 5,228 illegal stills were destroyed by the Alcohol, Tobacco and Firearms Division of the U.S. Treasury and 5,279 persons were arrested. In 1971, 3,327 illegal stills were destroyed and 5,512 persons were arrested.

Another disturbing question is raised by the issue of potency regulation. Most advocates of legalization stipulate potency limitations as one feature of their scheme. Presumably they would limit the THC content of the regulated product. This is not an easy undertaking. Especially when cannabis is so easily grown and a black market is so easily created, we are dubious about the success of a regulatory scheme distributing only a product with low THC content. Again, attention must be paid the prospect of increased hashish use under a regulatory scheme; merely stipulating potency control is not sufficient. As we noted in Chapter II, the heavy, long-term use of hashish is a source of major concern to the Commission from both private and public health standpoints.

These are a few of the problems confronting the policy-maker if he seeks to devise an effective regulatory system of distribution for what is, in fact, a universally common plant. Our doubts about the efficacy

of existing regulatory schemes, together with an uncertainty about the permanence of social interest in marihuana and the approval inevitably implied by adoption of such a scheme, all impel us to reject the regulatory approach as an appropriate implementation of a discouragement policy at the present time.

Future policy planners might well come to a different conclusion if further study of existing schemes suggests a feasible model; if responsible use of the drug does indeed take root in our society; if continuing scientific and medical research uncovers no long-term ill-effects; if potency control appears feasible; and if the passage of time and the adoption of a rational social policy sufficiently desymbolizes marihuana so that availability is not equated in the public mind with approval.

PARTIAL PROHIBITION

The total prohibition scheme was rejected primarily because no sufficiently compelling social reason, predicated on existing knowledge, justifies intrusion by the criminal justice system into the private lives of individuals who use marihuana. The Commission is of the unanimous opinion that marihuana use is not such a grave problem that individuals who smoke marihuana, and possess it for that purpose, should be subject to criminal procedures. On the other hand, we have also rejected the regulatory or legalization scheme because it would institutionalize availability of a drug which has uncertain long-term effects and which may be of transient social interest.

Instead we recommend a partial prohibition scheme which we feel has the following benefits:

- Symbolizing a continuing societal discouragement of use;
- Facilitating the deemphasis of marihuana essential to answering dispassionately so many of the unanswered questions;
- Permitting a simultaneous medical, educational, religious, and parental effort to concentrate on reducing irresponsible use and remedying its consequences;
- Removing the criminal stigma and the threat of incarceration from a widespread behavior (possession for personal use) which does not warrant such treatment;
- Relieving the law enforcement community of the responsibility for enforcing a law of questionable utility, and one which they cannot fully enforce, thereby allowing concentration on drug trafficking and crimes against persons and property;
- Relieving the judicial calendar of a large volume of marihuana possession cases which delay the processing of more serious cases; and
- Maximizing the flexibility of future public responses as new information comes to light.

No major change is required in existing law to achieve all of these benefits. In general, we recommend only a decriminalization of possession of marihuana for personal use on both the state and federal levels. The major features of the recommended scheme are that: production and distribution of the drug would remain criminal activities as would possession with intent to distribute commercially; marihuana would be contraband subject to confiscation in public places; and criminal sanctions would be withdrawn from private use and possession incident to such use, but, at the state level, fines would be imposed for use in public.*

Specifically, we recommend the following statutory schemes.

RECOMMENDATIONS FOR FEDERAL LAW

Under the Comprehensive Drug Abuse Prevention and Control Act of 1970, Congress provided the following scheme with respect to marihuana, by which was meant only the natural plant and its various parts, not the synthetic tetrahydrocannabinol (THC):

- Cultivation, importation and exportation, and sale or distribution for profit of marihuana are all felonies punishable by imprisonment for up to five years for a first offense and by up to 10 years for a second offense (the available penalty is doubled for sale to a minor).
- Possession of marihuana with intent to distribute is a felony punishable by imprisonment for up to five years for the first offense and by up to 10 years for a second offense.
- Possession of marihuana for personal use is a misdemeanor punishable by up to one year in jail and a $1,000 fine for first offense and by up to two years in jail and a $2,000 fine for second offense (expungement of criminal record is available for first offenders).

---

*Commissioners Rogers, Congressman from Florida, and Carter, Congressman from Kentucky, agree with the Commission's selection of a discouragement policy and also agree that criminalization and incarceration of individuals for possessing marihuana for their own use is neither necessary nor desirable as a means of implementing that policy.

At the same time, both Commissioners feel that the contraband concept is not a sufficiently strong expression of social disapprobation and would recommend in addition a civil fine for possession of any amount of marihuana in private or in public.

Both Commissioners feel that the civil fine clearly symbolizes societal disapproval and is a simple mechanism for law enforcement authorities to carry out. If a person is found by a law enforcement officer to be in possession of marihuana, the officer would issue such person a summons to appear in court on a fixed day. Although a warrant would not issue for search of a private residence unless there were probable cause to believe a *criminal* offense was being committed, a police officer legitimately present for other reasons could issue a civil summons for violation of the "possession" proscription.

- Transfer of a small amount of marihuana for no remuneration is a misdemeanor punishable by up to one year in jail and a $1,000 fine for first offense and by up to two years in jail and a $2,000 fine for second offense (Congress singled out marihuana in this way to allow misdemeanor treatment of casual transfers and permitted first offender treatment, as allowed for possession for personal use).

The Commission recommends *only* the following changes in federal law:

- POSSESSION OF MARIHUANA FOR PERSONAL USE WOULD NO LONGER BE AN OFFENSE, BUT MARIHUANA POSSESSED IN PUBLIC WOULD REMAIN CONTRABAND SUBJECT TO SUMMARY SEIZURE AND FORFEITURE.
- CASUAL DISTRIBUTION OF SMALL AMOUNTS OF MARIHUANA FOR NO REMUNERATION, OR INSIGNIFICANT REMUNERATION NOT INVOLVING PROFIT WOULD NO LONGER BE AN OFFENSE.

The Commission further recommends that federal law be supplemented to provide:

- A PLEA OF MARIHUANA INTOXICATION SHALL NOT BE A DEFENSE TO ANY CRIMINAL ACT COMMITTED UNDER ITS INFLUENCE, NOR SHALL PROOF OF SUCH INTOXICATION CONSTITUTE A NEGATION OF SPECIFIC INTENT.

Commissioners Rogers and Carter believe that the legal system must be utilized directly to discourage *the person* from using marihuana rather than being utilized only indirectly as in the case of contraband.

This civil fine would not be reflected in a police record, nor would it be considered a criminal act for purposes of future job consideration, either in the private sector or for government service.

Agreeing with the other Commissioners that the casual transfers of marihuana for no profit should be treated in the same manner as possession for one's own use, Congressmen Rogers and Carter do not agree that it should extend to transfers involving remuneration. They prefer the limiting language of the Comprehensive Drug Abuse Prevention and Control Act of 1970 which does not include the term "or insignificant remuneration not involving a profit."

Apart from the addition of the civil fine to the contraband recommendation in the respects set out above, Congressmen Carter and Rogers are in complete agreement with the statutory recommendations set out in the Report.

Commissioner Ware concurs completely with the statements made by Congressmen Rogers and Carter but wishes to reemphasize that the social policy and legal scheme adopted is applicable only to marihuana and should not be construed to embrace other psychoactive drugs. The policy set forth in this Report, subject to the already noted comments of the two Congressional Commissioners, makes sense for marihuana on the basis of what is known about the drug and in the absence of any conclusive showing which would verify

RECOMMENDATIONS FOR STATE LAW

Under existing state marihuana laws, cultivation, distribution and possession with intent to distribute are generally felonies and in most states possession for personal use is a misdemeanor. The Commission strongly recommends uniformity of state laws and, in this regard, endorses the basic premise of the Uniform Controlled Substances Act, drafted by the National Conference of Commissioners on Uniform State Laws. The following are our recommendations for a uniform statutory scheme for marihuana, by which we mean, as under existing federal law, only the natural cannabis plant and its various parts, not the synthetic tetrahydrocannabinol (THC):

Existing Law

- CULTIVATION, SALE OR DISTRIBUTION FOR PROFIT AND POSSESSION WITH INTENT TO SELL WOULD REMAIN FELONIES (ALTHOUGH WE DO RECOMMEND UNIFORM PENALTIES).

---

some of the anecdotal law enforcement testimony heard by the Commission regarding criminal behavior exhibited while under the influence of marihuana.

Commissioner Ware feels that some penalty short of criminalizing the user, such as a civil fine or some type of intensive drug education, will act as a positive deterrent toward minimizing the incidence of marihuana use especially among the young. Further, he is opposed to the use of *any* drug for the express purpose of getting intoxicated, and includes alcohol within this category. The Commissioner feels that what is needed is an internalizing of discipline among our citizenry, with the legal system assisting this process through the use of disincentives.

Commissioners Hughes, Senator from Iowa, and Javits, Senator from New York, feel that the Commission has taken a major, highly laudable step in recommending that the private use of marihuana be taken out of the criminal justice system. They concur in its threshold judgment that overall social policy regarding this drug should seek to discourage use, while concentrating primarily on the prevention of irresponsible use. They disagree, however, with three specific recommendations relating to the implementation of this discouragement policy.

First, they would eliminate entirely the contraband provision from the partial prohibitory model adopted by the Commission. They want it eliminated first because its legal implications are confusing and the subject of disagreement even among lawyers. Whether or not possession of a given substance is criminal, possession of material designated as contraband makes that possession *unlawful.* Also, marihuana designated as contraband would be subject to government search and seizure, even though the underlying possession is no longer criminal. The provision—which does not apply to marihuana held for personal use within the home—is considered by both Commissioners to be an unnecessary "symbol" of the discouragement policy. It will not foster elimination of the misunderstanding and mistrust which is a hallmark of our current marihuana policy.

Commissioner Hughes and Javits seek to eliminate it also because as a practical matter it serves no useful law enforcement purpose within the overall partial prohibitory model. If marihuana held for personal use within the home is not contraband, why should marihauna held for personal use within one's

Private Activities

- POSSESSION IN PRIVATE OF MARIHUANA FOR PERSONAL USE WOULD NO LONGER BE AN OFFENSE.
- DISTRIBUTION IN PRIVATE OF SMALL AMOUNTS OF MARIHUANA FOR NO REMUNERATION OR INSIGNIFICANT REMUNERATION NOT INVOLVING A PROFIT WOULD NO LONGER BE AN OFFENSE.

Public Activities

- POSSESSION IN PUBLIC OF ONE OUNCE OR UNDER OF MARIHUANA WOULD NOT BE AN OFFENSE, BUT THE MARIHUANA WOULD BE CONTRABAND SUBJECT TO SUMMARY SEIZURE AND FORFEITURE.
- POSSESSION IN PUBLIC OF MORE THAN ONE OUNCE OF MARIHUANA WOULD BE A CRIMINAL OFFENSE PUNISHABLE BY A FINE OF $100.
- DISTRIBUTION IN PUBLIC OF SMALL AMOUNTS OF MARIHUANA FOR NO REMUNERATION OR INSIGNIFICANT REMUNERATION NOT INVOLVING A PROFIT WOULD BE A CRIMINAL OFFENSE PUNISHABLE BY A FINE OF $100.
- PUBLIC USE OF MARIHUANA WOULD BE A CRIMINAL OFFENSE PUNISHABLE BY A FINE OF $100.
- DISORDERLY CONDUCT ASSOCIATED WITH PUBLIC USE OF OR INTOXICATION BY MARIHUANA WOULD BE A MISDEMEANOR PUNISHABLE BY UP TO 60 DAYS IN JAIL, A FINE OF $100, OR BOTH.

---

automobile be contraband? The area of operation of the contraband provision is extremely narrow. If one possesses *more* than one ounce of marihuana in public, it may be seized without regard to the contraband doctrine since such possession is a criminal violation.

Since the contraband provision does not apply to marihuana possession and use in private, the only effective area covered by the contraband provision is the area of possession in public of *less* than one ounce. The Commission has chosen to remove the stigma of the criminal sanction in this kind of case. To impose instead a contraband provision, which it is argued is in the nature of a civil "in rem" seizure which does not operate against the person, is to cloud the issue and to weaken the force of the basic decriminalization. A persuasive justification simply has not been made.

Both Commissioners seek to eliminate it also because they believe that the voice of the Commission should be loud and clear that the preservation of the right of privacy is of paramount importance and cannot be casually jeopardized in the pursuit of some vague public or law enforcement interest which has not been defined and justified with clarity and precision.

The second area of disagreement with the Commission's recommendations concerns the casual distribution of marihuana and the not-for-profit sale. As understood:

- OPERATING A VEHICLE OR DANGEROUS INSTRUMENT WHILE UNDER THE INFLUENCE OF MARIHUANA WOULD BE A MISDEMEANOR PUNISHABLE BY UP TO ONE YEAR IN JAIL, A FINE OF UP TO $1,000, OR BOTH, AND SUSPENSION OF A PERMIT TO OPERATE SUCH A VEHICLE OR INSTRUMENT FOR UP TO 180 DAYS.
- A PLEA OF MARIHUANA INTOXICATION SHALL NOT BE A DEFENSE TO ANY CRIMINAL ACT COMMITTED UNDER ITS INFLUENCE NOR SHALL PROOF OF SUCH INTOXICATION CONSTITUTE A NEGATION OF SPECIFIC INTENT.
- A PERSON WOULD BE ABSOLUTELY LIABLE IN CIVIL COURT FOR ANY DAMAGE TO PERSON OR PROPERTY WHICH HE CAUSED WHILE UNDER THE INFLUENCE OF THE DRUG.

DISCUSSION OF FEDERAL RECOMMENDATIONS

The recommended federal approach is really a restatement of existing federal policy. From official testimony and record evaluation, we know that the federal law enforcement authorities, principally the Federal Bureau of Narcotics and Dangerous Drugs and the Bureau of Customs, do not concentrate their efforts on personal possession cases. The avowed purpose of both Bureaus is to eliminate major traffickers and sources of supply. For the most part, the federal

---

(1) The totally donative transfer is not subject to criminal penalty, regardless of where it takes place.

(2) The transfer of *small* amounts for *insignificant* remuneration *not involving a profit* is not subject to criminal penalty (except if it is accomplished in public, in which case it is subject to criminal sanction), but

(3) The transfer of *"large* amounts" for *"significant"* remuneration not involving a profit is subject to criminal penalty.

Footnote 4 on page 158 of the Report, the Commission refers to a Report of The Senate Judiciary Committee on the Comprehensive Drug Abuse Prevention and Control Act of 1970. In substance, it implies that within the meaning of the Act, transfers of more than one or two marihuana cigarettes in return for 50 cents or one dollar to cover cost are not intended to be covered as casual transfers, but rather are to be treated as unlawful sales.

Commissioners Hughes and Javits feel that the Commission has failed to set forth a clear standard which will adequately inform the public of their obligations under the law. The recommendation and its discussion in the Report are confusing and fail to provide the individual with sufficient guidance to allow him to act without having to dodge in and out of illegality. It also undermines a basic, stated objective of the Commission i.e., to concentrate the weight of the criminal sanction upon significant supply and distribution activities, rather than upon casual consumption.

Moreover, proscribing even the most casual not-for-profit transfers when they occur in public is, in their opinion, wrong. Such transfers are necessarily inci-

agencies have left possession enforcement to the states. Underlying this approach is a need to maximize the use of enforcement resources for major priorities and allow the states, in exercising their "police powers," to assume the responsibility for local activities, including possession for personal use.

By withdrawing the criminal sanction from possession for personal use we are, in effect, codifying official policy. In addition, such a scheme follows the model chosen for alcohol in the Volstead Act, and also revives the approach taken by Congress in the Drug Abuse Control Amendments (DACA) of 1965. We are in agreement with the original thrust of DACA, when Congress brought previously uncontrolled drugs, LSD, barbiturates and amphetamines, under control but did not assess criminal penalties for possession for personal use.

Instead, Congress placed on the prosecution the burden of proof that the possession was for purposes of sale. Regardless of whether or not Congress was wise in imposing a penalty in 1968 for possession for personal use, a subject we will consider in our next Report, we think the original DACA concept is enlightened where marihuana is concerned.

At the same time, present federal law classifies marihuana as contraband, and this feature should be maintained. The contraband

---

dent to private possession and use. To hold that they should be subject to criminal sanction is logically inconsistent with the Commission's rationale and recommendation on decriminalization of such private activities.

Instead, both Commissioners recommend that all not-for-profit sales be excluded from the criminal sanction. It is fundamental that there be a clear separation between the serious, commercial, profit-making-seller, or "pusher" as he is known, and the individual who merely splits the cost of a reasonable supply of the drug with his friends or acquaintances.

Thirdly, exception is taken to the retention of the criminal sanction on public possession of more than one ounce. The individual who buys an ounce and a half would be a criminal when he buys on the corner, when he puts it in his pocket, when he gets in his car and drives home, when he is on his doorstep, but not when he crosses the threshold of his home. Commission policy should direct the attention of the law enforcement community to the person who sells the drug for profit, and not to the person who uses the drug privately.

If an individual has more than a few ounces in his possession, and there is probable cause to believe that he intends to sell it for profit, that activity is already covered under the Commission's recommendation that possession with intent to sell is illegal. Therefore, there is no need to further proscribe simple public possession.

All the component parts of the recommended policy of the Commission should be consistent with its objective of non-interference with casual transfers and possession and use which is essentially and fundamentally private and personal.

The contraband device, the not-for-profit sale, and public possession of some reasonable amount which should be presumed to be necessarily incident to private use should all be removed from the ambit of legal sanction. To do so would be to strike down "symbols" of a public policy which had never been adequately justified in the first instance. Such steps would in no way jeopardize the firm determination of the Commission that the use of marihuana ought to be discouraged.

concept serves the discouragement policy in two ways: it assists the removal of supply from the market and it symbolizes a continuing societal opposition to use. Accordingly, if a person is found in possession of marihuana in public and the government is unable to prove any intent to sell, it may nevertheless seize the marihuana and confiscate it is contraband.

The contraband provision would apply only to possession in public and would not extend to possession for personal use in the home. During Prohibition, the Federal Government and most of the states employed a similar statutory limitation. For example, the Volstead Act provided that a private dwelling could not be searched "unless it is being used for the unlawful sale of intoxicating liquor. . . ." [1]

The impact of this contraband concept is that marihuana possessed or found in public can be summarily seized by law enforcement officials and forfeited to the state for subsequent destruction.[2] The criminal justice system is not involved in the process. The individual receives no record of any kind; he simply loses the economic value of the marihuana.[3]

With regard to the casual distribution of small amounts of marihuana for no remuneration or insignificant remuneration not involving a profit we are following the approach taken in the Comprehensive Drug Abuse Prevention and Control Act of 1970 which in essence treats such casual transfers as the functional equivalent of possession. In doing so, Congress recognized that marihuana is generally

---

[1] § 39. *Unlawful possession of liquor or property designed for manufacture thereof; search warrants.* It shall be unlawful to have or possess any liquor or property designed for the manufacture of liquor intended for use in violating this chapter or which has been so used, and no property rights shall exist in any such liquor or property. A search warrant may issue as provided in [sections 611 to 631 and 633 of Title 18] and such liquor, the containers thereof, and such property so seized shall be subject to such disposition as the court may make thereof. If it is found that such liquor or property was so unlawfully held or possessed, or had been so unlawfully used, the liquor, and all property designed for the unlawful manufacture of liquor, shall be destroyed, unless the court shall otherwise order. No search warrant shall issue to search any private dwelling occupied as such unless it is being used for unlawful sale of intoxicating liquor, or unless it is in part used for some business purpose such as a store, shop, saloon, restaurant, hotel, or boarding house. The term "private dwelling" shall be construed to include the room or rooms used and occupied not transiently but solely as a residence in an apartment house, hotel or boarding house. The property seized on any such warrant shall not be taken from the officer seizing the same on any writ of replevin or other like process. (Oct. 28, 1919, c. 85, Title II, § 25. 41 Stat. 315)

[2] The federal and state provisions presently in force regarding the seizure and forfeiture of an automobile transporting marihuana would no longer be applicable. They would still remain in force for other controlled drugs classified as contraband.

[3] See the views of Commissioners Rogers, Carter, Ware, Hughes and Javits expressed in the footnote on pages 151–156.

shared among friends and that not all people who distribute marihuana are "pushers."*

The accuracy of Congress' appraisal is underscored by the National Survey. When people who had used marihuana were asked how they first obtained the drug, 61% of the adults and 76% of the youth responded that it had been given to them. Only 4% of the adults and 8% of the youth said that they had bought it. When asked who their source had been, 67% of the adults and 85% of the youth responded that it had been a friend, acquaintance or family member.

The close association between the concepts of casual transfer and personal possession is also underscored by the fact that 56% of the prosecutors in our survey thought that the present law did not deter casual transfer at all or deterred it only minimally.

With regard to importation and exportation, we recommend no change in existing law and make the following observations. First, the United States must maintain its international standing and, as a member of the community of nations, this country should do everything in its power to restrict the exportation of marihuana to other countries and to penalize such international traffic.

As to importation of marihuana, the most effective way to discourage use is to cut off supply at the top of the pyramid. Recognizing that most of the marihuana consumed in the United States comes from abroad, we feel that the Bureau of Customs at the borders should have all necessary authority to halt and interdict supplies intended for consumption in this country. There has been a long-standing practice of excepting ports and borders from procedural rules applying within the United States. One example is that Customs officials are allowed to search without the showing of probable cause, even though such a

---

*In considering this relationship, the Senate, in the Report of the Committee on the Judiciary of the United States Senate regarding S. 3246 (a precursor bill to the new Federal law) stated:

> The language "distributes a small amount of marihuana for no remuneration or insignificant remuneration not involving a profit" as contained in section 501(c)(4) is intended to cover the type of situation where a college student makes a quasi-donative transfer of one or two marihuana cigarettes and receives 50 cents or a dollar in exchange to cover the cost of the marihuana. Transfers of larger quantities in exchange for larger amounts of money, or transfers for profit, are not intended to be covered by this section, but rather are to be covered by section 501(c)(2) which deals with unlawful distribution.

This language sketches a prototype situation which the Committee had in mind; however, the wording of the Federal Act and of our recommendations is not intended to establish inflexible rules. The objective in both provisions is to distinguish between commercial sellers and casual distributors. Ultimately the courts will have the responsibility of drawing this distinction according to the evidence in individual cases. The recommended provision intentionally establishes a loose standard not tied to specific amounts of marihuana or money.

See also the views of Commissioners Rogers, Carter, Ware, Hughes and Javits expressed in the footnote on pages 151–156.

showing is mandatory for searches conducted within the United States. We can see a legitimate reason for continuing this policy.

DISCUSSION OF STATE RECOMMENDATIONS

The states have primary responsibility for enforcing the existing proscriptions against possession for personal use. Their present efforts are designed mainly to keep marihuana use contained and in private. Such an enforcement policy is consistent with our social policy approach, and is an appropriate exercise of the states' obligations to maintain public order. So while we see no need for criminal sanctions against possession for personal use or against casual transfers, we recommend a number of provisions for confining marihuana use to the home.

The first point is that even marihuana possessed for personal use is subject to summary seizure and forfeiture if it is found in public. This concept is now applicable under federal law which we commend also to the states. In our view, the contraband feature symbolizes the discouragement policy and will exert a major force in keeping use private.

Another means of symbolizing the discouragement policy which has been suggested is the imposition of a civil fine on those possessing marihuana outside the home for personal use.* Under such an approach, a fine would be levied and processed outside the criminal justice system. Essentially, possession of marihuana would be the equivalent of a traffic offense in those jurisdictions where such an offense is not criminal.

Such a scheme would accomplish little more than that achieved under a partial prohibition scheme. Warrants would presumably not be issued for searches of private residences, and possession offenses would be detected only by accident or if the offender uses the drug in public. The more direct way to confront such behavior is a penalty against public use.

A further problem with the civil fine approach lies in the area of non-payment of the fine. With traffic tickets, or with civil fines levied against industrial polluters, society can compel compliance by withdrawing its permission to engage in regulated activity. For example, it can revoke the motorists' license to drive or the polluters' license to do business within the state. In short, the state has remedies beyond the criminal law to achieve its policy goal. The same would not be true for the marihuana user and enforceability of the statute would ultimately require court action.

---

*See the views of Commissioners Rogers, Carter and Ware expressed in the footnote on pages 151–153.

As we have suggested, a central feature of our statutory approach at the state level would be a vigorously enforced prohibition of public use. No intoxicant should be used in public, both because it may offend others and because the user is risking irresponsible behavior if he should be under its influence in public. Moreover, where marihuana is concerned, continuing societal disapproval requires that the behavior occur only in private if at all. Public use, under the proposed scheme, would therefore be punishable by a fine of $100.

We also recognize the need for some prophylactic measure for anticipating distribution, even though there may be no intent to sell for profit. To this end, and in order to deter public use, possession and transfer, we have drawn a line at one ounce of marihuana. Possession in public of more than this amount would be punishable by a fine of $100.

For these same reasons, we believe the states should prohibit all transfers outside the home, whether or not for remuneration. A transfer for profit would be a felony, as under present law. A casual transfer of a small amount would be punishable by a fine of $100.

Taken together, the contraband feature, the proscriptions of public use and public possession of more than an ounce (even if for personal use) and the prohibition of public transfers will reflect the discouragement policy underlying the entire scheme.

The remaining set of recommendations aims at irresponsible behavior under the influence of marihuana. Whatever the precise legal scheme employed, these provisions should be included.

First, the "drunk and disorderly" statutes presently in force in the states are useful tools for maintaining public order. We would suggest similar statutes in the case of marihuana, punishing offenders by up to 60 days in jail, a fine of $100, or both. Law enforcement authorities must have a means to halt antisocial behavior exhibited incidental to marihuana use.

The second aspect of irresponsible behavior is the operation of automobiles, other vehicles, or any potentially dangerous instrument while under the influence of marihuana. Such behavior is gross negligence in itself, risking harm to others unnecessarily. In addition to penalizing a person who "drives under the influence" as a serious misdemeanant, we would impose absolute civil liability on anyone who harms the person or property of another while under the influence of marihuana.

Finally, no one should be able to limit his criminal accountability by alleging that he was under the influence of marihuana at the time of the crime. Under both federal and state law, the defendant should not be able to negate the mental element of "specific intent," which some offenses carry, by pleading that he was under the influence of marihuana and was therefore unable to have formed such an intent. Unlike many users of heroin, the user of marihuana is not physically de-

pendent on the drug. The use of the drug is usually a matter of choice. Although we believe on the basis of available evidence that there is no causal connection between marihauna use and crime, we would under no circumstances allow a person to escape the consequences of his actions by hiding behind the cloak of marihuana use.

DISCUSSION OF POTENTIAL OBJECTIONS

Having discussed our recommended scheme at the federal and state levels, we think it useful to answer some objections we anticipate will be raised. Possible objections are:

1. Partial prohibition is not a sufficient reflection of the discouragement policy.
2. Partial prohibition is logically inconsistent.
3. A possession penalty is necessary for effective enforcement of sale proscriptions.
4. Partial prohibition won't "work" for marihuana any more than it did for alcohol.
5. A possession offense is essential as a device for detecting problem users.
6. Retention of a possession offense is required by our international obligations.
7. A firm distinction should be drawn between less potent and more potent preparations.

1. The Partial Prohibition Approach Is a Sufficient Reflection of the Discouragement Policy

To those who would argue that a criminal sanction against use is a necessary implementation of an abstentionist policy, we need only respond that this country has not generally operated on that assumption. We would be astounded if any person who lived during the 1920's was not aware of a definite governmental policy opposed to the use of alcohol. Yet, *only five states prohibited possession for personal use during Prohibition.* The failure of the 18th Amendment, the Volstead Act and 43 state prohibition acts to criminalize private possession certainly did not signify official approval of or neutrality toward alcohol use.

As we pointed out in Chapter I, our nation has not generally seen fit to criminalize private drug-related behavior; only in the narcotics area was possession made a crime and marihuana was brought within the narcotics framework because of unfounded assumptions about its ill effects. We think it is time to correct that mistaken departure from tradition with respect to marihuana. As during Prohibition, the drug will remain contraband, and its distribution will be prohibited.

Even as late as 1965, an abstentionist drug policy was not thought to require prohibition for personal use. At that time, Congress enacted the Drug Abuse Control Amendments, bringing LSD, amphetamines and barbiturates under federal control. National policy was clearly opposed to use of the hallucinogens and the non-prescription use of amphetamines and barbiturates, yet Congress did not impose a penalty for possession. Whether or not Congress' subsequent decision in 1968, to impose such a penalty was appropriate is an issue we will cover in our next Report after analyzing the individual drugs controlled. The important point now is that such a penalty is not a necessary feature of a discouragement policy for marihuana, regardless of its propriety for other drugs.

2. The Partial Prohibition Approach Is Not Logically Inconsistent

It will be argued that a law which permits a person to acquire and use marihuana but does not permit anyone to sell it to him for profit is logically unsound. We do not agree. If we had recommended a social policy of approval or neutrality toward use, partial prohibition would indeed have been illogical. However, under a discouragement policy, such a scheme is perfectly consistent.

Under partial prohibition, use is discouraged in three main ways. First, law enforcement authorities will make a concerted effort to reduce the supply of the drug. If a person wishes to use marihuana, he will have to seek out a person to sell it to him; and if his seller is in the business of distributing marihuana for profit, the seller is violating the law.

Second, the user will have to confine his disapproved behavior to the home. If he uses the drug in public, he has committed an offense; if he possesses it in public, it may be summarily seized as contraband.

Third, continuing efforts will be made by educators, public health officials, and official government spokesmen to discourage use. Realizing that educational efforts are not always successful, we would hope for a sound program. In any event, the law should be an ancillary rather than a focal consideration.

There is nothing theoretically inconsistent about a scheme which merely withdraws the criminal sanction from a behavior which is not immoral but which is disapproved. The individual is being allowed to make his own choice. Hopefully, he will choose not to use marihuana. If he chooses to do so, however, he will have to do so discreetly and in private. Apart from its ultimate possession by the user, however, all marihuana-related activity is prohibited. The drug is contraband from its initial growth, through its harvest and distribution. It ceases to be contraband only when possessed and used in the home.

3. Prohibition of All Possession Is Not Essential to Prohibition of Sale

The other side of the "inconsistency" objection is the argument by law enforcement officials that they cannot adequately enforce proscriptions against sale without a possession penalty. We disagree. We have already explained that enforcement of a possession offense to some extent *impedes* the effort to reduce supply. Possession cases are generally regarded in the law enforcement community and by judges and prosecutors as "cheap" cases. Few seriously contend that prosecution of possessors reduces supply.

Some persons argue in response that the law should remain on the books as a tool not against the possessor but against the seller. They say that a possession offense is helpful in three ways. First, a prosecution can be used as a bargaining tool to encourage the possessor to reveal his source; this is called "turning an informant." Second, the police may know that a person is a seller, but may not be able to prove either sale or intent to sell, so they can at least charge such suspected sellers with simple possession.

Third, a corollary of the second argument is that the possession offense provides a useful tool in the "plea bargaining" process. That is, a seller may plead guilty to the lesser offense of possession, now generally a misdemeanor, instead of running the risk of trial and conviction of the more serious offense of sale, generally a felony. The prosecution may accept such a "bargain' if it is uncertain of the strength of the case, to avoid delay in sentencing, to reduce judicial backlog or in return for information from the defendant.

From an institutional standpoint, we do not find these arguments persuasive. First, if a possession offense is on the books, possession is a criminal activity. We oppose criminalizing conduct when its purpose and intent is directed not toward that conduct but toward another behavior.

In answer to the informant argument, the marihuana user (and this may not be true of other drugs) is simply too low in the distributional chain to help very much. As indicated earlier, the National Survey shows most users receive their marihuana from their friends or acquaintances either as a gift or at cost. Rarely is the time spent on him or on his "source" a fruitful allocation of the law enforcement official's time. Also, it is institutionally improper to hold the criminal sanction over a person to force him to talk, when we otherwise would be unwilling to use that sanction.

As to the "lack of proof" and "plea bargaining" arguments, we believe they challenge a fundamental tenet of our criminal justice system. That is, under our law, a person is not guilty just because the police think he is guilty; his offense must be proven beyond a reasonable doubt to a judge or jury. If a possession offense were not

on the books, the police would have to gather enough evidence to convict the seller of sale or of possession with intent to sell, and the prosecution would have to convince the judge beyond a reasonable doubt. The defendant, suspected seller or not, is entitled to due process of law.

The "lack of proof" argument is nothing more than a plea for an "easy out" when the police do not have enough evidence. This simply represents an admission that law enforcement officials want a possession offense which they can apply selectively, to people whom they think, but cannot prove, are sellers. Such a notion is inconsistent with the basic premise of our system of equal treatment under the law. If "simple" possession is not an offense for some, it is not an offense for all. A "known seller" is entitled to the same rights as anyone else: criminal conduct must be proved beyond a reasonable doubt. We do not favor coddling criminals. We do insist, as did the framers of the Constitution, that suspected criminal behavior be proved.

4. That Partial Prohibition Did Not "Work" For Alcohol Doesn't Mean It Won't For Marihuana

Prohibition failed to achieve its avowed purpose of eliminating the use of intoxicating liquors from American life. Risking an oversimplification, we think two reasons were essentially responsible for this failure: the unwillingness of a substantial minority, and probably a majority, of the American public to discard a habit deeply ingrained in their lives; and the inability of the law enforcement community to eliminate the bootlegging traffic which catered to this continuing demand.

As we have repeatedly noted, one of the reasons for adoption of a partial prohibition approach is uncertainty about the extent to which marihuana use is ingrained in American culture. Indeed, adoption of partial prohibition is the best way to find out for sure. If the social interest turns out to be only transient, this policy will prove particularly appropriate.

Similarly, an increase in marihuana use may be prevented by a concerted effort to eliminate major trafficking, the scope of which is presently only a small fraction of Prohibition bootlegging. We do not pretend that supply of a plant so easily grown can be eliminated. However, an intensive effort to eliminate commercial criminal enterprise should have some impact on the extent of use.

5. The Possession Offense Is Not Required as a Detection Device

In addition to their deterrent and symbolic functions, the drug possession laws serve a third function not shared by most other criminal laws. Like laws against public drunkenness, they facilitate societal detection of drug-dependent persons. Ideally, such persons, although

apprehended by law enforcement authorities, may be detained for purposes of treatment and rehabilitation.

Whatever the merits of such an argument for the opiates and alcohol, such an argument does not apply to marihuana. Only a very small percentage of marihuana users are drug-dependent or are in need of treatment. Their dependence is generally upon multiple drug use, not on marihuana. In any event, the existence of such a small population does not justify retention of the possession offense as a detection device.

6. International Obligations Do Not Require Maintenance of a Possession Penalty

Some have raised the possibility that removal of simple possession criminal penalties would contravene this country's obligations under the Single Convention on Narcotic Drugs (1961), to which it became a signatory in March, 1967. We do not believe the provisions of that Convention compel the criminalization of possession for personal use.

Nowhere in the Convention are its Parties expressly required to impose criminal sanctions on possession for personal use. Article 4 requires Parties to "take such legislative and administrative measures as may be necessary . . . . to limit exclusively to medical and scientific purposes the production, manufacture, export, import, distribution of, trade in, use and possession of drugs." Penal sanctions are not necessarily included in this formulation.

Article 36, which deals specifically with penal provisions, requires each party to adopt "such measures as will ensure" that the listed activities, including possession, "shall be punishable offenses." Some have argued that this provision requires prohibition of personal use.

However, from a comprehensive study of the history of the Convention, the Commission has concluded that the word "possession" in Article 36 refers not to possession for personal use, but to possession as a link in illicit trafficking. This interpretation is bolstered also by the failure to include "use" in Article 36 even though it has been included in Article 4.

Finally, we must consider Article 33, which provides that "the Parties shall not permit the possession of drugs except under legal authority." This Article also does not require the imposition of any sanctions on possession for personal use. Experts consulted by the Commission have indicated that this Article may, nevertheless, require that the Parties to limit possession and use to medical and scientific purposes. To affirmatively allow drugs to remain in the possession of persons for non-medical use would in this view contravene Articles 4 and 33 to read together. From this perspective our international obligations may require the classification of marihuana as contraband. For this reason, together with a desire to symbolize our dis-

couragement policy in a clear way, we have included the contraband feature in our legal implementation scheme.

In conclusion, our reading of the Convention is that a Party may legitimately decide to deal with non-medical use and possession of marihuana through an educational program and similar approaches designed to discourage use.

7. No Potency Distinction is Necessary at the Present Time

Following the approach taken in the Comprehensive Drug Abuse Prevention and Control Act of 1970, we have drawn a line between the natural cannabis plant and the synthetic tetrahydrocannabinols. "Marihuana" is defined as any and all parts of the natural plant. That we choose this approach for purposes of statutory implementation does not mean that we are unaware of the difference between the less potent and more potent preparations of the natural plant.

As noted in Chapters II and III, the highest risk of cannabis use to the individual and society arises from the very long-term, very heavy use of potent preparations commonly called hashish. No such pattern of use is known to exist in the United States today.

The predominant pattern of use in the United States is experimental or intermittent use of less potent preparations of the drug. Even when hashish is used, the predominant pattern remains the same. In addition, whatever the potency of the drug used, individuals tend to smoke only the amount necessary to achieve the desired drug effect.

Given the prevailing patterns of use, the Commission does not believe it is essential to distinguish by statute between less potent and more potent forms of the natural plant. Reinforcing this judgment are the procedural and practical problems attending an effort to do so.

If the criminal liability of an individual user is dependent on the THC content of the substance, neither he nor the arresting officer will know whether he has committed a crime until an accurate scientific determination is made. Even if such accurate determinations were feasible on a large scale, which is not now the case, such after-the-fact liability is foreign to our criminal laws.

Under present circumstances, then, a statutory line based on potency is neither necessary nor feasible. We emphasize also that any legal distinction is an artificial reflection of the Commission's major concern: the heavy use of the drug over a long term. The most emphatic element of official policy should be to discourage such use, especially of the more potent preparations. Unfortunately precise legislative formulations regarding the amount of the drug presumed to be for personal use do not assist this effort at all. Whether it is lawful to possess one ounce of hashish or a proportionate amount based on potency (for example, one-fourth ounce), an individual prone to use the drug heavily will do so. Society's resources should be committed to the

task of reducing supply of the drug and persuading our citizens not to use it. Expenditure of police time and financial resources in an attempt to ascertain the THC content of every seized substance would make little, if any, contribution to this effort.

A Final Comment

In this Chapter, we have carefully considered the spectrum of social and legal policy alternatives. On the basis of our findings, discussed in previous Chapters, we have concluded that society should seek to discourage use, while concentrating its attention on the prevention and treatment of heavy and very heavy use. The Commission feels that the criminalization of possession of marihuana for personal use is socially self-defeating as a means of achieving this objective. We have attempted to balance individual freedom on one hand and the obligation of the state to consider the wider social good on the other. We believe our recommended scheme will permit society to exercise its control and influence in ways most useful and efficient, meanwhile reserving to the individual American his sense of privacy, his sense of individuality, and, within the context of an interacting and interdependent society, his options to select his own life style, values, goals and opportunities.

The Commission sincerely hopes that the tone of cautious restraint sounded in this Report will be perpetuated in the debate which will follow it. For those who feel we have not proceeded far enough, we are reminded of Thomas Jefferson's advice to George Washington that "Delay is preferable to error." For those who argue we have gone too far, we note Roscoe Pound's statement, "The law must be stable, but it must not stand still."

We have carefully analyzed the interrelationship between marihuana the drug, marihuana use as a behavior, and marihuana as a social problem. Recognizing the extensive degree of misinformation about marihuana as a drug, we have tried to *demythologize* it. Viewing the use of marihuana in its wider social context, we have tried to *desymbolize* it.

Considering the range of social concerns in contemporary America, marihuana does not, in our considered judgment, rank very high. We would *deemphasize* marihuana as a problem.

The existing social and legal policy is out of proportion to the individual and social harm engendered by the use of the drug. To replace it, we have attempted to design a suitable social policy, which we believe is fair, cautious and attuned to the social realities of our time.

addendum

The previous Chapter recommended a social policy oriented toward the discouragement of marihuana use and presented a set of proposals for the legal implementation of that policy. In addition to these legal recommendations for federal and state action, the Commission believes certain other recommendations should be presented for action.

Ancillary Recommendations

These recommendations are presented in three categories: (1) legal and law enforcement, (2) medical, and (3) other. Some of these recommendations apply to other drugs as well and will be discussed further in our second Report. However, we consider it useful to make recommendations now so that policy planners can be informed of the implications of what has been studied to date.

Foremost among the Commission's conclusions is a need for consistency between federal and state laws affecting marihuana distribution and use, and uniformity of marihuana laws among the states. The administration of all marihuana laws must be mutally reenforcing so that *total* governmental response to marihuana is both equitable and understandable.

Legal and Law Enforcement Recommendations

I. Federal

RECOMMENDATION: FEDERAL LAW ENFORCEMENT AGENCIES, ESPECIALLY THE BUREAU OF NARCOTICS AND DANGEROUS DRUGS AND THE BUREAU OF CUSTOMS, SHOULD IMPROVE THEIR STATISTICAL REPORTING SYSTEMS SO THAT POLICIES MAY BE PLANNED AND RESOURCES ALLOCATED ON THE BASIS OF ACCURATE AND COMPREHENSIVE INFORMATION.

In an effort to obtain information relating to enforcement of the marihuana laws including arrest, prosecution, sentencing and conviction data, the Commission found that sufficient information was available about prosecution and court action, but not about the activities of the law enforcement agencies. We were confronted by and large with inadequate statistical information and little or no in-depth evaluation.

The statistical reporting procedures of the Bureau of Narcotics and Dangerous Drugs and the Bureau of Customs are not uniform, making it extremely difficult to assess the effectiveness of the two principal drug enforcement agencies of the Federal Government. The Bureau of Narcotics and Dangerous Drugs keeps centralized files but the Bureau of Customs maintains its files on a regional basis. In both Bureaus, statistical information is kept only in its raw form; that is, number of arrests, number of seizures and so on. Very little analysis exists of the procedures leading to arrest, of the characteristics of persons arrested, and of the law enforcement strategies involved in the arrest. For law enforcement personnel to understand more fully *how* they are carrying out their functions so that internal assessments of particular policies can be made, sophisticated statistics must be maintained.

Both the Bureau of Narcotics and Dangerous Drugs and the Bureau of Customs are aware of these problems. Both were extremely helpful to the Commission and its research staff in seeking useful information from the mass of raw statistics. However, the information from the available statistics is incomplete and of limited utility for policy planning purposes.

In support of this priority recommendation, Congress is urged to provide additional and adequate funding for this area, at the same time requiring both agencies to utilize a common reporting system so that information can be more easily shared between them.

In addition, it is recommended that the Federal Bureau of Investigation, in its Uniform Crime Reports, requests the state agencies to

identify marihuana cases separately from narcotic cases and report them as a separate component.

RECOMMENDATION: THE FEDERAL BUREAU OF NARCOTICS AND DANGEROUS DRUGS SHOULD INCREASE ITS TRAINING PROGRAMS OF STATE AND LOCAL POLICE WITH SPECIAL EMPHASIS ON THE TRAINING IN THE DETECTION OF TRAFFICKING CASES.

The Commission's interviews with state and local police officials revealed a consistent desire to upgrade the quality of their investigations. Since the Federal Bureau of Narcotics and Dangerous Drugs, through its National Training Institute, has been performing this task well, it is recommended that the funds be granted by the Congress to extend the range of the educational program offered and increase the number of persons trained.

RECOMMENDATION: INCREASED BORDER SURVEILLANCE, A TIGHTENING OF BORDER PROCEDURES, AND A REALISTIC ERADICATION PROGRAM TO DIMINISH THE SUPPLY OF DRUGS COMING INTO THE COUNTRY, COUPLED WITH A MORE EFFECTIVE PROGRAM FOR DIMINISHING THE DOMESTIC PRODUCTION AND DISTRIBUTION OF MARIHUANA, ARE REQUIRED.

The Commission, as part of its mandate, studied drug trafficking patterns along the borders of the United States. An analysis of border marihuana seizures was also made. The results of both studies indicated that proportionately larger seizures were made along the borders at locations where there were no manned checkpoints. The Commission therefore recommends that more vigorous effort be made by federal agencies to interdict smugglers along the entire border while continuing their efforts at the formal checkpoints.

In discussions with representatives of other countries, a common observation made by foreign officials has been this country's somewhat indifferent attitude about the eradication of our home-grown marihuana, an attitude that is not appreciated by other countries under pressure from the United States to destroy their crops. Since this Administration has wisely made illicit trafficking in all drugs a foreign policy priority, we recommend that priority be supported by an equally assiduous effort to eradicate marihuana within our borders.

We recommend further that preclearance procedures be eliminated so that Customs personnel may more effectively control smuggling of marihuana and other drugs. Preclearance is a procedure whereby passengers and their baggage destined for the United States are inspected by U.S. Customs, Immigration and Agriculture officials *prior* to departure from a foreign location. This practice is in effect in Ber-

muda, Montreal, Nassau, Toronto, Vancouver, Winnipeg and the Virgin Islands. Other locations are petitioning for the same privilege.

An inherent weakness in the preclearance procedure is that Customs personnel stationed outside the United States have no authority for search, seizure and arrest. This fact is well-known to the professional smuggler who uses it to his advantage. Since we have been informed that preclearance creates a gap in Customs' interdiction process, reason dictates that the procedure be eliminated in the interest of tighter control.

II. State

RECOMMENDATION: ALL STATES SHOULD ADOPT THE UNIFORM CONTROLLED SUBSTANCES ACT TO ACHIEVE UNIFORMITY WITH REGARD TO MARIHUANA AND OTHER DRUG LAWS, WITH THE EXCEPTION THAT THE LEGAL RESPONSE TO POSSESSION FOR ONE'S OWN USE BE UNIFORMLY ADOPTED IN ACCORDANCE WITH OUR RECOMMENDATION IN CHAPTER V OF THIS REPORT.

As noted earlier, one of the greatest needs in the entire drug area is uniformity of state laws with regard to structure and penalties. While this recommendation applies to all drugs and not just marihuana, we feel it essential to make this recommendation now to help deemphasize the marihuana problem. Significant differences in penalties among the states constitute a valid source of irritation and conflict among various segments of our population. In an age of high mobility, it is unconscionable that penalties should vary so greatly in response to the same behavior.

RECOMMENDATION: EACH STATE SHOULD ESTABLISH A CENTRALIZED COMPULSORY REPORTING AND RECORD-KEEPING AUTHORITY SO THAT ADEQUATE AND ACCURATE STATISTICS OF ARRESTS, SENTENCES AND CONVICTIONS ON A STATEWIDE BASIS ARE AVAILABLE.

Several states have systems for maintaining records of drug arrests on a statewide basis. Accurate reporting and compilation of these cases permit the state to assess accurately the impact of law enforcement on drug offenders. The Law Enforcement Assistance Administration of the Department of Justice should assist the states to establish compulsory statistical reporting centers so that individual state needs are met and a clearer picture of the national trends can be ascertained. Efficient state record-keeping will have an additional benefit of increasing the reliability of the Uniform Crime Reports compiled by the Federal Bureau of Investigation.

RECOMMENDATION: THOSE STATES REQUIRING PHYICIANS TO REPORT DRUG USERS SEEKING MEDICAL ASSISTANCE SHOULD CHANGE SUCH REQUIREMENTS TO INSURE THE CONFIDENTIALITY OF THE DRUG USER'S IDENTITY, SO THAT PERSONS NEEDING MEDICAL HELP WILL FEEL FREE TO SEEK IT.

Seventeen states* currently require physicians to report to a government agency information on those persons treated by them who are dependent on, or are habitual users of drugs. No common pattern emerges among these states.

After reviewing these statutes, the Commission believes that the disadvantages of maintaining such reporting systems outweigh the benefits to society or the individual. Fear of disclosure to the police discourages many persons from seeking needed medical help. Furthermore, the requirement makes the physician an informant and an agent of law enforcement.

While a need exists for reliable statistics regarding the number and nature of those persons being treated, the Commission does not feel that identification of the individual user is necessary. We again emphasize that society should encourage persons in need of medical attention to seek out authorized practitioners without having to fear legal repercussions for such action.

III. International

RECOMMENDATION: IF THE UNITED STATES SHOULD BECOME A SIGNATORY OF THE PROPOSED PSYCHOTROPIC CONVENTION, WE RECOMMEND THAT CANNABIS BE REMOVED FROM THE EXISTING SINGLE CONVENTION AND CONSIDERATION BE GIVEN TO LISTING IT IN THE PSYCHOTROPIC CONVENTION AMONG DRUGS WHICH HAVE SIMILAR EFFECTS.

Under the Single Convention on Narcotic Drugs, 1961, of which the United States became a signatory in 1967, cannabis, with the exception of its leaves and stems, is included with narcotic drugs and cocaine. While that categorization had some justification in 1961 when knowledge about marihuana was more limited, this justification no longer exists. More importantly, tetrahydrocannabinol (THC), the psychoactive ingredient in cannabis, is not included in the Single Convention and is proposed for inclusion in the Psychotropic Convention.

The Commission sees little sense in having the potent psychoactive ingredient in cannabis covered in one Convention and the natural

*California, Connecticut, Hawaii, Idaho, Iowa, Massachusetts, Michigan, Montana, Nebraska, New Jersey, New Mexico, New York, North Carolina, Pennsylvania, Vermont, Virginia, Washington.

product in another. Logic dictates combining the active ingredient with the plant form under one international control scheme. The Commission concludes that cannabis is more appropriately included in an international agreement which would control the hallucinogens, stimulants, depressants, and other drugs rather than in the Single Convention, which includes the narcotics and cocaine.

Medical Recommendations

I. Research Coordination and Emphasis

RECOMMENDATION: FULLER COORDINATION OF THE MARIHUANA RESARCH CONDUCTED BY GOVERNMENTAL AND PRIVATE AGENCIES IS NEEDED TO REDUCE THE DUPLICATION OF EFFORT, ASSURE A DIVERSITY OF NEW APPROACHES AND NEW OBJECTIVES, AND TO PROVIDE EFFICIENT INTEGRATION OF FINDINGS INTO THE AVAILABLE BODY OF KNOWLEDGE.

The Commission recognizes the need for studies of chronic, heavy users of marihuana in this country. Among the required areas of information are the user's sociologic background (family dynamics, social stresses, impact of socioeconomic status), and medical status (documentation of physiological and psychological parameters, including pulse rate, blood pressure, electro-cardiogram, electroencephalogram, mental status examination, psychological tests). Epidemiological studies are also needed. Such studies should be directed toward understanding the life histories of chronic, heavy users, and identifying the effects of marihuana on the life patterns of these individuals.

The Commission recommends that intensive research be conducted on the carcinogenic properties of the components of marihuana smoke, in both animals and man. Further work should be conducted to analyze the effect of marihuana smoking on pulmonary function. The Commission-sponsored study in Boston and the study of heavy long-term users in Jamaica both indicated there was some decrement in measurable lung function capacity.

In addition to these physiological studies, investigations on the effects of marihuana-smoking on the bronchial epithelium and mucous membranes of the mouth, throat and lips should be undertaken. The relationship of marihuana smoking to cardiac diseases, particularly coronary artery disease, should be studied. Although such studies have been conducted in connection with tobacco use, they have not been performed on a significant scale with regard to marihuana use.

Some clinical investigators have voiced concern regarding the effect of marihuana-smoking on the peripheral vascular system. In order to accomplish the initial phase of this investigation, the Com-

mission recommends that thermographic studies be carried out on extremities of chronic, heavy marihuana users.

There are many unanswered questions about the effects of marihuana upon the brain. These include reported alterations upon the neuronal systems which produce effects resembling those of both psychedelic drugs and alcohol. Studies of the biogenic amines which appear to be neurotransmitters in the emotional areas of the brain are needed.

The Commission in the course of its work has encouraged cooperation among various federal agencies concerned with marihuana. Continuing and formalized informational exchange among federal agencies and the state, local and private agencies which have a professional concern with marihuana can be helpful to all of them. We recommend that an appropriate federal agency, such as the Special Action Office for Drug Abuse Prevention in the White House, serve as the catalyst in developing a permanent program for assembling and exchanging marihuana-related information.

II. Detection of Marihuana in the Human Body

RECOMMENDATION: RESEARCH EFFORTS TO DEVELOP AN INEXPENSIVE, EASY METHOD FOR DETECTING AND QUANTIFYING THE PRESENCE OF MARIHUANA IN THE BLOOD, BREATH OR URINE OF A PERSON SUSPECTED OF BEING INTOXICATED SHOULD BE ACCELERATED.

In keeping with the necessity to detect and punish persons who are operating vehicles and other dangerous equipment under the influence of marihuana, it is important for law enforcement officials to have a swift, easy-to-use mechanism that will determine with a high degree of certainty whether the person is acting under the influence of marihuana. The Commission understands that the Department of Transportation and other federal agencies are working toward this goal and we strongly recommend that this research be continued as a priority item.

III. International Cooperation

RECOMMENDATION: AN ACCELERATED PROGRAM FOR FUNDING FOREIGN RESEARCH SHOULD BE UNDERTAKEN IMMEDIATELY.

For the purposes of definitive research on the effects of heavy and very heavy marihuana use, the Commission has found that the United States fortunately does not have significant numbers of people who have been exposed over a long period of time to such use. The National Institute of Mental Health has cooperated with the Commission in

supplying data from its major foreign studies of chronic cannabis users in Jamaica and Greece. For medical research purposes, an analysis of data derived from populations in other countries with 10, 20 or 30 years of experience with heavy marihuana use will provide useful information about probable consequences if the incidence of marihuana use in the United States were to continue and increase, and if more people engaged in heavy, long-term use.

IV. Therapeutic Uses

RECOMMENDATION: INCREASED SUPPORT OF STUDIES WHICH EVALUATE THE EFFICACY OF MARIHUANA IN THE TREATMENT OF PHYSICAL IMPAIRMENTS AND DISEASE IS RECOMMENDED.

Historical references have been noted throughout the literature referring to the use of cannabis products as therapeutically useful agents. Of particular significance for current research with controlled quality, quantity and therapeutic settings, would be investigations into the treatment of glaucoma, migraine, alcoholism and terminal cancer. The NIMH–FDA Psychotomimetic Advisory Committee's authorization of studies designed to explore the therapeutic uses of marihuana is commended.

V. Community-Based Treatment

RECOMMENDATION: COMMUNITY-BASED TREATMENT FACILITIES SHOULD BE PROMOTED IN CARING FOR PROBLEM DRUG USERS UTILIZING EXISTING HEALTH CENTERS WHEN POSSIBLE AND APPROPRIATE.

In studying marihuana, the Commission has obtained information about a number of treatment centers and services. The wide range of agencies and the variety of goals and techniques present a confusing array of services available to drug users, varying widely in their effectiveness. Uniform criteria for evaluating the "success" of these programs is urgently needed.

The medical members of the Commission believe that some of the techniques being used may pose as much potential harm as good. Many young people who are experiencing profound difficulties resulting from the use of drugs may suppose they are being treated and helped, when in reality they are not. In some cases, the short-term benefit may be disruptive to the long-term welfare of the individual. In the rush to provide treatment facilities, many programs have been given impressive credientials without meeting minimal medical standards. It is essential that treatment facilities have, as their primary orientation, the well-being of the individual under treatment.

83-313 O - 77 - 14

VI. Training Programs

RECOMMENDATION: PUBLIC HEALTH COURSES ON THE SOCIAL ASPECTS OF DRUG USE SHOULD BE INCLUDED IN THE CURRICULA OF THE SCHOOLS OF THE HEALTH PROFESSIONS.

The Commission recommends that schools of the health professions include in their curricula courses on the social, public health and therapeutic aspects of drug use as appropriate to the educational purpose of the individual school. The National Survey indicated that the public views the family physician as an important source of information about drugs. Next to school personnel, physicians were mentioned most often in this connection. Persons involved in the health professions must be provided with information about non-medical as well as the medical aspects of drug use.

Other Recommendations

I. Reclassification of Cannabis

RECOMMENDATION: THE COMMISSION RECOGNIZES THAT SEVERAL STATE LEGISLATURES HAVE IMPROPERLY CLASSIFIED MARIHUANA AS A NARCOTIC, AND RECOMMENDS THAT THEY NOW REDEFINE MARIHUANA ACCORDING TO THE STANDARDS OF THE RECENTLY ADOPTED UNIFORM CONTROLLED SUBSTANCES LAW.

Scientific evidence has clearly demonstrated that marihuana is not a narcotic drug, and the law should properly reflect this fact. Congress so recognized in the Comprehensive Drug Abuse Prevention and Control Act of 1970, as did The Conference of Commissioners on Uniform State Laws in the Uniform Controlled Substances Law.

In those states where the Uniform Controlled Substances Law has not yet been adopted, twelve of which continue to classify marihuana as a "narcotic", the Commission recommends that the legislatures distinguish marihuana from the opiates and list it in a separate category. The consequence of inappropriate definition is that the public continues to associate marihuana with the narcotics, such as heroin. The confusion resulting from this improper classification helps to perpetuate prejudices and misinformation about marihuana.

II. Information

RECOMMENDATION: A SINGLE FEDERAL AGENCY SOURCE SHOULD DISSEMINATE INFORMATION AND

MATERIALS RELATING TO MARIHUANA AND OTHER DRUGS. THE NATIONAL CLEARINGHOUSE FOR DRUG ABUSE INFORMATION SHOULD BE CHARGED WITH THIS RESPONSIBILITY.

A great proliferation of drug information materials has occurred in recent years. These materials are currently distributed by a number of federal agencies. Some of these materials conflict with each other. The result is a confusion and uncertainty on the part of the public about the accuracy of all these statements. The public should have one federal source from which to obtain drug information. The National Clearinghouse for Drug Abuse Information appears best suited to perform this task.

III. Education

RECOMMENDATION: THE SPECIAL ACTION OFFICE FOR DRUG ABUSE PREVENTION IN THE WHITE HOUSE SHOULD BE RESPONSIBLE FOR THE COORDINATION, DEVELOPMENT AND CONTENT REVIEW OF ALL FEDERALLY-SUPPORTED DRUG EDUCATIONAL MATERIALS AND SHOULD ISSUE A REPORT AS SOON AS POSSIBLE, EVALUATING EXISTING DRUG EDUCATION MATERIALS.

The Commission has studied many programs of drug education throughout the country. Some are irrelevant, others are poorly designed, still others are misleading, and a good many of them are of questionable value. A few are excellent. The Federal Government must provide assistance to the states and school districts in this matter, and should provide the leadership in developing sample programs in cooperation with educational systems. An evaluation of existing programs by The Special Action Office for Drug Abuse Prevention of the White House could be very helpful in improving the standards of drug education.

IV. Voluntary Sector Participation

RECOMMENDATION: THE COMMISSION NOTES THE SIGNIFICANT ROLE PLAYED BY THE VOLUNTARY SECTOR OF THE AMERICAN COMMUNITY IN INFLUENCING THE SOCIAL, RELIGIOUS AND MORAL ATTITUDES OF OUR NATION'S CITIZENS AND RECOMMENDS THAT THE VOLUNTARY SECTOR BE ENCOURAGED TO TAKE AN ACTIVE ROLE IN SUPPORT OF OUR RECOMMENDED POLICY OF DISCOURAGING THE USE OF MARIHUANA.

Already very active in drug education and prevention activities, the social agencies, service clubs, church groups, and other non-govern-

mental bodies have been extremely helpful in attending to the difficult problems of drug abuse. The local and personal nature of such organizations gives them an advantage over state and federal governments in the development of attitudes by our citizens.

The policy which we here recommend, indeed *any* policy which might be recommended, will inevitably encounter widespread and earnest objections. The fullest efforts of all citizens of good will will be required to attend to the massive problem of drug abuse in a calm, just, responsible and effective manner. The help of the voluntary agencies in working toward this end is earnestly invited and urgently needed.

BUREAU OF NARCOTICS AND DANGEROUS DRUGS' COMMENTS ON THE FIRST REPORT OF THE NATIONAL COMMISSION ON MARIHUANA AND DRUG ABUSE

The Commission on Marihuana and Drug Abuse is to be commended for the thoroughness with which it carried out its assignment. The members, under Chairman Raymond P. Shafer, have produced an extremely valuable report. It is both readable and worth reading. The report should be of great assistance to the Government agencies immediately concerned with the marihuana problem.

The Bureau is in accord with several of the recommendations made by the Commission. After careful study, however, it has come to different conclusions on a few of them.

The basic flaw in the report is one that might have been predicted: the Commission lost sight of the larger goal of the general public interest as it ranged across the nation and the globe in what was essentially an adversary proceeding, pitting advocates of already established views on cannabis use against each other.

It is clear that the Commission made a valiant effort to walk the thin line between legalization and decriminalization. This effort resulted in recommendations which, if put into effect and coupled with limitations it will place on such matters of search and seizure and probable cause, would make effective enforcement for marihuana possession and even sale of small amounts nearly impossible for any normally operated police agency. The evidence is clear that what the majority of the Commission intended is that law enforcement agencies be discouraged from enforcing laws against any personal possession. Three of the Commissioners, agree that criminalization and incarceration for possession for personal use is neither necessary nor desirable; however, they do feel that a civil fine for possession of any amount of marihuana in private or in public is in order. Thus, in effect, the Commission has recommended legalization of cannabis for personal use and for distribution of small quantities.

This goes against all reasons for ever having drug control laws. This is a pronouncement that the Government no longer takes a harsh view regarding proselytizers--those who convert naive persons to drug abusers. If this activity is "legalized" then there is little left of the Commission's expressed policy seeking to discourage marihuana use. The policy of discouragement, as expressed by the Commission, is simply at odds with its recommendation to condone the activities of proselytizers. Indeed, such a recommendation is contrary to the Commission's statement: "Any semblance of encouragement enhances the possibility of abuse and removes from a psychological standpoint, an effective support of individual restraint."

Avoiding the problem of "potency distinction" is a glaring deficiency of the report. The argument used to justify this omission is that making the distinction is too difficult and use of stronger forms of marihuana is not known to exist in the U.S. today. Thus, possession of less than an ounce of low-grade marihuana, and of high-grade hashish, 20 or more times as potent, would be allowable in the home, and subject only to confiscation elsewhere. It is not difficult to predict the choice of those who would transport cannabis. The processing of hashish and liquid hashish would increase, thus making more potent forms of cannabis available in greater quantity, the exact opposite of the result desired by the Commission. This is already happening.

To de-emphasize marihuana as a problem as the report suggests requires more than the wish. And making the drug more easily available is not likely to do this. It is significant that many of the most specific steps the Commission urges are in the area of law enforcement. Its recommendations are, in the last analysis, an accommodation of a minority of the population, and a tacit admission that the Commission considers it more desirable to be permissive rather than firm on the basis of "insufficient evidence." This is not consistent with the drug laws which require a drug to be proven safe and effective before marketing.

This raises the issue which appears to be central to the whole problem: the use and approval of "pleasure drugs" as a basic right. Researchers have indicated that at certain dosages, both

cannabis and LSD have similar psychopharmacological effects. If this is true, then based upon the argument used by the Commission (marihuana in low dosages is relatively of little harm) then any drug chosen by a particular group ought logically to be similarly treated. Heroin comes quickly to mind and so the issue will be debated again, over another drug, by another advocate group, using another set of research findings--supporting the preconception that using low doses of a new drug is not harmful to most users.

The Commission has accepted the reversed argument of the advocate of legalization: that society must prove to a minority of its members that what they want is harmful. Yet for almost every other activity it is the individual who must bear the burden of proof.

We agree that the marihuana problem must be demythologized and desymbolized, but we do not believe that most of our population has accepted any particular myth. By the Commission's own survey a majority of American adults queried indicated disapproval of the lessening of penalties. In interpreting the statistics the Commission presumed that when 41% find the existing laws unacceptable they mean that the laws are too harsh. Perhaps the public feels the present laws are too lenient. While there may be some confusion as the questionnaire indicates, perhaps due to poor design, most adults do not seem to want a more permissive policy nor do they wish to gamble the country's future when all of the facts are still not in. Rather, it is waiting to see what its leadership recommends for marihuana. The majority of the public cannot or is reluctant to make a decision based on inadequate exploration of the alternatives. Unfortunately, the Commission has, through its recommendations, compounded the difficulty of dealing with the short-range problem.

The long-range effect of the report may be more salutory. It has provided a range of possibilities, and given them a clearer form than has existed heretofore. Thus, the report provides the opportunity to point out the inconsistencies in the legal position taken by the Commission. Previously, one would have had to set up the issues before being able to point out inconsistencies, illogic, and inadequacies.

In defense of the Commission, it attempted to do the impossible given (a) the present knowledge in the field, and (b) the present state of social values and attitudes toward drug use. It has succeeded in focusing the issues; it has succeeded in taking some of the mythology out of marihuana; it has provided a broader context within which to view the problem; it has, on a world-wide basis, gathered the available data. Unfortunately, it began with a negative bias: that is, it began looking (perhaps sub-consciously) for the best way to avoid a confrontation, rather than to let the evidence lead it to the truth. Perhaps the Commission was asked to judge too soon before all the witnesses were heard. In our opinion, that is the case. We prefer to view the evidence in terms of the long-term public interest, rather than as a judgment between a vocal minority and the status quo. The evidence, it seems to us, makes a case for greater caution than the Commission appears to have exercised.

The following section comments on the recommendations of the Commission.

RECOMMENDATION

FOR THESE REASONS, WE RECOMMEND TO THE PUBLIC AND ITS POLICY MAKERS A SOCIAL CONTROL POLICY SEEKING TO DISCOURAGE MARIHUANA USE, WHILE CONCENTRATING PRIMARILY ON THE PREVENTION OF HEAVY AND VERY HEAVY USE.

COMMENT

This recommendation goes counter to the escalation process. A person is a light user - or experimenter - before he becomes a heavy user. Prevention of heavy use assumes extensive light use by many others.

The recommendation raises a contention that the Commission is not as concerned for the future, but rather primarily for the present user. Ignoring tomorrow's problem by pretending that there is no escalation of use, from experimentation to heavy, is not a realistic view.

The recommendation implicitly assumes that (a) light users will not become heavy users in large numbers, which is not true in the case of tobacco or alcohol, and (b) education efforts alone will be effective in discouraging light use, which is not supported by solid data.

RECOMMENDATION

POSSESSION OF MARIHUANA FOR PERSONAL USE WOULD NO LONGER BE AN OFFENSE, BUT MARIHUANA POSSESSED IN PUBLIC WOULD REMAIN CONTRABAND SUBJECT TO SUMMARY SEIZURE AND FORFEITURE.

COMMENT

The line of demarcation between what is possessed in private for one's own use or for distribution in small quantities with little or no remuneration, and what is possessed with intent to sell for profit is exceedingly difficult to make. If a person is known to have one, two or three kilograms of hashish in his home, is this sufficient to assume he possesses it for sale? In gathering probable cause for an arrest or search warrant, or in ruling on the sufficiency of probable cause for issuance of a warrant, how is a police officer or judiciary official to know whether a crime is being committed? In order to make the determination contemplated by the Commission, a judiciary official would be required to have more than probable cause; he would be required to have prima facie evidence of intent to distribute the hashish for profit. Moreover, the law enforcement agent would be required to show in his affidavit that none of the hashish was for the personal use of the accused or for distribution in small quantities for little or no remuneration.

The issue of probable cause cannot be overlooked. In most cases law enforcement agencies simply will not have the proof to negate the defense of possession for one's own use or to distribute in small quantities with little or no remuneration. The information necessary to show possession with intent to sell for profit is difficult enough to prove. Accordingly, we believe this recommendation will place such a loophole in the law as to allow traffickers to possess with impunity supplies of marihuana virtually out of reach of law enforcement agencies.

RECOMMENDATION (FOR FEDERAL LAW)

CASUAL DISTRIBUTION OF SMALL AMOUNTS OF MARIHUANA FOR NO REMUNERATION, OR INSIGNIFICANT REMUNERATION NOT INVOLVING PROFIT WOULD NO LONGER BE AN OFFENSE.

COMMENT

This distinction is inappropriate because it is not measurable in terms that can be applied practically to various activities.

This recommendation impinges on the "pleasure drugs" question, and by extension a case could be made for applying the same criteria to other drugs such as mescaline, LSD, and heroin. The broader public interest has been subordinated in this recommendation to the requirements of satisfying the minority adversaries.

We also have legal difficulties with the recommendation. What is a "casual distribution," what is a "small amount of marihuana," and what is "insignificant remuneration not involving profit?" This means that if a person desires to introduce marihuana use to juveniles, he is free to do so as long as the transfers are "small" and are totally donative or only to reimburse himself for out-of-pocket expenses.

In dealing with such terms, police agencies, prosecutors and courts will have an impossible task. Every investigation of a trafficker's activities will require the law enforcement agency to negate all of the defenses by showing that the distributions were more than "casual," that the sales were more than "small amounts," and that the accused received more than "insignificant remuneration." Warrants of arrest will be made more difficult to obtain, and prosecutions will be threatened. Correct instructions to juries will be extremely difficult, and juries will be called upon to make almost impossible borderline decisions. The possibility of reversible error and numerous appellate problems are obvious.

RECOMMENDATION (FOR FEDERAL LAW)

A PLEA OF MARIHUANA INTOXICATION SHALL NOT BE A DEFENSE TO ANY CRIMINAL ACT COMMITTED UNDER ITS INFLUENCE, NOR SHALL PROOF OF SUCH INTOXICATION CONSTITUTE A NEGATION OF SPECIFIC INTENT.

COMMENT

We agree with this recommendation.

RECOMMENDATION (FOR STATE LAW)

CULTIVATION, SALE OR DISTRIBUTION FOR PROFIT AND POSSESSION WITH INTENT TO SELL WOULD REMAIN FELONIES (ALTHOUGH WE DO RECOMMEND UNIFORM PENALTIES).

COMMENT

We generally agree with this recommendation, in the classification of the offense and the desirability for a range of appropriate penalties to fit the particular offense. Also, we see advantages in having the penalties within similar boundaries between the States. On the other hand, if the citizens of a State believe the drug abuse situation would become worse by enacting less severe penalties, we believe it would be inappropriate to make such a change purely for purposes of uniformity.

RECOMMENDATION

POSSESSION IN PRIVATE OF MARIHUANA FOR PERSONAL USE WOULD NO LONGER BE AN OFFENSE.

COMMENT

We disagree with this recommendation for the reasons cited above regarding Federal law.

RECOMMENDATION (FOR STATE LAW)

DISTRIBUTION IN PRIVATE OF SMALL AMOUNTS OF MARIHUANA FOR NO REMUNERATION OR INSIGNIFICANT REMUNERATION NOT INVOLVING A PROFIT WOULD NO LONGER BE AN OFFENSE.

COMMENT

We disagree with this recommendation for the reasons cited above regarding the Federal law.

RECOMMENDATION (FOR STATE LAW)

POSSESSION IN PUBLIC OF ONE OUNCE OR UNDER OF MARIHUANA WOULD NOT BE AN OFFENSE, BUT THE MARIHUANA WOULD BE CONTRABAND SUBJECT TO SUMMARY SEIZURE AND FORFEITURE.

COMMENT

This recommendation disregards all considerations of the quality of the substance possessed, and places leaves, stems and seeds of the cannabis plant in the same category as the "liquid hashish" now being found in the traffic. Any effort to distinguish between small-time peddlers and major traffickers based on a rigid statutory formula, in our opinion, cannot adequately reflect the variety of illegal substances or the variety of means which will be used to escape being in violation of the law. Even major traffickers of hashish can adapt their operations to any statutory line of demarcation.

The feature also would place a heavy burden on law enforcement officers. Officers will not be able to estimate the quantity of marihuana; the precise weight is necessary to determine whether or not a crime has been committed. The law enforcement officer would be charged to make an on-the-spot determination of whether or not an ounce was involved, whether to charge the person with possession involving only a $100 fine and issue a summons, or to charge the person with possession with intent to sell and place the accused under arrest.

In the normal street situation, the police officer may not have the facts necessary to make a decision, he will not be able to take into account the type of substance involved, i.e., marihuana leaves as distinguished from hashish, he will not be able to readily determine in many cases whether the person is transient, and the possibility of misjudgment and mishandling is greatly increased. Based upon quantity alone, a police officer would be required to distinguish between (1) no crime at all, (2) a minor offense, or (3) a serious offense. Although training police officers to make such sophisticated decisions is not insurmountable, it is a feature that must be considered before adoption of this recommendation.

RECOMMENDATION (FOR STATE LAW)

POSSESSION IN PUBLIC OF ONE OUNCE OR UNDER OF MARIHUANA WOULD BE A CRIMINAL OFFENSE PUNISHABLE BY A FINE OF $100.

COMMENT

The degree of culpability between mere "possession" of this type and possession with intent to sell is not discernible. Again, this recommendation fails to take into account the variety of substances available and the methods of operation that may be employed by violators.

RECOMMENDATION (FOR STATE LAW)

DISTRIBUTION IN PUBLIC OF SMALL AMOUNTS OF MARIHUANA FOR NO REMUNERATION OR INSIGNIFICANT REMUNERATION NOT INVOLVING A PROFIT WOULD BE A CRIMINAL OFFENSE PUNISHABLE BY A FINE OF $100.

COMMENT

We agree that this recommendation would be a viable alternative in the handling of persons who are not responsible for introducing drug abuse to naive persons. On the other hand, we do not believe such a minor offense is consistent with the Commission's view that society should not approve or encourage even the recreational use of marihuana. Merely subjecting a person to a $100 fine for introducing other persons to the use of marihuana may not be considered discouragement in the minds of many citizens.

RECOMMENDATION (FOR STATE LAW)

PUBLIC USE OF MARIHUANA WOULD BE A CRIMINAL OFFENSE PUNISHABLE BY A FINE OF $100.

COMMENT

Providing the offense involves nothing more than simple use of marihuana, we would not object to this recommendation as an alternative to having no penalty at all.

RECOMMENDATION (FOR STATE LAW)

DISORDERLY CONDUCT ASSOCIATED WITH PUBLIC USE OF OR INTOXICATION BY MARIHUANA WOULD BE A MISDEMEANOR PUNISHABLE BY UP TO 60 DAYS IN JAIL, A FINE OF $100, OR BOTH.

COMMENT

No objection.

RECOMMENDATION (FOR STATE LAW)

OPERATING A VEHICLE OR DANGEROUS INSTRUMENT WHILE UNDER THE INFLUENCE OF MARIHUANA WOULD BE A MISDEMEANOR PUNISHABLE BY UP TO ONE YEAR IN JAIL, A FINE OF UP TO $1,000, OR BOTH, AND SUSPENSION OF A PERMIT TO OPERATE SUCH A VEHICLE OR INSTRUMENT FOR UP TO 180 DAYS.

COMMENT

No objection.

RECOMMENDATION (FOR STATE LAW)

A PLEA OF MARIHUANA INTOXICATION SHALL NOT BE A DEFENSE TO ANY CRIMINAL ACT COMMITTED UNDER ITS INFLUENCE NOR SHALL PROOF OF SUCH INTOXICATION CONSTITUTE A NEGATION OF SPECIFIC INTENT.

COMMENT

No objection.

RECOMMENDATION (FOR STATE LAW)

A PERSON WOULD BE ABSOLUTELY LIABLE IN CIVIL COURT FOR ANY DAMAGE TO PERSON OR PROPERTY WHICH HE CAUSED WHILE UNDER THE INFLUENCE OF THE DRUG.

COMMENT

No objection.

BACKGROUND

The National Commission on Marihuana and Drug Abuse was established pursuant to a provision of Public Law 91-513, the Comprehensive Drug Abuse Prevention and Control Act of 1970. The provision was an amendment by the House Interstate and Foreign Commerce Committee to the original Administration proposal. The law provided that the Commission should be composed of two Members of the Senate appointed by the President of the Senate, two Members of the House appointed by the Speaker of the House, and nine members appointed by the President of the United States. Appointed in early 1971, the Commission was charged to report to the President, Congress and the public within one year on the problems involved in marihuana use, and within two years on the causes of drug abuse in general and their relative significance. The 13-member commission, chaired by the Honorable Raymond P. Shafer, held formal and informal hearings, soliciting many different points of view -- including those of public officials, community leaders, professional experts and students. They commissioned more than fifty projects, ranging from a study of the effects of marihuana on man to a field survey of enforcement of the marihuana laws in various metropolitan areas. After a year's study, on March 22, 1972, the Commission submitted its first report, "Marihuana: A Signal of Misunderstanding." This report, according to the Commission, "is an all-inclusive effort to present the facts as they are known today, to demythologize the controversy surrounding marihuana, and to place in proper perspective one of the most emotional and explosive issues of our time."

EXCERPTS FROM THE REPORT

Origins of the Marihuana Problem

"Marihuana has been used as an intoxicant in various parts of the world for centuries and in this country for 75 years. Yet use of the drug has been regarded as a problem of major proportions for less than a decade.

"The Commission believes that three interrelated factors have fostered the definition of marihuana as a major national problem. First, the illegal behavior is highly visible to all segments of our society. Second, use of the drug is perceived to threaten the health and morality not only of the individual, but of society itself. Third, and most important, the drug has evolved in the late sixties and early seventies as a symbol of wider social conflicts and public issues."

Historical Perspective

"When viewed in the context of American society's ambivalent response to the non-medical use of drugs, the marihuana problem is not unique. Both the existing social policy toward the drug and its contemporary challenge have historical antecedents and explanations. American opinion has always included some opposition to the non-medical use of any drug, including alcohol and tobacco.

"In 1932, the National Conference of Commissioners on Uniform State Laws included an optional marihuana provision in the Uniform Narcotic Drug Act, and by 1937, every state, either by adoption of the Uniform Act or by separate legislation, had prohibited marihuana use. In late 1937, the Congress adopted the Marihuana Tax Act, superimposing a federal prohibitory scheme on the state scheme.

"Not once during this entire period [from the early 1900's until recently] was any comprehensive scientific study undertaken in this country of marihuana and its effects. The drug was assumed to be a "narcotic," to render the user psychologically dependent, to provoke violent crime, and to cause insanity.

"When penalties for narcotics violations escalated in the 1950's, marihuana penalties went right along with them, until a first-offense possessor was a felon subject to lengthy incarceration.

"With this historical overview in mind, it is not surprising that the contemporary marihuana experience has been characterized by fear and confusion on one side and outrage and protest on the other."

The Effects of Marihuana on the User

"Any psychoactive drug is potentially harmful to the individual, depending on the intensity, frequency, and duration of use. Marihuana is no exception.

"Looking only at the effects on the individual, there is little proven danger of physical or psychological harm from the experimental or intermittent use of the natural preparations of cannabis. The risk of harm lies instead in the heavy, long-term use of the drug, particularly of the most potent preparations."

Social Impact of Marihuana Use

"From what is now known about the effects of marihuana, its use at the present level does not constitute a major threat to public health. However, this statement should not lead to complacency. Marihuana is not an innocuous drug. The clinical findings of impaired psychological function, carefully documented by medical specialists, legitimately arouse concern. These studies identify marihuana-related problems which must be taken into account in the development of public policy. Unfortunately, these marihuana-related problems, which occur only in heavy, long-term users, have been overgeneralized and over dramatized.

"We believe that experimental or intermittent use of this drug carries minimal risk to the public health, and should not be given overzealous attention in terms of a public health response. We are concerned that social influences might cause those who would not otherwise use the drug to be exposed to this minimal risk and the potential escalation of drug-using patterns. For this group, we must deglorify, demythologize, and deemphasize the use of marihuana and other drugs."

SUMMARY OF FINDINGS

An estimated 24 million Americans over the age of 11 years (15% of the adults 18 and over, and 14% of the 12-17 year olds) have used marihuana at least once. About 8,300,000 still use the drug, and 500,000 are heavy users.

Age is presently one of the most significant correlates of marihuana use, the incidence of use being the greatest among young people: 27% of the 16-17 year olds, 40% of the 18-21 year olds, and 38% of the 22-25 year olds have tried marihuana; at the low extremes, 6% of the 12-13 year olds and 6% of the over-50 generation have used the drug.

No conclusive evidence exists of any physical damage, disturbances of bodily processes or proven human fatalities attributable solely to even very high doses of marihuana.

Experimenters and intermittent users develop little or no psychological dependence on the drug. No organ injury is demonstrable.

Long-term heavy users show strong psychological dependence on marihuana and hashish. Organ injury, especially diminution of pulmonary function, is possible. Specific psychological and behavioral changes are detectable.

Marihuana, like other psychoactive substances, predominantly affects mental processes and responses and thus the motor responses. Generally the degree of impairment of performance is dose-related, with minimal effect at low doses.

Rare cases of full-blown psychotic episodes have been precipitated by marihuana. Generally, the individuals had previous mental disorders or had poorly developed personalities.

No reliable evidence was found indicating that marihuana causes genetic defects in man. However, fetal damage cannot be ruled out, therefore, the use of marihuana during pregnancy is not advisable.

No objective evidence of brain damage from marihuana use has been found.

Marihuana use does not lead to physical dependence. No torturous withdrawal syndrome follows the sudden cessation of chronic, heavy use.

The overwhelming majority of marihuana users do not progress to other drugs. Only moderate and heavy use of marijuana is significantly associated with persistent use of other drugs.

The weight of the evidence is that marihuana does not cause violent or aggressive behavior; if anything, it generally serves to inhibit the expression of such behavior.

No valid evidence was found to support the thesis that marihuana, by itself, either inevitably, generally or even frequently causes or precipitates crime.

RECOMMENDATIONS

"The Commission is of the unanimous opinion that marihuana use is not such a grave problem that individuals who smoke marihuana, and possess it for that purpose, should be subject to criminal procedures. On the other hand, we have also rejected the regulatory or legalization scheme because it would institutionalize availability of a drug which has uncertain long-term effects and which may be of transient social interest.

"In general, we recommend only a decriminalization of possession of marihuana for personal use on both the State and Federal levels. The major features of the recommended scheme are that: production and distribution of the drug would remain criminal activities as would possession with intent to distribute commercially; marihuana would be contraband subject to confiscation in public places; and criminal sanctions would be withdrawn from private use and possession incident to such use, but, at the State level, fines would be imposed for use in public."

Recommendations for Federal Law

Possession of marihuana for personal use would no longer be an offense, but marihuana possessed in public would remain contraband subject to seizure and forfeiture.

Casual distribution of marihuana for no remuneration or insignificant remuneration not involving profit would no longer be an offense.

A plea of marihuana intoxication shall not be defense to any criminal act committed under its influence, nor shall proof of such intoxication constitute a negation of specific intent.

Recommendations for State Law

Cultivation, sale or distribution for profit and possession with intent to sell would remain felonies. [The Commission additionally recommends that such laws and penalties should be uniform throughout the States.]

Possession in private for personal use, and distribution in private of small amounts for no remuneration or insignificant remuneration not involving a profit would no longer be an offense.

Possession in public of one ounce or under of marihuana would not be an offense, but the marihuana would be subject to seizure and forfeiture. Possession in public of more than one ounce would be a criminal offense punishable by a fine of $100.

Public use or distribution in public of small amounts for no remuneration or insignificant remuneration involving no profit would be a criminal offense punishable by a fine of $100.

Disorderly conduct associated with public use of or intoxication by marihuana would be a misdemeanor punishable by up to 60 days in jail, a fine of $100, or both.

Operating a vehicle or dangerous instrument while under the influence of marihuana would be a misdemeanor punishable by up to one year in jail, a fine of up to $1,000, or both, and suspension of a permit to operate such a vehicle or instrument for up to 180 days.

A plea of marihuana intoxication shall not be a defense to any criminal act committed under its influence nor shall proof of such intoxication constitute a negation of specific intent.

A person would be absolutely liable in civil court for any damage to person or property while he is under the influence of the drug.

BACKGROUND

The National Commission on Marihuana and Drug Abuse was established pursuant to a provision of Public Law 91-513, the Comprehensive Drug Abuse Prevention and Control Act of 1970. The law provided that the Commission should be composed of two Members of the Senate appointed by the President of the Senate, two Members of the House of Representatives appointed by the Speaker of the House, and nine Members appointed by the President of the United States. Appointed in early 1971 with the Honorable Raymond P. Shafer as chairman, the Commission was charged to report to the President, Congress and the public within one year on the problems involved in marihuana use, and within two years on the phenomena of drug use in general and its social impact.

After a year's study, on March 22, 1972, the Commission submitted its first report, "Marihuana: A Signal of Misunderstanding". This report attempted to present the facts concerning marihuana as they were currently known, and, among other things, recommended the elimination of criminal penalties for the private use and possession of the drug. For further details see Congressional Research Service multilithed report No. 72-129 ED.

The Commission's final report, "Drug Use in America: Problem in Perspective," was released on March 22, 1973, following two years of hearings and research. This report, in the words of the chairman, "is an effort to examine the roots of the drug problem in the United States, to analyze the assumptions upon which present policy is based, and to recommend policy directions for both the public and private sectors".

EXCERPTS FROM THE REPORT

Drug Abuse: Synonym for Social Disapproval

"Drug abuse is another way of saying drug problem. Now immortalized in the titles of federal and State governmental agencies (and we might add, in our own), this term has the virtue of rallying all parties to a common cause: no one could possibly be for abuse of drugs any more than they could be for abuse of minorities, power or children. By the same token, the term also obscures the fact that 'abuse' is undefined when drugs are concerned. Neither the public, its policy makers nor the expert community share a common understanding of its meaning or of the nature of the phenomenon to which it refers.

"Drug abuse, or any similar term, creates an impression that all drug-using behavior falls in one of two clear-cut spheres: drug use which is good, safe, beneficial and without social consequence; and drug 'abuse' which is bad, harmful, without benefit and carrying high social cost. From either a descriptive or an evaluative standpoint, the matter is much too complex to be handled in such a polarized fashion. The Commission urges that the public and its policy makers avoid such labels and focus instead on the relative risks and social consequences of various patterns of drug-taking behavior."

Defining America's Drug Problem

"Theoretically, social concern about use of a particular substance relative to another should correlate with the verified social costs attending the use of each drug in that society. As the incidence of intensified and compulsive use increases, so too should the public's concern with the problem. However, the current problem definition in the United States bears little relationship to actual social cost. The intense public concern regarding use of most drugs in large measure reflects anxiety for the future rather than empirical considerations rooted in the present. The result has been an over-estimation of the nature of

the problem attending use of some drugs, such as marihuana, and an underestimation of the problem attending use of other drugs, such as barbiturates and alcohol.

"In the Commission's view, problem definition should take into account the relationship between the maximum social cost of use of a particular drug under given conditions of availability, compared with the verified social costs at a particular point in time. In this context, the most serious concern in contemporary America should attach to use of alcohol and heroin. Moderate social concern should attach to the use of amphetamines, barbiturates, hallucinogens, methaqualone and cocaine, the use of which is relatively well-controlled within the present social policy framework. The use of marihuana and the so-called minor tranquilizers appears to require relatively minimum social concern at the present time. Present trends do suggest, however, that the incidence of use of and dependence on barbiturates and cocaine may be increasing and may demand increased social attention."

A Typology of Drug-Using Behavior

"In an effort to provide policy makers with a more accurate data base upon which to form their decisions, the Commission has attempted to relate the various patterns of drug use observed in the youth and adult populations to their motivating factors, and has tendered its best judgment of both the personal and social risks posed by the five usage patterns identified:

"1. Experimental drug use -- Experimental drug use is defined by the Commission as the short-term, non-patterned trial of one or more drugs, either concurrently or consecutively, with a variable intensity but maximum frequency of ten times per drug, used either singly or in combination.

"2. Social or recreational drug use -- Social or recreational use, like experimental drug use, occurs in social settings among friends or acquaintances who desire to share an experience perceived by them as both acceptable and

pleasurable. The most distinguishing characteristic of such use is that it is a voluntary act and, regardless of the duration of use, tends not to escalate in either frequency or intensity to patterns of uncontrolled and uncontrollable use which is personally rather than socially motivated. Nor is it sustained by virtue of the dependence of the user in any meaningful sense of that term.

"3. Circumstantial or situational drug use -- Circumstantial use is generally task-specific, self-limited use which may be variably patterned, differing in frequency, intensity and duration. The distinguishing feature of this pattern is that use is motivated by the perceived need or desire to achieve a known and anticipated effect deemed desirable to cope with a specific, sometimes recurrent, situation or condition of a personal or vocational nature.

"4. Intensified drug use -- Intensified use is generally a long-term, patterned use of drugs at a minimum level of at least once daily and is motivated by an individual's perceived need to achieve relief from a persistent problem or stressful situation or his desire to maintain a certain self-prescribed level of performance. A distinguishing characteristic of this class of behavior is the regular use of one or a combination of drugs escalating to patterns of consumption which might properly be defined as dependence.

"5. Compulsive drug use -- Compulsive use is patterned at both high frequency and high intensity levels of relatively long duration, producing physiological or psycholcgical dependence such that the individual cannot at will discontinue such use without experiencing physiological discomfort or psychological disruption. Compulsive use may be characterized by preoccupation with obtaining adequate and sufficient amounts of the drug in order to forestall the abstinence syndrome."

Evaluating the Social Impact of Drug Dependence

"No rational social policy would aim to eliminate drug dependence per se. When the risk associated with a type of drug dependence does not involve drug-influenced behavior, but is rather limited to possible danger to individual health, it is the Commission's view that private normative choice should prevail, and that the social policy decision is of an entirely different order than that required behavior-influencing drugs. The primary policy consideration here is the behavioral impact on the public safety, health and welfare."

A Realistic Appraisal

"Most opiate-dependent persons have long histories of psychopathology and social pathology which are manifest in delinquent, criminal, suicidal and other deviant behavior prior to the onset of drug use. Psychiatric and other studies have also confirmed the hypothesis that the pre-existence of these problems significantly increased the individual's initial susceptibility to opiate dependence as well as high vulnerability to relapse into drug use and crime.

"Additional research findings have indicated that most opiate-dependent persons come from unstable home and family situations where social deviance was evident in other family members, and drop out of school at a fairly early time (generally about 10th grade). They generally possess no marketable skills; have non-existent or at best unstable employment histories; have unstable personal and social relations; reside in the inner-city ghettos and suffer the psychological, social and economic stresses so often concommitant with that type of existence.

"Taken together, these finds suggest that chances for rehabilitative success, however defined, are not high for such individuals... Notwithstanding the fact that social, psychiatric, psychological, counseling and other ancillary services are provided to those in treatment, this society must face the fact that even the

best of the services have inherent limitations in the degree to which such programs can alter the behavior of individuals who for so long have been subject to non-supportive social and emotional circumstances. While evidence does exist to show that some qualitative and quantitative changes in behavior with respect to crime and employment are associated with treatment, the precise nature or amount of change which can be directly attributable to programmatic inputs is difficult to measure and has not yet been documented substantially."

Irresponsible Use

"The primary goal of drug policy must be to minimize irresponsible drug-using behavior. The Commission finds that the use of drugs is clearly irresponsible:

when the manner or circumstances of use pose a threat to the safety or welfare of others;

when the pattern of use substantially impedes or risks the impairment of the individual's social and economic functioning; and

when the pattern of use reduces the individual's options for self-fulfillment by impairing his faculties or retarding his development."

Looking Ahead

"Gathering the best data available on incidence and consequences of drug use, the Commission has looked carefully for the grounds of legitimate social concern. The problem does not lie in drug use itself, for much use, even when illegal, does not have immediately harmful consequences either for the user or for the community. Nor does the difficulty relate to any use of particular drugs though, plainly, certain drugs are associated with more serious individual and social consequences than others. The Commission found that the problem is in the behavior induced by the drug experience or by drug dependence which impacts adversely on the public safety or, by inhibiting social functioning, on the public health and welfare.

"Having defined the drug problem in terms of objective standards of public concern, the Commission was then able to set the criteria for selecting and formulating appropriate drug policy. The Commission concluded that the following policy is appropriate: our society should continue to discourage any drug use outside medical channels or established social patterns. The primary concern of drug policy should be with disruptive or dysfunctional drug use. Finally, drug policy should not limit its concern to illegal drug taking, but should also include dysfunctional or disruptive use of "lawful" substances such as alcohol and barbiturates."

SUMMARY OF FINDINGS

Drug Use in the General Population

The Commission's Survey findings regarding the reported drug experiences of American youth and adults were as follows:

	Youth	Adults
Alcoholic beverages[1]	24%	53%
Tobacco, cigarettes[1]	17%	38%
Proprietary sedatives, tranquilizers, stimulants[2]	6%	7%
Ethical sedatives[2]	3%	4%
Ethical tranquilizers[2]	3%	6%
Ethical stimulants[2]	4%	5%
Marihuana	14%	16%
LSD, other hallucinogens	4.8%	4.6%
Glue, other inhalants	6.4%	2.1%
Cocaine	1.5%	3.2%
Heroin	.6%	1.3%

[1] (Within past 7 days; [2] Nonmedical use only)

83-313 O - 77 - 16

Comparative National Survey Student Data

Information about secondary school and college student drug-using behavior gathered in the Commission's National Survey revealed the following:

Seventy-three percent of the junior high students, 87% of the senior high students, and 98% of the college students have consumed some type of alcoholic beverage at one time or another.

Some experience with marihuana was reported by 8% of the junior high students, 24% of the senior high students, and 67% of the college students.

Five percent of the junior high students, 8% of the senior high students, and 2% of the college students reported experiences with glue or similar inhalants.

Three percent of the junior high students, 9% of the senior high students, and 27% of the college students have tried LSD or similar hallucinogens at least once.

Only 0.2% of the junior high students, 1.1% of the senior high students, and 4.3% of the college students reported having tried heroin at least once.

Experience with cocaine was reported by 1.2% of the junior high students, 2.6% of the senior high students, and 10.4% of the college students.

Roughly 4% of the junior high students, 10% of the senior high students, and 33% of the college students reported use of ethical stimulants or depressants at some time in their lives. These figures include use for both medical and non-medical reasons.

Drugs and Crime

The following tentative conclusions were reached from the data available regarding drug use and crime:

Alcohol is strongly associated with violent crime and with reckless and negligent operation of motor vehicles.

Research findings linking barbiturate and amphetamine users with criminal behavior, especially assaultive offenses, are increasing, but no definitive association has yet been established in this country; however, a strong association has been demonstrated between amphetamine use and violence in Sweden and Japan.

Research data are generally lacking regarding the actual relationship between cocaine use and criminal behavior; however, the pharmacologic effects of the drug would seem to suggest a potential for drug-induced violent behavior similar to that shown for amphetamine and barbiturate users.

Marihuana use, in and of itself, is neither causative of, nor directly associated with crime, either violent or non-violent.

Use of opiates, especially heroin, is associated with acquisitive crimes such as burglary and shoplifting. Assaultive offenses are significantly less likely to be committed by these opiate users, especially in comparison with users of alcohol, amphetamines and barbiturates.

Except in relatively rare instances generally related to drug-induced panic and toxic reaction, users of hallucinogens, non-barbiturate sedative-hypnotics, glue and similar volatile inhalants are not inclined toward assaultive criminal behavior. It should be noted, however, that some of the non-barbiturate sedatives, notably methaqualone, and the hydrocarbon solvents have a potential for inducing violent behavior although the incidence of such behavior is currently low.

Analyzing the Government Response

In fiscal year 1969, the federal government spent $66.4 million for all phases of its drug abuse program, including law enforcement, treatment and rehabilitation, education, training, research, and evaluation. By fiscal year 1973, total funding had reached $791.3 million, an increase of 1092%.

Failures of the Present System

The Commission's review of the present system suggests that the governmental response has failed in nine major ways:

The nature and extent of drug use have not been adequately identified.

Definitive goals and objectives of drug-related functions have not been sufficiently developed at any governmental level.

Effective planning is not being, and cannot be carried out under present conditions.

Lack of meaningful plans, in turn, has made effective control of resource allocation impossible.

Limited coordination among federal agencies has resulted in duplication, overlap of efforts and a disregard of problem areas requiring action.

Formulating and administering drug policy is not the primary mission of many federal agencies performing important drug-related functions.

Because goals and objectives have not been defined, programs cannot be evaluated in terms of their effectiveness.

Programs are not being evaluated in terms of their efficiency.

Drug and alcohol activities are treated as two entirely distinct functions and their policy directions are not coordinated.

SELECTED RECOMMENDATIONS

Recommendations for Public Institutions

I. Government Organization

A. Federal

1. Congress should create a Single Federal Agency similar in legal and political status to the Atomic Energy Commission. The agency, which might be called the Controlled Substances Administration, would establish, administer

and coordinate all drug policy at the Federal level and would be the principal, if not sole, point of contact with the State drug programs. The Single Agency would remain separate from all other Federal departments and agencies and would be responsible for its own organization and fiscal management. 1/

2. The Single Agency should have the authority and capability to do the following: (a) Distribute and monitor block or formula grants to States for drug dependence treatment, rehabilitation, prevention, education, and law enforcement programs; (b) Coordinate all substance-related programs which remain external to the agency itself, such as those of the Department of Defense and the Bureau of Prisons; (c) Provide evaluative capabilities for federally funded drug programs operated at the Federal, State and local levels; (d) Maintain and monitor an ongoing collection of data necessary for present and prospective policy planning, including data on incidence, nature and consequences of drug use; (e) Develop and implement a general directed research plan; (f) Provide discretionary funds for those areas in which innovative and experimental programs are necessary at the local level and for other essential programs which cannot be performed adequately by the States; and (g) Direct the Federal law enforcement response in the drug field and provide assistance to State law enforcement.

3. To avoid institutionalizing the drug "problem", the concept and accomplishements of the Single Agency should be reexamined four years after its creation; and the agency itself, by law, should disband within five years, its surviving components being reassigned to the agencies or departments from which they came.

1/ Commissioners Hughes, Senator from Iowa, and Javits, Senator from New York, do not concur in the recommendation.

4. Congress should establish a commission four years hence, with the specific responsibility to: (a) Evaluate the social response to drug use during the preceding four years; (b) Consider the results of both directed and undirected research programs; (c) Recommend to Congress whether the unified Federal agency should be continued, dissolved or modified; (d) Determine which measures have justified their costs and which have not; (e) Propose needed new policies, programs and techniques; and (f) Reexamine fully the basic issues and consider whether departures from the present response are required.

B. State

1. Each State should establish a unified drug agency on the same model as that proposed for the Federal government.

2. Each State agency should have sufficient powers to coordinate all drug programs at the State level and provide guidance and funding to community programs.

C. Community

Each community with a significant drug use problem should create a coordinating council to insure communication and concert of action between the various drug-related functions in the community.

II. Legal Controls

A. International

1. The State Department, in conjunction with the Department of Justice, should immediately undertake a comprehensive review of existing extradition treaties dealing with drug offenses with a view toward expanding the scope of extraditable offenses and facilitating the extradition process.

2. The United States should encourage law enforcement agencies in all concerned countries to increase both formal and informal exchanges of information concerning drug traffic and traffickers.

3. Both the Single Convention and the proposed Psychotropic Convention should be redrafted to make clear that each nation is free to determine for itself which domestic uses for controlled substances it will allow, provided only that each nation prevent diversion and prohibit exportation and production for exportation for illegal use in other countries.

B. Federal

1. At this time, none of the barbiturate drugs should be placed in Schedule II of the Federal Controlled Substances Act. Instead, the American Medical Association should immediately design and furnish to physicians guidelines on the prescribing of barbiturates.

2. Since, unlike the barbiturates, methaqualone does not have large-scale medical uses, and does present a significant problem of misuse, it should be placed in Schedule II, along with the amphetamines.

3. With respect to the drug trafficking laws, the trafficking offenses and penalty structure presently in force under the 1970 Comprehensive Drug Abuse Prevention and Control Act should be retained.

C. Federal and State

1. The Commission reaffirms its recommendations concerning marihuana as set out in its First Report. (See CRS report number 72-129 ED.)

2. The unauthorized possession of any controlled substance except marihuana should remain a prohibited act. The primary purpose of enforcement of the possession laws should be detection and selection of those persons who would benefit by treatment or prevention services.

3. For those drug-dependent persons who are apprehended for consumption-related offenses, including possession, one of the following dispositions should be mandatory: (a) Diversion to a treatment program in lieu of prosecution, or (b) Diversion to a treatment program after conviction but before entry of judgment by the court. Failure by an individual to comply with the conditions of treatment would result in his return to the court for prosecution or sentencing. In that event, he should be subject to punishment by up to one year imprisonment, a fine of up to $500, or both.

4. For those non-drug-dependent persons who are apprehended for consumption-related offenses, including possession, one of the following dispositions should be mandatory: (a) Diversion to a prevention services program in lieu of prosecution; (b) Diversion to a prevention services program after conviction but before entry of judgment of court; (c) A fine of up to $500; or (d) Probation with appropriate conditions. Failure by an individual to comply with the conditions of prevention services under alternatives (a) or (b) would result in his return to the court for prosecution or sentencing. In that event, he should be subject to punishment by up to one year's imprisonment, a fine of up to $500, or both.

D. State

1. States which have not already done so should adopt the Uniform Controlled Substances Act.

2. Each State should review its penalty structure for trafficking offenses and determine whether the penalties are commensurate with the relative severity of the offenses.

III. Law Enforcement

A. Federal

1. Federal criminal investigative agencies should concentrate primarily on the top level of the illegal drug distribution network: importation, exportation, and large scale foreign and domestic trafficking.

2. The Federal regulatory effort should concentrate on preventing diversion of drugs at the manufacturing and wholesale levels, leaving to the States primary responsibility for supervising retail pharmacies, hospitals, and physicians.

3. To minimize corruption and the appearance of corruption, a separate unit should be established to maintain internal security among Federal drug law enforcement agencies. This unit should be distinct from all other drug law enforcement activities and report directly to the Attorney General.

B. State

1. In order to complement the Federal effort, State enforcement should concentrate on the lower levels of both licit and illicit distribution networks.

2. Every State should systematically review and evaluate the operations of its boards of pharmacy and medicine, to ensure that they are adequately enforcing the provisions of State and Federal law.

3. Each State with a substantial trafficking problem should have a separate unit, responsible to the State attorney general, charged with the responsibility of investigating any evidence of corruption in drug law enforcement agencies.

C. Community

1. Local police departments should participate with other community institutions in the development of a preventive services program.

2. Police departments should formulate precise guidelines for non-arrest dispositions of persons apprehended for consumption-related offenses and for their referral to appropriate prevention or treatment services. Each police department should consider using citations, or other formal means of directing persons into appropriate programs.

IV. Treatment and Rehabilitation

A. Federal

1. Through block and formula grants to the States, the Federal government should have major responsibility for funding treatment and rehabilitation services administered by the States. The Federal government should retain discretionary funds for direct funding of demonstration and special projects in the field of treatment and rehabilitation.

2. Except for offenders within Federally-operated correctional institutions, the Federal government should not have direct operating responsibility for providing treatment and rehabilitation services.

3. The Federal government should sponsor a program to evaluate existing drug treatment and rehabilitation programs to see whether they (a) are cost effective; (b) are designed to deal effectively with their client populations; and (c) have established suitable criteria and objectives.

B. Federal and State

1. To avoid destroying program effectiveness, Federal and State regulations concerning maintenance programs should emphasize treatment flexibility, coupled with reasonable controls to curtail diversion.

2. The government should continue to prohibit heroin maintenance as a treatment modality.

C. State

1. Each State should establish a comprehensive Statewide drug dependence treatment and rehabilitation program including integrated health, education, welfare and treatment services, which should be administered as part of the State's broader health care delivery and human resources development systems.

2. Each State should review its current statutory mechanisms regarding the process by which drug-dependent persons are permitted or compelled to enter treatment. Those States which have not already done so should modify existing legislation to encourage drug-dependent persons to seek treatment voluntarily. In order to maximize the attractiveness of voluntary programs, formal legal processes should be avoided entirely.

3. Every State should have confidentiality-of-treatment laws.

V. Prevention

A. General

1. Drug use prevention strategy, rather than concentrating resources and efforts in persuading or "educating" people not to use drugs, should emphasize other means of obtaining what users seek from drugs, means that are better for the user and better for society. Information about drugs and the disadvantages of their use should be incorporated into more general programs, stressing benefits with which drug consumption is largely inconsistent.

2. The government role in prevention should be limited to assuring the availability of accurate information regarding the likely consequences of the different patterns of drug-using behavior. The Commission recommends the following actions to assure the production and dissemination of accurate information: (a) The Federal Government should establish a procedure for screening all Federally-sponsored or funded information materials for accuracy; (b) A moratorium should be declared on the production and dissemination

of new drug information materials to allow sufficient time for the development of necessary standards for accuracy and concept; (c) Policy makers should, in recognition of ignorance about the impact of drug education, seriously consider declaring a moratorium on all drug education programs in the schools, at least until programs now in operation have been evaluated and realistic objectives have been developed. At the very least, State legislatures should repeal all statutes which now require drug education courses to be included in the public school curriculum.

B. Federal

The Federal government should fund prevention services through block and formula grants to the States, and sponsor basic research in the prevention area. The Federal government should also retain discretionary funds for direct assistance to innovative and experimental programs, as well as to programs in communities receiving insufficient aid from the State.

C. State

The primary responsibility for designing a prevention strategy and operating appropriate programs should reside at the State and local levels. Each State should establish a comprehensive, statewide drug dependence prevention program including a full range of prevention services.

D. Community

1. Prevention requires community-wide strategy in which all members of a community acquire information about drug use.

2. Each community should give high priority to the development of crisis-intervention services as part of its overall prevention services.

VI. Research

Congress should provide The Special Action Office for Drug Abuse Prevention with sufficient funds to design and direct an extensive program of research covering all studies touching on drug use. The Department of Health, Education, and Welfare should participate in the design of the research plan to avoid overlap and maximize the cost-effectiveness of Federal research efforts. The research design itself should deal not only with the immediate information needed but also with requirements of future and long-term policy making. It should fund not only projects which produce quick results, but also those requiring several years to generate useful data.

Recommendations for Private Institutions

I. Health Professions

1. Schools of medicine, pharmacy, nursing, and public health should include in their curricula a block of instruction dealing with the social and medical aspects of drug use.

2. The medical profession should prepare criteria for use of all psychoactive drugs in medical practice. These guidelines should stress restraint in use of such drugs, emphasizing that they are not a treatment of first resort and that when prescribed, they should be given in the smallest dosage units and doses possible.

II. Pharmaceutical Industry

A. Manufacturers

1. Manufacturers of psychoactive substances should undertake a major campaign to educate both health professionals and the public about the appropriate role of these drugs in treatment of conditions of anxiety, tension, and depression.

2. Advertising of proprietary, mood-altering drugs should omit suggestions that the substances can result in pleasurable mood alteration or deal with malaise caused by stress or anxiety.

B. Retail Pharmacies

At the retail level, all pharmacists should verify the identity of persons seeking prescription psychoactive drugs.

III. Alcohol Industry

1. The alcohol beverage industry should take the lead in funding research into the nature of compulsive alcohol-using behavior and the relation between alcohol use and traffic accidents, violent crimes, and domestic difficulties.

2. Manufacturers and distributors of alcoholic beverages should inform the public that compulsive use of alcohol is the most destructive drug-use pattern in this nation. Advertising should emphasize moderate, responsible use and point out the dangers of excessive consumption.

IV. Industry

1. The business community should not reject an applicant solely on the basis of prior drug use or dependence, unless the nature of the business compels doing so.

2. Industry should consider alternatives to termination of employment for employees involved with drugs. Where the nature of the business allows, employees should be referred to company-run or other public and private rehabilitation or counseling programs.

3. The fact of treatment and rehabilitation should be confidential to encourage employees to accept counseling and other assistance.

V. Colleges and Universities

1. Colleges and universities should make their policies and practices regarding drug use, including alcohol, explicit, unambiguous, and readily available to all students.

2. Counseling, treatment and rehabilitation programs on campus should ensure confidentiality to their student clients.

VI. Mass Media

Since government intervention is inappropriate here, the media, on their own initiative, must reexamine the impact of information messages on interest in psychoactive drugs. They should look not only at advertising, but also at anti-drug public service announcements, at program content, and at news coverage of "drug stories".

A PLEA FOR AMELIORATION OF THE MARIHUANA LAWS*

MICHAEL P. ROSENTHAL**

Professor Rosenthal argues that existing doubts about the seriousness of the risks of using the drug and the heavy social costs of the present marihuana laws dictate an amelioration of those laws.

The marihuana laws must be ameliorated. Taking into account the known and likely risks of the drug and the social costs the marihuana laws are exacting, they are far too stringent.

By marihuana I mean only the plant *Cannabis sativa* and its parts—the stems, seeds, leaves, and flowering tops. The resin of the plant, derivatives of the plant or of the resin, and synthetic cannabis-like substances, such as synthetic tetrahydrocannabinols, are not included. It is appropriate to make this distinction because generally speaking, although the plant varies in strength, it is weaker than derivatives[1] and synthetics and has less potential for harm. The greater strength of cannabis derivatives, with their greater potential for harm, may perhaps call for more stringent laws than does the plant itself.

Just a year or two ago the position I espouse was somewhat less "respectable" than it is now. But recently more than one "responsible" body in the United States has urged amelioration of these laws, and two state legislatures have reduced penalties for some marihuana transactions.

The Council on Mental Health and the Committee on Drug Dependence of the American Medical Association and the Committee on Problems of Drug Dependence of the National Research Council, National Academy of Sciences, in a joint statement have advocated greater discrimination among different types of marihuana offenders. These groups pointed out that penalties for violations of the mari-

83-313 O - 77 - 17

huana laws are often harsh and unrealistic and suggested that "equitable penalties, insofar as they enhance respect for law, can contribute to effective prevention."[2]

A Harris County grand jury criticized "out-of-balance penalties" in Texas for possession and sale of marihuana. Stressing that penalties imposed for marihuana violations sometimes exceed the penalties imposed in murder cases, the grand jury said, "Surely this is not justice according to our national ideals, ideals which proclaim human life as of the greatest value."[3] And most important, both California[4] and Alaska[5] reduced penalties for possession of marihuana in 1968.[6]

Recently enacted changes to the Federal Drug Abuse Control Amendments are relevant also. Although they make simple possession of such drugs as LSD, barbiturates, and amphetamines a federal crime for the first time[7] (this law does not apply to marihuana), they provide that if a first offender is placed on probation and discharged before the expiration of the term of probation or if he satisfactorily complies with the conditions of probation, his conviction is automatically set aside, and he is to be given a certificate to that effect.[8] According to the Senate report on the bill, the purpose of this provision is to "minimize the long-term adverse consequences upon a youth of a conviction of a violation of the prohibition against possession of dangerous drugs."[9] The provision, however, contains no

5 ALAS. STAT. § 17.12.110(a) (Supp. 1969) (possession for personal use). The reduction in penalties for possession in Alaska was accompanied by an increase in penalties for distribution. ALAS. STAT. § 17.12.110(b) (Supp. 1969).

6 In addition, penalties for possession under the Canadian Federal Narcotic Control Act were reduced by providing for lesser penalties upon summary conviction. 17 & 18 Eliz. 2, c. 41, § 12 (1969), *amending* 9 & 10 Eliz. 2, c. 35, § 3(2) (1961). Prior to the amendment possession was treated only as an indictable offense carrying a higher penalty.

Also, the British Advisory Committee on Drug Dependence (the "Wootton Committee") recently recommended reduction in penalties for marihuana offenses. The committee stated that its recommendation for reducing penalties for simple possession was intended "to remove for practical purposes, the prospect of imprisonment for possession of a small amount and to demonstrate that taking the drug in moderation is a relatively minor offense." ADVISORY COMMITTEE ON DRUG DEPENDENCE, CANNABIS 28 (1968). The British Government, however, rejected the committee's recommendations. N.Y. Times, Jan. 24, 1969, § 1, at 2, col. 3.

On December 14, 1968, the Board of Directors of the American Civil Liberties Union announced its opposition to criminal penalties for use and possession of marihuana. Memorandum to A.C.L.U. Academic Freedom Committee (Jan. 2, 1969).

7 21 U.S.C. § 360a(c) (1964), *as amended*, (Supp. IV, 1969).

8 21 U.S.C. § 355 (1964), *as amended*, (Supp. IV, 1969).

9 SENATE COMM. ON LABOR AND PUBLIC WELFARE, S. REP. No. 1609 ON H.R. 14096, 90th Cong., 2d Sess. 6 (1968).

restriction on the age of offenders eligible for treatment under it. The report also stated that

> testimony before Congress reflects concern among educators and social scientists that the indiscriminate enforcement of excessively severe drug laws increases disrespect for the law on the part of young people and tends to alienate them from society . . . . In one way or another every witness from the fields of science or medicine has expressed caution with respect to increased penalties for drug law violations.[10]

These developments suggest the possibility that some widespread amelioration of the marihuana laws may become reality in the foreseeable future. This would be extremely desirable.

In considering whether the marihuana laws are appropriate, we must first consider the risks of use. At the present any attempt to judge the dangers of marihuana is itself fraught with danger. The statement that it is quite harmful will be criticized by some. The statement that it does not seem very harmful or not harmful at all will be criticized by others. But there are two things that can be said:

First, there is much we do not know about the drug. Present studies are not nearly definitive. Hopefully, studies now being sponsored and that will be sponsored by the National Institute of Mental Health and other agencies will in a few years help illuminate the facts, but even these studies will not yield a complete picture of the effects of long-term use.

Second, to paraphrase Dr. Jonathan Cole,[11] drug risks, like beauty, are often in the eye of the beholder. What is a very serious risk to some observers may be at most a minor risk or at least not serious enough to warrant criminal punishment to others. Some may even see it as a desirable effect. What has been termed amotivation—"dropping out"—illustrates this difference of viewpoint. A student may stop attending classes, he may lose interest, and his grades may drop. When these things occur we do not know what their relation to his use of marihuana is. Has it caused this state of affairs in a normal person who otherwise would not have dropped out? Has it merely precipitated it in a predisposed person? Is his drug use itself only a symptom of dropping out? And even if use of marihuana does in some way contribute to "dropping out," one's views on how serious this condition

---

11 Superintendent, Boston State Hospital, Boston, Mass. Formerly Chief Psychopharmacology Research Branch, National Institute of Mental Health.

is will influence his views on how serious the risks of marihuana are. Some may believe that this condition is unfortunate but certainly no reason to punish people. Others may find it a refreshing change from the usual pattern of our achievement-oriented society. Still others, however, may see a threat to the entire fabric of our society and its morality. Furthermore, while some may say that the phenomenon of amotivation (assuming that use in some way "causes" it) demonstrates that marihuana has adverse psychic effects on the individual and consequently that prohibition and punishment for those who violate it are in order, others may say that the judgment that amotivation is bad is essentially a moral judgment and that the criminal law should not and cannot regulate morality.

Actually, the dividing line between dangers to health (and dangers to psychic health in particular) and the regulation of morality is probably nonexistent. What is a danger to psychic health to one person is only a question of morality to another. Conceptions of mental health often involve moral judgments,[12] and perhaps for some purposes, such as a person's voluntary decision to begin psychotherapy or psychoanalysis because he decides he is not "mentally healthy," this is the way it should be. Whether deviations from a particular picture of health should be visited by the punishment of the state on the theory that a person is harming his psyche is yet another question.

On the basis of what we now know, marihuana, as defined, is probably the least or among the least harmful of the hallucinogens controlled under federal law,[13] and this is a fact relevant to the appropriate criminal controls on its use and distribution.

Of course, the drug may turn out to be more harmful than some of us think it is, and this complicates the question for the policy-maker. Another complicating factor is that attempts at change in the marihuana laws start out from the position that distribution and use of the drug is now unlawful, rather than from the position that they are lawful. The question is whether highly punitive laws should be made less punitive and not whether a free commodity should be regulated for the first time. The starting point may be relevant to the lawmaker. If marihuana were a free commodity and efforts were being made to restrict its distribution and use, a greater showing of the drug's risks vis à vis the user's subjective feelings of benefit from its use would be

---

12 *See, e.g.*, K. HORNEY, NEUROSIS AND HUMAN GROWTH 14 (1950) (certain neurotic trends involve "a fundamental problem of morality").

13 *See* authorities cited note 1 *supra*.

required. It is now restricted, however, and it may turn out to be more harmful than some of us believe and as or even more harmful than others believe. If the law does act as a deterrent to use,[14] and if society wants neither to approve or endorse use, the loss of this deterrent through "legalization" (much as distribution and use of alcohol is legalized) might well be regretted at a later date.[14a] Legalization, conceivably, might lead in time to a substantial public health problem, and the decision to legalize could turn out to be irreversible. Even if such a decision were not irreversible, it is doubtful whether switching from one course to another and then back again would be likely to enhance respect for social policy or those who make it. Moreover, given that marihuana is restricted, a decision to legalize distribution and use, even if not intended to express social approval of use, may be more likely to be taken as that and may be more likely to influence conduct[15] than a decision *not* to restrict a free commodity. Although any attempt to ameliorate the marihuana laws—whether by reducing permissible penalties even by one day, by repealing laws prohibiting simple possession and use itself, or by at least minimizing these offenses while retaining restrictions on distribution—might be "misinterpreted" by some, it is unlikely that most alternatives short of legalization would be misinterpreted to the same extent as legalization would. And there is reason for taking measures such as these despite the risk that some persons may mistake them for a limited license to use the drug.

Regardless of whether legalization of marihuana would be warranted at the present time, the widely held doubts about how extensive the risks of the drug are and the costs of marihuana laws, require alternatives to current penalties and current offenses. The uncertainty concerning how harmful marihuana is—with the possibility that its use may involve risks (such as psychosis) whose extent or relationship to marihuana (as the term is used here) are now unclear or debatable,[16]

[14] I believe it does deter some people, but how many is another question.

[14a] If marihuana, however, should turn out to be less harmful than alcohol and tobacco, to the extent an increase in the use of marihuana involved switching from either of these drugs to it, the results would be beneficial.

[15] It should be noted, however, that regardless to what extent changes in law influence conduct, the only empirical study coming to my attention that has dealt with the effect of changes in the law on morality concluded that in the short-run people's moral judgments are only minimally affected by their knowledge or belief about the state of the law. *See* Walker & Argyle, *Does the Law Affect Moral Judgments?*, 4 BRIT. J. CRIM. 570 (1964). On the other hand, there is some evidence that the repeal of prohibitory laws may result in an increase in the conduct involved. *See* Andenaes, *The General Preventive Effects of Punishment*, 114 U. PA. L. REV. 949, 964 (1966) (abortion).

[16] Marihuana may distort perception while, unlike alcohol, not making the user aware that perception is distorted and not incapacitating him. Consequently there may be danger in the performance of certain skilled tasks such as driving. *See Hearings on H.R. 14096 Before the Subcomm. on Public Health and Welfare of the House Comm. on Interstate and Foreign Commerce*, 90th Cong., 2d Sess. 169 (1968) (statement by Dr. Stanley

lack of reliable information on the effects of long-term use, and the fact that extensive study of the drug is really just beginning, may suggest that legalizing the drug at *the present time* in the absence of a general public demand for it would be premature. However, the same uncertainty about how harmful the drug is—with the possibility that dangers that may be feared as possibilities but have not been verified, may turn out to be nonexistent—make current grading of penalties and perhaps definition of offenses inappropriate. With such uncertainty about the effects of the drug, it is inappropriate to permit punishments as harsh as those we currently permit.[17]

F. Yolles, Director of the National Institute of Mental Health) [hereinafter cited as *1968 House Hearings*]. *But cf.* Weil, Zinberg & Nelsen, *Clinical and Psychological Effects of Marihuana in Man*, 162 SCIENCE 1234, 1241 & n.26 (1968). This would not in itself, however, necessarily preclude legalization because the problem could be met by lesser measures than total prohibition. *See* Rosenthal, *Dangerous Drug Legislation in the United States: Recommendations and Comments*, 45 TEXAS L. REV. 1037, 1119-20 (1967). Also, even if use of marihuana is a consequence of dropping out rather than a cause of it, the preoccupation with the drug and the drug world that characterizes some persons habituated to marihuana (or other mind-altering drugs) may make it more difficult for those persons to solve their underlying problems or to make "an adequate adjustment to a complex society" than had they not become dependent on the drug. *See 1968 House Hearings, supra.* On the other hand, it is conceivable that being a chronic user may be the "best" adjustment that some people are capable of.

The relationship between use of marihuana and psychosis, use of other drugs, crime, birth defects, and amotivation is unclear. *See generally* PRESIDENT'S COMM'N ON LAW ENFORCEMENT AND ADMINISTRATION OF JUSTICE, TASK FORCE REP.: NARCOTICS AND DRUG ABUSE 13 (1967) (crime and violence, psychosis and other drug effects) [hereinafter cited as TASK FORCE]; CALIFORNIA JOINT LEGISLATIVE COMM. FOR REVISION OF THE PENAL CODE, DRUGS, Part I: Marihuana, ch. 2 (aggression), ch. 3 (heroin use), ch. 4 (psychosis and other drug effects) (Proposed Tentative Draft 1968) [hereinafter cited as CALIFORNIA JOINT LEGISLATIVE COMM.]; McGlothlin, *Cannabis: A Reference*, THE MARIHUANA PAPERS 401 (Solomon ed. 1966) (crime and violence, psychosis and other drug effects); Murphy, *The Cannabis Habit: A Review of Recent Psychiatric Literature*, 15 BULL. NARCOTICS No. 1, at 15 (1963) (same). For example, while some marihuana users become psychotic or have psychotic episodes, evidently a rare occurrence in the United States, it is unclear what part, if any, the drug plays in these occurrences. Does it induce psychosis in individuals who would have suffered a psychosis anyway? Are psychoses seen in users not attributable to or connected with use of the drug at all?

[17] For example, the federal marihuana laws make distribution (including gifts), importation, and handling the drug in various ways with knowledge that it has unlawfully been imported punishable by mandatory minimum terms of five to twenty years imprisonment and a maximum fine of $20,000 for a first offense and ten to forty years imprisonment and a maximum fine of $20,000 for subsequent offenses. 26 U.S.C. §§ 4742(a), 7237(b) (1964); 21 U.S.C. § 176(a) (1964). Probation and suspended sentence are unavailable. 26 U.S.C. § 7237(d) (1964); 21 U.S.C. § 176(a) (1964). Distributors to minors are punished even more severely. 26 U.S.C. § 7237(b) (1964). With only minor exceptions, penalties for federal marihuana violations are the same as penalties for violations relating to opiates and cocaine.

While 26 U.S.C. § 4744(a) (1964) prohibits, *inter alia*, acquisition, transportation, or concealment by a person required to pay the transfer tax on marihuana who has not paid the tax, the Supreme Court has held that if a defendant who would otherwise stand in violation of this provision properly claims the privilege against self incrimination he has a complete defense to a prosecution based on it. Leary v. United States, 395 U.S. 6 (1969); United States v. Covington, 395 U.S. 57 (1969).

In response to the *Leary* and *Covington* cases the Nixon administration has sponsored legislation that would directly prohibit simple possession of marihuana. S. 2657, 91st Cong., 1st Sess. § 8 (1969). This offense would be punishable like violations of 26 U.S.C. § 4744(a) (1964): first offenses by a minimum prison term of two years, a maximum of ten

In most states the distribution of marihuana, including noncommercial distribution (for example, as a gift), is punished as a felony.[18] Not only is it treated as a felony, but it is often punished as a very high degree felony with long terms of imprisonment permitted.[19] In fact, marihuana is defined as a narcotic drug under the laws of all but a few states, and the permissible punishments for distribution (including gifts) are much more often than not the same as those that apply to offenses involving opiates and cocaine.[20] The level of permissible penalties for a single small distribution of marihuana in some states may approximate those prescribed for such traditional crimes against person or property as larceny, burglary, aggravated assault, unaggravated robbery, kidnapping, arson, unaggravated forcible rape, or even second degree murder.[21] It is difficult to see how this treatment is consistent with ideals that proclaim human life as "the greatest value."[22]

Simple possession of marihuana is more often than not treated like

years, and a maximum fine of $20,000; second offenses by a mandatory minimum term of five years, a maximum of twenty years, and a maximum fine of $20,000; third and subsequent offenses by a mandatory minimum term of ten years, by a maximum of twenty years, and by a maximum fine of $20,000. 26 U.S.C. § 7237(a) (1964). Suspension of sentence and probation are unavailable for second and subsequent offenses. 26 U.S.C. § 7237(d) (1964).

The Nixon administration has also sponsored an omnibus drug bill which would, in effect, replace most existing federal narcotics, marihuana, and dangerous drug legislation. S. 2637, 91st Cong., 1st Sess. (1969). This bill would also directly prohibit simple possession of marihuana. § 501(d). Penalties would also parallel the penalties for violation of 26 U.S.C. § 4744(a) (1964), §§ 501(d), 508(b), except that in the case of a first offender the court would have discretion, with the consent of the defendant, to place the defendant on probation without entering a judgment of conviction, and if the defendant satisfactorily complied with the conditions of probation, the proceedings would be dismissed and no conviction would be entered. § 507.

In addition the omnibus bill would raise the maximum fine for, *inter alia*, unlawful distribution and importation of marihuana to $25,000 for a first offense and $50,000 for a subsequent offense. §§ 501(a), 501(c)(1), 508(a). It would also raise penalties for transactions involving LSD and other hallucinogens. §§ 202(a), 501(c)-(d), 506, 508(a)-(b).

In Texas, distributions (again including gifts) are punishable by five years to life imprisonment for a first offense and by ten years to life imprisonment for subsequent offenses. Possession is punishable by two years to life imprisonment for a first offense and by ten years to life imprisonment for subsequent offenses. Neither suspension of sentence nor probation are available for second or subsequent offenses. TEX. PENAL CODE ANN. art. 725b, § 23 (Supp. 1968), *as amended*, Tex. Laws 1969, ch. 242, § 1, at 703. A second offense of distribution to a minor may result in imposition of the death sentence. TEX. PENAL CODE ANN. art. 725b, § 23, *as amended*, Tex. Laws 1969, ch. 242, § 1, at 703.

18 *See* W. ELDRIDGE, NARCOTICS AND THE LAW 177-231 (App. B) (2d ed. 1967).

19 *Id.*

20 *Id.*

21 In New York, for example, a distribution of marihuana is punishable less severely than murder, forcible rape, or kidnapping; as severely as some burglaries; more severely than others, and less severely than still others; as severely as unaggravated arson; as severely as some grand larcenies and more severely than others; as severely as some robberies, more severely than others, and less severely than still others.

In California a distribution of marihuana is punishable as severely as second degree murder.

22 *See* note 3 *supra*.

simple possession of opiates and cocaine, often as a felony.[23] In those states that prohibit use or being under the influence of the drug, the penalties are often less severe than for possession.[24] But this is no consolation for the user because he is typically found in possession of the drug and charged accordingly. At the least a statute could distinguish marihuana from more dangerous forms of cannabis such as hashish (cannabis resin), other cannabis derivatives, and synthetic tetrahydrocannabinols. If it were thought desirable, transactions in these substances could be punished more severely than transactions in the plant and in parts of the plant itself.[25]

Relevant also to the wisdom of the marihuana laws are their costs. Scholars and others are increasingly beginning to pay attention to them,[26] and I do not propose to duplicate those discussions. Some of the leading costs should be discussed, however, for even if they may not yet be great enough to warrant legalization of marihuana, they do point to amelioration of the laws.

The extent to which marihuana is used is germane to the question of how substantial the costs of these laws are. Assuming that an undesirable effect of the law, anticipated or not, is a cost, the burden of the cost often varies directly, if not perfectly, with the extent of the effect. There is unanimous agreement that use of marihuana is increasing.[27] Many believe it is increasing rapidly. While there are many regular users, some of whom are probably psychologically dependent on the drug or "multi-habituated,"[28] there is also much experimental[29] and occasional use; many users try the drug once or a few times and then stop. Unfortunately, we do not really know either how widespread use is or how fast use is increasing. Beliefs of users, of those

---

25 Neither marihuana nor these other substances should be classified as narcotics. While marihuana may on occasion produce sleep, this effect is clearly overshadowed by its other effects. If these drugs are to be classified, they should be classified as hallucinogens.

29 *Id.*

promoting use, of nonusers, of those who want to see the laws ameliorated, of those who want to see no changes in the laws, or of those who want penalties increased, may often be suspect because of the interest of the person or group making the claim or because living as so many of us do in our own little worlds, we sometimes find it hard to believe that there are other worlds in which people believe and act differently.[30]

Unfortunately also, the marihuana laws are probably in good part themselves responsible for our lack of any solid figures on the extent of use because when conduct is unlawful, it is difficult to obtain reliable information concerning its incidence. Moreover, when the conduct prohibited involves a willing transaction between two parties, neither of whom have reason to complain, it is even more difficult to obtain such information.

In any event, estimates of persons in the United States who have used marihuana at least once range from hundreds of thousands to twenty million. In March, 1966, the New York County Medical Society referred to "hundreds of thousands of persons who have had one or a few marihuana experiences."[31] In testimony before the Subcommittee on Public Health and Welfare of the House Committee on Interstate and Foreign Commerce, Dr. Stanley F. Yolles, Director of the National Institute of Mental Health stated

> In the United States, we are not quite sure of the exact extent of the problem. Estimates as high as 20 million have been made, but it is much more likely in the neighborhood of 4 to 5 million persons have used it at least once.[32]

Use among persons in the eighteen to thirty age group (many of whom are from middle class backgrounds) and among persons of high school age (many of whom are also from middle class backgrounds)[33] is generally considered higher than use in other age groups. While campus and high school use is usually stressed, use among young professionals

---

[30] A recent study of drug use at five California colleges and universities found that sometimes user estimates of the frequency of use were more nearly correct than nonuser estimates and concluded that they should not be discounted. R. BLUM & ASSOCIATES, STUDENTS AND DRUGS: DRUGS II, at 147, 163 (1969). Apparently, nonusers may underestimate use as easily as users may overestimate use.

[31] Medical Society of County of N.Y., *The Dangerous Drug Problem*, 22 N.Y. MEDICINE 241, 242 (1966).

[32] *1968 House Hearings, supra* note 16, at 177. Another estimate is that there may be one million or more marihuana users in the United States. Fort, *Social Problems of Drug Use and Drug Policies*, 56 CALIF. L. REV. 17, 22 n.29 (1968).

[33] TASK FORCE, *supra* note 16, at 24; BLUM, DRUGS I, *supra* note 27, at 242.

also seems to be increasing,[34] and there are a growing number of accounts of junior high school and grammar school use.

Between the estimates of hundreds of thousands and twenty million, the number of persons in the United States who have tried marihuana is unclear. Moreover, the estimates are usually cumulative use or cumulative incidence figures only. They usually speak of persons who have used the drug at least once and do not usually deal with frequency of use or how recent the last use was. Such information would, of course, be helpful in assessing the extent and seriousness of the problem.

Arrest statistics have built-in limitations. While they may furnish some indication of trends in the incidence of the conduct for which arrests are made, they primarily measure law enforcement activity and priorities.[35] Consequently, increases in arrests cannot necessarily be taken as a good measure of the incidence of the conduct for which arrests are made. Nevertheless, for what it is worth, marihuana arrests have been increasing rapidly. Federal Bureau of Narcotics figures show that state marihuana arrests reported to the Bureau rose from 4,113 in 1960 to 54,468 in 1967.[36] The figure for 1966 was 27,822,[37] meaning that arrests reported to the Bureau virtually doubled during 1967. California reported 26,527 adult drug arrests for marihuana offenses in 1967 compared with 14,209 in 1966 and 4,245, 3,386, and 3,433 in 1960, 1961, and 1962, respectively.[38] During the same period California also reported 10,987 juvenile marihuana arrests in 1967 compared to 4,034 in 1966 and 910, 408, and 310 in 1960, 1961, and 1962, respectively.[39] Preliminary data from California for 1968 show the trend continuing with 33,753 adult arrests and 16,754 juvenile arrests.[40] In addition, the California figures for 1967 show that over thirty-five percent of the adults arrested during that year for marihuana offenses had no prior criminal record whatsoever and that over forty percent had only a minor criminal record.[41]

---

41 DRUG ARRESTS 1967, *supra* note 35, at 64 (Table I-10). Seizures and purchases of

Chief among the costs of the marihuana laws is that they criminalize[42] large numbers of people, many of whom are young and developing and many of whom appear to have no prior criminal record or at most only a minor record. They criminalize in two general ways. First, those who are convicted are the ones obviously criminalized. Some of these may go to jail or prison;[43] others may not. Even if a person is not incarcerated but is fined, given a suspended sentence, or placed on probation, the fact remains that he has a criminal record, whether that record is for a felony or a misdemeanor. Probably never before in our history has the mere possession of a criminal record been as serious and detrimental as it is today. A conviction may adversely affect opportunities in employment and education. For example, the Board of Regents of the University of Texas System has promulgated a regulation providing for mandatory expulsion from the university of any student "finally convicted of" or "placed on probation for" selling, possession, or using "a drug or narcotic."[44] At another time, it may have been that the consequences of a conviction could be forgotten, but in the complex society that we live in, a man's history, be it one of conviction or not, follows him.

Moreover, the consequences of conviction have become particularly meaningful as marihuana has spread to the middle class. The middle class person convicted of crime really has something to lose. Employment and educational opportunities are meaningful opportunities to him. Being an adjudged criminal, with all the stigma that

---

marihuana in the United States and at ports and borders by federal authorities reported by the Federal Bureau of Narcotics increased from 1,890.3 kilograms in 1960 to 27,914.98 in 1967. BUREAU OF NARCOTICS, U.S. TREASURY DEP'T, TRAFFIC IN OPIUM AND OTHER DANGEROUS DRUGS [*compare* Table 8, at 72 (1960) *with* Table 6, at 43 (1967)]. (A kilogram is the equivalent of 2.2 pounds.) The corresponding figure for 1966 was 10,780.12 kilograms, less than one-half the 1967 total. *Id.* at 45 (Table 6) (1966). Seizure figures also primarily measure law enforcement activity.

42 *See generally* CALIFORNIA JOINT LEGISLATIVE COMM., *supra* note 16, ch. 1 (by J. Kaplan); Kaplan, *Foreword*, *supra* note 26.

43 Some marihuana offenders, of course, are sent to jail or prison. While the effects of incarceration depend so much on both the individual and the kind of institutional experience he is subjected to, institutionalization carries with it the possibility that the offender will, because of association with hardened criminals or for other reasons, become worse rather than better for his experience. Also, large numbers of marihuana offenders are middle class persons to whom our correctional systems may generally have less to offer than they do to an underprivileged person. While at their best, given the realities of our institutions, they may offer vocational training and some educational opportunities that an underprivileged offender might not otherwise have access to, these opportunities would seem to be geared to the needs of the ill-trained and ill-educated rather than to the needs of *most* middle-class offenders. *Cf.* Letter from Hon. Richard A. McGee to Judge John W. Oliver, in Oliver, *A Judge Looks at LSD*, 32 FED. PROB., Mar., 1968, at 5, 10 (1968).

44 Rules and Regulations of the Board of Regents of the University of Texas System for the Government of the University of Texas System, Part 1, ch. 6, § 3.3 (Apr. 20, 1968, *as amended*, Mar. 14, 1969).

attends it, may be as or more meaningful to a middle class person than incarceration may be to a person who has few options in life.

Perhaps most important, to the extent that the use of marihuana may be a symptom of alienation from society,[45] a judgment of conviction may deepen the alienation of the user.[46] Criminal conviction is a particularly strong form of social condemnation. Conviction of a user may make both the user and others think of him as a criminal or "outsider."[47] It may deepen the user's loss of respect for a society at least one of whose values he does not share. Conviction may thus alienate the user further from society.[48] It may also alienate those who were not alienated before, and to the extent that a conviction may interfere with opportunities in a person's life, it may compound alienation even more.

The danger of further alienating the alienated extends beyond those who are convicted to those who are arrested, and beyond them to those who never come in contact with the law. An arrest is recorded, while acquittal or dismissal of a charge often is not. Merely labeling users (and sellers also) as members of a criminal class may make both themselves and others think of them as criminals or "outsiders" and thus further alienate them from society.[49] This danger may be compounded when so many people, whether rightly or wrongly, believe that marihuana is not or is negligibly harmful and view our harsh laws (particularly against possession and use) as unjust or irrational. There is disrespect for the marihuana laws, and the indications are that it is becoming more acute as the number of users and others who think these laws are unjust or irrational increases. In addition, the marihuana laws—regulating, as they do, consensual conduct—are difficult to enforce, and enforcement must be irregular.[50] This too may increase

---

45 By alienation I mean a sense of nonbelonging or apartness; a feeling that the values and doings of the mainstream of the society are irrelevant to one's life. This may be translated into either noninvolvement or hostility. *See generally* 1968 *House Hearings*, *supra* note 16, at 179-80 (statement of Dr. Yolles).

46 Of course, conviction also may sometimes alienate offenders who are not alienated already.

47 The word is Howard Becker's. *See* H. BECKER, OUTSIDERS (1966).

48 *See generally* H. BECKER, OUTSIDERS *passim* (1966); E. SCHUR, CRIMES WITHOUT VICTIMS 5-7 (1965); Fort, *Social and Legal Response to Pleasure-giving Drugs*, in UTOPIATES 205, 221 (R. Blum ed. 1964) ("An added consequence of present procedures with all the drugs but alcohol is to create in the illicit user a negative self-image and added difficulty in finding employment, which perpetuates and intensifies any social alienation."). I am not necessarily claiming that criminal sanctions for marihuana users increase use, although it is certainly possible that some persons may be affirmatively attracted to use by its illegality or because they view penalties as inappropriate. *See* TASK FORCE, *supra* note 16, at 25. I make the point that criminal sanctions may reduce use and influence users to stop use and still compound alienation.

49 *See* E. SCHUR, *supra* note 48, at 5-7.

50 *See Project—Marihuana Laws: An Empirical Study of Enforcement and Administration in Los Angeles County*, 15 U.C.L.A.L. REV. 1499, 1539-42 (1968). Enforcement may

disrespect for the marihuana laws,[51] and disrespect for them may lead to a more generalized disrespect for law and for our institutions.[52]

If use of marihuana should be as widespread as some of the estimates claim, and if it continues to spread, the consequences of the marihuana laws will be to label as criminal an increasingly substantial segment of our population and further to alienate the alienated on a larger scale. Even under conservative estimates of use, the risk that by criminalizing we may be compounding alienation is a substantial one because the largest group of users seems to be persons of high school and college age and persons in their twenties. There is nothing novel in pointing out that this is a critical generation because it is the generation of tomorrow and at the same time probably a generation more alienated from its elders than any other of recent memory. To the extent that the marihuana laws criminalize and contribute to the alienation of this generation, they adversely affect not only a quantitatively but a qualitatively significant element of our society.[53]

Of course, as long as dominant public attitudes generally disapprove of use of marihuana, users (and sellers too) would be considered deviant even if marihuana were to be legalized. It often is difficult to distinguish deviancy as defined by social attitudes from those attitudes given effect in law generally or in the criminal law in particular.[54] To the extent social attitudes view use of marihuana as deviant, merely taking use or possession for personal use out of the ambit of the criminal law will not wipe out the deviancy of the user. The criminal law, however, is in many ways the most powerful form of official social condemnation in our society, and when a social judgment of deviancy is accompanied by criminalization, the judgment is heavy indeed. Just as the criminal law reinforces the social judgment, removal of criminal sanctions may lessen the harshness of the social judgment.

The harshness of this social judgment should be relieved as much as possible. The verified dangers of marihuana do not warrant such severe judgments as our legislatures have commonly made. Of course, criminal sanctions are commonly visited upon the alienated, the disaffected, the disturbed, and those who present psychiatric problems

also bear more heavily on lower economic and social classes, minorities, and hippie communities. *See* CALIFORNIA JOINT LEGISLATIVE COMM., *supra* note 16, ch. 1; *Project*, *supra*, at 1541-42.

51 *See* Record at 122-24, United States v. Mutrux, Crim. No. 5527 (W.D. Mo., Aug. 21, 1967) (testimony of Dr. Richard H. Blum).

54 *See* E. SCHUR, *supra* note 48, at 6.

unless they fail to meet standards of criminal responsibility that apply to the generality of crimes. Since, however, criminalization is generally the strongest official mark of condemnation and deviance our society possesses, the criminal law should not be used against these persons unnecessarily. While not all who try marihuana are alienated, much less disturbed or in need of psychiatric care, alienation seems to be so much a major problem that criminalization should be treated quite circumspectly.

Moreover, many, if not most, American users apparently are experimental users. Certainly, the consequences of criminalization would seem to be least warranted in the case of the experimenter. A small transgression or even a small number of transgressions, especially—but not exclusively—when committed by the young and developing, should not be the basis for permanently scarring a person's life. This is part of the rehabilitative ideal. While that ideal is usually spoken of in connection with sentencing after conviction of crime, it should be given weight in formulating definitions of criminality also.

Much of my discussion up to this point could support legalization of marihuana.[55] Users of marihuana often give it away, share it with friends, exchange it, act as agents of friends in securing it, and sell it.[56] Some users sell it for profit in order to support themselves through school. Nonusing sellers may also be alienated; they too may have something to lose by a conviction. Social policy, however, rarely—and, more often than not, properly—exalts one policy to the complete exclusion of all others. If legalization of the drug would at present be premature, sellers could still be amenable to punishment even though conviction may have adverse collateral consequences in foreclosing

---

[55] Because the marihuana laws prohibit consensual transactions, enforcement is difficult. Consequently, there is need for use of informers, undercover agents, and searches to enforce them, and practices approaching entrapment sometimes occur. These methods of enforcement, often regarded critically, are also costs of the law. *See generally* CALIFORNIA JOINT LEGISLATIVE COMM., *supra* note 16, ch. 1; H. PACKER, *supra* note 26, at 337-41; J. SKOLNICK, JUSTICE WITHOUT TRIAL ch. 6-7 (1966); Kadish, *The Crisis of Overcriminalization*, *supra* note 26; Skolnick, *Coercion to Virtue: The Enforcement of Morals*, *supra* note 26; *Project*, *supra* note 50, at 1515-37; Note, *Hallucinogens*, 68 COLUM. L. REV. 521, 552-54 (1968). While elimination of the simple possession offense or reduction of penalties for simple possession would reduce these costs, they could be eliminated only by "legalization" of sale and possession. As long as sales are unlawful, use of informants and undercover agents is necessary, and practices approaching the borderline of entrapment are likely to occur. Moreover, as long as possession with intent to sell is unlawful—even if possession for personal use is not—searches will occur. The further cost of requiring users to associate with criminals will not be eliminated completely as long as sale is unlawful.

[56] *See* CALIFORNIA JOINT LEGISLATIVE COMM., *supra* note 16, at 153 ("Our data indicate that over 20% of the users of marihuana have sold the drug on occasion in small quantity, to friends who tacitly agree they will return the favor if the drug becomes available to them in the future.").

opportunities and even though criminalization may further reinforce alienation and negative self-images.

These negative results may be outweighed by the attempt to keep some semblance of control over use of the drug. Restrictions on commercial trafficking would seem to have a greater potential for controlling use[57]—to the extent that use can ever be kept under control—than restrictions on use itself, possession for personal use, or even noncommercial distribution. Consequently, a balance can be struck by minimizing sanctions for the latter while prescribing significant (though not inordinate) sanctions for the former. Either sanctions on use and possession for personal use could be abandoned, or, for deterrent purposes, present criminal penalties could be replaced by a *civil* violation —with the only sanction being a fine or, in addition, a period of probation, satisfactory completion of which would result in reduction or remission of the fine.[58] Incarceration would not be permitted, the civil violation would not constitute a criminal conviction, and the offender would not have a criminal record.[59] Possibly, a first-time transgression should result solely in the issuance of a written warning by the law enforcement officer, with only subsequent transgressions being treated as

[57] In addition, the distributor by definition makes the drug available to others, while the user-possessor may or may not. When marihuana is unavailable, however, some users switch to more powerful drugs such as hashish (cannabis resin), amphetamines, and LSD. N.Y. Times, Sept. 17, 1969, at 1, col. 1. This suggests that to the extent the availability of marihuana prevents people from using more powerful drugs, measures tending to increase the availability of marihuana may be desirable.

[58] Possession for personal use could be distinguished from possession for the purpose of distribution in one of several ways: (1) the prosecution could be required to prove beyond a reasonable doubt that the accused possessed for the purpose of distribution; (2) the accused could be required to prove by a preponderance of the evidence that he possessed for personal use, or, alternatively, this determination could be made as a sentencing decision; or (3) the legislature could make a rough distinction between possessors who are likely to use and possessors who are likely to distribute on the basis of the quantity possessed; possession of more than a specific small quantity would result in treatment as a distributor.

It can be argued that federal abandonment of a sanction on possession for personal use or simple possession would conflict with the obligations of the United States under the Single Convention on Narcotic Drugs, May 15, 1967, [1967] 18 U.S.T. 1407, T.I.A.S. No. 6298, 520 U.N.T.S. 204. Article 33 of the Convention states that "[t]he parties shall not permit the possession of drugs except under legal authority," and Article 36-1 provides that

> [s]ubject to its constitutional limitations, each Party shall adopt such measures as will insure that . . . possession . . . of drugs contrary to the provisions of this Convention . . . shall be punishable offences when committed intentionally, and that serious offences shall be liable to adequate punishment particularly by imprisonment or other penalties of deprivation of liberty.

Despite this language, I believe that a strong case can be made for the view that Article 36 requires only domestic legislation generally oriented to the restriction of the use of drugs subject to the treaty to medical and scientific purposes, the principal purpose of the treaty. *See* Article 4-1.(c). Under this reading possession with intent to distribute might be prohibited. The last clause of Article 36-1 suggests that a civil violation for possession for personal use or simple possession would comply with the treaty. Moreover, it is doubtful if the treaty speaks to state law at all.

[59] *See* ALI MODEL PENAL CODE § 1.04(5) (Proposed Official Draft, 1962).

civil violations.[60] The civil violation could even be used to reach noncommercial distributions.[61] The aim is to balance the need for controlling use of marihuana while at the same time keeping criminalization to a minimum.

Admittedly, any amelioration of the marihuana laws may be taken by some as social approval of use even though it would not be so intended. I do not believe, however, that this possibility precludes amelioration. Much depends on to what extent the marihuana laws are changed. Reduction of penalties and redefinition of offenses in order to minimize criminalization are not the same thing as legalizing the drug, and it is not to be expected that the extent of misinterpretation of these measures would approximate the extent of misinterpretation that would probably follow legalization. Of course, if it were appropriate to visit marihuana transactions with the consequences currently permitted, there would be no reason to chance misinterpretation by reducing penalties and redefining offenses. But this I submit is not the case. Reduction in the deterrent effect of the marihuana laws, while relevant, is not controlling. Deterrence is not the sole goal of the criminal law. If it were, we might not only impose the death sentence for all crimes but might draw and quarter offenders also.[62]

At this time I would like to discuss in more detail the question of "legalization" of marihuana. Whether or not marihuana should be legalized (much as distribution and use of alcohol has been legalized) is a matter of both concern and dispute.

Some would require that before the state interferes with the individual's interest in pursuing his own inclinations it must have a compelling reason to do so. I think, however, that the interest required of the state before it may properly restrict individual freedom varies directly with the social value of the activity it would restrict. The use of marihuana is not generally regarded as having any substantial social value, although it can certainly be argued that insofar as the drug brings pleasurable or positive feelings to the user, it does possess some social value. The question then is whether that

---

[60] This is the administrative practice in Great Britain with respect to violations of the Street Offences Act, 7 & 8 Eliz. 2, c. 57 (1959), by women observed loitering or soliciting for the purpose of prostitution. *See* C. DONNELLY, J. GOLDSTEIN & R. SCHWARTZ, CRIMINAL LAW 546 (1962).

[61] Commercial distribution could be treated as a higher offense than simple distribution, or the accused could be required to prove by a preponderance of the evidence that he did not act commercially, or, alternatively, the latter determination could be made as a sentencing decision.

[62] *Cf.* Hart, *Murder and the Principles of Punishment: England and the United States*, 52 NW. U.L. REV. 433, 450 (1957).

value and the existing costs of the marihuana laws are sufficient to warrant its "legalization" when it is unclear just how harmful it is, when existing studies of its effects are inadequate, when more extensive studies are only just beginning, and when the drug is now restricted. On balance, I doubt whether they now are,[63] and I think that to "legalize" marihuana *at the present time* would probably be premature even if it were a politically viable alternative.[64] Since, however, the drug brings pleasure to a considerable and increasing number of Americans, I believe that if in a few years time research shows that the short-term effects of the drug are not particularly harmful and fails to furnish substantial indications that its long-term effects are significantly harmful, legalization would be in order. True, we will probably not be as clear as we would like to be about marihuana's long-term effects for some twenty-five years. We cannot, however, wait until all the data are in until we make a decision: to do so would be to deprive a considerable number of people of their liberty to use the drug (with the pleasure it brings), and perhaps also of their liberty *for* using the drug, for more than a generation without a showing of demonstrated potential for harm. In addition, current social costs that may be tolerated for the few years before more is known about the short-term effects of the drug may become intolerable if they should be borne for a generation.

Furthermore, it should be recognized that the extent of use, pub-

[63] I am referring to nonmedically or scientifically oriented use in general. Religious use may have greater social value and consequently require a greater interest on the part of the state before its restriction would be warranted. *See* People v. Woody, 61 Cal. 2d 716, 394 P.2d 813, 40 Cal. Rptr. 69 (1964); *In re* Grady, 61 Cal. 2d 887, 394 P.2d 728, 39 Cal. Rptr. 912 (1964) (peyote); Finer, *Psychedelics and Religious Freedom*, 19 HASTINGS L.J. 667 (1968).

[64] In addition, federal legislation legalizing distribution and use of the flowering tops of the cannabis plant would be inconsistent with the obligations of the United States under the Single Convention on Narcotic Drugs, May 15, 1967, [1967] 18 U.S.T. 1407, T.I.A.S. No. 6298, 520 U.N.T.S. 204. Article 4-1.(c) of the Convention obligates the parties "[s]ubject to the provisions of this Convention, to limit exclusively to medical and scientific purposes the production, manufacture, export, import, distribution of, trade in, use and possession of drugs." Cannabis is a drug subject to the Convention and is defined as "the flowering or fruiting tops of the cannabis plant (excluding the seeds and leaves when not accompanied by the tops) from which the resin has not been extracted . . . ." Art. 1-1.(b). While federal legislation legalizing cannabis as so defined would for domestic purposes supersede the treaty, it would leave the United States in default of its international obligations.

The Convention also provides that "[t]he parties shall adopt such measures as may be necessary to prevent the misuse of, and illicit traffic in, the leaves of the cannabis plant." Art. 28-3. According to an official of the Federal Bureau of Narcotics and Dangerous Drugs, cannabis leaves were excluded from the full controls of the Convention because low potency beverages made from the lower leaves of the cannabis plant had widespread use without significant abuse in parts of India; and it was intended that such use would continue, but that abuse would be met by action of the affected party under Article 28-3. Personal communication to the author. It is unclear what "abuse," "misuse," or "illicit traffic" mean in this context.

lic attitudes toward use, and the social costs of existing laws are highly relevant to restriction and proscription. If use of marihuana were to become so accepted and so common that the marihuana laws would label as criminals a sizable minority of the population, so common that the police would not enforce them or juries not convict, or so common that enforcement would pose an intolerable burden on pocket books and on police manpower that could be used to deal with more serious crimes, legalization then might be in order despite the risks of the drug (and even if those risks may be greater than some of us believe). It might also be in order if increased enforcement efforts lead to significant organized crime involvement in the marihuana traffic. In these events, the increased costs of the marihuana laws might then outweigh their benefits.

In addition, public attitudes may be manifested more directly. Countless activities, including sky diving, are permitted even though they entail risk because it is believed they possess some sort of social value. Use of alcohol is permitted even though it is recognized that alcohol can have harmful effects. Of course, we have had national prohibition of alcohol; it failed as Professor Louis B. Schwartz of the University of Pennsylvania Law School has said, "not merely because violation was frequent, but because of increasing doubts that the forbidden conduct was undesirable and much evidence that the cost and consequences of enforcement were intolerable."[65] If the public *generally* begins to regard marihuana use as "not so bad" or as desirable, and if this attitude is translated into demands for legalization by groups that possess or come to possess the ability to have their views enacted into law, legalization of marihuana would be in order and would probably follow. Public acceptance and demand for change would in itself be a judgment on the social utility of use of marihuana.

While the attitude of the law toward any conduct, including use of any substance, must be based on a balancing—conscious or unconscious—of its harm or dangers against its social utility, and while some individuals and groups currently feel that the social utility of marihuana outweighs the risks of use, views on social utility differ. Again, beauty is in the eye of the beholder. Some or even all users of marihuana may believe that the effects of the drug are beneficial, creating feelings that they deem pleasurable or more generally "positive."[66]

---

[65] Schwartz, Book Review, 96 U. PA. L. REV. 914, 916 (1948).

[66] Some people may deem "therapeutic" reactions that most of us would deem "adverse." For example, one psychiatrist has suggested to me that sometimes the precipita-

Others—nonusers particularly but some users also—may deem the feelings described as "negative," not in the sense that they deny that the feelings are pleasurable or positive in the opinion of those who ascribe these characteristics to them, but in the sense that they feel it inappropriate to induce or precipitate these feelings by the use of a drug in a situation that is not at least officially sanctioned as "medical." Even if they do not feel that the feelings described by users are negative in the sense just mentioned, they may react to them neutrally in the sense that they feel it neither appropriate nor inappropriate to induce such feelings in such settings. In this case they may, in effect, balance the subjective value to users of the feelings precipitated and the individual's interest in pursuing his own inclinations against the likely risks of harm. Perhaps at some time in the future there will be a change in public attitudes toward use of marihuana so that there is some *general* belief that the feelings ascribed to the drug are not inappropriate in the described setting and that the value of these feelings outweighs the perceived risks of harm. There are, of course, people in the country who hold one or the other of these views; how many is unclear, and there is reason to believe that their number is increasing. It is unknown, however, how widely held these views are. Certainly, these views have not been translated into large-scale demands for legalization by those groups that presently have the ability to enact their views into law. If and when public attitudes so change, this will be a judgment that the social utility of use outweighs the risks of use. Obviously, influencers of public attitudes, whether they be the medical and allied professions, lawmakers, law enforcement groups, academics, mass media, or others, will influence what public attitudes will be just as they have influenced what public attitudes are.

Epilogue

Especially in rapidly changing areas, the time elapsing between preparation and publication of an article may see substantial changes in events. Since preparation of this article, use of marihuana has continued to increase,[67] the costs of the marihuana laws have continued to

tion of a psychotic reaction may not be undesirable, because it brings the individual's problems out in the open.

[67] Thus Dr. Stanley F. Yolles, Director of the National Institute of Mental Health, has revised his estimate of use in the United States upward. Testifying before the Subcommittee on Juvenile Delinquency of the Senate Judiciary Committee, he recently stated, "A conservative estimate of persons in the United States, both juvenile and adult, who have used marihuana at least once is about eight million and may be as high as 12 million people." N.Y. Times, Sept. 18, 1969, at 47, col. 4.

rise, and pleas for amelioration have multiplied. Many state legislatures have listened to these pleas. As a result, to date in 1969 at least eight states have reduced penalties for possession of marihuana.[68] Although none of these reductions has been as substantial as I have argued for and although some of the new statutes raise penalties for distribution at the same time they reduce penalties for possession,[69] the movement is on the whole a welcome one. I hope it will continue.

QUESTIONS AND ANSWERS

ABOUT

MARIJUANA DECRIMINALIZATION

Prepared by NORML

The National Organization for
the Reform of Marijuana Laws
2317 M Street, N.W.
Washington, D.C. 20037

March 26, 1975

(202) 223-3170

QUESTIONS AND ANSWERS ABOUT MARIJUANA DECRIMINALIZATION

1. What's the difference between decriminalization and legalization?

A. Legalization, as the term is used in the drug field, means that marijuana could be legally sold, under appropriate governmental controls. This could, though not necessarily would, be similar to alcohol licensing. The important concept here is that both use and sale would be legal.

Decriminalization only pertains to the user. The user is taken out of the criminal justice system, although selling remains illegal. This concept is intended to continue a discouragement policy against marijuana; thus no legal market is permitted. By focusing the law enforcement attention against the commercial traffickers, rather than the user, we can eliminate over 90% of the marijuana arrests.

2. Why not go ahead and legalize marijuana?

A. First, legalization may be inconsistent with our current treaty obligations under the Single Convention of 1961.

Second, many believe legalization would institutionalize marijuana and give it the status of official approval, thus making its use more inviting and widespread.

But more importantly, there is currently no political consensus to support legalization. There are still unanswered questions about the effects of long term chronic use, and there is still considerable moral opposition to making marijuana available legally. In a few years, society may decide that the harm from marijuana could be minimized if we controlled the market and imposed age, quality and strength controls. But for now, this position has insufficient political support and would likely be construed as encouraging use.

Decriminalization can be expected to eliminate 90% of the marijuana arrests which occur annually. That is a significant step, well worth taking now. And there is a broad-based national coalition which has surfaced to support this change.

3. Since most states and the federal government have already lowered marijuana penalties to a misdemeanor, and very few people go to jail any more, why bother to go any further?

A. A misdemeanor is still a crime. The person is left with a debilitating criminal record, and is faced with a possible jail sentence.

Most of these people are young (88% of those arrested are under 26), otherwise law abiding citizens. There is simply no justification to continue to treat them as criminals.

In addition, hundreds of millions of dollars of law enforcement resources are wasted annually prosecuting marijuana smokers. We need these resources directed against serious crimes. For example, 66.9% of all drug arrests in the country in 1973 were marijuana arrests. Marijuana prosecutions are a significant cause of the court backlogs many jurisdictions face today. By decriminalizing marijuana we will free our law enforcement apparatus of an impossible and costly burden and thereby permit law enforcement officals to concentrate on such serious crimes as robbery, burglary, rape and murder.

4. Won't this be interpreted as an official sign of approval of marijuana smoking?

A. Certainly not. As the Marijuana Commission did when they issued their report, this change should be accompanied with clear indications that an official policy of discouragement is being continued.

By focusing law enforcement efforts at the commercial trafficker, society can maintain pressure on the illegal market.

If an "Oregon" type decriminalization plan is adopted, the purpose of maintaining the civil fine against the user is to dramatize society's disapproval and underscore the discouragement policy.

5. Isn't decriminalization illogical since it only applies to the user, leaving penalties against the seller?

A. No. Criminal penalties are retained against the seller as a means of discouragement. This is consistent with the way we treat such other "victimless crimes" as pornography, gambling and prostitution.

It balances the right of the individual in a free society to remain free from governmental interference in his private life, with society's right to protect itself against those who would purvey something society deems potentially detrimental.

6. What about the recent medical claims that marijuana may be more dangerous than we originally thought?

A. No drug is totally harmless, including marijuana. But the evidence strongly suggests no significant harm is caused by the occasional use of marijuana and whatever risk is involved with marijuana is far less than the demonstrated harm from a number of other drugs permitted in our society.

We should continue to look for potential ill effects from the use of marijuana -- especially the chronic, heavy use. But any findings of potential harm should be used to discourage use, not to justify treating the user as a criminal. As Dr. Tom Bryant, president of the Drug Abuse Council recently stated:

> "... we should not permit a medical debate to frustrate the decriminalization policy recommended by the Marijuana Commission. Even if marijuana were eventually shown to be as dangerous as alcohol or tobacco, giving a criminal record to the user only exacerbates the potential harm."

This past year we have heard several new claims of potential harm from marijuana use. These claims have received widespread media exposure, often far greater than the substance of the study warranted. Because of inadequate controls, excessive dosage levels, the claims often fall flat under close objective examination. Unfortunately the public is left only with the original, unfounded impression.

A glaring recent example is the Report of the U.S. Senate Subcommittee on Internal Security entitled "Marijuana-Hashish Epidemic and its Impact on United States Security." Subcommittee Chairman James O. Eastland talked of a "marijuana-hashish epidemic," a pending "national disaster," and "a large population of semi-zombies."

The Senator's answer to this perceived threat: wage an all-out propaganda campaign, beginning with the distribution of his admittedly unbalanced one-sided

Report. Senator Eastland refused to permit anyone to testify unless their testimony would support his premise -- that marijuana was highly dangerous, medically and morally. The result is a biased, frightening document offering little scientific value and no solutions.

Yet, because the Eastland hearings were reported by a generally uncritical press, there now appears to be a rather widespread belief that recent studies have shown marijuana to be terribly dangerous.

Each year the Department of H.E.W. attempts to summarize the research on marijuana and to reach some conclusions about the potential dangers. In their recently released Report for 1974, National Institute for Drug Abuse (NIDA) Director Dr. Robert L. DuPont discusses the recent claims:

> "These more recent studies deal with three areas of concern. They are: effects on male sex hormone levels, interference with the body's immune response and effects on fundamental cell metabolism. The implications of these preliminary studies are, at this point, speculative. There is concern that alteration in hormone levels as a result of chronic use may interfere with normal adolescent development or with sexual differentiation of male fetuses if cannabis is used by pregnant women at criminal periods of fetal development. Effects on the immune response and on cell metabolism might seriously affect resistance to disease or result in a variety of degenerative or genetic changes. Thus far there is no clinical evidence indicative of such consequences although continuing research is obviously required." (emphasis added)

Dr. DuPont also cautioned,

> "We must also recognize that no drug with major pharmacological action -- including marihuana -- can ever be truly safe. In is inevitable that further reserach will disclose additional hazards. In developing rational social policy, scientific evidence of a health hazard must be balanced against social and economic costs incurred by possible alternative strategies for discouragin drug abuse."

Dr. DuPont, who also serves as chief Presidential drug advisor in his capacity as director of the White House Special Action Office for Drug Abuse Prevention, recently endorsed publicly the Oregon approach. He believes

marijuana presents health risks to the user, and should be actively discouraged, but opposes the use of the criminal law for possession of small amounts.

It should be stressed that the National Commission on Marijuana and Drug Abuse, when they recommended decriminalizing the user, did not presuppose marijuana would be harmless. And several members of the Commission have reiterated their conclusions since the Eastland Hearings.

> "No drug is totally safe or harmless. In a sense, there is no human activity which is totally harmless. However, it is my opinion that marijuana involves only a minimal risk of harm to the user. Clearly the potential harmfulness of marijuana to the user is on a much lower order of magnitude than the potential harmfulness of such other drugs as alcohol, tobacco, amphetamines, barbiturates, and hallucinogens." J. Thomas Ungerleider, M.D., Presidential Appointee to the National Commission.

> "Since publication of the Commission's Report in March 1972, numerous studies have been reported, some suggesting that the dangers from marijuana are far greater than the Report indicated, others demonstrating that its use produces relatively little harm. In short, work in the last two years has not fundamentally changed the data base on which the recommendations were made." Dr. Dana Farnsworth, Presidential Appointee to the National Commission.

In response to the flurry of contradictory medical claims, the Drug Abuse Council, a Washington, D.C. based private foundation funded primarily by the Ford Foundation, recently sponsored a seminar to discuss the recent research. The major researchers wre invited, including some of the most vocal opponents of marijuana. At the conclusion of the conference, following closed-door meetings involving critiques of the major work by peers, Dr. Daniel X. Freedman, the respected Chairman of the Department of Psychiatry, University of Chicago, had this to say:

> "I don't think that scientists can tell the public there is going to be any major damage to their health on the basis of the current knowledge."

This is also the conclusion of a detailed critique of the recent medical reports by award winning science writer Ed Brecher and the editors of Consumer Reports,

in an update of their excellent work Licit and Illicit Drugs. The March and April issues of Consumer Reports conclude that "recent reports, like past reports, fail to prove that marijuana is either harmful or harmless." C.U. reiterated their belief that "no drug is harmless to all persons at all dosage levels or under all conditions of use."

As part of the 1974 NORML Conference, a medical panel headed by Dr. Norman Zinberg, including Drs. Lester Grinspoon, J. Thomas Ungerleider, Andrew T. Weil and David Smith, discussed these recent claims and reached similar conclusions; the risk to the user demonstrated by these studies has been grossly exaggerated by the authors and/or the media.

The potential harm from marijuana has been greatly exaggerated by those who wish to maintain criminal penalties against the user. The thrust of this campaign has been to allege that new research, unavailable when the Marijuana Commission Report was released in 1972, renders their recommendations invalid. This is an attempt to use the medical/health questions as a "red herring."

Marijuana should be decriminalized, even if it were eventually shown to be dangerous. Giving an arrest record to the user only exacerbates the potential for harm.

And while marijuana may not be harmless, neither is it a terribly dangerous drug. Certainly it presents far less of a health hazard than alcohol, tobacco, birth control pills, and a host of other drugs available in our society. Any risk to the user falls within the ambit of choice the informed individual should be allowed in a free society. So long as the research results warrant it, we should warn against the use of marijuana, but we should not criminalize those who ignore our advice.

7. Why not leave the law as it is, at least so long as there are still unsettled medical questions?

A. The decriminalization of marijuana is not based upon an assumption of medical harmlessness. Rather it is a recognition that the costs of wrecked lives and careers and wasted law enforcement resources involved with continued criminal prohibition far outweigh any harm caused by the use of the drug. Or put another way, giving a criminal arrest record to the user only exacerbates whatever potential harm the drug itself causes.

The annual HEW report on marijuana, entitled Marijuana and Health, has yet to find any substantial evidence that occasional marijuana use presents a significant risk to the smoker. The research is now concentrating on chronic, long term use. And the only controlled study of long term use to date, funded by HEW, failed to demonstrate any harm among users in Jamaica, even after using very strong marijuana for an average of 17.5 years.

We should continue our research into the potential harm from marijuana use, but we should use this information to warn the user, not to justify continuing to maintain criminal penalties. Each year we wait, another 400,000 Americans are arrested for marijuana. It's time to change the law.

8. Will the decriminalization of marijuana be the first step towards more permissive drug laws generally?

A. We are talking about removing criminal penalties only from possession and not-for-profit transfers of small amounts of marijuana. Stiff penalties remain for sale. This concept is not permissive.

Also, other drugs must be considered individually as to their acceptance by the society, their potential for harm, their effects on the user, and a number of other factors. What is an appropriate policy for marijuana, for example, may not apply to other drugs.

9. Can you estimate the total cost of law enforcement resources used enforcing the marijuana laws?

A. Since most of the arrests are made on the state and local level, most of the costs of law enforcement are absorbed by state and local law enforcement.

While exact costs are impossible to determine, it has been estimated that the state of California, for example, spends an average of $1400 per marijuana arrest. At this rate, California spends more than $100 million dollars annually enforcing the marijuana laws, and the cost nationally would exceed $600 million.

These police and prosecutorial resources are badly needed to combat serious crime. Decriminalization will eliminate more than 90% of the marijuana arrests, thereby freeing-up hundreds of millions of dollars of law enforcement resources for more important use.

10. How many people are arrested on marijuana charges each year in this country? Are most arrests against sellers or users?

A. According to the F.B.I., more than one million persons have been arrested for marijuana offenses in this country in the last four years. (Ten years ago there were less than 8,000 marijuana arrests nationwide.)

TOTAL MARIJUANA ARRESTS NATIONALLY

Year	Total Marijuana Arrests	% of Total Drug Arrests	Increase Over Prior Year	Total Drug Arrests
1970	188,682	45.4%	--	415,600
1971	225,828	45.9%	19%	492,000
1972	292,179	55.4%	29%	527,400
1973	420,700	66.9%	43%	628,900
TOTAL	1,127,389			2,063,900

And note that 62% of those arrested were under the age of 21 and 88% of those arrested were under the age of 26.

A statistical analysis of state marijuana arrests by the Shafer Commission uncovered the unsettling fact that 93% were for possession -- not sale -- and two-thirds of these involved the quantity of one ounce or less. Only 7% of the arrests were against the commercial trafficker.

In sum, what we're doing in this country is arresting more than 400,000 young people each year, the vast-majority possessing small quantities of marijuana for their personal use.

11. Is there any indication that marijuana smoking leads to violent behavior or behavior which might endanger others?

A. Quite the contrary. Research has indicated that marijuana tends to cause passivity, rather than aggression. Marijuana smokers, for example, are under-represented in crimes of aggression and violence; alcohol drinkers, on the other hand, are over-represented in these same categories.

The Marijuana Commission Report had this to say:

> "In sum, the weight of the evidence is that marijuana does not cause violent or aggressive behavior.." (p. 73)

"Neither the marijuana user nor the drug itself can be said to constitute a danger to public safety." (p. 78)

12. Is it safe to drive an automobile after smoking marijuana?

A. As the tests have become more sophisticated in this area, it has become more and more obvious that it is not safe to smoke marijuana and drive a car. Though clearly not as debilitating as alcohol, nonetheless, the marijuana smoker makes more errors on driving tests than the non-smoker.

In their 1974 report to Congress, entitled Marijuana and Health, HEW had this to say about the effects of marijauna on driving:

"It has been found to increase both braking and starting times, to adversely affect attention and concentration abilities, and to detract from performance on a divided attention task."

"Based on the accumulated evidence it seems clear that driving while under the influence of marijuana is ill advised."

No new laws are needed to protect against the driver who may be intoxicated with marijuana. It is already illegal to drive while intoxicated, regardless of the drug. It is against the law to drive and smoke marijuana now, and it will continue to be after marijuana smoking is decriminalized.

13. Does marijuana smoking lead to the use of more dangerous drugs such as cocaine or heroin?

A. No. There are an estimated 30 million Americans who have tried marijuana, with perhaps 13 million remaining regular users. Very few of those millions of marijuana smokers have ever tried either cocaine or heroin. This "marijuana leads to heroin" myth is widespread (held by 70% of the public in 1972, including 56% of the youth), despite the finding that less than 6% of the current marijuana smokers had ever experimented with heroin, less than 16% with cocaine.

The Marijuana Commission made the following conclusion:

"marijuana use per se does not dictate whether other drugs will be used; nor does it determine

the rate of pregression, if and when it occurs, or which drug might be used." (pp. 88-89)

"the fact should be emphasized that the overwhelming majority of users do not progress to other drugs." (p. 87)

No drug chemically predisposes a person to try yet another drug.

Many heroin addicts will say they "started" on marijuana. But ask that same group of heroin addicts how many of them used alcohol before they used marijuana or heroin, and you'll find that alcohol is the drug first used by most heroin addicts, not marijuana.

Does alcohol lead to heroin? Of course not.

But so long as we treat the marijuana user as a criminal, we are grouping marijuana in the same illicit category as the more dangerous drugs and the result will inevitably be some experimentation with more dangerous drugs by marijuana smokers. Laws which honestly reflected a distinction might serve to discourage this regrettable and potentially dangerous association.

14. Would the decriminalization position still be valid if it turns out that marijuana is far more dangerous than we now believe?

A. Yes, decriminalization would still be appropriate. As Dr. Tom Bryant, President of the Drug Abuse Council, recently concluded:

"We have two problems: a health problem and a criminal problem. They are no more automatically synonymous in the case of marijuana than they are in the case of alcohol."

. . .

"Even if marijuana were eventually shown to be as dangerous as alcohol or tobacco, giving a criminal record to the user only exacerbates the potential harm."

15. How many people smoke marijuana in this country?

A. According to surveys taken in October 1972 by the National Commission on Marijuana and Drug Abuse (Shafer Commission), 26 million Americans had tried marijuana and 13 million were regular users. This breaks down

to 16% of the adult population over 18, and 14% of youth between 12 and 17. Two-thirds of all college students have tried marijuana, as have 55% of persons 18-21 years old and 40% of the age group 22-25. Recently released survey results taken in October 1974 by the independent, Washington, D.C. based Drug Abuse Council indicate that 18% of the adults have now tried marijuana, (approximately 30 million Americans) with 8% continuing to use it (13 million). It is note worthy that despite recent alarmist claims by Sen. Eastland and others, in fact there is no "epidemic" of marijuana use in this country. The number of current users have remained constant since 1972.
