3. Report of the World Health Organization Expert Committee on Drug Dependence, No. 407, which was introduced in evidence at the hearing below by the DEA staff as ALJ Ex. No. 40. See Tr. 19-21. This was the only document introduced in evidence at the hearing below by the DEA staff which related to the Single Convention or international obligations.

After the hearing had concluded on January 30, 1975, Proposed Findings of Fact and Conclusions of Law, and Reply Briefs, were filed by petitioners and the DEA staff with the Administrative Law Judge. See Cert. Ind. Nos. 10-13.

---

4. The Certified Index to the Record filed by respondent did contain ALJ Ex. No. 1-49, but not this exhibit, ALJ 50. On January 21, 1976, petitioner filed a Motion for Leave to Supplement Certified Index, etc., which included this exhibit. This Motion is pending before the Court.

Upon petitioners' request, the Administrative Law Judge held an oral argument on April 18, 1975. See Transcript of Oral Argument, Cert. Ind. No. 16. At this oral argument the DEA staff introduced in evidence a letter from Dr. Theodore Cooper, Acting Assistant Secretary for Health, Department of Health, Education, and Welfare, to Mr. Jerry N. Jenson, Acting Deputy Administrator of DEA, dated April 14, 1975. Cert. Ind. No. 16, pp. 1-3. Since this letter from Dr. Cooper is so brief, and since the Acting Administrator relies so heavily on it in his final decision and order for his conclusion that CSA Section 201(a)-(c) procedures did not have to be complied with, the letter is set out in full below.[5]

---

5. The letter, introduced as Gov. Ex. No. 79, states:

Dear Mr. Jenson:

At your request, we have prepared the following statement giving our position on the medical uses of Cannabis sativa L. (marihuana).

There is currently no accepted medical use of marihuana in the United States. There is no approved New Drug Application for Cannabis sativa L. (marihuana) or tetrahydrocannabinol, the active principle in marihuana. There are Investigational New Drug Applications on file to determine possible therapeutic uses and potential toxic effects of the substance.

We have included for your information a copy of the most recent report on these studies and a copy of the FDA policy regarding clinical studies with marihuana.

Sincerely yours,

/s/

Theodore Cooper, M.D.
Acting Assistant Secretary
for Health

Accompanying this letter from Dr. Cooper as part of Gov. Ex. No. 79 is a letter dated April 17, 1975, from Mr. Robert J. Rosthal, DEA Deputy Chief Counsel and principal DEA attorney in the proceeding below, to Mr. Peter H. Meyers, one of the counsel for petitioners. This letter from the DEA Deputy Chief Counsel ascribes a much more modest significance to the Dr. Cooper letter than the significance accorded it by the Acting Administrator in his final decision. The Deputy Chief Counsel's letter stated, Gov. Ex. No. 79, at pp. 1-2:

> Since this letter is simply corroborative of the testimony of Donald E. Miller on the fact that the Food and Drug Administration had issued no New Drug Application for any part of the cannabis plant, it should occasion no delay in the oral argument scheduled for April 18.

C. Report and Recommended Decision of the Administrative Law Judge

The Administrative Law Judge filed his Report containing recommended findings of fact and conclusions of law, and a Recommended Decision, on May 21, 1975. See Cert. Ind. No. 19. This Report is contained in the Appendix To Brief For Petitioner.

In this Report, the Administrative Law Judge set out the issue involved as follows (Id., pp. 7-8):

> This is the first phase of the proceeding. The only issue which must be decided is whether there is any latitude with respect to the scheduling of marihuana, consistent with treaty obligations. If there is, the extent to which such latitude permits descheduling or rescheduling is an issue which would more properly be decided in the second-phase proceeding after the views of the Secretary of Health, Education, and Welfare are considered by the Administrator of DEA.

In a footnote, the Judge added (Id.):

> Even this single issue presents complex problems because of the different definitions of cannabis in the Single Convention and the Controlled Substances Act. Thus, the issue has several parts, namely, whether control is required as to 1) the flowering or fruiting tops and cannabis resin; 2) the leaves when not accompanied by the tops; 3) the seeds when not accompanied by the tops; or 4) synthetic cannabis.

The Report proceeds to review the documents and testimony which had been introduced, and makes the following conclusions on treaty obligations:

1. The United States is not required by treaty obligations to control either synthetic cannabis (Id., p. 14) or cannabis seeds, when unaccompanied by the tops (Id., pp. 11-12).

2. The United States is required to control cannabis leaves, when unaccompanied by the tops, but this obligation would be satisfied if such cannabis leaves were rescheduled to Schedule V of the CSA (Id., pp. 28-29).

3. Finally, with respect to "cannabis" and "cannabis resin" (as those terms are defined by the Single Convention), the Report concluded that rescheduling to Schedule II, but no lower, would be consistent with treaty obligations (Id., pp. 18-21). While acknowledging that there was a "substantial dispute" over whether cannabis and cannabis resin could be rescheduled below Schedule II (Id., p. 21), the Administrative Law Judge concluded:

> [A]ny uncertainty that lesser controls would be adequate must be resolved by adhering to a control regime under which there is no question of adequacy. In this case, there is no question that placing cannabis in Schedule II meets treaty obligations. Placement in a lower schedule, or decontrol, raises too many questions about our ability to meet those obligations.

CONTINUED

24 OF 33

The Administrative Law Judge then analyzed Section 201 of the Controlled Substances Act (Id., pp. 31-34), rejecting the DEA staff's interpretation of Section 201(d):

> Despite Congress' intent as revealed in Sections 201(a) and (b); the Government insists that all of these procedures can be ignored and that the Administrator, because of Sec. 201(d), can decree, without referring the matter to the Secretary of HEW and without holding hearings, that cannabis shall remain in Schedule I so long as some control over cannabis and cannabis leaves is required by treaty, even though the treaty could be satisfied by placing these drugs in a less restrictive schedule.
>
> Congressional history does not in my opinion support the Government's interpretation of Sec. 201(d)....
>
> The hearing and referral provisions of Secs. 201(a) and (b) clearly reveal Congress' desire to place the responsibility for the medical and scientific evaluation of drugs in the hands of the Secretary of HEW, not the Administrator of DEA. (Id., pp. 32-33)

The Administrative Law Judge then set out his Recommended Decision at pp. 34-35 of the Report. This Recommended Decision, with one exception,[6] is identical to the order NORML seeks in this Court:

> The United States is not required by any treaty, convention or protocol to control cannabis seeds or artificial cannabis (Findings 22, 25 and 26 b) (1), (2)). Therefore, I recommend that the Administrator, pursuant to Sec. 201(b) of the Controlled Substances Act, 21 U.S.C. 811(b), request from the Secretary of Health, Education, and Welfare a scientific and medical evaluation and the Secretary's recommendation as to the appropriate schedule in which cannabis seeds and artificial cannabis should be placed or whether these drugs should be removed from the schedules as controlled substances. After receiving these recommendations, the Administrator should hold hearings pursuant to Sec. 201(a).

---

6. The one difference concerns the amount of rescheduling for cannabis and cannabis resin that is consistent with treaty obligations.

The United States is required by the Single Convention to control cannabis, cannabis resin, and cannabis leaves (Findings 21, 23, 24 and 26 a) (1) and (2)). However, its obligations thereunder can be satisfied if cannabis and cannabis resin are placed in Schedule II of the Controlled Substances Act and if cannabis leaves are placed in Schedule V of the Act. Therefore, I recommend that the Administrator, pursuant to Sec. 201(b), 21 U.S.C. 811(b), of the Controlled Substances Act, request from the Secretary of Health, Education, and Welfare a scientific and medical evaluation and the Secretary's recommendation as to the appropriate schedule (within the limits of the United States' treaty obligations)* in which cannabis, cannabis resin and cannabis leaves should be placed. After receiving these recommendations, the Administrator should hold hearings pursuant to Sec. 201(a).

---

*This phrase is included to make it clear that the Secretary, while he might recommend it, could not bind the Attorney General to place cannabis and cannabis resin in Schedules III-V or decontrol cannabis leaves since such action would violate the United States' treaty obligations.

D. Final Decision of the Acting Administrator

After the Administrative Law Judge filed his Report, petitioners filed on June 13, 1975, a motion entitled "motion for Oral Argument and Appeal From Rulings of Administrative Law Judge." Cert. Ind. No. 17. In response, the Acting Administrator write a letter to Peter H. Meyers, Counsel for petitioners, dated July 14, 1975, which, generally, deferred until the final decision in the proceeding any ruling on the motion. (NORML has requested that this letter, which was not included in the Certified Index, be added thereto. See p. 13, fn.4, above.)

On September 25, 1975, the Acting Administrator published in the Federal Register his final decision and order in the

proceeding. 40 Fed. Reg. 44164-68, Cert. Ind. No. 21. The order denies NORML's petition "in all respects," 40 Fed. Reg. at 44168 col. 3.

In his decision, the Acting Administrator does acknowledge, however, that there is latitide to reschedule marijuana from Schedule I, consistent with treaty obligations. In fact, in terms of specific categories of cannabis materials, there is not that much difference between the Acting Administrator and the Administrative Law Judge on what amount of rescheduling would be consistent with treaty obligations.

The Acting Administrator held that there was no international obligation to control synthetic cannabis or THC, as had the Administrative Law Judge. See 40 Fed. Reg. at 44166 col. 1 and 44167 col. 1. The Acting Administrator also agreed that there was no obligation to control certain cannabis seeds (i.e., those incapable of germination), but that some control was required over other cannabis seeds (i.e., those capable of germination). See 40 Fed. Reg. at 44166 col. 1 and 44167 col. 1. (The Acting Administrator further held, wrongly we believe, that cannabis seeds and synthetic cannabis were "not at issue in this proceeding" 40 Fed. Reg. at 44168, col. 1, 44167, col. 1).

Turning to the question of cannabis leaves, when unaccompanied by the tops, the Acting Administrator concluded that such leaves could be rescheduled to Schedules II-IV of the

CSA, but not Schedule V, as the Administrative Law Judge had concluded. 40 Fed. Reg. at 44167 col. 1, 44168 col. 1. Finally, the Acting Administrator also agreed with the Administrative Law Judge that cannabis and cannabis resin could be rescheduled to Schedule II, but no lower, consistent with treaty obligations. 40 Fed. Reg. at 44167 col. 1 and col. 3.

Turning to the question of what he should do with the NORML petition since there was discretion to reschedule marijuana, the Acting Administrator stated, 40 Fed. Reg. at 44165 col. 2:

> It is unnecessary to decide whether Section 201(d) requires the Attorney General to seek the views of HEW on a substance included in an international treaty. In the instance of marihuana he has done so and he has received a reply.

The reference here is to the letter from Dr. Theodore Cooper, Acting Assistant Secretary for Health, which was introduced at oral argument before the Administrative Law Judge as Gov. Ex. No. 79, and is quoted in full on p. 15, fn. 4, above. The Acting Administrator's argument, insofar as petitioner can understand it, appears to be that this letter from Dr. Cooper is equivalent to the referral procedures contained in Section 201(a)-(c) of the CSA. The Acting Administrator concludes that this letter makes the placement of marijuana in Schedule I "mandatory" rather than "discretionary," 40 Fed. Reg. at 44168 col. 2:

> Placement of marihuana in Schedule I is therefore less discretionary than mandatory. Considering the Single Convention and the Act together there is in fact no discretion unless the appraisal of the Secretary, HEW, can be ignored. The Court of Appeals indicates that it should not be ignored and we have not done so here.

Petitioner would point out here one additional aspect of the Acting Administrator's final decision. The Acting Administrator refers repeatedly to the statement in this Court's prior decision that "it would seem appropriate for the Court to have the benefit of the views of ... the international organizations involved." NORML v. Ingersoll, 497 F. 2d at 661. The Acting Administrator states that the DEA has complied with this direction by introducing in evidence the two Resolutions from the Economic and Social Council (ALJ Ex. No. 3) and the Report from the World Health Organization (WHO) Expert Committee on Drug Dependence (ALJ Ex. No. 40). See 40 Fed. Reg. at 44164 col. 2, 44165 col. 1, 44166 col. 2, 44168 col. 2-3. The Acting Administrator states that these three documents "require the closest attention." 40 Fed. Reg. at 44166 col. 2.

The two Resolutions from the Economic and Social Council deal primarily with the medical and social aspects of marijuana use, and do not address at all the legal issue of what amount of rescheduling would be consistent with treaty obligations. The Report of the WHO Committee deals exclusively with scientific and medical questions about marijuana.

Mr. Donald E. Miller, the DEA's Chief Counsel, testified under cross-examination at the hearing below that there were two other international organizations -- the Division of Narcotic Drugs and the International Narcotics Control Board -- which do have the responsibility for determining whether a country's laws satisfy treaty obligations, Tr. 469-70:

> A. You make it sound like that I have no concern. Well, I do have concern. I just simply hadn't thought

that a country would be in derogation of their treaty obligations. I do not make it my job to read laws of all countries to make a determination as to whether they are in derogation of their treaty obligations. That is the concern of an international agency, the Division of Narcotic Drugs specifically.

* * *

A. Once again, you are going back to putting me into the position of accusing me of misfeasance of not being concerned about that is not my responsibility. And I keep pointing out to you, and I hope I can clarify it this time, that the Division of Narcotic Drugs in Geneva is the responsible agency to make a determination as to whether the laws are adequate in a certain country to carry out their treaty obligations.

The International Narcotics Control Board also functions in that area to make a determination as to whether or not they are satisfying their treaty obligations.

There is no indication in the record of whether the DEA attempted to contact the Division of Narcotic Drugs or the International Narcotics Control Board for their views on what rescheduling of cannabis would be consistent with treaty obligations.

The contents of the three documents introduced by the DEA staff are discussed in more detail below. Dr. Joel Fort, one of petitioners' witnesses at the hearing, testified on the nature of the organizations which prepared these documents, and responded to a number of the scientific and medical claims which are contained in the documents.

The Acting Administrator published a Correction to his final decision (of a minor nature) in the Federal Register on September 30, 1975, 40 Fed. Reg. 44856, Cert. Ind. No. 22.[7]

---

7. The Correction substituted the phrase "leaves which are entirely detached from the tops and seeds," for the phrase "leaves which are capable of germination," at 40 Fed. Reg. 44168 col. 1.

On October 22, 1975, NORML filed a Petition for Review of the Acting Administrator's decision and order in this Court.

E. Sources for Interpreting the Single Convention

The only treaty or other international obligation which was cited in the Acting Administrator's final decision as imposing an obligation on the United States to control marijuana was the Single Convention on Narcotic Drugs ("Single Convention"). The Single Convention is the only treaty that has ever been at issue in this proceeding. The official text of the Single Convention is continued in the Appendix To Brief For Petitioner

The Single Convention was adopted at the United Nations Conference for the Adoption of a Single Convention on Narcotic Drugs, which met at United Nations Headquarters, in New York City, from January 24 to March 25, 1961. The deliberations of the Conference are set out in the two-volume Official Records, E/CONF. 34/24 and E/CONF. 34/24/Add.1. Volume I of the Official Records, which was introduced as ALJ Ex. No. 31, contains the summary records of the plenary meetings of the Conference. Volume II of the Official Records contains the Final Act of the Conference (ALJ Ex. No. 29), the third draft of the Single Convention (ALJ Ex. No. 30), and the summary records and reports by the committees of the Conference, preparatory documents, amendments and miscellaneous papers circulated at the Conference (ALJ Ex. No. 32). The third draft of the Single Convention,

which had been prepared by the Commission on Narcotic Drugs, was the principal working document of the Conference. ALJ Ex. No. 29, p. 298, para. 12.

Two documents relating to United States accession to the Single Convention in 1967 were introduced in evidence. See, Message from the President Transmitting the Single Convention to the Senate, Exec. G, 90th Cong., 1st Sess. (1967), ALJ Ex. No. 35; Report on the Single Convention by the Senate Committee on Foreign Relations, Exec. Rept. No. 11, 90th Cong., 1st Sess. (1967), ALJ Ex. No. 36.

Also introduced into evidence was the Commentary on the Single Convention on Narcotic Drugs, 1961 ("Commentary"), ALJ Ex. No. 39. The Commentary was prepared by the Secretary-General of the United Nations pursuant to a resolution of the Economic and Social Council, and published in 1973. It is a definitive and official United Nations interpretation of the Single Convention. Hoover Tr. 70. The Commentary contains an Article-by-Article (and often word-by-word) analysis of the Single Convention, relying upon the Official Records of the Conference, earlier negotiating history, subsequent practice of the parties, and other sources. See generally, Hoover Tr. 69-71. The Commentary was relied upon extensively by the Administrative Law Judge in his Report.

For a concise discussion of the background of the Single Convention, the early drafts, and the Conference for the Adoption of the Single Convention, see Lande, "The Single Convention

on Narcotic Drugs, 16 International Organization 776-97 (1962), introduced as ALJ Ex. No. 37. For a more comprehensive article on current international drug treaties, including a detailed analysis of the Single Convention, see Lande, "The International Drug Control System, ALJ Ex. No. 38, Appendix, Vol. III, pp. 6-132, Second Report of the National Commission on Marihuana and Drug Abuse (March 1973).[8]

F. Single Convention Controls Over Cannabis

The Single Convention provides for different measures of control for different parts of the cannabis plant. The definitions contained in Article 1 of the Single Convention provide:

> (b) "Cannabis" means the flowering or fruiting tops of the cannabis plant (excluding the seeds and leaves when not accompanied by the tops) from which the resin has not been extracted, by whatever name they may be designated.
>
> (c) "Cannabis plant" means any plant of the genus cannabis.
>
> (d) "Cannabis resin" means the separated resin, whether crude or purified, obtained from the cannabis plant.

---

8. Mr. Adolf Lande, the author of these two articles, was Deputy Executive Secretary of the Conference for the Adoption of the Single Convention, and actively participated in the conference deliberations on marijuana. See, e.g., Official Records, Vol. I, ALJ Ex. No. 31 at p. 186; Vol. II, ALJ Ex. No. 32 at pp. 177-78, 272.

Mr. Hoover, petitioner's witness at the hearing below, testified that he knew and had worked with Mr. Lande in Geneva, and that Mr. Lande was probably more than any other individual responsible for the drafting of the preparatory documents which became the Single Convention. Tr. 66. See generally, Hoover Tr. 66-70.

In the forward to the Commentary, the Secretary-General of the United Nations commends Mr. Lande "for his valuable assistance...." ALJ Ex. No. 39, at p. v.

"Cannabis" and "cannabis resin," as those terms are defined above, are listed in Schedules I and IV of the Single Convention, and are subject to all of the controls applicable to substances listed in those schedules. When the leaves and seeds of the cannabis plant accompany the tops, they are included within the Single Convention's definition of "cannabis," and are subject to the same controls.

Article 2(1) of the Single Convention lists the Articles and controls applicable to all substances listed in Schedule I of the Single Convention. Important features of the Schedule I control regime include:

-- Parties must license and control persons engaged in the manufacture (Art. 29), trade and distribution (Art. 30), and international trade (Art. 31).

-- Parties must prepare estimates of their drug requirements (Art. 19) and statistical returns of drugs consumed (Art. 20) for the International Narcotics Control Board.

-- The parties shall take such measures as may be necessary to limit the production, distribution, possession, etc., to authorized medical and scientific purposes. Art. 4(c).

-- The parties shall not permit the possession of drugs except under legal authority. Art. 33.

-- Subject to their constitutional limitations, the parties shall make certain activities "punishable offenses" and "serious" offenses must be subject to imprisonment penalties. Art. 36(1).

Substances listed in Schedule IV of the Single Convention, including cannabis and cannabis resin, are also subject to Article 2(5):

> The drugs in Schedule IV shall also be included in Schedule I and subject to all measures of control applicable to drugs in the latter schedule, and in addition thereto:
>
> (a) A Party shall adopt any special measures of control which in its opinion are necessary having regard to the particularly dangerous properties of a drug so included; and
>
> (b) A Party shall, if in its opinion the prevailing conditions in its country render it the most appropriate means of protecting the public health and welfare, prohibit the production, manufacture, export and import of, trade in, possession or use of any such drug except for amounts which may be necessary for medical and scientific research only, including clinical trials therewith to be conducted under or subject to the direct supervision and control of the Party. (emphasis added)

The United States is also obligated to apply to cannabis and cannabis resin the controls set out in Article 23 of the Single Convention, because the United States presently authorizes the cultivation of the cannabis plant for scientific research. Miller Tr. 526-27; Administrative Law Judge Report, Cert. Ind. No. 19, at p. 12.

When the leaves and seeds of the cannabis plant do not accompany the tops, they are not defined as cannabis by the Single Convention, and are not subject to the obligations which the Single Convention imposes on "cannabis." As the Commentary states, marijuana cigarettes "containing material derived only from the leaves are consequently not subject to the provisions [of the Single Convention] governing cannabis." ALJ Ex. No. 39, at p. 3. In India, the leaves of the cannabis plant are widely used, most commonly in a liquid preparation called "bhang." Fort Tr. 196-97; Administrative Law Judge's Report, Cert. Ind. No. 19, at p. 9.

The only provision of the Single Convention which applies to cannabis leaves, when unaccompanied by the tops, is Article 28, para. 3. Commentary, ALJ Ex. No. 39, at p. 315. Art. 28(3) provides:

> The Parties shall adopt such measures as may be necessary to prevent the misuse of, and illicit traffic in, the leaves of the cannabis plant.

There is a dispute concerning whether any article in the Single Convention requires control of cannabis seeds, when unaccompanied by the tops. The Acting Administrator concluded that Article 2, para. 8 required control over certain cannabis seeds which were unaccompanied by the tops (i.e., seeds capable of germination). 40 Fed. Reg. at 44165 col. 3.[9] The Administrative Law Judge concluded that Article 2, para. 8 did not require the United States to control any cannabis seeds, when unaccompanied by the tops. Cert. Ind. No. 19, at. pp. 11-12.

Finally, there is no dispute that the Single Convention covers only the cannabis plant, and the various parts of the plant. The Single Convention does not apply to synthetic cannabis or THC, i.e., THC produced from chemicals in the laboratory, rather than naturally-occurring in the plant. The United States has no international obligation to control synthetic cannabis. Acting Administrator's final decision, 40 Fed. Reg. at 44166 col. 1; Administrative Law Judge's Report, Cert. Ind. No. 19, at pp. 14-15.

---

9. Article 2, para. 8, provides that:

> The parties shall use their best endeavors to apply to substances which do not fall under this Convention, but which may be used in the illicit manufacture of drugs, such measures of supervision as may be practicable.

Summary of Argument

The Acting Administrator acknowledged in his final decision that there is discretion to reschedule cannabis materials from Schedule I of the Controlled Substances Act, consistent with treaty obligations, and this is not in dispute. There is a dispute on the amount of rescheduling which would be consistent with treaty obligations.

It is NORML's position in this appeal that the following rescheduling would be consistent with treaty obligations: (1) decontrol of synthetic cannabis; (2) decontrol of all cannabis seeds, unaccompanied by the tops; (3) rescheduling of cannabis leaves, unaccompanied by the tops, to Schedule V; (4) rescheduling of "cannabis" and "cannabis resin" to Schedule II, or in the alternative, to Schedule V through the DEA's rule-making authority.

A chart contained on the following page compares NORML's position with the Acting Administrator's final decision and the Administrative Law Judge's recommended decision, on the amount of rescheduling which would be consistent with treaty obligations.

Rescheduling of Cannabis Materials Which Would Be Consistent With Treaty Obligations

	Acting Administrator's Final Decision	Administrative Law Judge's Recommended Decision	NORML's Position in This Appeal
Synthetic Cannabis	Decontrol	Decontrol	Decontrol
Cannabis Seeds*	Decontrol and Control[1]	Decontrol	Decontrol
Cannabis Leaves*	Schedule IV	Schedule V	Schedule V
"Cannabis" and "Cannabis Resin"	Schedule II	Schedule II	Schedule II or Schedule V[2]

*When unaccompanied by the tops.

[1]The Acting Administrator held that seeds capable of germination had to be "controlled," but never indicated the CSA schedule of control which would be sufficient. Presumably this would be CSA Schedule V. The Acting Administrator also held that the Single Convention did not require control of seeds incapable of germination.

[2]NORML concedes for the purpose of this appeal that "cannabis" and "cannabis resin" could not be rescheduled below CSA Schedule II, unless the DEA has the authority to reschedule these materials to a lower schedule (III-V) and require additional controls through its rulemaking powers.

As this chart indicates, there is much more agreement than disagreement on the amount of rescheduling which would be consistent with treaty obligations. The only dispute between NORML and the Acting Administrator involves these three narrow areas:

(1) Whether cannabis leaves could be rescheduled to Schedule IV or V,

(2) Whether cannabis seeds capable of germination must be controlled, and

(3) Whether the DEA has the authority to reschedule "cannabis" and "cannabis resin" below Schedule II through the use of its rulemaking authority.

There is, however, a very substantial dispute on the other issue involved in this case -- what procedures should the DEA follow in the "second phase" of its proceeding, since there is discretion to reschedule cannabis materials from Schedule I.

NORML believes that the correct procedure for the second phase of the DEA proceeding is the procedure contained in the Administrative Law Judge's Recommended Decision, which included the formal referral of the NORML petition to the Secretary of HEW, pursuant to Sections 201(a)-(c) of the Act, for consideration of such rescheduling as would be consistent with treaty obligations. After the Acting Administrator receives the Secretary's scientific and medical recommendations, Sec. 201(b), he would hold hearings, on the record, and then issue his final decision in this proceeding, Sec. 201(a). See Administrative Law Judge Report, Cert. Ind. No. 19, at pp. 34-35.

The Acting Administrator held that while it was "unnecessary" to interpret Section 201, the procedures specified in Sections 201(a)-(c) did not have to be complied with because of the letter from Dr. Cooper, Assistant Secretary for Health. 40 Fed. Reg. at 44165 col. 2. NORML argues below that this letter from Dr. Cooper is in no way comparable with, or an adequate substitute for, the full Section 201(a)-(c) procedures.

NORML has also requested below that a number of specific directions be included in the Court's decision remanding this case.

Finally, petitioner would point out that while the Courts must give due weight and consideration to the interpretation of a treaty made by a member of the Executive branch, the Courts are not required to give a strained construction to the language of a treaty, or to place an unreasonable interpretation upon it. See, e.g., Geofroy v. Riggs, 133 U.S. 258, 271 (1890); Oklahoma v. Texas, 260 U.S. 606, 633 (1923).[10]

---

10. The well-established rule is that the Courts are the ultimate arbiters of what a treaty or statute provides, and have the final authority to interpret treaties as they affect the domestic law of the United States. See, e.g., Factor v. Laubenheimer, 290 U.S. 276 (1933); Arizona v. California, 373 U.S. 546 (1963); United States v. Texas, 339 U.S. 707 (1950). This is based upon the scope of the judicial powers, set out in Article III, Section 2 of the Constitution. See American Law Institute, Second Restatement of the Foreign Relations Law of the United States (1965), at p. 461 et seq.

ARGUMENT

I. Cannabis Substances Can Be Rescheduled from Schedule I of the CSA Consistent With Treaty Obligations

A. Rescheduling of "Cannabis" and "Cannabis Resin" to Schedule II, Or in the Alternative, to Schedule V

The Acting Administrator concluded that "cannabis" and "cannabis resin," as those terms are defined in the Single Convention, could be rescheduled to Schedule II of the CSA, but no lower, consistent with treaty obligations. 40 Fed. Reg. at 44167 col. 1, col. 3. The Acting Administrator is clearly correct that "cannabis" and "cannabis resin" could be rescheduled to Schedule II. See, Administrative Law Judge Report, Cert. Ind. No. 19, at pp. 18-26; Miller Tr. 431, 437; Hoover Tr. 51-54; Fort Tr. 203.

Mr. Miller, the DEA's Chief Counsel, testified below that the only difference between substances in CSA Schedules I and II is that substances in Schedule I are deemed to have "no currently accepted medical use" and cannot be prescribed by physicians, while substances in Schedule II are deemed to have "a currently accepted medical use" and can be prescribed by physicians. See Miller Tr. 473-74, 488. Compare CSA Sec. 201(b)(1)(B) with (b)(2)(B). See also Sec. 303 (f).[11]

11. Mr. Miller testified that there were substances listed in Schedule II of the CSA, including poppy straw, which did not have a "currently accepted medical use," Tr. 473-74, and Mr. Miller acknowledged that "cannabis" could be rescheduled to Schedule II under Section 201(d) even without "a currently accepted medical use." Tr. 487-88. (continued on following page)

Two provisions of the Single Convention relate to the question of whether "cannabis" can be prescribed for medical purposes. Article 4(c) expressly authorizes the medical use of all substances listed in Schedule I of the Single Convention, including "cannabis" and "cannabis resin." Hoover Tr. 51; Commentary, ALJ Ex. No. 39, at p. 111.

"Cannabis" and "cannabis resin" are also placed in Schedule IV of the Single Convention, and are therefore subject to Article 2(5)(b), which requires parties to limit the use of Schedule IV drugs to medical and scientific research, but only if in the party's opinion "the prevailing conditions in its country render it the most appropriate means of protecting the public health and welfare...."

The DEA staff did request a Proposed Conclusion of Law which stated that this article "obligates the United States to limit the use of cannabis and cannabis resin to medical and scientific research" (emphasis added). Government's Proposed Findings of Fact and Conclusions of Law, Cert. Ind. No. 11, at p. 38.

The Administrative Law Judge correctly rejected this proposed finding in his Report, Cert. Ind. No. 19, at pp. 20-21, stating that:

> While Article 2(5) of the Single Convention reveals the concern of the parties as to the medical use of cannabis, I find that it imposes no requirement on the

---

(footnote continued from preceding page)
This point is important in connection with the discussion below on the significance which should be accorded to the letter from Dr. Cooper. For purposes of this discussion, we assume that Schedule II drugs must have an accepted medical use.

parties to prohibit its use. It is left to the good faith discretion of each party to determine whether prohibition of use is the most appropriate means of protecting the public welfare. See Commentary on the Single Convention on Narcotic Drugs (U.N. 1961) (ALJ 39, p. 65). Thus Article 2(5) does not amount to an obligation within the meaning of Sec. 201(d) of the Controlled Substances Act, and does not prohibit the United States from rescheduling cannabis to Schedule II, under which it could be prescribed for legitimate medical purposes.

See generally, Petitioners' Proposed Findings of Fact, Cert. Ind. No. 10, at pp. 17-22.

As indicated above, petitioner conceeds that CSA Schedule II controls are required for "cannabis." See Sec. 306 of the Act, which only applies to substances listed in Schedules I and II. Petitioner's argument that "cannabis" could be rescheduled below Schedule II, to Schedules III-V, focuses exclusively on the question of whether the DEA could reschedule "cannabis" to Schedules III-V, and in that same order indicate that "cannabis" would continue to be subject to Schedule II controls to fulfill treaty obligations, pursuant to the DEA's rulemaking powers.

This would allow the Secretary of HEW to consider whether "cannabis" should be rescheduled to Schedules III-V, and if the Secretary's recommendation indicated that "cannabis" should be rescheduled to one of those schedules based upon the scientific and medical criteria, the DEA could place "cannabis" in that schedule and continue to require Schedule II controls to fulfill treaty obligations.

It would be desirable for the Secretary of HEW to consider the broadest possible rescheduling of "cannabis," especially whether it should be rescheduled to Schedules III-V. The criteria for Schedules III-V reflect, in petitioner's view, a more realistic assessment of the potential for abuse of "cannabis" than the criteria for Schedule II. On a more practical level, rescheduling "cannabis" below Schedule III would significantly reduce the potential penalties for persons who are convicted of the unauthorized manufacture, distribution, or possession with intent to distribute, of "cannabis."[12]

The Administrative Law Judge believed that "despite the DEA's broad rulemaking power and the court's traditional deference to the exercise of that power," there might be a successful challenge to the adoption of the rule sought by NORML. See Cert. Ind. No. 19 at p. 25.

NORML submits that the rule sought is clearly within the authority of the DEA, and the argument below is based in large part upon the testimony at the hearing of Mr. Donald Miller, the DEA's Chief Counsel.

---

12. The penalties for these offenses are set out in Section 401 of the Act. If "cannabis" is scheduled in Schedules I-III of the Act, the penalty for committing any of these offenses is up to five (5) years imprisonment and/or a fine of up to $15,000. Sec. 401(b)(1)(B). If "cannabis" were rescheduled to Schedule IV, the penalty for the above offenses would be up to three (3) years imprisonment and/or a fine of up to $10,000. Sec. 401(b)(2). If "cannabis" were rescheduled to Schedule V, the penalty for the above offenses would be up to one (1) years imprisonment and/or a fine of up to $5,000.

Rescheduling "cannabis" would not effect the penalty for simple possession, however, which is a maximum of one (1) years imprisonment and/or a fine of up to $5,000, for all controlled substances. Sec. 404(a).

Mr. Miller testified at length in his direct examination about the authority of the DEA to require by rulemaking the controls specified in the Single Convention. See Tr. 425-27. Mr. Miller testified that, in his opinion, the DEA did have authority to implement treaty obligations (specifically referring to Article 23) for cannabis by rulemaking, but only if cannabis were scheduled in Schedule I or II of the CSA. Tr. 425-26. Mr. Miller testified that, in his opinion, the DEA would not have authority to implement treaty obligations for cannabis by rulemaking if cannabis were rescheduled to Schedules III-V of the Act. Tr. 526.

The difference which Mr. Miller points to is that the Attorney General is directed to consider treaty obligations in granting registrations to manufacture Schedule I and II substances, but is not explicitly directed to consider treaty obligations in granting registrations to manufacture Schedule III-V substances. Tr. 526.27. This cannot be disputed. Compare CSA Sec. 303(a) and 303(d).

Mr. Miller did acknowledge, however, that Congress was not authorizing the DEA to register an applicant to manufacture Schedule III, IV, or V drugs in violation of treaty obligations, or disregarding treaty obligations. Tr. 505.

In addition, the Controlled Substances Act does not explicitly provide that the Attorney General shall consider treaty obligations in registering distributors of controlled substances in Schedules I and II [see CSA Sec. 303(b)] or distributors of controlled

substances in Schedules III-V [see CSA Sec. 303(e)]. The Controlled Substances Act also does not explicitly provide that the Attorney General shall consider treaty obligations in registering practitioners to dispense or conduct research in controlled substances. CSA Sec. 303(f).

In light of the fact that one of the primary purposes of the Controlled Substances Act was to fulfill treaty obligations, particularly the Single Convention, see Hoover Tr. 101-02; Miller Tr. 430-32, there should not be any question that the DEA must consider treaty obligations in granting registrations to manufacture Schedule III-V drugs, and registrations to distribute and dispense drugs in all schedules, even though this is not explicitly set out in the Act.

In addition, petitioner submits that the DEA has the authority to reschedule "cannabis" below Schedule II and to require all persons who manufacture, distribute, or dispense "cannabis" to continue to apply Schedule II controls, if those controls are required by treaty obligations.

There are a number of provisions in the CSA which give the DEA broad authority over persons registered under the Act, including the authority to "promulgate rules and regulations" to carry out the Act, Section 301, and the authority to consider "such other factors as may be relevant to and consistent with the public health and safety." Sections 303(a)(6), (b)(5), (d)(6), and (e)(5). See also Sections 302(b), 1008(e) and (f).

There are a number of recent cases in which agency rulemaking similar to that proposed by NORML has been upheld. These cases reflect what the Administrative Law Judge termed the "court's traditional defense" to agency rulemaking. In Mourning v. Family Publications Service, Inc., 411 U.S. 356 (1973), the Supreme Court recently reaffirmed that agency rulemaking will be sustained as long as it is "reasonably related to the purposes of the enabling legislation." 411 U.S. at 369.

In Mourning, the validity of Regulation Z, enacted by the Federal Reserve Board under the Truth-in-Lending Act was in question. Regulation Z implemented disclosure requirements on credit transactions where no finance charges were involved. The Regulation was attacked on the ground that it was inconsistent with some portions of the statute, in that the statute itself authorized disclosure requirements with respect to transactions actually involving a finance charge. The Court stated:

> Neither the sections of the Truth-in-Lending Act which refer specifically to transactions involving finance charges nor any other sections of the Act indicate that Congress attempting to list comprehensively all types of transactions to which the Board's regulations might apply. To the contrary, the broad grant of rule-making authority reflects an intention to rely on those attributes of agency administration recognized in American Trucking. We cannot then infer that references in the Act to transactions involving credit were intended to limit the deterrent measures which the Board might choose. 411 U.S. at 372-73.

Similarly, in Public Service Commission of New York v. F.P.C., 327 F.2d 893 (D.C. Cir., 1964), the petitioner challenged the authority of the Federal Power Commission to issue regulations

permitting the issuance of temporary certificates on grounds other than those explicitly set out in the National Gas Act. This Court stated:

> The question is whether the regulation is valid. We think it is. The power to issue temporary certificates is not limited to emergencys "to assure maintenance of adequate service or to serve particular customers." As the legislative history makes clear, this language has a special relationship to pipelines. The courts should not construe this affirmative grant of authority as excluding authority in other situations if its exercise finds justification in the Act as a whole....[W]e are unable to say now that the action of the Commission ... was so clearly arbitrary and unreasonable as to justify us in setting it aside. 327 F.2d at 897.

The Seventh Circuit faced an analogous situation in Rex Chainbelt, Inc., v. Volpe, 486 F.2d 757 (7th Cir. 1973). The National Traffic and Motor Vehicle Safety Act requires every manufacturer or distributor of a motor vehicle to furnish a certificate of conformity with federal motor vehicle safety standards. The statute also gives the Secretary of Transportation the authority to "issue, amend, and revoke such rules as he deems necessary" to carry out the statute. The Secretary enacted a rule providing that manufacturers and installers of cement mixers on truck bodies must certify the entire vehicle, since such person is the "final-stage manufacturer" of the motor vehicle. Plaintiff, a cement mixer manufacturer and installer, argued that the Act does not authorize the imposition of any kind of certificate requirement upon manufacturers not selling through distributors or dealers. The Court stated:

> Regulations promulgated pursuant to this delegation of power are to be upheld by a reviewing court if they conform to purposes and policies of the Act and if they do not contravene any of its terms. Sec. 1403 does not prohibit the imposition of further certification requirements by regulations of the Secretary but merely specified who must certify their vehicles. We therefore find that the Secretary has power under the Act to require manufacturers not working through distributors and dealers to certify their vehicle or equipment. 486 F.2d at 761.

B. Rescheduling of Cannabis Leaves (When Unaccompanied by the Tops) to Schedule V.

The Acting Administrator held that cannabis leaves, when unaccompanied by the tops, could be rescheduled to Schedule IV of the CSA, consistent with treaty obligations. 40 Fed. Reg. at 44167 col. 1. This follows the testimony of Mr. Miller at the hearing below, see Tr. 448-50, and the Proposed Findings of Fact and Conclusions of Law filed by the DEA staff. Cert. Ind. No. 11 at p. 25.[13]

The Administrative Law Judge concluded that cannabis leaves, when unaccompanied by the tops, could be rescheduled to Schedule V. Cert. Ind. No. 19, at pp. 28-29. It is clear beyond a reasonable doubt that the Administrative Law Judge is correct and the Acting Administrator is wrong.

---

13. The Acting Administrator did acknowledge that he "might agree" to Schedule V if the question was presented "in the framework of an academic discussion." 40 Fed. Reg. at 44167 col. 1..

The only provision of the Single Convention which applies to cannabis leaves, when unaccompanied by the tops is Article 28, para. 3. Commentary, ALJ Ex. No. 39, at p. 315; Hoover Tr. 41. Article 28, para. 3 provides in full:

> The Parties shall adopt such measures as may be necessary to prevent the misuse of, and illicit traffic in, the leaves of the cannabis plant.

Mr. Miller testified that the only material difference in control exercised over substances listed in Schedules IV and V of the CSA is that Schedule IV drugs require a medical prescription, while Schedule V drugs do not. Tr. 453-54. See CSA Sec. 309.

The Single Convention contains a provision requiring "medical prescriptions for the supply or dispensation of drugs to individuals." Article 30(2)(b)(i)(emphasis added). However, there is no dispute that cannabis leaves are not "drugs" as defined in the Single Convention [See Article 1(J)], and that this prescription requirement in Article 30 is not applicable to cannabis leaves. Miller Tr. 450-51, 454; Commentary, ALJ Ex. No. 39, at pp. 9, 315.

The fact that the Single Convention contains a medical prescription requirement, which it is agreed does not apply to cannabis leaves, is a strong indication, to say the least, that the United States is not required to distribute cannabis leaves by medical prescription only.

In addition, it is somewhat absurd to argue that medical prescriptions are required when all authorities, including Mr.

Miller, agree that cannabis leaves need not even be limited to medical uses. Article 28(3) allows a party to authorize to non-medical, or recreational, use of leaves. Miller Tr. 445,452; Hoover Tr. 43, 48; Commentary, ALJ Ex. No. 39, at p. 316.

In fact, a number of countries which are parties to the Single Convention presently permit the non-medical use of cannabis leaves. The National Commission on Marihuana and Drug Abuse reported in 1972 that there was extensive use of cannabis leaves in India for non-medical purposes, primarily in a liquid preparation referred to as "bhang." ALJ Ex. No. 47, p. 10. The National Commission stated (Id.):

> High-caste Hindus are not permitted to use alcohol. But they are allowed "bhang" at religious ceremonials, and also employ it as an intoxicant at marriage ceremonies and family festivals. "Bhang" is used by laborers in India in much the same way as beer is used in the United States.

Dr. Fort testified that in India:

> [T]here is open and widespread use by millions of people of cannabis leaves, particularly in beverage form and in foods, or confections. Most commonly this is in a preparation called bhang, b-h-a-n-g, where people can walk into, in a sense, an equivalent of our bar and have this liquid concoction prepared for them, a mixture of leaves and spices and water, and drink it down and leave and go about whatever they were going to do.
>
> They also, I would say even more commonly, prepare it themselves at home and have easy access to it.... Tr. 196.

The Administrative Law Judge found this evidence "convincing" on the question of whether leaves could be rescheduled to Schedule V, Cert. Ind. No. 19, at p. 28:

The experience of India in this respect is convincing. Dr. Fort's testimony reveals that if, indeed, it can be said that India applies any controls over cannabis leaves, such control is minimal (TR, pp. 196-97). Yet there is no doubt that India believes, and the United Nations is satisfied, that it is meeting its treaty obligations insofar as misuse of, and illicit traffic in, leaves is concerned.

The Controlled Substances Act provides for the following measure of control for all substances listed in all schedules, including Schedule V, of the Act:

-- Every person who manufactures, distributes or dispenses any controlled substance must register annually. Sec. 302(a).

-- All registrants must make complete and accurate records of all stocks on hand and of each substance manufactured, received, sold, delivered, or otherwise disposed of. Sec. 307(a)

-- The Attorney General is authorized to make administrative inspections of the records, and of the places of business, of all registrants. Sec. 510(a).

-- It is a criminal offense subject to imprisonment penalties, to manufacture, distribute, etc., any controlled substance except for authorized purposes. Sec. 401, 404.

-- All of the above controls also apply to importers and exporters. Secs. 1002-03, 1008.

It is virtually inconceivable that these controls over CSA Schedule V substances are insufficient to satisfy Art. 28(3) of the Single Convention.

Article 28(3) is drafted in very general terms, and does not require any specific or particular controls. Hoover Tr. 127; Miller Tr. 415. A party to the Single Convention need only apply the controls it feels are necessary and appropriate. Hoover

Tr. 43, 48. The determination of what measures are necessary to prevent misuse and illicit traffic are essentially a matter for each party to decide for itself. Hoover Tr. 43, 48; Miller Tr. 445, 452. A party to the Single Convention would not object to the failure of another party to adopt any specific measures of control. Hoover Tr. 127. See also letter from the Assistant Legal Advisor, Department of State, incorporated in ALJ Ex. No. 3, 39 Fed. Reg. at 23073:

> The provision regarding measures necessary to prevent the misuse of the leaves is not elaborated upon by any other provision of the convention. It appears to be dependent solely upon a judgment in good faith of the party concerned as to what constitutes misuse. With respect to illicit traffic in the leaves, the Convention does not specify any particular measures that are to be adopted in preventing such traffic.

The discussion of control over the leaves at the Conference for the Adoption of the Single Convention is set out in detail in Petitioners' Proposed Findings of Fact, Cert. Ind. No. 10 at pp. 14-21. This history, together with the other considerations set out above, demonstrate that the Administrative Law Judge was correct in concluding that, Cert. Ind. No. 19 at pp. 27-28:

> Although the Single Convention imposes an obligation on the United States to adopt some control measures over cannabis leaves when they are not accompanied by the flowering or fruiting tops of the cannabis plant (Finding 26 a) 2), supra), the Convention does not require the United States to adopt any particular control scheme as to the leaves (Finding 23, supra).
>
> Thus, any measures which the United States adopted when, viewed objectively, amounted to a good faith effort to prevent the "misuse of, and illicit traffic in, the leaves of the cannabis plant" (Article 28(3) of the Single Convention) would satisfy our obligations under the Convention.

C. Decontrol of Cannabis Seeds
(When Unaccompanied by the Tops)

The Administrative Law Judge concluded that cannabis seeds, when unaccompanied by the tops, could be decontrolled consistent with treaty obligations. Cert. Ind. No. 19, at pp. 11-12. The Acting Administrator made a distinction between cannabis seeds which were incapable of germination (these did not have to be controlled), and cannabis seeds which were capable of germination (which the Single Convention required to be "controlled"). 40 Fed. Reg. at 44166 col. 1, 44167 col. 1. As far as NORML can determine, the Acting Administrator never indicates the schedule of control required for seeds capable of germination. Presumably this would be the lowest schedule of control, Schedule V. The Acting Administrator also stated that, in his view, cannabis seeds were "not at issue" in the proceeding. 40 Fed. Reg. at 44167 col. 1, 44168 col. 1.

The Article in the Single Convention which the Acting Administrator refers to as requiring control of cannabis seeds capable of germination is Article 2(8), See 40 Fed. Reg. at 44165 col. 3. Article 2(8) provides:

> The Parties shall use their best endeavours to apply to substances which do not fall under this Convention, but which may be used in the illicit manufacture of drugs, such measures of supervision as may be practicable.

Clearly Article 2(8) does not require the United States to control cannabis seeds, or any other substance in particular. The Commentary describes this provision as leaving it "practi-

cally to the discretion of each Party to decide to what substances it should apply the control provided in that paragraph, and what measures it would be practicable to take." ALJ Ex. No. 39, at p. 71. See also, Administrative Law Judge Report, Cert. Ind. No. 19, at pp. 11-12.

The Acting Administrator also stated that cannabis seeds were "not at issue" in this proceeding. 40 Fed. Reg. at 44167 col. 1, 44168 col. 1.

While this Court, in its prior decision, did not specifically direct that findings be made on cannabis seeds, petitioner believes that the Court's intent was for the DEA to make a complete record, and comprehensive findings, on all the different cannabis materials the Single Convention controls and does not control. Mr. Miller testified at the hearing below that this was also his view, Tr. 487:

> Q. Do you think that is a valid point anymore, that we failed to ask for the right thing in our original petition?
>
> A. I think the Circuit Court -- and it has been a while since I have read that case through -- sort of resolved it by saying we will consider everything.

Cannabis seeds were specifically listed as a "sub-issue" in petitioners' original request for a hearing, ALJ. Ex. No. 4, at p. 2. At the hearing, witnesses Hoover and Miller testified, without objection, on controls applicable to the seeds. Hoover Tr. 40-41; Miller Tr. 458-59. Dr. Turner, who was called by the DEA staff, testified at length concerning the physical appearance,

THC content, and other aspects of cannabis seeds and other parts of the plant. Tr. 308-35. Petitioners' Proposed Findings, submitted at the conclusion of the hearing, included the seeds as an issue, Cert. Ind. No. 10, at pp. 14-15. The Administrative Law Judge's Report treats the seeds as an issue, and recommends that cannabis seeds (when unaccompanied by the tops) be referred to the Secretary of HEW as a separate category. Cert. Ind. No. 19, at pp. 34-35. The Acting Administrator himself makes findings on the control required over seeds by the Single Convention.

Cannabis seeds are "at issue" in this proceeding, and since there is no international obligation to control cannabis seeds, unaccompanied by the tops, there should be no question that the procedures for rescheduling contained in Sections 201(a)-(c) of the CSA must be followed.

D. Decontrol of Synthetic Cannabis or THC

The Acting Administrator and the Administrative Law Judge agreed that neither the Single Convention nor any other treaty presently in force requires the United States to control synthetic cannabis or THC. 40 Fed. Reg. at 44168 col. 1; Cert. Ind. No. 19, at pp. 14-15. The Acting Administrator also stated that since synthetic THC is not controlled by treaty, "therefore, U.S. control of synthetic tetrahydrocannabinol is not an issue in this proceeding." 40 Fed. Reg. at 44167 col. 1. See also, 40 Fed. Reg. at 44166 col. 1 and 44168 col. 1.

Synthetic THC is THC which is produced from chemicals in the laboratory, as distinct from the THC which is naturally-occurring in the plant. In his letter, Dr. Cooper described THC as "the active principle in marihuana." Gov. Ex. No. 79, at p. 1. Synthetic THC was not included in the Controlled Substances Act as passed by Congress, but was added to Schedule I by rulemaking by the BNDD in 1971. See Notice of Rulemaking, 36 Fed. Reg. 7803 (April 24, 1971). This Notice of Rulemaking listed synthetic THC at Schedule I(c)(17) and defined it as follows, 36 Fed. Reg. at 7803:

> (17) Tetrahydrocannabinols ----------
> Synthetic equivalents of the substances contained in the plant, or in the resinous extractives of Cannabis, sp. and/or synthetic substances, derivatives, and their isomers with similar chemical structure and pharmacological activity such as the following:
> Δ1 cis or trans tetrahydrocannabinol, and their optical isomers.
> Δ6 cis or trans tetrahydrocannabinol, and their optical isomers.
> Δ3,4 cis or trans tetrahydrocannabinol, and its optical isomers.
> (Since nomenclature of these substances is not internationally standardized, compounds of these structures, regardless of numerical designation of atomic positions are covered.)

In a recent update of the CSA schedules, the DEA redesignated synthetic THC as Schedule I(c)(20), without changing the language of the provision. 40 Fed. Reg. 23306 (May 29, 1975).

The definitions contained in Article 1 of the Single Convention include, and require control over, THC which is nationally-occurring in the plant or obtained from the plant, but do

not require control over synthetic THC. Hoover Tr. 49; Miller Tr. 471. Synthetic THC is controlled by the Convention on Psychotropic Substances, but this Convention is not yet in force. Hoover Tr. 49. The United States has at present no international obligation to control synthetic THC. Hoover Tr. 49; Miller Tr. 471. See Petitioner's Proposed Findings of Fact, Cert. Ind. No. 10, at p. 14.

The Acting Administrator also states that since synthetic THC is not controlled by treaty obligations "therefore" synthetic THC "is not an issue" in this proceeding. 40 Fed. Reg. at 44167 col. 1. This statement turns logic on its head. The conclusion to be drawn from the premise that synthetic THC is not controlled by treaty obligations is that the DEA must, without question, comply with the procedures set out in Sections 201(a)-(c) of the Act for substances which are not affected by treaty obligations and section 201(d).

In his Report, the Administrative Law Judge expressed a different concern on whether synthetic THC was an issue in this proceeding. The Administrative Law Judge correctly noted that petitioners had not listed synthetic THC in their initial letter requesting a hearing, ALJ Ex. No. 4. Despite this, the Administrative Law Judge held that synthetic THC was an issue in this proceeding. Cert Ind. No. 19 at p. 15. Witnesses Hoover and Miller testified concerning synthetic THC at the hearing, without objection. Hoover Tr. 49; Miller Tr. 49. The Administrative

Law Judge added that the DEA staff did not "point out what evidence it might have adduced at the hearing which it did not because of lack of notice." Cert. Ind. No. 19, at p. 15 (footnote).

Even the Acting Administrator made findings concerning synthetic THC, concluding that treaty obligations did not require control. In light of this Court's prior decision (See Miller Tr. 4871, and in light of the fact that there is no dispute on whether international obligations require control of synthetic THC, petitioner requests that the Administrative Law Judge's Recommended Decision be followed, and that the question of rescheduling synthetic THC be referred to the Secretary of HEW as a separate category of cannabis material.

II. Since there is Discretion to Reschedule Cannabis Materials, the Procedures Contained in Sections 201(a)-(c) of the CSA Must be Complied With

Since there is discretion, as the Acting Administrator acknowledged, to reschedule cannabis materials from Schedule I of the Controlled Substances Act, the other issue involved in this case concerns the proper procedures for the DEA to follow in the "second phase" of its proceeding.

NORML believes that the correct procedure for the second phase of the DEA proceeding is the procedure contained in the

Administrative Law Judge's Recommended Decision, which included the formal referral of the NORML petition to the Secretary of HEW, pursuant to Sections 201(a)-(c) of the Act, for consideration of such rescheduling as would be consistent with treaty obligations. After the Acting Administrator has received the Secretary's scientific and medical recommendations, Sec. 201(b), he would hold hearings, on the record, and then issue his final decision in this proceeding, Sec. 201(a). See Administrative Law Judge Report, Cert. Ind. No. 19, at pp. 31-35.

The Administrative Law Judge rejected the DEA staff's argument that Section 201(d) of the CSA gave the DEA sole authority over the rescheduling of marijuana, Cert. Ind. No. 19 at pp. 32-33:

> Despite Congress' intent as revealed in Sections 201(a) and (b), the Government insists that all of these procedures can be ignored and that the Administrator, because of Sec. 201(d), can decree, without referring the matter to the Secretary of HEW and without holding hearings, that cannabis shall remain in Schedule I so long as some control over cannabis and cannabis leaves is required by treaty, even though the treaty could be satisfied by placing these drugs in a less restrictive schedule.
>
> Congressional history does not in my opinion support the Government's interpretation of Sec. 201(d)....
>
> The hearing and referral provisions of Secs. 201(a) and (b) clearly reveal Congress' desire to place the responsibility for the medical and scientific evaluation of drugs in the hands of the Secretary of HEW, not the Administrator of DEA.[14]

---

14. The DEA staff had proposed the following finding, Government's Proposed Findings of Fact and Conclusions of Law, Cert. Ind. No. 11, at p. 30:

> This provision [Section 201(d)] is clear on its face, when an international obligation is present, the Attorney General

(continued on following page)

In his final decision, the Acting Administrator stated that it was "unnecessary" for him to interpret Section 201(d), because the letter from Doctor Cooper, Acting Assistant Secretary for Health, Gov. Ex. No. 79, resolved the questions which would have been involved in the "second phase" of the proceeding. 40 Fed. Reg. at 44165 col. 2. See also, 40 Fed. Reg. at 44167 col. 2.

NORML argues below that Dr. Cooper's letter does not resolve the issues involved in the "second phase" of this proceeding, and is in no way comparable with, or an adequate substitute for, the full Section 201(a)-(c) procedures.

While the Acting Administrator stated that it was "unnecessary" to interpret Section 201(d), it should be pointed out that the Acting Administrator did decide in his final decision that the full Section 201(a)-(c) procedures did not have to be complied with, including formal referral of the petition to the Secretary of HEW for findings and recommendations, Sec. 201(b), and then hearings, on the record, at DEA, Sec. 201(a).

It should also be pointed out that the Acting Administrator bases his authority to issue the final order upon Section 201(d).

(continued from preceding page)
need not utilize the scheduling procedures for drugs as delineated in CSA Sections 201(a) and (b) and 202(b), 21 U.S.C. 811(a) and (b) and 812(b). Congress has given the Attorney General absolute discretion to 1) determine what obligations are required by treaty, and 2) place substances in CSA schedules consistent with these treaty obligations.

This finding was based upon the testimony of Mr. Miller, the DEA's Chief Counsel. See Tr. 476-99. Mr. Miller testified that: "I have no problems with the DEA making the medical and scientific determination. If control is required by treaty obligations, then that decision is made by DEA." Tr. 496.

The final order begins, 40 Fed. Reg. at 44168 col. 2:

> Order
>
> Under the authority vested in the Attorney General by Section 201(d), of the Comprehensive Drug Abuse Prevention and Control Act of 1970, 21 USC 811(d), and redelegated to the Acting Administrator of the Drug Enforcement Administration....

For these reasons, NORML believes that Section 201(d) is at issue in this appeal. The interpretation of Section 201(d) was an issue before this Court when this case was here on Petition for Review of the BNDD's order in 1972 initially rejecting the petition. The Court, while not making a final interpretation of Section 201(d), did state, 497 F. 2d at 660-61, that:

> The decision under review rightly refers to Section 201(d) of the Act as establishing a basis for control under the Act if required by treaty obligations. But the decision seems to go further and say that if some control is required by treaty then the decision of which Schedule is appropriate is a matter for the exclusive decision of the respondent as the delegee of the Attorney General. This is a matter that gives us pause. The respondent seems to be saying that even though the treaty does not require more control than schedule V provides, he can on his own say-so and without any reason insist on Schedule I. We doubt that this was the intent of Congress.

There is no dispute that Section 201(d) is applicable to "cannabis" and "cannabis resin" (as those terms are defined in the Single Convention) and to cannabis leaves (either accompanied by or unaccompanied by the tops). There should also be no dispute that Section 201(d) is inapplicable to synthetic THC and cannabis seeds (unaccompanied by the tops) because Section 201(d), by its terms, is only applicable "if control is required by United States obligations under international treaties, conventions, or protocols...." (emphasis added)

Perhaps the single most important document on the proper procedure the DEA must follow, in light of Section 201(d), is the Memorandum from the Deputy Assistant Attorney General, Office of Legal Counsel of the Department of Justice, to the Director of the BNDD, dated August 21, 1972, entitled "Petition to Decontrol Marihuana; Interpretation of Section 201 of the Controlled Substances Act of 1970." This Memorandum was supplied to NORML in response to a general request for documents to the DEA staff, and was introduced in evidence at the hearing as ALJ Ex. No. 28. See Tr. 8-10. The Memorandum states that it was prepared in response to a request from the Director of BNDD for the Justice Department's legal opinion on what procedure should be followed with respect to the NORML petition, which had just been filed. The Memorandum was not available to the Court when it first heard this case.

The Memorandum indicates that the views of the BNDD and of the Special Action Office for Drug Abuse Prevention ("SAODAP") were solicited on the interpretation of Section 201. The BNDD's position on Section 201 was that since cannabis was controlled by the Single Convention, the BNDD could decide the issues involved in the NORML petition without referring it to the Secretary of HEW. Id., p. 3. SAODAP's interpretation of Section 201(d) was "diametrically opposite" (Miller Tr. 484) -- SAODAP construed that section only to apply to newly added drugs, and not to the rescheduling of drugs, such as cannabis. Id., pp. 2-3.

The Memorandum evaluates the respective interpretations of Section 201 by BNDD and SAODAP, and the legislative history behind the Controlled Substances Act, and then provides its own interpretation of Section 201. Id., pp. 4-10. The Memorandum's conclusion, which represented a "compromise" between the BNDD and SAODAP positions, stated that Section 201 should be construed to require the Attorney General to refer a petition for rescheduling of a substance controlled by the Single Convention to the Secretary of HEW for his medical and scientific findings and for consideration of such rescheduling, and only such rescheduling, as would be consistent with treaty obligations:

> Given the wording of subsection 201(d), in the context of the other provisions, it is our view that the subsection is intended to give the Attorney General final authority to ensure compliance with treaty obligations in all cases in which the propriety of the scheduling of a substance is at issue under subsection 201(a). Id., p. 6.
>
> * * *
>
> While the Attorney General retains primary authority for scheduling procedures, certain important inputs in the decision-making process are delegated to the Secretary of Health, Education, and Welfare. In particular, under subsection 201(b), the Attorney General is instructed to request from the Secretary a scientific and medical evaluation of a substance and recommendations as to its proper scheduling. Id., p. 2.
>
> * * *
>
> Nonetheless, it is possible that Congress has placed marihuana on a schedule imposing stricter controls than international obligations require. If the Attorney General were to find that classification under Schedule V were sufficient to satisfy these obligations, the scheduling procedures outlined in section 201 of the Act could still be followed in determining whether a rescheduling from Schedule I to Schedule V is warranted. Id., p. 10.
>
> * * *

> Should the petition be modified to seek a rescheduling consistent with our international obligations, the Attorney General would be obliged to follow the prescribed procedures in obtaining a medical and scientific evaluation from the Secretary of Health, Education, and Welfare. Id., p. 14.

The last statement, which suggests that the NORML petition "be modified to seek a rescheduling consistent with our international obligations," refers to the fact that the original petition only requested that marijuana be rescheduled to Schedule V or decontrolled, actions which the Memorandum stated would violate treaty obligations. In light of the remand from this Court, and the subsequent proceedings at DEA, it is no longer necessary for NORML to amend its petition to seek lesser rescheduling than sought in the original petition. See Miller Tr. 486-87. Even the Acting Administrator made findings on rescheduling to all schedules, not just the rescheduling requested in the initial petition.

The Memorandum also indicates that most of the substances which are listed in the schedules of the Controlled Substances Act are also controlled by the Single Convention. Id., p. 3. The interpretation of Section 201 therefore involves not just cannabis, but most of the substances controlled in the CSA. Congress could not have intended that the DEA have sole authority to reschedule all of these substances.

The Memorandum from the Office of Legal Counsel discusses and quotes from the legislative history of the Controlled Substances Act in support of its interpretation of Section 201.

See Id., pp. 5-9. The Memorandum relies primarily upon the House and Senate reports on the Act. House Report No. 91-1444, 91st Cong., 2d Sess. (1970); Senate Report No. 91-613, 91st Cong., 1st Sess. (1969). Additional portions of the House and Senate reports which are not quoted in the Memorandum, but which support the Memorandum's conclusion that Section 201(d) gives the Attorney General authority to prevent violations of treaty, but not authority to make medical and scientific findings, are as follows:

A). House Report, supra., Pt. 1, at pp. 22-23:

> Considerable controversy arose during the hearings over this provision of the bill [Section 201], with respect to the proper role of the Attorney General and the Secretary of Health, Education, and Welfare in making determinations concerning which drugs should be controlled. The reported bill strikes a balance between the extent to which control decisions should be based upon law enforcement criteria and the extent to which such decisions should be based on medical and scientific determinations. The bill provides that the ultimate authority for decision as to whether or not drugs should be controlled, and the schedule in which they are to be placed, shall rest with the Attorney General, based upon all the evidence, with all scientific and medical determinations being made by the Secretary of Health, Education, and Welfare, and these determinations being made binding upon the Attorney General.

B). House Report, supra, Pt. 1, at p. 4:

> An exception [to the rescheduling procedures contained in Section 201(a) and (b)] is made in the case of treaty obligations of the United States. If a drug is required to be controlled pursuant to an international treaty, convention, or protocol in effect on the enactment of the bill, the drug will be controlled in conformity with the treaty or other international agreement obligations.

C). Senate Report, supra, p. 5:

> This title [Title II] vests the authority for control of the substances enumerated under its provisions with the Attorney General.
>
> There has been a point of controversy evident among the professions involved in drug control and drug research on whether or not the Justice Department has the expertise to schedule or reschedule drugs since such decisions require special medical knowledge and training.
>
> This difficulty is resolved by the provision contained in this title which requires the Attorney General to seek advice from the Secretary of Health, Education, and Welfare and from the Scientific Advisory Committee on whether or not a substance should be added, deleted or rescheduled with respect to the provisions of the bill.[15]

This legislative history supports the conclusion reached by the Office of Legal Counsel of the Department of Justice, and by the Administrative Law Judge below, that Section 201(a)-(c) procedures must be complied with for consideration of such rescheduling as would be consistent with treaty obligations.

Before the Sub-Committee to Investigate Juvenile Delinquency of the Senate Judiciary Committee, 91st Cong., 1st Sess., pp. 279, 317 (1969), statement of Dr. Henry Brill, Chrmn., Amer. Med. Assoc. Comm. on Alcoholism and Drug Dependence (at 317), and testimony of Dr. Stanley Yolles, Dir., Nat'l. Inst. of Mental Health (at 279).

III. The Letter from Doctor Cooper is Not Comparable with, or an Adequate Substitute for, the Full Procedures Specified in Sections 201(a)-(c).

The Letter for Doctor Cooper, Acting Assistant Secretary for Health, Gov. Ex. No. 79, is in no way comparable with, or an adequate substitute for, the full procedures contained in Sections 201(a)-(c) of the CSA. The complete text of this letter is set out in the footnote below.[16]

This letter focuses exclusively on the question of whether marijuana has a currently accepted medical use in the United States, and indicates that it does not, and that no New Drug Applications ("NDA") have been filed for marijuana under the Federal Food, Drug, and Cosmetic Act, 21 U.S.C. Sec. 301 et seq.

NORML recognizes that marijuana does not have a "currently accepted" use in medicine in the United States. This is obvious -- marijuana is still in CSA Schedule I. What NORML has been arguing since it first filed its petition for rescheduling in

---

16. The letter states, 40 Fed. Reg. at 44165 col. 2:

Dear Mr. Jenson: At your request, we have prepared the following statement giving our position on the medical uses of Cannabis sativa L. (marihuana).

There is currently no accepted medical use of marijuana in the United States. There is no approved New Drug Application for Cannabis sativa L. (marihuana) or tetrahydrocannabinol, the active principle in marihuana. There are Investigational New Drug Applications on file to determine possible therapeutic uses and potential toxic effects of the substance.

We have included for your information a copy of the most recent report on these studies and a copy of the FDA policy regarding clinical studies with marihuana.

Sincerely yours,

/s/

Theodore Cooper, M.D.,
Acting Assistant Secretary
for Health.

1972 is that the petition should be referred to HEW, for findings and a recommendation on whether marijuana should be recognized as having "currently accepted" medical uses in the United States. It is clear that the consideration which HEW will give this question, pursuant to Section 201 of the CSA, is far more than just checking the files to see whether any NDA's have been granted.

A recent article in Drug Enforcement, a magazine published by the DEA, contains a detailed description of what happens in practice when a petition is referred by DEA to HEW under Section 201 of the Act. Vodra, "The Controlled Substances Act," Drug Enforcement, Spring 1975, at pp. 2 et seq. Mr. William Vodra, the author of this article, is in the Office of General Counsel, Department of HEW, and was formerly Assistant Chief Counsel of the DEA. The article states (Id., p. 34):

> Once DEA has collected the "necessary data," the Administrator of DEA (by authority of the Attorney General) requests from HEW a "scientific and medical evaluation" and recommendations as to whether the drug or other substance should be controlled or removed from control. This request is filed with the Commissioner of FDA, who has the responsibility for coordination of activities within HEW. The Commissioner solicits evaluations and recommendations from the affected bureaus within FDA (e.g., Bureau of Drugs, Bureau of Veterinary Medicine), from the National Institute of Drug Abuse, and from the Controlled Substances Advisory Committee. There is no statutory requirement that HEW receive comments from, or provide a hearing to, interested parties in preparing its evaluation and recommendations. A reason for creating this advisory committee, however, is to provide a forum whereby HEW can hear from interested persons, the medical and scientific community, and the public. Once these evaluations are received, the Commissioner submits a report and recommendations to the Assistant Secretary for Health. The Assistant Secretary (by authority of the Secretary) then transmits back to DEA his medical and scientific evaluation regarding the substance and his recommendations as to whether the drug should be controlled.

After reviewing HEW's evaluation and recommendations, DEA then would hold hearings, on the record, pursuant to Section 201(a) of the Act. At this hearing, the "recommendations of the Secretary to the Attorney General [DEA] shall be binding on the Attorney General [DEA] as to such scientific and medical matters." Section 201(b).[17]

It should also be pointed out again that the scientific and medical evaluation of HEW covers far more than just the question of medical use. The different factors which HEW considers are set out in Sections 201(b)-(c) of the CSA, and include: "The state of current scientific knowledge regarding the drug or other substance"; "What, if any, risk there is to the public health"; "Its psychic or physiological dependence liability." Dr. Cooper's letter does not consider any of these additional factors.

Furthermore, Mr. Miller testified that there were substances listed in Schedule II of the CSA, including poppy straw, which did not have a "currently accepted medical use," Tr. 473-74, and Mr. Miller further testified that "cannabis" could be rescheduled

---

17. The article by Mr. Vodra in Drug Enforcement, supra., states on p. 34:

> The medical and scientific evaluations are binding on DEA with respect to scientific and medical matters. The recommendation on scheduling is binding only to the extent that if HEW recommends that the substance not be controlled, DEA may not control the substance. While the issue has never been legally resolved, it is understood by DEA and HEW that DEA may not exceed the level of control recommended by HEW but may take final action for a lower level of control than that recommended. For example, if a drug is recommended by the assistant Secretary for Health for control in Schedule III, DEA may place the drug in Schedule III, IV or V, but may not place it in Schedule II.

to Schedule II under Section 201(d) even without a "currently accepted medical use." Tr. 487-88. If Mr. Miller is correct, then Dr. Cooper's letter would be totally irrelevant to the "second phase" of the proceeding, because Dr. Cooper's letter deals exclusively with the medical use question.[18]

The Acting Administrator's heavy reliance on the fact that there are no NDA's for marijuana is also misplaced. First, as pointed out above, the consideration of medical uses by HEW pursuant to Section 201 of the CSA is far greater than merely checking the files to see whether any NDA's have been granted. Second, the procedure for obtaining NDA's under the Federal Food, Drug, and Cosmetic Act, 21 U.S.C. Sec. 301 et seq., is a procedure for persons who want to ship substances "in interstate commerce." See 21 U.S.C. Sec. 355(a). This is a procedure primarly designed for drug manufacturers. NORML itself does not seek to ship cannabis "in interstate commerce." Congress created two complimentary procedures -- the NDA procedure for shipment of substances in interstate commerce, and the CSA procedure for rescheduling substances controlled by the CSA. The NDA procedure does not subsume or eliminate the procedure Congress created in the CSA. See generally, American Pharmaceutical Ass'n v. Weinberger, 377 F.Supp. 824, 825-31 (D.D.C. 1974).

---

18. In petitioner's view, it is unnecessary for this Court to decide whether cannabis could be rescheduled to Schedule II without a "currently accepted medical use" under Section 201(d) of the Act. Petitioner only cites Mr. Miller's testimony to show that, even in Mr. Miller's view, the letter from Doctor Cooper would be totally irrelevant to the "second phase" of the proceeding below.

The Acting Administrator attempts to read far too much significance into Dr. Cooper's letter. When the letter was introduced at oral argument before the Administrative Law Judge (See Transcript of Argument held April 18, 1975, Cert. Ind. No. 16 at pp. 1-3), it was accompanied by a letter from the DEA's Deputy Chief Counsel to counsel for NORML, dated April 17, 1975, which contained a much more modest view of the letter's significance, Gov. Ex. No. 79, at pp. 1-2:

> Attached is a letter dated April 14, 1975, addressed to Acting Deputy Administrator Jerry N. Jenson, by Dr. Theodore Cooper, Acting Assistant Secretary for Health, Department of Health, Education, and Welfare.
>
> Since this letter is simply corroborative of the testimony of Donald E. Miller on the fact that the Food and Drug Administration had issued no New Drug Application for any part of the cannabis plant, it should occasion no delay in the oral argument scheduled for April 18.

In this letter, the DEA's Deputy Chief Counsel also stated that the letter from HEW was requested by the DEA "pursuant to [the] direction" of this Court.[19] This is a totally different rationale for the Dr. Cooper letter than that given by the Acting Administrator in his final decision. In his final decision, the Acting Administrator indicated that the letter from Dr. Cooper

---

19. The letter from the Deputy Chief Counsel states, Id., p. 1:

> In NORML et al. v. Ingersoll et al., 497 F.2d. 654, the United States Court of Appeals for the District of Columbia Circuit directed the Administrator to provide "a new look and a hard look at the questions raised by the (NORML) petition."
>
> Pursuant to that direction, the Drug Enforcement Administration requested a statement of the position of the Department of Health, Education, and Welfare on whether there exists a currently accepted medical use of marihuana in the United States.

was sought because Dr. Fort, one of petitioners' witnesses, was allowed by the Administrative Law Judge to testify on matters outside the "first phase" of the proceeding, including testimony on the medical uses for cannabis. See 40 Fed. Reg. at 44165 col. 1. Petitioner submits that this is misleading and unfair, both as to petitioner, and as to the Administrative Law Judge.

In petitioner's view it was the DEA staff which first injected the medical issue into this proceeding by introducing into evidence, before Dr. Fort was called to testify, the Report from the WHO Expert Committee on Drug Dependence, ALJ Ex. No. 40, Tr. 19-21, which contained such statements as:

> As pointed out by previous WHO Expert Committees concerned with drug dependence, medical need for cannabis as such no longer exists. Id., p. 1.
>
> This Committee strongly reaffirms the opinions expressed in previous reports that cannabis is a drug of dependence, producing public health and social problems.... Id., p. 2.

A portion of Dr. Fort's testimony was directed at these statements, Tr. 159-60, 177-82, and to similar medical and scientific statements made in the two Reports from the U.N. Economic and Social Council, introduced by the DEA staff prior to the hearing as part of ALJ Ex. No. 3. See Tr. 183-92.

However, putting aside the question of who first injected the medical issue into the "first phase," petitioner would agree that the Administrative Law Judge gave both petitioners and the DEA staff leeway in presenting testimony at the hearing, and that some of this testimony went beyond the strict "first phase" of the proceeding. The most prominent example of this is that the Adminis-

tive Law Judge permitted Mr. Porto and Dr. Turner, two witnesses called by the DEA staff, to testify at length on chemical and botanical subjects. Neither of these witnesses were qualified as an expert on treaty obligations, and neither testified on treaty obligations. See Porto Tr. 250-94; Turner Tr. 295-404. The Acting Administrator doesn't criticize the Administrative Law Judge for allowing this testimony, which the DEA staff believed was somehow relevant.

The important point, however, is that when the Administrative Law Judge prepared his Report, he stated that insofar as the testimony or Proposed Findings of either petitioners or the DEA staff involved medical and scientific questions they "are not relevant to the issues which must now be decided." Cert. Ind. No. 19, at p. 18.

The Administrative Law Judge concluded that since there was discretion to reschedule cannabis, the NORML petition should be referred to the Secretary of HEW for medical and scientific findings. This is what NORML sought when this petition was first filed in 1972, and it is what NORML still seeks today.

Petitioner sets out below certain suggested directions which it requests the Court to include in its decision remanding this case, if the Court so decides.

Suggested Directions For the Decision Remanding this Case

If the Court reverses and remands this case for further proceedings, NORML requests that the following directions be included in the Court's decision:

1. The Acting Administrator should be directed to refer the NORML petition to the Secretary of HEW, pursuant to Sections 201 (a)-(c) of the CSA, for medical and scientific findings and for consideration of such rescheduling as this Court determines would be consistent with treaty obligations. See the Administrative Law Judge's Recommended Decision, Cert. Ind. No. 19, at pp. 34-35.

2. NORML also requests that the Acting Administrator be directed to "immediately" refer the NORML petition to HEW, or refer the petition within thirty (30) days after entry of this Court's decision. There is almost nothing left for the DEA to do prior to referring the petition to HEW.

3. The Secretary of HEW should be directed to make separate evaluations for each of the following cannabis materials, and make a separate recommendation for rescheduling each of these materials, within the limits authorized by treaty obligations:

A. Synthetic Cannabis or THC (decontrol),

B. Cannabis seeds (decontrol)

C. Cannabis leaves (Schedule V),

D. "Cannabis" and "cannabis resin" (Schedule II, or V through rulemaking).

4. The Secretary of HEW should be directed that he has unlimited discretion, unaffected by the Single Convention, to recognize therapeutic uses for cannabis in the United States.[20] In considering the rescheduling of cannabis materials, the Secretary of HEW also has unlimited discretion to consider, for example, different dosage or THC levels. It would be consistent with treaty obligations if, for example, a synthetic substance having a low THC content were decontrolled, the same synthetic substance having a higher THC content were rescheduled to Schedule V, and the synthetic substance containing the highest THC content were rescheduled to Schedule II.

---

20. See Lande, "The International Drug Control System," ALJ Ex. No. 38, at p. 42:

> [D]ifferent interpretations by governments of the term "medical purposes" have also continued under the regime of the Single Convention and no party has protested against the use of the controlled drugs for the purpose of maintenance programs such as in the United Kingdom. It must be concluded that governments have a very wide discretion in interpreting the term "medical purposes" in accordance with their own conditions.
>
> Moreover, the term "medical purposes" can not have exactly the same meaning at all times and under all circumstances. Its interpretation must also depend on the stage of medical science at the particular time in question. There may also be a legitimate difference of view among medical experts as to what is proper medical use in a particular case. It is suggested that the meaning of the phrase "medical purposes" must in all cases be determined by medical considerations.... (footnotes omitted)

5. The DEA, after receiving the Secretary of HEW's evaluation and recommendations, shall hold hearings, on the record, pursuant to Section 201(a) of the CSA. At this hearing the scientific and medical findings and the recommendations of HEW are binding upon DEA. Section 201(b).

6. NORML also requests that this Court's decision indicate that the scientific and medical findings made by the Acting Administrator, in his final decision[21] were (1) outside the scope of the hearing below and (2) for the Secretary of HEW, and not the Acting Administrator of DEA, to make. If the DEA seeks any medical or scientific findings, such as those set out in the footnote below, the DEA should include this in their formal referral to HEW.

7. Finally, petitioner requests certain directions to the Acting Administrator which are not directly related to the issues involved in this appeal. At the hearing below, Mr. Miller, the DEA's Chief Counsel, testified that the DEA (and through it, the United States) was violating three separate provisions of Article 23 of the Single Convention. Petitioner requests that the Acting Administrator be directed to look into these serious questions of United States noncompliance with treaty obligations, perhaps in the form of a rulemaking proceeding. The background for this requested direction is set out at pp. a3-a5 of the Addendum hereto.

---

21. See, e.g., 40 Fed. Reg. at 44166 col. 1:

> The administrative hearing developed certain facts which were not included in Judge Parker's findings:
>
> 1. The plant material of what is commonly called marihuana in the United States consists of a mixture of crushed leaves, flowers and twigs of the Indian Hemp plant, an annual belonging to the single species of Cannabis sativa.
>
> 2. Resin is found in all parts of the cannabis plant including the leaves and the psychoactive element tetrahydrocannabinol (THC) is found in all parts of the plant. It is possible to extract THC from a separated cannabis leaf....

Conclusion

NORML requests that the final decision and order of the Acting Administrator be reversed, and that this case be remanded with directions to refer the NORML petition to the Secretary of HEW, pursuant to Sections 201(a)-(c) of the Controlled Substances Act, for consideration of such rescheduling of cannabis materials as would be consistent with treaty obligations. NORML also requests that the Court include in its decision the other suggested directions contained above.

Respectfully submitted,

ADDENDUM

Section 201 of the Controlled Substances Act, 21 U.S.C. Sec. 811, provides:

> Sec. 201. (a) The Attorney General shall apply the provisions of this title to the controlled substances listed in the schedules established by section 202 of this title and to any other drug or other substance added to such schedules under this title. Except as provided in subsections (d) and (e), the Attorney General may by rule --
>
> (1) add to such a schedule or transfer between such schedules any drug or other substance if he --
>
> (A) finds that such drug or other substance has a potential for abuse, and
>
> (B) makes with respect to such drug or other substance the findings prescribed by subsection (b) of section 202 for the schedule in which such drug is to be placed; or
>
> (2) remove any drug or other substance from the schedules if he finds that the drug or other substance does not meet the requirements for inclusion in any schedule.
>
> Rules of the Attorney General under this subsection shall be made on the record after opportunity for a hearing pursuant to the rulemaking procedures prescribed by subchapter II of chapter 5 of title 5 of the United States Code. Proceedings for the issuance, amendment, or repeal of such rules may be initiated by the Attorney General (1) on his own motion, (2) at the request of the Secretary, or (3) on the petition of any interested party.
>
> (b) The Attorney General shall, before initiating proceedings under subsection (a) to control a drug or other substance or to remove a drug or other substance entirely from the schedules, and after gathering the necessary data, request from the Secretary a scientific and medical evaluation, and his recommendations, as to whether such drug or other substance should be so controlled or removed as a controlled substance. In making such evaluation and recommendations, the Secretary shall consider the factors listed in paragraphs (2), (3), (6), (7), and (8) of subsection (c) and any scientific or medical considerations involved in

paragraphs (1), (4), and (5) of such subsection. The recommendations of the Secretary shall include recommendations with respect to the appropriate schedule, if any, under which such drug or other substance should be listed. The evaluation and the recommendations of the Secretary shall be made in writing and submitted to the Attorney General within a reasonable time. The recommendations of the Secretary to the Attorney General shall be binding on the Attorney General as to such scientific and medical matters, and if the Secretary recommends that a drug or other substance not be controlled, the Attorney General shall not control the drug or other substance. If the Attorney General determines that these facts and all other relevant data constitute substantial evidence of potential for abuse such as to warrant control or substantial evidence that the drug or other substance should be removed entirely from the schedules, he shall initiate proceedings for control or removal, as the case may be, under subsection (a).

(c) In making any finding under subsection (a) of this section or under subsection (b) of section 202, the Attorney General shall consider the following factors with respect to each drug or other substance proposed to be controlled or removed from the schedules:

(1) Its actual or relative potential for abuse.
(2) Scientific evidence of its pharmacological effect, if known.
(3) The state of current scientific knowledge regarding the drug or other substance.
(4) Its history and current pattern of abuse.
(5) The scope, duration, and significance of abuse.
(6) What, if any, risk there is to the public health
(7) Its psychic or physiological dependence liability.
(8) Whether the substance is an immediate precursor of a substance already controlled under this title.

(d) If control is required by United States obligations under international treaties, conventions, or protocols in effect on the effective date of this part, the Attorney General shall issue an order controlling such drug under the schedule he deems most appropriate to carry out such obligations, without regard to the findings required by subsection (a) of this section or section 202(b) and without regard to the procedures prescribed by subsections (a) and (b) of this section.

Summary of Present United States
Non-Compliance With Article 23
Of The Single Convention

Mr. Miller, the DEA's Chief Counsel, testified at the hearing below that the United States was violating three separate provisions of Article 23 of the Single Convention, See Tr. 526-39, and that:

> I would concede that one thing that has been brought out by this hearing are certain inadequacies on our part, which will be straightened out. Tr. 539.

Mr. Miller acknowledged that the DEA licenses persons to import and export cannabis, in violation of Article 23(2)(e), which requires a "national agency" to itself do all of the importing and exporting of cannabis. Tr. 536-37. Mr. Miller also testified that the DEA did not "purchase and take physical possession" of all cannabis cultivated in this country by persons licensed to cultivate, including Dr. Carlton Turner, as required by Article 23(2)(d). Tr. 529-30. Finally, Mr. Miller acknowledged that the United States was required by Article 23(3) to have "a single government agency" to discharge the obligations required by Article 23, but that the United States, at the present time, has three such agencies -- (1) the Department of Justice, (2) the Department of HEW, and (3) the Department of Agriculture. See Tr. 528-29, 538-39.

The Proposed Findings of Fact and Conclusions of Law filed by the DEA staff below did recognize that Article 23 is binding upon the United States, Cert. Ind. No. 11 at pp. 12-13, but in

a long footnote the DEA staff attempts to gloss over those inadequacies. Id., p. 13. The Final Decision of the Acting Administrator is silent on these questions, and petitioner is aware of no action taken by the DEA to "straighten out" these problems.

Petitioner requests this Court to direct the Acting Administrator of DEA to look into these serious questions of noncompliance with treaty obligations, perhaps in the form of a rule-making proceeding.* At the present time, the United States can be accused of following the treaty obligations it "likes" and ignoring the obligations it doesn't "like."

---

*Cf., United States v. Castro, _____ F. Supp. _____, 16 Cr. L. Rep. 2511 (D.C.N.Ill.1975), where the Court, in upholding the constitutionality of classifying cocaine as a "narcotic" drug in the Controlled Substances Act, in a criminal prosecution, suggested that the Attorney General consider the rescheduling of cocaine, 16 Cr. L. Rep. at 2512:

> While there is some question as to whether the Attorney General could reclassify cocaine as a non-narcotic, hopefully this route will be pursued to obtain consideration of some of the unresolved questions surrounding the impact of cocaine as highlighted by the expert testimony before us. It is clearly preferable that the drug laws be based upon more substantial factual evidence than the slender threads of minimum rationality present here. As has been the experience with the marijuana laws, hopefully, a more enlightened factual foundation, grounded upon our expanding medical and scientific knowledge, will allow us to deal firmly, but also more fairly, with our drug problems. Dear Sir or Madame:

Re: Proposed Parole Regulations

Please find attached hereto the comments of NORML on the Parole Board's proposed regulations governing the parole of prisoners in federal institutions, which were published in the Federal Register on May 12, 1976, 41 Fed. Reg. 19326-40.

Sincerely,

Peter H. Meyers
Chief Counsel

BEFORE THE
UNITED STATES BOARD OF PAROLE

Parole, Release, Supervision and Recommitment of Prisoners, Youth Offenders and Juvenile Delinquents — Proposed Rulemaking
(28 C.F.R. Part 2)

COMMENTS OF NORML

The National Organization for the Reform of Marijuana Laws (NORML) submits these comments on the proposed regulations published by the U.S. Parole Board in the Federal Register on May 12, 1976, 41 Fed.Reg. 19326-40.

These comments are directed at Section 2.20 of the proposed regulations, which contains guidelines for parole release based, in part, on the severity of the offense.[1] NORML proposes that when the Parole Board issues its final regulations, the following three changes be made in these guidelines:

---

[1] Section 2.20 categorizes offenses into six levels of severity--Low, Low Moderate, Moderate, High, Very High, and Greatest. To determine the customary range of time to be served before release, the Parole Board will consider the level of severity of the offense and the parole prognosis of the individual offender.

Section 2.20 establishes separate guidelines for adult offenders, youth offenders, and persons sentenced under the Narcotic Addict Rehabilitation Act (NARA). See 41 Fed.Reg. at 19330-33. In each of these three guidelines, the severity levels for offenses are substantially identical, as is more fully discussed below.

(1) Simple possession of marijuana should be reduced one level in severity, from "Low Moderate" to "Low," and the other marijuana-related offenses should similarly be reduced one level in severity;

(2) Hashish should not be defined as a "soft drug," which have higher severity levels than comparable marijuana offenses; and,

(3) There appear to be a number of internal inconsistencies in the severity levels for "soft" and "hard" drug offenses, which require correction by the Parole Board, whatever view it has of their severity.

I. INTERESTS OF NORML

NORML is a non-profit organization working to decriminalize possession and use of marijuana. NORML maintains a National Headquarters in Washington, D.C., and state affiliates in 38 states. NORML is supported by more than 20,000 members, including hundreds of persons who are presently incarcerated in federal and state prisons for marijuana offenses. NORML has initiated and participated in numerous federal administrative proceedings and court cases involving the marijuana laws, including a petition to reschedule marijuana in the Federal Controlled Substances Act, petition denied, 40 Fed.Reg. 44164-68 (Sept. 25, 1975), appeal pending, NORML v. DEA, No. 75-2025, U.S. Court of Appeals for the D.C. Circuit; and lawsuits challenging the constitutionality of the marijuana laws, particularly as they relate to private possession and use, e.g. NORML v. Cullinane, Civ. Act. No. 1897-73, U.S. Dist. Court for the D.C. Circuit (three-judge court); NORML v. Gain, No. 697-445, Superior Court for the City and County of San Francisco.

II. ARGUMENT IN SUPPORT OF PROPOSED CHANGES

A. Reducing Marijuana Offenses One Severity Level

NORML has proposed that simple possession of marijuana be reduced one level in severity, from "Low Moderate" to "Low," and that the other marijuana offenses similarly be reduced one level in severity. The proposed guidelines for adult offenders, youth offenders, and persons sentenced under the NARA contain the identical three severity levels for marijuana offenses:[2]

-- "simple possession (less than $500)," in the "Low Moderate" category.

-- "possession with intent to distribute/sale (less than $5,000)," in the "Moderate" category.

-- "possession with intent to distribute/sale ($5,000 or more)," in the "High" category.

1. Reducing Simple Possession of Marijuana

Simple possession of marijuana (less than $500) is obviously an offense of much less severity than many of the other offenses listed in the "Low Moderate" category, including: passing or possessing counterfeit currency (less than $1,000), forgery or fraud (less than $1,000), theft from the mail (less than $1,000), and income tax evasion (less than $10,000). There are also a number of offenses presently listed in the "Low" category which appear to be on a much greater order of severity than simple possession of marijuana (less than $500), including: larceny and simple possession of stolen property (less than $1,000).

Even putting aside the dollar ceilings specified for these offenses, which range from double to 20 times the dollar ceiling for simple possession of marijuana, the inherent nature of these offenses are much more serious, and pose much more of a danger to society, than possession of marijuana.

---

[2] 41 Fed. Reg. at 19330, 19332, 19333.

A number of recent government reports and scientific studies have confirmed that the effects of marijuana are relatively innocuous, particularly when compared with the effects of other substances, such as narcotics, barbiturates, and alcohol. These reports and studies also show that marijuana presents no substantial danger to the public health, safety, or welfare.

In 1972, the National Commission on Marihuana and Drug Abuse issued its First Report, entitled Marihuana: A Signal of Misunderstanding (March 1972).[3] Among the significant findings of the report were the following, Id. at pp. 56-57:

> A large amount of research has been performed in man and animals regarding the immediate effect of marihuana on bodily processes. No conclusive evidence exists of any physical damage, disturbances of bodily processes or proven human fatalities attributable solely to even very high doses of marihuana.
>
> * * *
>
> These few consistently observed transient effects on bodily function seem to suggest that marihuana is a rather unexciting compound of negligible immediate toxicity at the doses usually consumed in this country. The substance is predominantly a psychoactive drug. The feelings and state of consciousness described by the intoxicated seem to be far more interesting than the objective state noted by an observer.

The Commission further found that use of marijuana generally does not cause any significant psychological disturbance or aberration. Id. at p. 59. When study subjects were given high doses of marijuana over several weeks, "no harmful effects were observed on general bodily functions, motor functions, mental functions, personal or social behavior or work performance." Id. at p. 60. Nor is there evidence that long-term use of marijuana directly causes alienation, "dropping out," or loss of motivation. Id. at p. 62. The studies failed to demonstrate any significant difference in mental or social functioning, occurrence of psychosis, motivation, or behavioral changes between even very heavy, very long-term users of cannabis preparations and the non-using population. Id. at pp. 63-64.

---

[3]The National Commission was created by Congress in the Comprehensive Drug Abuse Prevention and Control Act of 1970, P.L. 91-513, and given a broad mandate to study marijuana and other drugs, and then issue two reports, the first on marijuana alone, and the second on all other drugs. 84 Stat. at 1280.

The National Commission recommended that possession of marijuana for personal use no longer be a criminal offense. Id at pp. 152-54. A summary of this report is attached hereto as Appendix A.[4]

The Canadian Commission of Inquiry into the Non-Medical Use of Drugs also published its report on marijuana, Cannabis, in 1972. The Canadian Commission reached similar conclusions to those reached by the U.S. National Commission. The Canadian Commission stated, Id. at p. 114:

> In summary, at typical doses of cannabis use, few acute physiological effects have been detected. Those which have been identified generally seem to have little clinical significance. Even at relatively high doses, few substantial physiological changes occur.

Both the Canadian Commission and the National Commission found that marijuana does not cause criminal or violent behavior, Canadian Commission Report at 110, National Commission Report at 73; does not lead to the use of other drugs, Canadian Commission Report at 130, National Commission Report at 88-89; is not a narcotic or addicting drug, Canadian Commission Report at 123, National Commission Report at 87; and posed no danger of death from overdose, Canadian Commission Report at 113-114, National Commission Report at 56-57.

For the last five years, the U.S. Department of Health, Education and Welfare has issued annual reports on the health consequences of marijuana use, as required by Title V of the Marijuana and Health Reporting Act, P.L. 91-296. These annual reports have confirmed the findings of the National and Canadian Commissions concerning the relative harmlessness of marijuana. Attached hereto as Appendix B is a recent HEW publication which contains the 8-page summary of the most recent Fifth Annual Report, entitled Marihuana and Health (1975), and the comments of Dr. Robert Dupont, Director of the National Institute on Drug Abuse, at a press briefing releasing this report. Putting the health consequences of marijuana in perspective, Dr. Dupont stated, Id. at p. 9:

---

[4] The National Commission published its second and final report a year later. Drug Use in America: Problem in Perspective (March 1973). In this report, the Commission concluded, Id. at p. 467:

> 1. The Commission reaffirms its recommendations concerning marihuana as set out in its First Report.
>
> 2. The unauthorized possession of any controlled substance except marihuana for personal use should remain a prohibited act. . . .

83-317 O - 77 - 20

> I would say that for all of the drugs we have mentioned there are many people who use them without suffering negative health consequences. For each of the drugs, there is a spectrum of negative health risks that a user takes. . . I would say today, at our current use levels and our state of knowledge, that there is no question that alcohol and tobacco are causing us far more health problems than marihuana does. There is no question on that point.

Focusing on the appropriate penalty for possession of marijuana, Dr. Dupont stated, Id. at pp. 7-8:

> A few years ago, there was a very polar extreme in this country in thinking about penalties for marihuana possession ranging from legalization, that is, making it as available as we make cola or cigarettes in this country, to locking possessors up and throwing away the key on the other extreme. We have progressed a long way since then, and the current debate in the United States is very narrow in terms of what the right penalty ought to be for marihuana possession. If I can state it this way, on the extreme of the hard-line view about this is the use of very short prison sentences. For example, S.1., the new reform legislation in the Senate now includes, as I understand, up to 30-days imprisonment for marihuana possession, which is a very light penalty. That now represents one extreme. The other extreme is the policy that has been adopted by a number of States to substitute fines for imprisonment. Personally, my view on this is that we do not need to threaten young people with imprisonment to discourage their use of marihuana, and that we should substitute in place of imprisonment a fine, a monetary fine that signals to the public that we as the Government and as a country are opposed to the use of marihuana, but that we do not consider the possession of small quantities for personal use the kind of problem to be dealt with by putting people in prison.

In September, 1975, the Domestic Council Drug Abuse Task Force submitted a report to the President, entitled White Paper on Drug Abuse. The Task Force, which consisted of the federal government's chief officials involved with drugs and drug abuse, made a number of significant recommendations. The report urged that marijuana possession offenses be "deemphasized" because they posed the least risk of harm to the individual and to society of the drugs commonly used in the United States. Id. at p. 33. The report called for a "better targeting of limited resources. . .on the basis of priorities which reflect current conditions and current knowledge." Id. at p. 34.

The report contains the following chart which compares the severity of consequences, both personal and social, from drug use, Id. at p. 33:

SUMMARY OF DRUG PRIORITIES

		DEPENDANCE LIABILITY	SEVERITY of CONSEQUENCES		SIZE OF CORE PROBLEM
			PERSONAL	SOCIAL	
HEROIN		HI	HI	HI	HI 400,000
AMPHETAMINES	NEEDLE	HI	HI	HI	HI
	ORAL	LOW	MED	MED	500,000
BARBITURATES	MIXED	HI	HI	HI	MED
	ALONE	MED	HI	MED	300,000
COCAINE		LOW	LOW	MED	LOW
MARIHUANA		LOW	LOW	LOW	LOW
HALLUCINOGENS		MED	MED	MED	LOW
INHALENTS		MED	HI	MED	LOW

It is obvious that marijuana has the lowest severity of these drugs.[5] Selected portions of this report are attached hereto as Appendix C.

In considering how serious an offense simple possession of marijuana should be treated, the Parole Board should also consider recent legislative developments. In the past few years there has been a marked trend toward reduced penalties for marijuana possession. In the 1970 Federal Controlled Substances Act, 21 U.S.C. Sec. 801 et seq., Congress reduced the penalty for simple possession of marijuana and other drugs from felony to misdemeanor status, and provided for probation and record expungement for first offenders. By today, simple possession of small amounts of marijuana is a misdemeanor in all states except Nevada and Arizona. In Nevada, while possession is still a felony, conditional discharge is authorized for first offenders. In Arizona, possession can be prosecuted as either a felony or misdemeanor.

---

[5]This chart also suggests that the Parole Board should consider redefining cocaine as a "soft drug" rather than a "hard drug" in its guidelines. See footnote 6 to adult, youth, and NARA guidelines, 41 Fed. Reg. at 19331, 19332, 19333.

In addition, there are now eight states which no longer arrest or imprison persons for possession of a small amount of marijuana. While the provisions of these eight states laws vary, they are all similar in that possession of a specified amount of marijuana is subject to a citation-enforced fine, rather than arrest and possible imprisonment, and there is no permanent criminal record. The first state to adopt this approach was Oregon in 1973, which provided for a $100 maximum civil fine for possession of up to 1 ounce of marijuana. Since 1973, similar laws have been adopted in Alaska, Maine, Colorado, California, Ohio, South Dakota, and Minnesota. The following chart summarizes the provisions of these laws:

SUMMARY CHART - MARIJUANA CITATION LAWS

State	Max. Fine Imposed	Max. Amount Possessed	Criminal or Civil Violation	Effective Date
Oregon	$100.00	1 oz.	Civil	Oct. 5, 1973
Alaska	$100.00	Any amount in private for personal use or 1 oz. in public	Civil	Mar. 1, 1976
Maine	$200.00	Any amount[a] for personal use	Civil	Mar. 1, 1976
Colorado[b]	$100.00	1 oz.	Class 2 petty offense - no criminal record	July 1, 1975
California[b]	$100.00	1 oz.	Misdemeanor - no permanent criminal record	Jan. 1, 1976
Ohio[b]	$100.00	100 grams (approx. 3½ oz.)	Minor misdemeanor - no crim. record	Nov. 22, 1975
South Dakota	$ 20.00	1 oz.	Civil	April 1, 1977
Minnesota[b]	$100.00[c]	1½ oz.	Civil	April 10, 1976

[a] There is a rebuttable presumption that possession of less than 1½ oz. is for personal use, and possession of more than 1½ oz. is with an intent to distribute.

[b] Distribution of marijuana by gift, or for no remuneration, is treated the same as possession in four states: California (for up to 1 oz.), Colorado (up to 1 oz.), Ohio (up to 20 gr.), and Minnesota (up to 1½ oz.).

[c] Only Minnesota provides for increased penalties for second offenses: 0-90 days in jail and/or a $300 fine for second offense within a two year period.

The provisions of these laws are set out in greater detail in Appendix D hereto.[6]

[6] For an excellent legal history of the marijuana laws, see Bonnie and Whitebread, "The Forbidden Fruit and the Tree of Knowledge: An Inquiry into the Legal History of American Marijuana Prohibition," 56 U.Va. L. Rev. 971, 1010-1081 (1970); Bonnie and Whitebread, The Marihuana Conviction -- A History of Marihuana Prohibition in the United States (Univ. Virginia Press 1974).

In light of the above considerations, NORML requests that simple possession of marijuana (less than $500) be reduced one level in severity, from "Low Moderate" to "Low," in the Parole Board's final guidelines. If the Parole Board decides not to make this change, NORML requests, in the alternative, that simple possession of a smaller amount of marijuana — perhaps $250 — be placed in the "Low" category.

2. Reducing the Other Marijuana Offenses One Severity Level

If the Parole Board reduces simple possession of marijuana (less than $500) to the "Low" category, the Board should consider similarly reducing the other marijuana offenses contained in the guidelines one level in severity. Specifically, possession with intent to distribute/sale (less than $5,000) should be reduced from "Moderate" to "Low Moderate," and possession with intent to distribute/sale ($5,000 or more) should be reduced from "High" to "Moderate."

We will not repeat here what was stated above concerning the relative seriousness of marijuana offenses. We would note only the following two additional considerations: First, lowering these other marijuana offenses one severity level would be consistent with the intent of the originally proposed guidelines, which list marijuana offenses in 3 consecutive levels of severity. Second, these other marijuana offenses appear to be of much less severity than other offenses listed in their categories. For example, in the "Moderate" category, the following offenses are listed in addition to possession with intent to distribute/sale of marijuana (less than $5,000): Embezzlement (less than $20,000), bribery of public officials (no amount specified), receiving stolen property with an intent to resell (less than $20,000), and transportation of explosives (no amount specified). In the "High" category, together with possession of marijuana with intent to distribute/sale ($5,000 or more), are the following offenses: Passing or possessing counterfeit currency ($20,000-$100,000), theft, forgery, fraud, embezzlement, and receiving stolen property (all $20,000-$100,000), unauthorized purchase or sale of machine guns or sawed-off shotguns (no amount specified).

B. Hashish Should Not be Classified as a "Soft Drug."

The Parole Board's proposed guidelines classify hashish as a "soft drug," which have higher severity levels than comparable marijuana offenses.[7] This distinction is not supported by the scheme of the Federal Controlled Substances Act or current knowledge about these substances. Simple possession of hashish (less than $500) is not a more serious offense than simple possession of marijuana (less than $500). The dollar ceilings for these offenses make any further distinction unnecessary.

Marijuana and hashish are both derived from the marijuana, or cannabis, plant. Marijuana generally consists of the flowering tops, leaves, stalks, and seeds of the plant. Only the flowering tops and leaves are used for smoking, the stalks and seeds being discarded because they contain negligible levels of tetrahydrocannabinol (THC). THC, which is found in greatest percentages in the flowering tops and the leaves, is generally presumed to be the chemical substance which produces the effects of the drug. According to current information, the amount of THC present determines the potency of the preparation. Hashish is made by collecting and compacting the THC-rich resin contained in the flowering tops and leaves into a powdery or brick-like substance. Hashish is more potent than the marijuana from which it was made, but potency of different marijuana and hashish samples varies widely. Marijuana of "high quality" often has a greater percentage of THC than "low quality" hashish. See, Marihuana: A Signal of Misunderstanding (March 1972), at p. 50; Cannabis, Report of the Canadian Commission of Inquiry into the Non-Medical Use of Drugs (1972), at pp. 11-12; Edward Brecher and the Editors of Consumer Reports, Licit and Illicit Drugs (1972), at p. 396; PharmChem Newsletter, Vol. 3, No. 8 (1974) at p. 1.

---

[7] See footnote 6 to the adult, youth, and NARA guidelines, 41 Fed.Reg. at 19331, 19332, 19333, which states:

> 6. "Hard drugs" include heroin, cocaine, morphine, or opiate derivatives, and synthetic opiate substitutes; "soft drugs" include, but are not limited to, barbiturates, amphetamines, LSD and hashish.

There is no basis in the Federal Controlled Substances Act (CSA), 21 U.S.C. Sec. 801 et seq., for distinguishing between marijuana and hashish. The CSA treats them in an identical manner. The definition of "marihuana" contained in Sec. 102 (15) of the CSA includes concentrated forms of the plant:

> (15) The term "marihuana" means all parts of the plant Cannabis sativa L., whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture or preparation of such plant, its seeds or resin. . . .

All of the substances defined as "marihuana" are placed, without distinction, in Schedule I of the CSA, and are treated identically for penalty purposes and all other purposes. See CSA Schedule I (c) (10). By contrast, there are a number of substances in the CSA which are distinguished by potency level, including opium, codeine, and morphine. Schedule II (a) (1) of the CSA lists "Opium and opiate," but Schedule III (d)(7) lists substances containing "not more than 500 milligrams of opium per 100 milliliters. . .," and Schedule V (5) lists substances containing "not more than 100 milligrams of opium per 100 milliliters. . . ." Similarly, codeine preparations containing "not more than 1.8 grams of codeine per 100 milliliters" are in Schedule III (d)(1), while codeine preparations containing "not more than 200 milligrams of codeine per 100 milliliters" are in Schedule V(1). Certain morphine compounds are in Schedule I (b)(14)-(16), while morphine compounds containing "not more than 50 milligrams of morphine per 100 milliliters" are in Schedule IV (b)(8).

Also by way of contrast, there are a number of state drug laws which do distinguish between marijuana and hashish. The new Ohio law, House Bill No.300, amending Ohio Rev. Code Ann. Sec. 3719.01 et seq., effective Nov. 22, 1975, decriminalizes possession of up to 100 grams of marijuana and up to 5 grams of hashish. See Appendix D hereto at p. 6. The new California law, Senate Bill No. 95, amending Sec. 11357 et seq. of the Health and Safety Code, effective Jan. 1, 1976, decriminalizes possession of up to 1 ounce of marijuana, and lowers the penalty, but does not decriminalize, possession of hashish ("concentrated cannabis"). See Appendix D at p. 5. Pennsylvania's statute provides for a maximum 30

days in jail and/or a $500 fine for possession or distribution of "a small amount of marihuana" which is defined as "thirty (30) grams of marihuana or eight (8) grams of hashish. . . ." Pennsylvania Code, Title 35, Sec. 780-113 (a)(31).[8]

It is neither necessary nor desirable for the Parole Board to distinguish between marijuana and hashish in its guidelines. First, as indicated above, the guidelines have dollar ceilings which distinguish between the severity of the offense — less than $500, less than $5,000, and $5,000 or more. These dollar ceilings accomplish the same objective as the state statutes discussed above which distinguish between marijuana and hashish by weight. Hashish is generally more potent and more expensive than the marijuana from which it was made, but a person would have to smoke less to become "high." As John Kaplan has stated, "the significance of using stronger forms of the drug would simply be that they would take less." Marijuana: The New Prohibition, (World Publishing Company 1970), at p. 166. See also, Brecher and the Editors of Consumer Reports, Licit and Illicit Drugs, (1972) at p. 462.

Both the U.S. National Commission on Marihuana and Drug Abuse and the Canadian Commission of Inquiry into the Non-Medical Use of Drugs have recommended against distinguishing between cannabis materials on the basis of potency. The National Commission stated in Marihuana: A Signal of Misunderstanding, (March 1972), at p. 166:

> The predominant pattern of use in the United States is experimental or intermittent use of less potent preparations of the drug. Even when hashish is used, the predominant pattern remains the same. In addition, whatever the potency of the drug used, individuals tend to smoke only the amount necessary to achieve the desired drug effect.
>
> Given the prevailing patterns of use, the Commission does not believe it is essential to distinguish by statute between less potent and more potent forms of the natural plant. Reinforcing this judgment are the procedural and practical problems attending an effort to do so.

---

[8]Other states which distinguish between marijuana and hashish for penalty purposes include: Florida, see Fla. Stat. Ann. Sec. 404.15; Indiana, see Burns Ind. Stat.Ann. Sec. 10-3561 (c); Missouri, see Mo.Stat.Ann. Sec. 195.200 (a); Montana, see Mont.Rev.Code Sec. 54-133 (b); South Carolina, see S.C.Code Laws Sec. 32-1510.49; New Jersey, N.J. Stat.Ann. Sec. 24:21-20(3).

If the criminal liability of an individual user is dependent on the THC content of the substance, neither he nor the arresting officer will know whether he has committed a crime until an accurate scientific determination is made. Even if such accurate determinations were feasible on a large scale, which is not now the case, such after-the-fact liability is foreign to our criminal laws.

Under present circumstances, then, a statutory line based on potency is neither necessary nor feasible.

The Canadian Commission stated in Cannabis (1972) at pp. 31, 48:

It is clear that it is not possible to discriminate consistently between hashish and marijuana on a potency basis, since considerable overlap occurs between the respective THC distributions. THC in hashish ranged from a mere trace to an unusually high value of 14.3% and, in marijuana, from 0.02% to 3.46%. The potential for overlap is made even more explicit by reports of greater than 10% THC in selected marijuana flowering tops and bracts grown in Mississippi, England and Jamaica.

* * *

Although hashish may be many times more potent than marijuana, the effects of these two forms of cannabis, as usually used in North America, are generally similar and often indistinguishable. It has been reported that most experienced individuals smoke to attain a certain effect or level of "high" and adjust the dose according to the potency of the substance used.

Current data about marijuana and hashish samples tested in the United States indicate a very great variance in THC levels, and a significant range of overlap. The PharmChem Research Foundation in Palo Alto, California, does anonymous street drug testing for marijuana and other substances. The PharmChem Newsletter, Vol. 3, No. 8 (1974) at p. 1, reported that:

(M)ost hashish consumed in the U.S. is no more potent than "good quality" marijuana, yet commands three to five times the price. The average THC content for the (hashish) samples analyzed in this report is 2.3% THC. . . . The average THC content of marijuana samples analyzed is 3.6% THC, which is considerably greater than the hashish samples examined.

The PharmChem Newsletters contain many examples of hashish with very low THC levels. See, e.g., Vol. 2, No. 6 (1973) at p. 2, which lists hashish samples containing 2.4%, 0.1%, 1.9%, and 1.7% THC. The PharmChem Newsletters also contain many examples of marijuana with higher THC levels. See, e.g., Vol. 3, No. 2 (1974), at p. 3, which lists marijuana samples containing 4.6%, 3.7%, 3.8%, 5.7%, 5.5%, 5.6%, 4.2%, and 6.9% THC. In 1975, the PharmChem Research Foundation tested marijuana samples which contained 9.3%, 10.5%, and 14.0% THC. Letter from Carmen Helisten, Director, PharmChem Research Foundation, to Peter H. Meyers, NORML, dated July 6, 1976.

The Street Drug Analysis Program of the Los Angeles County--University of Southern California Medical Center also does anonymous testing of marijuana and other drugs. Recent marijuana samples have been found to contain 7.5%, 8.6%, 9.7%, 13.0%, 13.2%, and 19.1% THC. Letter from Sallie Montgomery, Street Drug Analysis Program, to Gordon Brownell, NORML, dated June 9, 1976.

The Drug Enforcement Administration has estimated the average THC content of domestic marijuana at 0.2%--4.0%, the average THC content of Jamaican marijuana at 4.0%--8.0%, and the average THC content of hashish at 5.0%--12.0%. DEA Fact Sheets (1975), at p. 36. Even these percentages indicate significant overlap.

These wide variances in THC levels, together with the other considerations set out above, indicate that the Parole Board should not put hashish offenses in a higher level of severity than comparable marijuana offenses. NORML requests that hashish be deleted from the list of "soft drugs" in footnote 6 to the adult, youth and NARA guidelines, and that marijuana be defined to include hashish.

C. Apparent Inconsistencies in the Severity Levels for "Soft" and "Hard" Drugs

There appear to be internal inconsistencies in the severity levels for "soft" and "hard" drug offenses, which require some correction by the Parole Board.

1. The dollar ceilings for "soft drug" offenses in the adult guidelines are as follows: "Moderate" category -- "possession with intent to distribute/sale (less than $5,000)"; "High" category -- "possession with intent to distribute/sale ($500 to $5,000)." 41 Fed. Reg. at 19330-31. If this inconsistency were resolved by changing the dollar ceiling in the "Moderate" category from "less than $5,000" to "less than $500," the adult guidelines on soft drugs would exactly parallel the youth and NARA guidelines on soft drugs. See 41 Fed. Reg. at 19332-33.

2. Neither the adult, youth, nor NARA guidelines contain the offense of "simple possession" of soft drugs. The lowest category of soft drug offenses is "Moderate," which contains the offense of "possession with intent to distribute/sale." 41 Fed. Reg. at 19330, 19332, 19333. The Parole Board could either change the "Moderate" category from "possession with intent to distribute/sale" to "simple possession," or the Board could leave the "Moderate" category as is, and put "simple possession" of soft drugs into the "Low Moderate" category. The latter alternative would be especially appropriate if simple possession of marijuana were reduced to the "Low" category.

3. Neither the adult, youth, nor NARA guidelines contain the offense of "simple possession" of hard drugs. The first listing of hard drugs is in the "Very High" category, which contains the offense of "possession with intent to distribute/sale," no dollar ceiling being specified. 41 Fed. Reg. at 19331, 19332, 19333. "Simple possession" of hard drugs should be added to the guidelines, perhaps in the "Moderate" category.

III. Conclusion

For the reasons set out above, NORML requests that the Parole Board modify Section 2.20 of its guidelines in the following respects:

1. Simple possession of marijuana and the other marijuana offenses should be reduced one level in severity.

2. Hashish should not be defined as a "soft drug."

3. Internal inconsistencies in the severity levels for "soft" and "hard" drugs should be corrected.

Respectfully submitted,

Marihuana: A Signal of Misunderstanding

(March 1972), First Report of the

National Commission on Marihuana and Drug Abuse.

United States of America

Congressional Record

PROCEEDINGS AND DEBATES OF THE 92d CONGRESS, SECOND SESSION

Vol. 118 WASHINGTON, WEDNESDAY, MARCH 22, 1972 No. 44

Senate

MARIHUANA AND THE LAW—NATIONAL COMMISSION REPORT

Mr. JAVITS. Mr. President, the National Commission on Marihuana and Drug Abuse—of which the Senator from Iowa (Mr. HUGHES) and I are members—today made public its long-awaited report and recommendations to the President and the Congress on the subject of marihuana.

The report deals in great detail not only with the medical and health implications of marihuana use, but also with the legal, economic, and social issues.

It covers the nature and scope of use, effects of the drug, the relationship of marihuana use to other social behavior, and the efficacy of existing law.

The Commission held formal and informal hearings developing extensive evidence from all points of view, including those of public officials, community leaders, district attorneys throughout the country, young people, medical, and other professional experts and students.

More than 50 projects were funded, ranging from a study of the effects of marihuana on man to a field survey of enforcement of the marihuana laws in six metropolitan jurisdictions.

Mr. President, I ask unanimous consent that there be included in the RECORD at the conclusion of my remarks a summary of the major findings presented in the report and recommendations of the Commission.

Of singular importance is the recommendation of the Commission that criminal penalties be eliminated for the private possession and use of marihuana. The Commission has taken a forthright and enlightened position which should go far toward deemphasizing marihuana as a confusing and controversial public policy issue. It is a most salutary and significant step.

But, my distinguished colleague, Senator HUGHES, chairman of the Special Senate Subcommittee on Alcoholism and Drug Abuse, and I would carry the decriminalization recommendation further, and have filed a joint statement containing our separate views so indicating.

We differ from the other commissioners in our view that certain activities involving possession and use of marihuana, which are deemed to be necessarily incident to private possession and use, ought also to be decriminalized. It is for this reason that we have taken exception to those parts of the recommendations dealing with the doctrine of contraband, the casual not-for-profit sale and the limited public possession of marihuana.

Mr. President, I ask unanimous consent that the full text of our separate views be printed in the RECORD following the summary of the findings and recommendations of the Commission, and that a list containing the names of the members of the Commission also be printed.

The report is comprehensive and thorough, and will assist materially in clearing the air of much misinformation and emotion which has heretofore prevented the development of rational social policy regarding this drug.

I urge Members of Congress to give their closest attention to this important report and the recommendations of the Commission. Senator HUGHES and I intend to introduce shortly appropriate legislation to accomplish several of the objectives found in the recommendations of the Commission.

We hope that others—in Congress, as well as parents, young people and others throughout the Nation—will take a fresh look at the problem of marihuana in our society with the new perspective provided by the Commission's report.

I commend the distinguished former Governor of Pennsylvania, Raymond P. Shafer, who, as Chairman of the Commission, provided important leadership in the development of the report. I commend also the Vice Chairman, Dr. Dana L. Farnsworth, other members of the Commission and its Executive Director, Michael Lowenreich—Americans of dedication and insight—who devoted much time away from their personal and professional interests to participate so productively in this effort. Lastly, I wish to congratulate the staff of the Commission which worked particularly effectively under great pressure to complete the first year's work of the Commission.

I look forward to the second-year study of the Commission which will deal with the critically important subject of drug abuse in the United States.

There being no objection, the summary was ordered to be printed in the RECORD, as follows:

SUMMARY OF FINDINGS AND RECOMMENDATIONS AND MEMBERSHIP OF THE COMMISSION

WHO USES THE DRUG

At least 24 million Americans 12-years-old and over have used marihuana at least once, and at least 8.3 million are current users.

More than 40% of college and graduate students have tried the drug.

Of those persons who have ever used marihuana, 41% of the adults (18 and older) and 45% of the youth (12-to-17) no longer use it.

The great majority of marihuana users use the drug less than once a week, probably on weekends, or at a party.

Two percent (500,000) of "ever-users" can be classified as heavy users and use the drug more than once a day.

THE EFFECTS OF MARIHUANA

There is no evidence that experimental or intermittent use of marihuana causes physical or psychological harm. The risk lies instead in the heavy, long-term use of the drug, particularly of the most potent preparations.

Marihuana does not lead to physical dependency. No tortuous withdrawal symptoms follow the sudden cessation of chronic, heavy use. Some evidence indicates that heavy, long-term users may develop a psychological dependence on the drug.

The immediate effects of marihuana intoxication on the individual's organs or bodily functions are transient and have little or no permanent effect. However, there is a definite loss of some psychomotor control and a temporary impairment of time and space perceptions.

No brain damage has been documented relating to marihuana use, in contrast with the well-established brain damage of chronic alcoholism.

A careful search of literature and testimony by health officials has not revealed a single human fatality in the United States proven to have resulted solely from use of marihuana.

Tests on monkeys have demonstrated that the dose required for "overdose death" is enormous and for all practical purposes unachievable by humans smoking marihuana.

No reliable evidence exists indicating that marihuana causes genetic defects in man; however, since fetal damage cannot be ruled out, the use of marihuana is not advisable during pregnancy.

The incidence of psychosis from marihuana use is exceedingly rare, and such reactions tend to occur in predisposed individuals.

MARIHUANA AND PUBLIC SAFETY

The evidence indicates that marihuana does not cause violent or aggressive behavior or crime.

Recent research has not proven that marihuana use significantly impairs driving ability; however, reliable research has not yet been conducted and the Commission strongly suspects that the acute effects of marihuana use (such as spatial and time distortion and slowed reflexes) may impair driving. The Commission believes that driving while under the influence of any intoxicant is a serious risk to public safety.

MARIHUANA AND PUBLIC WELFARE

From what is now known about the effects of marihuana, its present level of use in American society does not constitute a major threat to public health; the high-risk group constitutes the 2% of American "ever-users" who use the drug heavily and pose a concern for public health officials.

The Commission emphasizes the need for increased research into long-term psychological effects, especially with regard to effects on motivation.

Although some segments of society fear that marihuana use leads to idleness and "dropping out," little likelihood exists that the introduction of a single element such as marihuana use would significantly change the basic personality of any person; rather, an individual is more likely to drop out when circumstances join to produce pressures which he cannot handle effectively.

MARIHUANA AND OTHER DRUGS

Recognizing that one of the most controversial issues in the study of marihuana is its relationship to other drugs, the Commission explored in depth the hypothesis that marihuana use leads to the use of other drugs.

The overwhelming majority of marihuana users do not progress to other drugs, although statistically marihuana users are more likely to experiment with other drugs than are non-users.

Marihuana use does not dictate whether or which other drugs will be used.

As stated by Governor Shafer, "If any one reason can characterize why people in the United States escalate their drug use and become multidrug users, it is peer pleasure."

ENFORCEMENT OF THE MARIHUANA LAWS

The Commission was directed by Congress to evaluate the existing federal and state laws relating to marihuana. The vast majority of arrests occur at the state level (at least 200,000) as opposed to the federal level (approximately 4,000). In a study of enforcement in six metropolitan jurisdictions in different states, the Commission found:

93% of the arrests in the sample were for possession.

69% of the arrests were preceded by no investigation, occurring in vehicles or on the street.

Arrests were concentrated among the young (88% were 25 or under); typically the arrestee was a white male, in a school or employed in a blue collar job, without a prior record.

Two-thirds of the arrestees were arrested for possession of an ounce of marihuana or less.

Offenders were generally (67%) arrested in groups of two or more persons.

The Commission pointed out that the criminal justice system often responded to this unusual group of "criminals" in a lenient way:

At least 48% of the adult cases and 70% of the juvenile cases were dismissed by the police, the prosecution or the judiciary.

One-third of the arrestees were convicted and sentenced.

Of those convicted of possession, 24% were incarcerated, usually for a year or less.

ENFORCEMENT OF THE MARIHUANA LAWS

The Commission was directed by Congress to evaluate the existing federal and state laws relating to marihuana. The vast majority of arrests occur at the state level (at least 200,000) as opposed to the federal level (approximately 4,000). In a study of enforcement in six metropolitan jurisdictions in different states, the Commission found:

93% of the arrests in the sample were for possession.

69% of the arrests were preceded by no investigation, occurring in vehicles or on the street.

Arrests were concentrated among the young (88% were 25 or under); typically the arrestee was a white male, in school or employed in a blue collar job, without a prior record.

Two-thirds of the arrestees were arrested for possession of an ounce of marihuana or less.

Offenders were generally (67%) arrested in groups of two or more persons.

The Commission pointed out that the criminal justice system often responded to this unusual group of "criminals" in a lenient way:

At least 48% of the adult cases and 70% of the juvenile cases were dismissed by the police, the prosecution or the judiciary.

One-third of the arrestees were convicted and sentenced.

Of those convicted of possession, 24% were incarcerated, usually for a year or less.

The Commission concluded that the law enforcement community has adopted a policy of "containment." "Although effort is sometimes expended to seek out private marihuana use," the Report states, "the trend is undoubtedly to invoke the marihuana possession laws only when the behavior (possession) comes out in the open." Governor Shafer added: "The overriding feature of the present marihuana laws is the threat of arrest for indiscretion."

After considering the effects and social impact of marihuana use, the Commission considered four alternative social control policies for the drug: (1) Approval; (2) Elimination; (3) Neutrality; and (4) Discouragement.

The Commission emphasized that society should not approve or encourage the recreational use of any drug. On the other hand, the Commission concluded that elimination of marihuana and its use is unachievable, and the drug's relative potential for harm to individuals and society does not justify a social policy designed to seek out and firmly punish those who use it.

The most difficult question, the Commission explained, was whether society should try to dissuade its members from using marihuana or should defer entirely to individual judgment, remaining neutral. After lengthy consideration of this issue, the Commission chose to recommend to the public and its policy-makers a social control policy seeking to discourage marihuana use, while concentrating primarily on the prevention of heavy and very heavy use.

The Commission's next step was to consider three legal responses as a means of implementing the discouragement policy: (1) total prohibition (2) partial prohibition; and (3) regulation.

The Commission explained that the total prohibition scheme now in effect prohibits all marihuana-related behavior, including possession for personal use. Partial prohibition would prohibit cultivation and distribution of the drug but would not prohibit private consumption or acts related to consumption. The distinct feature of a regulation scheme (legalization) is that distribution of the drug is legal.

The Commission, rejecting both the present system and the regulatory scheme, was of the unanimous opinion that marihuana use is not a sufficiently grave problem to subject its users to criminal procedures, but that legalization was inadvisable for a drug which does alter short-term perception, which has uncertain long-term effects and which may be of transient social interest.

Instead, the Commission recommended a partial prohibition scheme which symbolizes a continuing societal disapproval of use, yet removes the criminal stigma and threat of incarceration for users, and also maximizes the flexibility of future public responses as new information comes to light.

The major features of the recommended scheme are that: production and distribution of the drug would remain criminal activities as would possession with intent to distribute commercially;

Marihuana would be contraband subject to confiscation in public places;

Criminal sanctions would be withdrawn from private use and possession incident to such use, but, at the state level, fines would be imposed for use in public;

In order to keep use private, possession of more than one ounce in public would be prohibited;

In addition, casual, not-for-profit transfers of small amounts, permitted in private, would be prohibited in public.

(Specific recommendations for federal and state law are attached).

Five of the 13 Commissioners differed in minor respects regarding the recommendations. Commissioners Rogers, Carter and Ware agree with the discouragement policy and the decriminalization aspects of the recommendations but would recommend, in addition, a civil fine for possession of any amount of marihuana and would limit casual transfers only to those instances where there is no remuneration at all. Commissioners Hughes and Javits believe that marihuana should not be contraband, that all not-for-profit sales should be excluded from the criminal sanction, and that the "ounce or less" requirement for possession in public should be removed.

"A most important question," said Governor Shafer in explaining the Commission's position, "and one which is still too early to answer, is whether the use of marihuana is fad or fashion. It is possible that the widespread use of marihuana could well disappear of its own accord."

In the Commission's opinion, the proposed partial prohibition scheme would permit the law enforcement community to concentrate on what it is best able to do, reduce trafficking and supply of the drug. At the same time, the Commission believes that responsibility for discouraging consumption should rest with non-legal institutions, such as family, schools, church, and the medical profession.

In anticipation of the Commission's responsibility to present a report on all drugs in 1973, Governor Shafer said:

"From the many surveys and research studies, and from our formal and informal hearings and deliberations, it is evident that the phenomenon of drug abuse in our country poses a very serious threat to our society which will require a massive and sustained effort in drug education and in the revision of our laws to make them uniform, appropriate, effective, and humane. However, such responses are in effect only medications that will help to contain the social illness of drug abuse. The causes of drug abuse must be identified more precisely and must be attended to by the cooperative efforts of all institutions of our society. We will not be able to deal effectively with the problem of drug abuse until we find answers to the larger problem of the diminishing concern among some of our citizens for such matters as long-range personal objectives, self-discipline and the sense of public obligation."

RECOMMENDATIONS*

I. Federal

a. Possession of marihuana for personal use would no longer be an offense, but marihuana possessed in public would remain contraband subject to summary seizure and forfeiture.

b. Casual distribution of small amounts of marihuana for no remuneration, or insignificant remuneration not involving profit would no longer be an offense.

c. A plea of marihuana intoxication shall not be a defense to any criminal act committed under its influence, nor shall proof of such intoxication constitute a negation of specific intent.

II. State

a. Cultivation, sale or distribution for profit and possession with intent to sell would remain felonies (although we do recommend uniform penalties).

b. Possession in private of marihuana for personal use would no longer be an offense.

c. Distribution in private of small amounts of marihuana for no remuneration or insignificant remuneration not involving a profit would no longer be an offense.

d. Possession in public of one ounce or under of marihuana would not be an offense, but the marihuana would be contraband subject to summary seizure and forfeiture.

e. Possession in public of more than one ounce of marihuana would be a criminal offense punishable by a fine of $100.

f. Distribution in public of small amounts of marihuana for no remuneration or insignificant remuneration not involving a profit would be a criminal offense punishable by a fine of $100.

g. Public use of marihuana would be a criminal offense punishable by a fine of $100.

h. Disorderly conduct associated with public use of or intoxication by marihuana would be a misdemeanor punishable by up to 60 days in jail, a fine of $100, or both.

i. Operating a vehicle or dangerous instrument while under the influence of marihuana would be a misdemeanor punishable by up to one year in jail, a fine of up to $1,000, or both, and suspension of a permit to operate such a vehicle or instrument for up to 180 days.

j. A plea of marihuana intoxication shall not be a defense to any criminal act committed under its influence nor shall proof of such intoxication constitute a negation of specific intent.

k. A person would be absolutely liable in civil court for any damage to person or property which he caused while under the influence of the drug.

ANCILLARY RECOMMENDATIONS

In addition to these legal recommendations for federal and state action, the Commission believes certain other ancillary recommendations should be presented for action.

Legal and Law Enforcement Recommendations

I. Federal

a. Federal law enforcement agencies, especially the Bureau of Narcotics and Dangerous Drugs and the Bureau of Customs, should improve their statistical reporting systems so that policies may be planned and resources allocated on the basis of accurate and comprehensive information.

b. The Federal Bureau of Narcotics and Dangerous Drugs should increase its training programs of state and local police with special emphasis on the training in the detection of trafficking cases.

c. Increased border surveillance, a tightening of border procedures, and a realistic eradication program to diminish the supply of drugs coming into the country, coupled with a more effective program for diminishing the domestic production and distribution of marihuana, are required.

II. State

a. All states should adopt the Uniform Controlled Substances Act to achieve uniformity with regard to marihuana and other drug laws, with the exception that the legal response to possession for one's own use be uniformly adopted in accordance with our recommendation in Chapter V of this report.

b. Each state should establish a centralized compulsory reporting and record-keeping authority so that adequate and accurate statistics of arrests, sentences and convictions on a statewide basis are available.

c. Those states requiring physicians to report drug users seeking medical assistance should change such requirements to insure the confidentiality of the drug user's identity, so that persons needing medical help will feel free to seek it.

III. International

If the United States should become a signatory of the proposed Psychotropic Convention, we recommended that cannabis be removed from the existing Single Convention and consideration be given to listing it in the proposed Psychotropic Convention among drugs which have similar effects.

MEDICAL RECOMMENDATIONS

1. Fuller coordination of the marihuana research conducted by governmental and private agencies is needed to reduce the duplication of effort, assure a diversity of new approaches and new objectives, and to provide efficient integration of findings into the available body of knowledge.

2. Research efforts to develop an inexpensive, easy method for detecting and quantifying the presence of marihuana in the blood, breath or urine of a person suspected of being intoxicated should be accelerated.

3. An accelerated program for funding foreign research should be undertaken immediately.

4. Increased support of studies which evaluate the efficacy of marihuana in the treatment of physical impairments and disease is recommended.

5. Community-based treatment facilities should be promoted in caring for problem drug users utilizing existing health centers when possible and appropriate.

6. Public health courses on the social aspects of drug use should be included in the curricula of the schools of the health professions.

OTHER RECOMMENDATIONS

1. The Commission recognizes that several state legislatures have improperly classified marihuana as a narcotic, and recommends that they now redefine marihuana according to the standards of the recently adopted Uniform Controlled Substances Law.

2. A single federal agency source should disseminate information and materials relating to marihuana and other drugs. The National Clearinghouse for Drug Abuse Information should be charged with this responsibility.

3. The Special Action Office for Drug Abuse Prevention in the White House should be responsible for the coordination, development and content review of all federally-supported drug educational materials and should issue a report as soon as possible, evaluating existing drug education materials.

4. The Commission notes the significant role played by the voluntary sector of the American community in influencing the social, religious and moral attitudes of our nation's citizens and recommends that the voluntary sector be encouraged to take an active role in support of our recommended policy of discouraging the use of marihuana.

SEPARATE VIEWS OF SENATORS JAVITS AND HUGHES

Commissioner Hughes (Senator from Iowa) and Commissioner Javits (Senator from New York) believe that the Commission has taken a major, highly laudable step in recommending that the private use of marihuana be taken out of the criminal justice system. They concur in its threshold judgment that overall social policy regarding this drug should seek to discourage use, while concentrating primarily on the prevention of irresponsible use. They disagree, however, with three specific recommendations relating to the implementation of this discouragement policy.

First, they would eliminate entirely the contraband provision from the partial prohibitory model adopted by the Commission. They want it eliminated first because its legal implications are confusing and the subject of disagreement even among lawyers. Whether or not possession of a given substance is criminal, possession of material designated as contraband makes that possession *unlawful*. Also, marihuana designated as contraband would be subject to government search and seizure, even though the underlying possession is no longer criminal. The provision—which does not apply to marihuana held for personal use within the home—is considered by both Commissioners to be an unnecessary "symbol" of the discouragement policy. It will not foster elimi-

*The 13 Commissioners are in basic agreement with the Report and its recommendations. However, several Commissioners diverge with specific recommendations and their opinions are presented in a footnote on pages 151–156. A brief summary of this footnote follows:

Commissioners Rogers and Carter agree with the discouragement policy and the decriminalization aspects of the recommendations, but feel that the contraband concept is not a sufficiently strong expression of societal disapproval of the use of marihuana. They would recommend, in addition, a civil fine for possession of any amount of marihuana in private or in public. This civil fine would not be reflected in a police record.

Commissioner Ware agrees completely with the statements of Congressmen Rogers and Carter but wishes to reemphasize that the social policy and legal scheme adopted is applicable only to marihuana and should not be construed to embrace other psychoactive drugs. He advocates some penalty short of criminalizing the users, such as a civil fine or some type of extensive drug education. Further, he is opposed to the use of any drug, including alcohol, for the express purpose of becoming intoxicated.

Commissioners Hughes and Javits, while agreeing with the Commission's recommendation that the private use of marihuana be taken out of the criminal justice system, disagree with three specific recommendations relating to the implementation of the discouragement policy.

First, they would eliminate the contraband provision from the partial prohibition scheme adopted by the Commission. Second, believing the Commission has not set forth a clear standard as to what constitutes the casual not-for-profit sale, they recommend that all not-for-profit sales be excluded from criminal sanction. Third, they feel there is no need to retain criminal sanction on public possession of more than one ounce of marihuana and would permit public possession of "some reasonable amount" for personal use.

nation and the misunderstanding and mistrust which is a hallmark of our current marihuana policy.

Commissioners Hughes and Javits seek to eliminate it also because as a practical matter it serves no useful law enforcement purpose within the overall partial prohibitory model. If marihuana held for personal use within the home is not contraband, why should marihuana held for personal use within one's automobile be contraband? As a matter of fact, the area of operation of the contraband provision is extremely narrow. If one possesses *more* than one ounce of marihuana in public, it may be seized without regard to the contraband doctrine since such possession is a criminal violation.

Since the contraband provision does not apply to marihuana possession and use in private, the only effective area covered by the contraband provision is the area of possession in public of *less* than one ounce. The Commission has chosen to remove the stigma of the criminal sanction in this kind of case. To impose instead a contraband provision, which it is argued is in the nature of a civil "in rem" seizure which does not operate against the person, is to cloud the issue and to weaken the force of the basic decriminalization step. A persuasive justification simply has not been made.

Both Commissioners seek to eliminate it also because they believe that the voice of the Commission should be loud and clear that the preservation of the right of privacy is of paramount importance and cannot be casually jeopardized in the pursuit of some vague public or law enforcement interest which has not been defined and justified with clarity and precision.

The second area of disagreement with the Commission's recommendations concern the casual distribution of marihuana and the not-for-profit sale. As they understand:

(1) The totally donative transfer is not subject to criminal penalty, regardless of where it takes place.

(2) The transfer of *small* amounts for *insignificant* remuneration not *involving a profit* is not subject to criminal penalty, (except if it is accomplished in public, in which case it is subject to criminal sanction), but,

(3) The transfer of *"large* amounts" for *"significant"* remuneration not involving a profit is subject to criminal penalty.

In a footnote on page 63 of the Report, the Commission refers to a Report of the Senate Judiciary Committee on the Comprehensive Drug Abuse Prevention and Control Act of 1970. In substance, it implies that within the meaning of the Act transfers of more than one or two marihuana cigarettes in return for 50 cents or one dollar to cover cost are not intended to be covered as casual transfers, but rather are to be treated as unlawful sales.

Commissioners Hughes and Javits feel that the Commission has failed to set forth a clear standard which will adequately inform the public of their obligations under the law. The recommendation and its discussion in the Report are confusing and fail to provide the individual with sufficient guidance to allow him to act without having to dodge in and out of illegality. It also undermines a basic, stated objective of the Commission i.e., to concentrate the weight of the criminal sanction upon significant supply and distribution activities rather than upon casual consumption.

Moreover, proscribing even the most casual not-for-profit transfers when they occur in public is, in their opinion, incorrect. Such transfers are necessarily incident to private possession and use. To hold that they should be subject to criminal sanction is logically inconsistent with the Commission's rationale and recommendation on decriminalization of such private activities.

Instead, both Commissioners recommend that all not-for-profit sales be excluded from the criminal sanction. It is fundamental that there be a clear separation between the serious, commercial, profit-making-seller, or "pusher" as he is known, and the individual who merely splits the cost of a reasonable supply of the drug with his friends or acquaintances.

Thirdly, exception is taken to the retention of the criminal sanction on public possession of more than one ounce.

The individual who buys an ounce and a half would be a criminal when he buys on the corner, when he puts it in his pocket, when he gets in his car and drives home, when he is on his doorstep, but not when he crosses the threshold of his home. Again Commission policy should direct the attention of the law enforcement community to the person who sells the drug for profit, and not to the person who uses the drug privately.

If an individual has more than a few ounces in his possession, and there is probable cause to believe that he intends to sell it for profit, that activity is already covered under the Commission's recommendation that possession with intent to sell is illegal. Therefore, there is no need to further proscribe simple public possession.

All the component parts of the recommended policy of the Commission should be consistent with its objective of non-interference with casual transfers, and possession and use which is essentially and fundamentally private and personal.

The contraband device, the not-for-profit sale, and public possession of some reasonable amount which should be presumed to be necessarily incident to private use should all be removed from the ambit of legal sanction. To do so would be to strike down "symbols" of a public policy which had never been adequately justified in the first instance. Such steps would in no way jeopardize the firm determination of the Commission that the use of marihuana ought to be discouraged.

COMMISSION MEMBERS

By law, the National Commission on Marihuana and Drug Abuse has 13 members. Nine public members were appointed by the President who also named the Chairman and Vice Chairman (five maximum from one political party).

Of the four congressional members, two were named by the President of the Senate and two by the Speaker of the House (two from each political party).

Raymond P. Shafer, Chairman, former Governor of Pennsylvania, Chairman of the Board and Executive Director, Teleprompter Corporation, New York.

Dana L. Farnsworth, M.D., Vice-Chairman, former Director of Health Services, Harvard University, Cambridge, Massachusetts.

Henry Brill, M.D., Director of Pilgrim State Hospital, West Brentwood, Long Island.

Representative Tim Lee Carter (R-Kentucky).

Mrs. Joan Cooney, President of the Children's Television Workshop and Producer of "Sesame Street," New York, New York.

Charles O. Galvin, Dean of Southern Methodist University, Law School, Dallas, Texas.

John A. Howard, Ph.D., President of Rockford College, Rockford, Ill. and President of the American Association of Independent College and University Presidents.

Senator Harold E. Hughes (D-Iowa).

Senator Jacob K. Javits (R-New York).

Representative Paul G. Rogers (D-Florida).

Maurice H. Seevers, M.D., Professor and former Chairman of the Department of Pharmacology, University of Michigan, Ann Arbor.

J. Thomas Ungerleider, M.D., Assistant Professor of Psychiatry, U.C.L.A. Neuropsychiatric Institute, Los Angeles.

Mitchell Ware, Attorney, Mazza, Mazzio and Ware, Chicago, former Superintendent of the Illinois Bureau of Investigation, Chicago.

IN THE

Supreme Court of the United States

OCTOBER TERM, 1974

No.

LOUISIANA AFFILIATE OF THE NATIONAL ORGANIZATION FOR THE REFORM OF MARIJUANA LAWS (NORML), *et al.*,

Petitioners,

v.

HON. WILLIAM J. GUSTE, JR., *et al.*,

Respondents.

PETITION FOR A WRIT OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE FIFTH CIRCUIT

The petitioners respectfully pray that a writ of certiorari issue to review the judgment of the United States Court of Appeals for the Fifth Circuit entered in this proceeding on April 17, 1975.

OPINIONS BELOW

The *per curiam* judgment of the Court of Appeals is not officially reported, and is reprinted at p. 1 of the Appendix hereto. The opinion of the District Court denying the application for a three-judge court is reported at 380 F. Supp. 404, and is reprinted at pp. 2-12 of the Appendix. The judgment and minute entry of the District Court subsequently dismissing the Complaint is not reported, and is reprinted at pp. 12-14 of the Appendix.

JURISDICTION

The judgment of the Court of Appeals for the Fifth Circuit was entered on April 17, 1975. The jurisdiction of this Court is invoked under 28 U.S.C. Sec. 1254(1).

QUESTIONS PRESENTED

Petitioners filed a Complaint in U.S. District Court alleging that the Right of Privacy, and other Constitutional guarantees, were violated by statutes which make it a criminal offense for adults to possess and use marijuana in private. The District Court denied petitioners' application for a three-judge court, and subsequently dismissed the Complaint, on the ground that the Constitutional issues raised were "obviously without merit." The Court of Appeals affirmed *per curiam.* The questions presented are:

1. Should a three-judge court be empanelled to hear this case, because the Right of Privacy, and the other Constitutional issues raised in the Complaint, are not obviously without merit or clearly precluded by this Court's previous decisions.

2. What standard should be used in evaluating the Constitutionality of these criminal prohibitions: the "compelling state interest" test, the "rational basis" test, or an "intermediate" test similar to that recently adopted by the Supreme Court of Alaska.

3. Was the lower court correct in concluding that *Ferguson v. Skrupa*, 372 U.S. 726, forecloses any judicial scrutiny of the legislative interests supporting the marijuana prohibition.

CONSTITUTIONAL AND STATUTORY PROVISIONS INVOLVED

The Constitutional provisions involved in this case are the Right of Privacy embodied in the Fourteenth Amendment, the Equal Protection Provisions of the Fifth and Fourteenth Amendments, and the Cruel and Unusual Punishment provision of the Eighth Amendment.

The statutes involved in this case are the Federal Controlled Substances Act, 21 U.S.C. Sec. 801, *et seq.*, and the Louisiana Controlled Dangerous Substances Law, LSA-R.S. 40:961, *et seq.*, the pertinent provisions of which are reprinted at pp. 14-17 of the Appendix hereto.

STATEMENT OF THE CASE

On January 21, 1974, petitioners filed a Complaint in the U.S. District Court for the Eastern District of Louisiana challenging, on Constitutional grounds, the Federal and Louisiana statutes which make it a criminal offense for adults to possess and use marijuana in private. The Complaint sought a declaratory judgment that the Federal Controlled Substances Act, 21 U.S.C. Sec. 801, *et seq.*, and the Louisiana Controlled Dan-

gerous Substances Law, LSA-R.S. 40:961, *et seq.*, were unconstitutional insofar as they make such private possession and use a criminal offense in the State of Louisiana. Injunctive relief was also sought against the enforcement of these statutes.[1]

Petitioners co-filed with their Complaint an application requesting that a three-judge Court be empanelled pursuant to 28 U.S.C. Secs. 2281-84, because the Constitutional issues raised in the Complaint were not "obviously without merit" or "wholly insubstantial." *Goosby v. Osser*, 409 U.S. 512, 518-19 (1973).

The Complaint alleged that imposing criminal sanctions upon the private possession and use of marijuana by adults violated three Constitutional guarantees – the Right of Privacy and liberty embodied in the Fourteenth Amendment, the Equal Protection provisions of the Fifth and Fourteenth Amendments, and the Cruel and Unusual Punishment provision of the Eighth Amendment.

In connection with the Right of Privacy, which was the principal cause of action contained in the Complaint, it was alleged that the marijuana prohibitions invade a number of "fundamental" interests or zones of privacy, including (1) the privacy of the home, in and of itself, and (2) the right

---

[1] Plaintiffs below, and Petitioners in this Court, are the Louisiana Affiliate of the National Organization for the Reform of Marijuana Laws (NORML), and a person employing the pseudonym "John Doe." The Complaint contained class action allegations, but this was never reached by the District Court.

Defendants below, and Respondents in this Court, are the Governor and Attorney General of Louisiana (hereinafter "Louisiana Respondents"), the Attorney General of the United States and the Administrator of the Drug Enforcement Administration, U.S. Department of Justice (hereinafter "Federal Respondents").

to be let alone by government to develop one's personality as one sees fit. Since these fundamental interests were involved, the Complaint alleged that the criminal prohibitions were subject to "particularly careful scrutiny" by the Court, they must be "necessary" to the fulfillment of "overriding and compelling governmental interests," and must be "narrowly drawn so as not to invade protected freedoms." In the alternative, it was alleged that even if the case did not involve fundamental interests; it was necessary to scrutinize the statutory prohibitions to determine whether they satisfy the less stringent "rational relationship" test. An intermediate test was also proposed in the Complaint.[2]

The Complaint alleged that the criminal prohibitions against the private possession and use of marijuana were unconstitutional under any of these tests.[3] The Complaint sought a factual inquiry into the state interests supporting these prohibitions, and in support it was alleged that:

---

[2] The Complaint alleged:

> The police power of the states and the federal government is inherently limited to the protection of the public welfare. Before the *private* possession and use of marijuana can be criminalized, it must be shown (a) that private use of marijuana adversely affects the public welfare, and (b) that the adverse effect upon the public welfare outweighs the intrusion into *prima facie* private conduct.

[3] Simple possession of marijuana is a misdemeanor under Federal and Louisiana law. The penalty for simple possession, first offense, under Federal law is up to one year's imprisonment and/or a fine of up to $5,000. 21 U.S.C. Sec. 844(a). The penalty under Louisiana law is up to 6 months imprisonment and/or a fine of up to $500. LSA-R.S. 40:966(D). These provisions are set out in Appendix D.

> Each of the successive rationales put forward to justify the marijuana prohibition has been demonstrated to be unsupported and unsupportable by modern scientific evidence. Specifically, marijuana is not a narcotic, and its use does not lead to physical addiction or dependence; marijuana use does not cause crime or aggressive behavior; marijuana does not lead to the use of dangerous or so-called hard drugs such as heroin; marijuana does not cause insanity; and, marijuana does not cause users to "drop out" of society.

The Federal and Louisiana defendants filed motions opposing the application for a three-judge Court, and seeking dismissal of the Complaint.

On May 29, 1974, the District Court handed down its decision denying the application for a three-judge court. See p. 2, *et seq.* of the Appendix hereto. The opinion of the District Court indicates that the application was denied for the single reason that the constitutional issues raised in the Complaint were not substantial. The District Court recognized that "insubstantiality" for the purpose of empanelling a three-judge court meant that the issues must be "obviously without merit" or so clearly foreclosed as to "leave no room for the inference that the question sought to be raised can be the subject of controversy." See p. 4 of the Appendix, quoting from *Ex parte Poresky*, 290 U.S. 30, 32 (1933).[4]

---

[4] The District Court specifically found that jurisdiction existed with respect to the Federal Defendants through 28 U.S.C. Sec. 1331, and that jurisdiction existed with respect to the Louisiana defendants through 42 U.S.C. Sec. 1983. See p. 5 of the Appendix. Neither the District Court decision, nor the Court of Appeals *per curiam* affirmance, discusses any other issue.

The District Court's opinion addresses each of the three constitutional issues raised in the Complaint. With respect to the Right of Privacy, the Court held that the private possession and use of marijuana in one's own home "is not and cannot be classified as a fundamental right," and that the "compelling state interest" test was therefore not applicable. See p. 7 of the Appendix. The District Court then stated that even if it were to apply the "compelling state interest" test, there was a compelling interest supporting the marijuana prohibitions, which was protection of the public health and welfare. The Court reasoned that since these prohibitions were based upon the authority to legislate for the public health and welfare, the Court could not "substitute its judgment" for that of the legislatures (App., p. 10):

> Congress and the state legislature have both found it necessary for general health and welfare to regulate the use and possession of dangerous drugs. This Court is in no position to substitute its judgment for that of the legislature.

In support of this conclusion, the Court cited *Ferguson v. Skrupa*, 372 U.S. 726 (1963).

The District Court then addressed the Cruel and Unusual Punishment allegations, and concluded that they are also without merit, stating that "the court finds that the conduct is legitimately proscribed by the legislatures." See p. 10 of the Appendix. Finally, the Court held that the Equal Protection allegations were also without merit, citing *Ferguson* again, and stating that the Court could not question the legislative prohibitions because they were based upon "the authority to legislate for the public health and welfare." See p. 11 of the Appendix. The District Court's opinion concluded (App., p. 11):

> The Plaintiffs' request for the convening of a three-judge court is hereby and the same denied for lack of a substantial federal question since the allegations are plainly without merit.

Subsequently, the District Court granted motions to dismiss the Complaint, adopting as its reasons the opinion it had issued denying the application for a three-judge court. See App., pp. 12-14.

An appeal was taken to the U.S. Court of Appeals for the Fifth Circuit, seeking an order reversing the District Court and directing that a three-judge court be empanelled. On April 17, 1975, the Fifth Circuit handed down a *per curiam* decision affirming the District Court, which stated in full (App., p. 1):

> AFFIRMED, on the basis of the well-reasoned opinion of District Judge Comiskey, 380 F. Supp. 404 (1974).

REASONS FOR GRANTING THE WRIT

1. This case involves important questions concerning the Right of Privacy which have not been, but should be, decided by this Court

In previous cases involving the Right of Privacy, this Court has followed a two-tiered test: If the rights involved were deemed to be "fundamental," the statute infringing those rights had to be shown to be "necessary" to furthering a "compelling state interest"; if the rights were not deemed to be fundamental, any "rational basis" that might be conceived to justify the legislation was held to be sufficient. *Roe v. Wade*, 410 U.S. 113, 155 (1973); *Stanley v.*

Georgia, 394 U.S. 557, 564 (1969); *Griswold v. Connecticut*, 381 U.S. 479, 497 (1965).

The principal questions concerning the Right of Privacy which are raised in this case are: First, do statutes which make the private possession and use of marijuana by adults a criminal offense infringe upon "fundamental" interests? Second, should this Court consider a new "intermediate" test similar to that formulated by the Supreme Court of Alaska in a recent case involving marijuana and the Right of Privacy provision contained in the Alaska Constitution? *Ravin v. State*, Op. No. 1156, File No. 2135 (May 27, 1975). Third, whatever test should be applied, is it "obviously without merit" that the private possession and use of marijuana by adults could be protected by the Right of Privacy?

(A) Is the privacy of the home, in and of itself, a "fundamental" zone or interest? In *Stanley v. Georgia*, 394 U.S. 557 (1969), this Court held that the possession of obscene materials in a person's home involved fundamental interests. The Court's opinion focused upon two distinct interests – the right to receive information and ideas and the privacy of the home:

> It is now well established that the Constitution protects the right to receive information and ideas. . . . This right to receive information and ideas, regardless of their social worth . . . is fundamental to our free society. Moreover, in the context of this case – a prosecution for mere posssession of printed or filmed matter in the privacy of a person's own home – that right takes on an added dimension. For also fundamental is the right to be free, except in very limited circumstances, from unwanted governmental intrusions into one's privacy. 394 U.S. at 564.

CONTINUED

25 OF 33

In cases subsequent to *Stanley* involving transportation, distribution, and "commercial" presentation of obscene materials, this Court has emphasized that *Stanely* did not involve the right to receive information and ideas so much as it did the privacy of the home. See, *e.g., United States v. 12 200-Ft. Reels of Super 8 MM. Film,* 413 U.S. 123, 126 (1973). In *Paris Adult Theatre I v. Slaton,* 413 U.S. 49, 66 (1973), Mr. Chief Justice Burger, writing for the Court, indicated that the "privacy right encompasses and protects the personal intimacies of the home," and described *Stanley* as "hardly more than a reaffirmation that 'a man's home is his castle.'"

It would now be appropriate for this Court to rule directly on this important question of whether the privacy of the home or other residence is, in and of itself, a "fundamental" interest in terms of the Right of Privacy.

The privacy of the home, contrary to the District Court below (see App., p. 7), is related to, and emanates from, a number of specific guarantees in the Bill of Rights, including the Third Amendment ("No Soldier shall, in time of peace be quartered in any house, without the consent of the Owner . . .") and the Fourth Amendment ("The right of the people to be secure in their persons, houses, papers and effects, against unreasonable searches and seizures, shall not be violated. . .").

The privacy of the home is also an area about which Americans entertain legitimate expectations of privacy. See, *e.g.,* Mr. Justice Powell's concurring opinion in *United States v. Robinson,* 414 U.S. 218, 236 (1973).

In a number of different contexts, this Court has indicated that the privacy of the home is "fundamental," "basic to a free society" and "implicit in the concept of ordered liberty."

See, *Wolf v. Colorado*, 338 U.S. 25, 27-28 (1949); *Mapp v. Ohio*, 367 U.S. 643, 656 (1961); *Weeks v. United States*, 232 U.S. 383, 390-91 (1914); *Boyd v. United States*, 116 U.S. 616 (1886). In *Boyd*, the Court stated in 1886:

> The principles laid down in this opinion affect the very essence of constitutional liberty and security. They reach farther than the concrete form of the case then before the court, with its adventitious circumstances; they apply to all invasions on the part of the government and its employees of the sanctity of a man's home and the privacies of life. It is not the breaking of his doors, and the rummaging of his drawers, that constitutes the essence of the offense; but it is the invasion of his indefeasible right of personal security, personal liberty and private property . . . (116 U.S. at 630).

(B) Is the right to be let alone by government to develop one's personality as one sees fit a "fundamental" interest in terms of the Right of Privacy? This Court has indicated in a number of different contexts that the right to be let alone – the right of personal autonomy – is a fundamental value in this country. In *Union Pacific Railway Co. v. Botsford*, 141 U.S. 250, 251 (1891), the Court stated:

> No right is held more sacred, or is more carefully guarded by the common law, than the right of every individual to the possession and control of his own person, free from all restraint or interference of others, unless by clear and unquestionable authority of law. As well said by Judge Cooley, "the right to one's person may be said to be a right of complete immunity: to be let alone."

Similarly, in *Meyer v. Nebraska,* 262 U.S. 390, 392 (1923), it was stated:

> [W]e should not overlook the fact that the spirit of America is liberty and toleration – the disposition to allow each person to live his own life in his own way, unhampered by unreasonable and arbitrary restrictions.

See also, *Allgeyer v. Louisiana,* 165 U.S. 578, 589 (1897); *Eisenstadt v. Baird,* 405 U.S. 438, 453-54 (1972); *Stanley v. Georgia,* 392 U.S. 557, 564 (1969), quoting from *Olmstead v. United States,* 277 U.S. 438, 478 (1928) (Brandeis, J., dissenting); *Roe v. Wade, supra,* 410 U.S. at 154.

John Stuart Mill eloquently stated this principle in *Principles of Political Economics,* Vol. II, pp. 560-61 (1848):

> There is a circle around every individual human being, which no government, be it that of one, of a few, or of the many, ought to be permitted to overstep; there is a part of the life of every person who has come to years of discretion, within which the individuality of that person ought to reign uncontrolled either by any other individual or by the public collectively. That there is, or ought to be, some space in human existence thus entrenched around and sacred from authoritative intrusion, no one who professes the smallest regard to human freedom or dignity will call in question.

This Court should now rule on whether the right of personal autonomy, either standing alone or in conjunction with the privacy of the home, represents fundamental interests in terms of the two-tiered Right of Privacy test.

(C) Petitioners respectfully suggest that this Court consider the adoption of a new "intermediate" test for judging the constitutionality of statutes which are alleged to violate the Right of Privacy, as this Court has done in analyzing Equal Protection claims. See, *e.g., Weber v. Aetna Cas. & Sur. Co.,* 406 U.S. 164 (1972); *Eisenstadt v. Baird,* 405 U.S. 438 (1972).

The Supreme Court of Alaska recently formulated a new test by which it judged the constitutionality of the State's marijuana prohibition in terms of the Right of Privacy provision contained in the Alaskan Constitution. *Ravin v. State,* Op. No. 1156, File No. 2135, May 27, 1975. The Court's opinion, recognizing that there was "considerable dissatisfaction" with the two-tiered privacy test, Slip Op. at 5, formulated the following test:

> It is appropriate in this case to resolve Ravin's privacy claims by determining whether there is a proper governmental interest in imposing restrictions on marijuana use and whether the means chosen bear a substantial relationship to the legislative purpose. If governmental restrictions interfere with the right of privacy, we will require that *the relationship between means and ends be not merely reasonable but close and substantial.*
>
> * * *
>
> The privacy of the individual's home cannot be breached absent a persuasive showing of a close and substantial relationship of the intrusion to a legitimate governmental interest. *Here, mere scientific doubts will not suffice. The state must demonstrate a need based upon proof that the public health or welfare will in fact suffer*

if the controls are not applied. (Slip Op. at 6-7, 40) (emphasis added).

Employing these principles, the Alaskan Supreme Court unanimously held that the private possession of marijuana for personal use by adults was protected by the Right of Privacy contained in the Alaskan Constitution.[5] The opinion of the Court, issued subsequent to the Fifth Circuit's *per curiam* affirmance below, was written by Chief Justice Rabinowitz. Justices Boocher and Conner filed concurring opinions.

All of the Justices on the Alaskan Supreme Court agreed that possession of marijuana by adults for personal use in the home was constitutionally protected. See Slip Op. at 40-41, 51-52, 53. All of the Justices also agreed that the prohibition against the possession or use of marijuana while operating a motor vehicle was valid and constitutional, stating, in the words of the Court: "The one significant risk in use of marijuana which we do find established to a reasonable degree of certainty is the effect of marijuana intoxication on driving." Slip Op. at 33; see also, Slip Op. at 39-40.

The Court's opinion indicates that it would decide in future cases whether the possession and/or use of marijuana in other contexts outside the home would be constitutionally protected. Slip Op. at 39-40. The concurring opinions

---

[5] Art. I, Sec. 22 of the Alaskan Constitution provides: "The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section." As the Alaskan Supreme Court noted, however, the mere fact that the Constitution contains an express provision recognizing the right of privacy does not "yield answers" concerning the test to be applied when statutes allegedly infringe on that right, or determine what scope should be accorded the right. Slip Op. at 13.

filed by Justices Boochever and Conner indicated that in their view the Right of Privacy protects some activities outside the home, but they agreed with the Court's opinion that this should be reserved for future cases depending on the specific facts of the case. Slip Op. at 52 and 54.

The Court's opinion also indicates that there is no constitutional protection to buy or sell marijuana, and no protection for possession at home of amounts of marijuana indicative of an intent to sell, rather than for personal use. See Slip Op. at 40-41. The Court also implied that the right to possess in the home might be limited to adults, and might not be extended in future cases to include juveniles, noting that "distinct government interests with reference to children may justify legislation that could not properly be applied to adults." See Slip Op. at 40 and fn. 69.

Petitioners have lodged copies of the *Ravin* Slip Opinion with the Clerk's Office, and would commend it to the attention of the Court. Petitioners believe it would be desirable for this Court to consider adopting a new test for the Federal Right of Privacy, similar to the test adopted by the Supreme Court of Alaska in *Ravin*.

(D) Whatever test or principles should be applied, a three-judge court should be empanelled because the Right of Privacy allegations contained in the Complaint are not "obviously without merit."

There has never been any dispute in this case that the standard for empanelling a three-judge court is whether the Constitutional claims are "obviously without merit," "wholly insubstantial," or so clearly foreclosed as to "leave no room for the inference that the question sought to be raised can be the subject of controversy." See, *e.g.*, *McLucas v. De Champlain*, __U.S.__, 43 U.S.L.W. 4453, 4456 (April 15,

1975); *Goosby v. Osser,* 409 U.S. 512, 518-19 (1973); *Ex parte Poresky,* 290 U.S. 30, 32 (1933).

The District Court below, in holding that the Right of Privacy and the other claims were "obviously without merit," relied primarily on *Ferguson v. Skrupa,* 372 U.S. 726 (1963). Whether this reliance upon *Ferguson* is "well-reasoned" (as the Fifth Circuit believed, App. p. 1) or constitutes an unwarranted and inappropriate expansion of *Ferguson* (as petitioners believe), is discussed in Part II of this petition, below.[6]

The District Court also relied upon a footnote in *Stanley v. Georgia, supra,* where the Court, taking care to limit its holding to possession of obscene materials by an individual in his home, indicated that its ruling did not affect the power of the states or federal government to prohibit the possession of "narcotics," firearms, stolen goods, and other articles, noting that no First Amendment interests are ordinarily involved. 394 U.S. at 568 fn. 11. Petitioners would point out that they do not challenge the power of the States or Federal Government to prohibit in the home the possession of truly dangerous substances or items. However, there is another side to this issue which must be faced: what if the substance is not truly dangerous, and its private possession and use does not pose any substantial danger or harm to the public health and welfare? Petitioners must have an opportunity to show that, whatever standard is appropriate, there is no sufficient government interest to justify the criminal sanctions against private possession and use of marijuana. Whether

---

[6] Petitioners have focused on the privacy issue herein, but the Complaint also contained allegations involving Cruel and Unusual Punishment and Equal Protection, and the District Court applied *Ferguson* to each of these allegations. See p. 7, *supra.*

this footnote in *Stanley* used the term "narcotic" in its literal sense, *i.e.*, opiates and opiate-derivatives, or in the broader sense of "dangerous" drugs, it does not foreclose the issues raised here.[7] In addition, as pointed out above, this Court has indicated in cases subsequent to *Stanley* that even in the absence of First Amendment interests, the privacy of the home, in and of itself, may be a "fundamental" interest. See, *e.g.*, *Paris Adult Theatre I v. Slaton, supra,* 413 U.S. at 66.

Another case which is relevant in this appeal, but was not cited by the District Court, is *Crane v. Campbell,* 245 U.S. 304 (1917), where this Court held that the states could prohibit the private possession of alcoholic beverages without violating the guarantees of the Fourteenth Amendment. *Crane* does not "clearly foreclose" the constitutional issues raised in this case involving marijuana. First, the Court in *Crane* based its decision, in part, upon the "well known noxious qualities and extraordinary evils," attendant to the use of alcoholic beverages. 245 U.S. at 307. As pointed out above, Petitioners are arguing that the private use of marijuana does not have such consequences, and that a three-judge court should be empanelled to hear this issue.

Second, the Court in *Crane* reasoned that the right to possess alcohol would "necessarily imply" the right to procure it, and the Court noted that it had previously rejected

---

[7] We do not think that Respondents would claim that marijuana is a "narcotic" drug under any accepted criteria for, or definition of, that term. Two state supreme courts have recently declared unconstitutional state statutes which classified marijuana as a "narcotic" drug and penalized marijuana-related offenses the same as "narcotic"-related offenses. *People v. McCabe,* 49 Ill.2d 338, 275 N.E.2d 407, 413 (1971); *People v. Sinclair,* 387 Mich. 91, 194 N.W.2d 878, 887 (1972).

Constitutional arguments dealing with the right to procure and transport alcohol. 245 U.S at 308. However, this reasoning was explicitly rejected in *Stanley v. Georgia,* when the Court enunciated a right to private possession of obscene materials, see 394 U.S. at 567-68, and in *Paris Adult Theatre I v. Slaton, supra,* 413 U.S. 49, 66 (1973), where the Court, while not questioning *Stanley,* refused to extend this right to the transportation or procurement of obscene materials.

In connection with whether the issues involved in this case are "insubstantial," petitioners would also bring to the attention of the Court a suit now pending in the U.S. District Court for the District of Columbia Circuit, *The National Organization for the Reform of Marijuana Laws (NORML), et al. v. Wilson, et al.,* Civil Action No. 1897-73. The Complaint in that suit is similar to the Complaint in the instant suit. The District Court Judge who initially received the Complaint denied motions to dismiss based upon a number of grounds, including lack of a substantial federal question, and granted the application for a three-judge court. The three-judge court was empanelled on March 14, 1974. The three-judge court then received motions to dismiss on a number of grounds, including lack of a substantial federal question. The three-judge court denied these motions in an order without opinion dated November 11, 1974, but in that same order the Court stayed the case until the conclusion of an administrative proceeding in the U.S. Department of Justice (Drug Enforcement Administration). Whether or not the doctrine of exhaustion of administrative remedies will still be relevant when this case is remanded for a three-judge court is an issue we believe should be addressed to the three-judge court, if one is to be empanelled, and not to this Court. The District Court below did not mention or discuss the exhaustion doctrine, and this Court has long held that the application of the exhaustion doctrine is within the "sound

discretion" of the trial court. See, *e.g., McKart v. United States,* 395 U.S. 185, 193 (1969); *N.L.R.B., v. Industrial Union of Marine and Shipbuilding Workers,* 391 U.S. 418, 426 (1968); *United States v. Abilene & So. R.R. Co.,* 265 U.S. 274, 282 (1924). See also, *United States v. Kiffer,* 477 F.2d 349 (2d Cir. 1973), *cert. denied,* 414 U.S. 831 (1973).

2. The Court Below Erroneously Applied *Ferguson v. Skrupa*, 372 U.S. 726, As Have Other Courts.

The District Court held that even if the private possession and use of marijuana involved "fundamental rights," the Constitutional claims contained in the Complaint were still "obviously without merit." The District Court reasoned that even if it were to apply the compelling state interest test, there was a compelling state interest supporting the marijuana prohibitions, *i.e.*, protection of the public health and welfare. Since these prohibitions were based upon the authority to legislate for the public health and welfare, the Court concluded that it could not "substitute its judgment" for that of the legislatures (App., p. 10):

> Congress and the state legislature have both found it necessary for general health and welfare to regulate the use and possession of dangerous drugs. This Court is in no position to substitute its judgment for that of the legislature.

For this conclusion, which was the heart of the District Court's decision, the Court relied exclusively on *Ferguson v. Skrupa, supra,* 372 U.S. 726 (1963).

The Fifth Circuit found this to be "well reasoned" (App., p. 1), but Petitioners submit that the opposite is true: This

decision elevates the phrase "protection of the public health and welfare" into a magic incantation that merely must be invoked to foreclose absolutely any constitutional challenge. The Court's reasoning, and its use of *Ferguson,* in denying petitioners even a three-judge court eliminates entirely the historic role of the Courts in protecting individual rights and liberties.

This Court has indicated over and over again that the courts have the power, and *the duty,* to inquire into the facts behind a statute. In *Mugler v. Kansas,* 123 U.S. 623, 661 (1887), the Court stated:

> The Courts are not bound by mere forms, nor are they to be misled by mere pretenses. They are at liberty – indeed, under a solemn duty – to look at the substance of things, whenever they enter upon the inquiry whether the legislature has transcended the limits of its authority. If, therefore, a statute proporting to have been enacted to protect the public health, the public morals, or the public safety, has no real or substantial relation to those objects, or is a palpable invasion of the rights secured by the fundamental law, it is the duty of the Courts to so adjudge, and thereby give effect to the Constitution.

See also, *United States v. Carolene Products Co.,* 314 U.S. 144, 153-54 (1938):

> [W]e recognize that the constitutionality of a statute, valid on its face, may be assailed by proof of facts tending to show that the statute as applied to a particular article is without support in reason because the article, although within the prohibited class, is so different from others of the class as to be without the reason for the prohibition.

More recently, this Court reversed the Fifth Circuit in a case involving a presumption in the previous federal marijuana law. *Leary v. United States,* 395 U.S. 6 (1969). One of the issues decided in *Leary* was whether the presumption in 21 U.S.C. Sec. 176a, which provided that a possessor of marijuana was deemed to know of its unlawful importation into the United States, denied petitioner Due Process of Law. The Court, in declaring the presumption unconstitutional, stated, 395 U.S. at 38:

> [W]e have not confined ourselves to data available at the time the presumption was enacted in 1956, but have also considered more recent information, in order both to obtain a broader general background and to ascertain whether the intervening years have witnessed significant changes which might bear upon the presumption's validity.

In a footnote, the Court added (*Id.*, fn. 68):

> A statute based upon a legislative declaration of facts is subject to constitutional attack on the ground that the facts no longer exist; in ruling upon such a challenge a court must, of course, be free to re-examine the factual declaration. See *Block v. Hirsh,* 256 U.S. 135, 154-155 (1921); *Communist Party v. SACB,* 367 U.S. 1, 110-114 (1961).

In this Court's previous decisions involving the Right of Privacy, *Griswold v. Connecticut, Stanley v. Georgia,* and *Roe v. Wade, supra,* it was argued by the State that the prohibitions involved were supported by considerations of the public health and welfare. In each of these cases the Court

scrutinized the legislative purposes supporting the challenged statutes. Such scrutiny is also appropriate here.[8]

Moreover, the Complaint in this case does not ask the Court to substitute its judgment on the wisdom of the law for that of the legislature, but to fulfill the historic judicial role of defining the constitutional rights of individuals and the limitations on government powers.[9]

Ferguson v. Skrupa involved a state statute which prohibited the practice of debt adjusting except as incident to the practice of law. In reversing the lower court's use of the Due Process Clause to strike down this statute, the Court stated, 372 U.S. at 731:

> We emphastically refuse to go back to the time when courts used the Due Process Clause to strike

---

[8] In *Roe v. Wade*, Mr. Chief Justice Burger, concurring, indicated that he was "somewhat troubled that the Court has taken judicial notice of various scientific and medical data in reaching its conclusion." 410 U.S. at 208. In this case, petitioners seek a full factual inquiry before the three-judge court.

[9] In *Ravin*, the Supreme Court of Alaska recognized that the wisdom of legislative enactments was for the legislatures, not the Courts, Slip Op. at 44:

> In opposition, the State argues that under Alaska's Constitutional system of separate but equal branches of government the issue is a "political controversy over the State's fundamental policy toward the drug marijuana." Thus, the "issue should be properly determined by the peoples' elected representatives." We agree that determination of the wisdom of a particular legislative enactment is more properly the subject of investigation and resolution by the legislature rather than the judiciary.

> down State laws regulatory of business and industrial conditions because they may be unwise, improvident, or out of harmony with a particular school of thought.

Each of the state laws which were referred to in *Ferguson* as being mistakenly stricken involved the regulation of commercial or economic practices. See, *e.g., Adkins v. Childrens Hospital,* 261 U.S. 525 (1923) (minimum wage for women); *Lochner v. New York,* 198 U.S. 45 (1905) (maximum working hours for bakeries); *Coppage v. Kansas,* 236 U.S. 1 (1915) ("yellow dog" contracts).

This Court has consistently applied *Ferguson* when economic regulations have been challenged as unwise or undesirable under the Due Process Clause. See, *e.g., Seagram & Sons v. Hostetter,* 384 U.S. 35, 47 (1966) (regulation of distillers and wholesalers by state liquor control board); *Fireman v. Chicago, R.I. & P.R. Co.,* 393 U.S. 129, 143 (1968) ("full crews" on railroads).

However, there is confusion among the lower federal courts as to the reach of *Ferguson,* and particularly whether the principle of judicial nonintervention applies when statutes are alleged to violate the Right of Privacy or other individual rights and liberties. In cases involving hairlength regulations, a number of courts have applied *Ferguson,* improperly we believe, in sustaining the regulations. The Tenth Circuit, in *Freeman v. Flake,* 448 F.2d 258 (10th Cir. 1971), sustained a school hairlength regulation using language substantially indentical to that used by the District Court below:

> We doubt the applicability of the test of reasonableness in the determination of the nebulous constitutional rights here asserted. The issue should not turn on views of a federal judge relating to

> the wisdom or necessity of a school regulation controlling the length of hair worn by a male student in a state public school. In Ferguson v. Skrupa, 372 U.S. 726, 730, 83 S. Ct. 1028, 1031, 10 L. Ed.2d 93, the Court said that the courts will not "substitute their social and economic beliefs for the judgment of legislative bodies." The same principle is pertinent to dress codes of school boards. We do not read Griswold v. Connecticut as over-ruling Ferguson v. Skrupa. The Griswold decision turned on the specific issues there presented. 448 F.2d at 261.

See also, *Karr v. Schmidt,* 460 F.2d 609, 614-15 (5th Cir. 1972); *Ashley v. City of Macon, Ga.,* 377 F. Supp. 540, 543 (D.C. Ga. 1974); *Farmer v. Catmull,* 339 F. Supp. 70, 72-73 (D.C. Utah 1972).

In other cases involving hairlength regulations, the Courts have inquired into the interests supporting these regulations, and have declared them unconstitutional when not supported by legitimate state interests. See, *e.g., Bishop v. Colaw,* 450 F.2d 1069 (8th Cir. 1971); *Richards v. Thurston,* 424 F.2d 1281 (1st Cir. 1970); *Breen v. Kahl,* 419 F.2d 1034 (7th Cir. 1969); *Barry v. Dwen,* __F.2d __(2d Cir. 1975), *cert. granted,* 43 U.S.L.W. 3621 (May 27, 1975) (No. 74-1269).

Barry v. Dwen involves a regulation issued by the Suffolk County Police Department specifying the acceptable length of hair, mustaches, etc., for individual police officers. Petitioners believe it is significant that the Commissioner of the Suffolk County Police Department, in his Petition for a Writ of Certiorari filed in this Court, does not argue the extreme position of total judicial nonintervention based upon *Ferguson.* Instead, it is argued that the regulation is justified by

a number of legitimate state interests, including the safety of the officer and the "morale factor." See Pet. at pp. 2, 6-7. Whatever the merit of these asserted state interests, this is a fundamentally different position from that adopted in *Freeman v. Flake, supra,* and by the Court below, which was that the Courts could not even inquire into the state interests supporting the challenged statute or regulation.

A distinction must be carefully drawn between legislation involving commercial and economic matters and legislation which infringes upon personal rights and liberties. In *Levy v. Louisiana,* 391 U.S. 68 (1968), the Court discussed *Ferguson* and related cases in the context of a constitutional challenge based upon the Equal Protection Clause, and made the following distinction which we believe is also appropriate in connection with the privacy claims involved in the case, 391 U.S. at 71:

> In applying the Equal Protection Clause to social and economic legislation, we give great latitude to the legislature in making classifications. . . . However that might be, was have been extremely sensitive when it comes to basic civil rights (*Skinner v. Oklahoma, supra,* at 541; *Harper v. Virginia Board of Elections,* 383 U.S. 663, 669-670) and have not hestitated to strike down an invidious classification even though it had history and tradition on its side. (*Brown v. Board of Education,* 347 U.S. 483; *Harper v. Virginia Board of Elections, supra,* at 669).

As Justice Levinson of the Supreme Court of Hawaii recently stated, *State v. Kantner,* 53 Haw. 327, 493 P.2d 306, 317-18, *cert. denied,* 409 U.S. 948 (1972):

> Any criticism which attempts to deter courts from inquiring into the constitutionality of laws must

> distinguish between legislation which seeks to regulate economic and social relationshhips and that which intrudes into the purely private sphere of human life. In the former instance courts rightfully grant the legislature wide latitude for experimentation in the promotion of the general good. But, where the State endeavors to intrude into the individual's private life and regulate conduct having no public significance, it is the duty of the courts to offer a haven of refuge where the individual may secure vindication of his right to be let alone.

See also, Hamilton, Federalist Paper No. 78, *The Federalist Papers* at p. 469 (Rossiter Ed. 1961):

> This independence of the judges is equally requisite to guard the Constitution and the rights of individuals from the effects of those ill humors which the acts of designing men, or the influence of particular conjunctures, sometimes disseminate among the people themselves, and which, though they speedily give place to better information, and more deliberate reflection, have a tendency, in the meantime to occasion dangerous innovations in the government, and serious oppressions of the minor party in the community.

CONCLUSION

For the foregoing reasons, this petition for a writ of certiorari should be granted.

Respectfully submitted,

APPENDIX A – Judgment of the Court of Appeals

IN THE UNITED STATES COURT OF APPEALS
FOR THE FIFTH CIRCUIT

No. 74-2528

LOUISIANA AFFILIATE OF THE NATIONAL ORGANIZATION FOR THE REFORM OF MARIJUANA LAWS, *et al.*,

Plaintiffs-Appellants,

v.

HON. WILLIAM J. GUSTE, JR., Attorney General of the State of Louisiana, *et al.*,

Defendants-Appellees.

Appeal from the United States District Court for the Eastern District of Louisiana

(April 17, 1975)

Before GIBSON*, THORNBERRY and AINSWORTH, Circuit Judges.

PER CURIAM:

AFFIRMED, on the basis of the well-reasoned opinion of District Judge Comiskey, 380 F. Supp. 404 (1974).

* Of the Eighth Circuit, sitting by designation.

APPENDIX B – Memorandum of the District Court Denying The Application for a Three-Judge Court

UNITED STATES DISTRICT COURT
Eastern District of Louisiana

Civil Action No. 74-163

The Louisiana Affiliate of the National Organization For the Reform of Marijuana Laws (NORML), *et al.*,

Plaintiffs,

v.

Hon. William J. Guste, Jr., Attorney General of the State of Louisiana, *et al.*,

Defendants.

March 19, 1974

COMISKEY, District Judge

MEMORANDUM OF REASONS

The plaintiffs herein have filed suit seeking declaratory and injunctive relief against the Federal Controlled Substances Act and the Louisiana Controlled Dangerous Substance Law insofar as they make the private use and possession of marijuana by adults a crime in Louisiana. The federal statutes which prohibit the possession of marijuana are contained in 21 U.S.C. § 801-904. The Louisiana provision is encompassed in LSA-R.S. 40:966.

Plaintiffs allege that these statutes violate their rights of privacy and personal liberty guaranteed by the Due Process Clause of the Fifth and Fourteenth Amendments and by the Ninth Amendment as well as constituting cruel and unusual punishment under the Eighth Amendment. They contend that these laws encroach on constitutionally protected zones of privacy since social, medical and historical facts show that there can be neither an overwhelming compelling state interest nor any possible relationship to a legitimate state interest which can justify the exercise of the police powers of the state. In addition they allege that the criminalization of the mere possession of marijuana is a violation of the equal protection clause of the Fifth and Fourteenth Amendments which constitutes invidious and arbitrary discrimination since other more potentially harmful substances such as alcohol and cigarettes are not subject to the same control.

The anonymous representative John Doe seeks to maintain a class action. Doe's identity is to be revealed to the Court in a sealed affidavit.

Presently before the Court for consideration is the propriety of the plaintiff's request for convening a three-judge court pursuant to 28 U.S.C. 2284.

The scope of a district court's considerations when a three-judge court has been requested is set out in *Idlewild Bon Voyage Liquors Corp. v. Epstein,* 370 U.S. 713, 82 S. Ct. 1294, 1296, 8 L.Ed. 794 (1962):

> "When an application for a statutory three-judge court is addressed to a district court, the court's inquiry is appropriately limited to determining whether the constitutional question raised is substantial, whether the complaint at least formally alleges a basis for equitable relief, and whether the case presented otherwise

comes within the requirements of the three-judge statute."

The present question at issue is the substantiality of the question presented. Several general principals emerge from the cases.

> "The existence of a substantial question of constitutionality must be determined by the allegations of the bill of complaint."

Mosher v. Phoenix, 287 U.S. 29, 53 S. Ct. 67, 7 L.Ed. 148, 1922; *Levering-Garriques & Co. v. Morrin*, 289 U.S. 103, 53 S. Ct. 549, 77 L.Ed. 1062 (1933); *Local U. No. 300 Amal. Meat Cutters & B. Work v. McCulloch*, 428 F. 2d 396 (5th Cir. 1970). The Supreme Court in *Ex Parte Poresky*, 290 U.S. 30, 54 S. Ct. 3, 4, 78 L.Ed.2d 152 (1933) set forth the dual standards under which substantiality must be determined.

> "The question may be plainly insubstantial, either because it is "obviously without merit" or because "its unsoundness so clearly results from the previous decisions of this court as to foreclose the subject and leave no room for the inference that the question sought to be raised can be the subject of controversy."

These two criteria have been somewhat refined by the appellate courts,

> "Insubstantiality in the claim may appear because of absence of federal jurisdiction, lack of substantive merit in the constitutional claim, or because injunctive relief is otherwise unavailable. Such insubstantiality may be evident from the frivolous nature of the claim or from previous decisions of

> the Supreme Court which require an adverse answer. *Maryland Citizens for a Rep. Gen. A. v. Governor of Md.*, 529 F.2d 606 (4th Cir. 1970)

In the present case the issues of jurisdiction against the federal and state defendants as well as the question of preclusion of substantiality through prior decisions is not present. The state defendants come within the provisions of 42 U.S.C. 1983 since state action is attacked which allegedly results in the deprivation of constitutional rights. The federal defendants are covered by the issue of a federal question as alleged in the complaint under 28 U.S.C. § 1331. Although attacks on the constitutionality of these statutes have been made in criminal proceedings, research reveals no civil action for declaratory or injunctive relief in which a decision has been rendered.

The Eighth Circuit in *The Herald Company v. Harper*, 410 F.2d 125 (8th Cir. 1969) commented on the problem of substantiality which we ourselves face in resolving this issue:

> "At the outset we realize, as Judge Friendly has stated, "these tests cannot be of mathematical precision. Previous decisions do not always foreclose new considerations even though they are directly on point, as the single district judges correctly thought in convoking three-judge courts in the second flag salute case . . . and in the desegregation cases. The other basis for finding lack of substantiality, obvious lack of merit, is still less precise; judges have not been fitted with identical lenses for detecting just when lack of merit is obviously such." *Id.* p. 128.

Plaintiff's causes of actions may be categorized into three general categories: 1) violation of right of privacy; 2) cruel and unusual punishment and 3) violation of equal protection of the laws.

The plaintiffs' allegation regarding privacy springs from *Roe v. Wade*, ____U.S.____, 93 S. Ct. 705 (1973) and *Stanley v. Georgia*, 394 U.S. 557, 89 S. Ct. 1243, 22 L.Ed.2d 542 (1969). Plaintiff alleges that the concept of the constitutional right of privacy has now evolved to the point that its mere invocation raises a constitutional issue. In the recent case of *Roe v. Wade, supra*, the court said,

> "The Constitution does not explicitly mention any right of privacy. In a line of decisions . . . the Court has recognized that a right of personal privacy, or a guarantee of certain zones of privacy, does exist under the Constitution. . . . These decisions make it clear that only personal rights that can be deemed "fundamental" or implicit in the concept of ordered liberty are included in this guarantee of personal liberty." *Id.*, p. 726.
>
> "The Court's decisions recognizing a right of privacy also acknowledge that some state regulation in areas protected by that right is appropriate. As noted above, a state may properly assert important interests in safeguarding health, in maintaining medical standards and in protecting potential life."

Plaintiff in the present case bases his claim to privacy on a far too expansive interpretation of this phrase. The present case does not rest its roots in the First Amendment, *Stanley v. Georgia*, 394 U.S. 557, 89 S. Ct. 1243, 22 L.Ed.2d 542 (1969), in the Fourth and Fifth Amendment, *Terry v. Ohio*,

392 U.S. 1, 88 S. Ct. 1868, 20 L.Ed.2d 889 (1968); *Katz v. U.S.*, 389 U.S. 347, 88 S. Ct. 507, 19 L.Ed.2d 576 (1967), in penumbras of the Bill of Rights, *Griswold v. Connecticut*, 381 U.S. 479, 85 S. Ct. 14 L.Ed.2d 510 (1965) or in the concept of liberty guaranteed by the first section of the Fourteenth Amendment. All of the above cases have involved concepts of basic and fundamental rights such as the right to marry, to bear children, to think and read what one wishes, to worship God according to the dictates of his conscience, to acquire useful knowledge. Even *Roe* and *Doe* came within these basic provisions and to a large extent are no more than a logical extension of the *Griswold* philosophy of marital privacy as applied to women. Plaintiffs' claim in the present case rests on bare allegations of a general right to privacy to do what one wishes in his own home and with his own body. Although plaintiff does claim enforcement of this right of privacy through the Fifth and Fourteenth Amendment and through the Ninth Amendment he does not ground it or even attempt to ground it on any one of the amendments which protect certain guaranteed rights and which in doing so create constitutionally guarded zones of privacy. The right of plaintiff to possess marijuana in his own home can under no factual or legal interpretation be classified as fundamental or implicit in the concept of ordered liberty.

The Supreme Court in *Stanley v. Georgia*, the very case relied on so strongly by plaintiff, qualified its approval of private possession of obscene material with the following:

> "What we have said in no way infringes upon the power of the State or Federal Government to make possession of other items such as narcotics, firearms, or stolen goods, a crime. Our holding in the present case turns upon the

> Georgia statute's infringement of fundamental liberty protected by the First and Fourteenth Amendments. No First Amendment rights are involved in most statutes making mere possession criminal. *Stanley*, footnote 11 at 394 U.S., at 568, 89 S. Ct. at 1249, 22 L.Ed.2d 551.

The Fifth Circuit in *U.S. Drotar*, 416 F.2d 914 (5th Cir. 1969) used this very expression of the Supreme Court in *Stanley*, to uphold an attack on the constitutionality of a guilty plea under the now repealed provision of 26 U.S.C. § 4741(a) in violation of 26 U.S.C. 4744(a)(1) for possession of marijuana without payment of the tax imposed by law. The court's reasoning in *Drotar* reflects the part "fundamental liberties" plays in defining the concept of privacy.

However, even conceding that plaintiff's right to possess is fundamental even *Roe & Doe* recognized that they may be curtailed by "compelling state interest", *Roe v. Wade*, ___ U.S.___, 93 S. Ct. 705, 728 (1973). 21 U.S.C. § 801 and LSA-R.S. 40:962 expresses the state interest behind the federal and state prohibitions.

> "The Congress makes the following declarations:
>
> (1) Many of the drugs included within this subchapter have a useful and legitimate medical purpose and are necessary to maintain the health and general welfare of the American people.
>
> (2) The illegal importation, manufacture, distribution and possession and improper use of controlled substances have a substantial and detrimental effect on the health and general welfare of the American people." 21 U.S.C. § 801 (1) & (2).

The legislative intent of the state in controlling dangerous drugs is found in the criteria set out in LSA-R.S. 40:962(A)(1-8) and in LSA-R.S. 40:963(A). The fact that they are addressed to the State Board of Health reflects the considerations which moved the Louisiana legislature to control dangerous drugs:

> "In making such a determination the State Board of Health shall consider the following:
>
> (1) Its actual or relative potential for abuse;
> (2) Scientific evidence of its pharmacological effect, if known;
> (3) State of current scientific knowledge regarding the substance;
> (4) Its history and current pattern of abuse;
> (5) The scope, duration and significance of abuse;
> (6) What, if any, risk there is to public health;
> (7) Its psychic or physiological dependence liability; and
> (8) Whether the substance is an immediate precursor of a substance already controlled by this section.
>
> "In determining that a substance is to be added to these schedules, the State Board of Health shall find the following:
>
> A. As to Schedule I:
>
> (1) The drug or other substance has a high potential for abuse;
> (2) The drug or other substance has no currently accepted medical use in treatment in the United States;
> (3) There is a lack of accepted safety for use of the drug or other substance under medical supervision.

Plaintiff alleges that this reasoning is incorrect by virtue of recent scientific findings and investigations and urges this court to upset this specific finding of the legislature. In order for the court to do this it would be necessary for this court to substitute its judgment based on social, economic, historical and scientific evidence for that of the respective legislatures. The Supreme Court has specifically turned away from such an approach in *Ferguson v. Skrupa*, 372 U.S. 726, 83 S. Ct. 1028, 10 L.Ed.2d 93 (1963). Congress and the state legislature have both found it necessary for general health and welfare to regulate the use and possession of dangerous drugs. This court is in no position to substitute its judgment for that of the legislature.

Plaintiffs also contend that the criminal sanctions imposed for the possession and use of marijuana constitute cruel and unusual punishment under the Eighth Amendment. Plaintiff's allegation under this cause of action has validity only if the conduct proscribed is disproportionate to the offense, *Kasper v. Brittian*, 245 F.2d 92, cert. den. (6th Cir. 1957), 355 U.S. 834, 78 S. Ct. 542 L.Ed.2d 46 (1957), reh. den., 355 U.S. 886, 78 S. Ct. 147, 2 L.Ed. 115 (1957). The punishment becomes disportionate only if the conduct should not be proscribed or only if the punishment is clearly arbitrary and without rational relationship to the crime. Since the court finds that the conduct is legitimately proscribed by the legislatures and that it encompasses no fundamental right the Eighth Amendment argument has no validity.

Plaintiff rests finally on the prohibitions of equal protection. Plaintiff alleges that invidious discrimination is present since no rational basis exists for treating marijuana different from cigarettes or alcohol. Classification becomes unreasonable only when they are arbitrary and rest upon no rational basis, *Lindsley v. National Carbonic Gas Company*, 220 U.S.

61, 31 S. Ct. 337, 55 L.Ed. 369 (1911); *Morey v. Doud*, 354 U.S. 457, 77 S. Ct. 1344, 1 L.Ed.2d 1484 (1957). The legislatures, both federal and state, rest their distinction in treatment on their obligation and authority to legislate for the public health and welfare. It is only by substituting a judicial judgment that this is incorrect that these statutes can be overturned, see *Ferguson, supra.*

The Fifth Circuit's admonition in *Jackson v. Choate*, 404 F.2d 910 (5th Cir. 1968):

> "Except for cases on which there can be no doubt at all, the alternatives to certification and constituting of a three-judge court as unsatisfactory and administratively disadvantageous with no compensating redeeming virtue of a substantive kind." *Id.*, p. 912.
>
> "In this day and time of dynamic expansion of constitutional principles and their application to new and sometimes unheard of situations it takes judicial prescience of a delphic order to say with certainty that the attack is insubstantial. It is the better course – certainly from an administrative standpoint – to forego the doubts, constitute a three-judge court, and allow that court to determine initially this and other issues." *Id.*, p. 913.

is not applicable under the circumstances of the present case.

The plaintiff's request for the covening of a three-judge court is hereby and the same denied for lack of a substantial federal question since the allegations are plainly without merit. The right to possess and use marijuana in one's own

home is not and cannot be classified as a fundamental right protected by a constitutional zone of privacy.

UNITED STATES DISTRICT JUDGE

March 19, 1974

APPENDIX C – Judgment and Minute Entry of the District Court Dismissing the Complaint

UNITED STATES DISTRICT COURT
Eastern District of Louisiana

Civil Action No. 74-163

[Title omitted in printing]

May 31, 1974

JUDGMENT

The Court having on May 29, 1974, for the reasons dictated into the record and the memo of reasons filed herein on the 19th day of March, 1974, granted the motions of defendants, Hon. William J. Guste, Jr., Hon. Edwin Edwards, William B. Saxbe and Hon. John R. Bartels, to dismiss:

IT IS ORDERED, ADJUDGED AND DECREED that there be judgment in favor of defendants, Hon. William J. Guste, Jr., Attorney General of the State of Louisiana; Hon. Edwin Edwards, Governor of the State of Louisiana; William

B. Saxbe, Attorney General of the United States and Hon. John R. Bartels, as Administrator of the Drug Enforcement Administration of the Federal Government, and against plaintiffs, The Louisiana Affiliate of the National Organization for the Reform of Marijuana Laws (NORML) and John Doe, on behalf of himself and all others similarly situated, dismissing said plaintiffs' suit at their costs.

New Orleans, Louisiana, this 31st day of May, 1974.

BENJAMIN W. REISCH, Clerk
By: /s/ Nelson B. Jones
Chief Deputy Clerk

APPROVED AS TO FORM:

/s/ Judge Comiskey
UNITED STATES DISTRICT JUDGE

* * *

[Title omitted in printing]

Minute Entry

July 1, 1974

On May 29, 1974, there came on for hearing motions to dismiss by each of the three defendants. At that time the Court ruled from the bench granting the motions and orally adopted its previous Memorandum of Reasons denying the plaintiffs' request to convene a three-judge court. The Court now formally adopts as its reasons for judgment granting

defendants' motions to dismiss its March 19, 1974 Memorandum of Reasons denying plaintiffs' request for a three-judge court. In consideration of these reasons, a copy of which is attached, the defendants' motions are hereby granted and the case dismissed.

/s/ Judge Comisky
UNITED STATES DISTRICT JUDGE

APPENDIX D – Statutory Provisions Involved

(1) The Federal Controlled Substances Act, 21 U.S.C. Sec. 801, *et seq.*

Sec. 404(a), 21 U.S.C. Sec. 844(a). Penalty For Simple Possession.

It shall be unlawful for any person knowingly or intentionally to possess a controlled substance unless such substance was obtained directly, or pursuant to a valid prescription or order, from a practitioner, while acting in the course of his professional practice, or except as otherwise authorized by this title or title III. Any person who violates this subsection shall be sentenced to a term of imprisonment of not more than one year, a fine of not more than $5,000, or both, except that if he commits such offense after a prior conviction or convictions under this subsection have become final, he shall be sentenced to a term of imprisonment of not more than 2 years, a fine of not more than $10,000, or both.

Sec. 202, 21 U.S.C. Sec. 812. Schedules of Controlled Substances.

(c) Schedules I, II, III, IV, and V shall, unless and until amended pursuant to section 811 of this title, consist of the

following drugs or other substances, by whatever official name, common or usual name, chemical name, or brand name designated:

Schedule I

* * *

(c) Unless specifically excepted or unless listed in another schedule, any material, compound, mixture, or preparation, which contains any quantity of the following hallucinogenic substances, or which contains any of their salts, isomers, and salts of isomers whenever the existence of such salts, isomers, and salts of isomers is possible within the specific chemical designation:

* * *

(10) Marihuana

* * *

(2) The Louisiana Controlled Dangerous Substances Law, LSA-R.S. 40:961, *et seq.*

Sec. 966, LSA-R.S. 40:966. Prohibited acts – Schedule I; penalties.

C. **Possession.** It is unlawful for any person knowingly or intentionally to possess a controlled dangerous substance classified in Schedule I unless such substance was obtained directly, or pursuant to a valid prescription or order from a practitioner or as provided in R.S. 40:978, while acting in the course of his professional practice, or except as otherwise authorized by this part. Any person who violates this subsection with respect to:

(1) A substance classified in Schedule I which is a narcotic drug (all substances in Schedule I preceded by an asterisk "*"), shall be imprisoned at hard labor for not less than four years nor more than ten years without benefit of probation

or suspension of sentence and may, in addition, be required to pay a fine of not more than five thousand dollars.

(2) Any other controlled dangerous substance classified in Schedule I, shall be imprisoned at hard labor for not more than ten years, and may in addition, be required to pay a fine of not more than five thousand dollars.

D. **Possession of marijuana.** (1) On a first conviction for violation of Subsection C of this section with regard to marijuana, the offended shall be fined not more than five hundred dollars and/or imprisoned in the parish jail for not more than six months.

(2) On a second conviction for violation of Subsection C of this section with regard to marijuana, the offender shall be fined not more than two thousand dollars and/or imprisoned with or without hard labor for not more than five years.

(3) On a third or subsequent conviction for violation of Subsection C of this section with regard to marijuana the offender shall be sentenced to imprisonment with or without hard labor for not more than twenty years.

Sec. 964, LSA-R.S. 40:964. Composition of schedules.

Schedules I, II, III, IV and V shall, unless and until added to pursuant to R.S. 40:962, consist of the following drugs or other substances, by whatever official name, common or unusual name, chemical name, or brand name designated:

SCHEDULE I

* * *

C. **Hallucinogens.** Unless specifically excepted or unless listed in another Schedule, any material, compound, mixture, or preparation, which contains any quantity of the following

hallucinogenic substances, or which contains any of their salts, isomers and salts of isomers whenever the existence of such salts, isomers, and salts of isomers is possible within the specific chemical designation:

* * *

(10) Marijuana

* * *

July 27, 1976

John Rector
Staff Director and Chief Counsel
Senate Subcommittee to Investigate Juvenile Delinquency
Washington, DC 20510

Dear John:

Pursuant to our conversation today, I've enclosed the amicus curiae brief recently filed by NORML in the California Supreme Court. The question involved here is one of "moral turpitude" and the dismissal of a teacher, but the issue of marijuana decriminalization is discussed at some length and may provide for you a worthwhile current legal index.

I've also enclosed a bibliography of books of merit on the subject.

Regards,

Larry A. Schott

QUESTION PRESENTED	1
INTRODUCTORY STATEMENT: INTERESTS OF AMICUS CURIAE	2
STATEMENT OF FACTS	4
ARGUMENT	
I. DISMISSAL OF THOMAS MANN FROM HIS TEACHING POSITION WAS ONLY PROPER IF HE WAS CONVICTED OF A CRIME INVOLVING "MORAL TURPITUDE."	7
A. THE JUDGE CASE HOLDS THAT TEACHERS CANNOT BE DISMISSED FOR CONVICTION OF A FELONY UNDER EDUCATION CODE SECTION 13403(h) UNLESS THE FELONY INVOLVES MORAL TURPITUDE	7
B. EVEN IF THIS COURT INTERPRETS EDUCATION CODE SECTION 13403(h) AS STATING TWO INDEPENDENT GROUNDS FOR DISMISSAL, THOMAS MANN WAS NOT CONVICTED OF A FELONY AT THE TIME OF HIS DISMISSAL BY THE TRIAL COURT AND CONSEQUENTLY HIS DISMISSAL WAS ONLY PROPER IF THE CRIME OF WHICH HE WAS CONVICTED INVOLVED "MORAL TURPITUDE."	8
II. CRIMES INVOLVING "MORAL TURPITUDE" ARE THOSE WHICH ARE "BASE, VILE, OR DEPRAVED," OR WHICH DEMONSTRATE UNFITNESS TO PRACTICE ONE'S PROFESSION	12
III. PRIVATE POSSESSION OF A SMALL AMOUNT OF MARIJUANA IS NOT A CRIME INVOLVING "MORAL TURPITUDE."	14
A. THE HIGBIE CASE HOLDS THAT POSSESSION OR USE OF MARIJUANA IS NOT A CRIME INVOLVING "MORAL TURPITUDE."	14
B. RECENT LEGISLATIVE DEVELOPMENTS IN CALIFORNIA AND OTHER JURISDICTIONS DEMONSTRATE A CLEAR TREND TOWARD GREATLY REDUCED PENALTIES FOR POSSESSION OF MARIJUANA	15
C. STATE AND FEDERAL COURTS HAVE RECOGNIZED THE IRRATIONALITY AND UNCONSTITUTIONALITY OF MARIJUANA PROHIBITIONS	20

QUESTION PRESENTED

The Petition for Hearing filed in this Court contains a number of issues relating to petitioner's dismissal by the Governing Board of the Rialto Unified School District. This amicus curiae brief will focus on the following issue:

> Whether a conviction for possession of a small amount of marijuana is cause for dismissal of a public school teacher under Section 13403(h) of the California Education Code, as a conviction of "a felony or of any crime involving moral turpitude."

BRIEF OF AMICUS CURIAE

INTRODUCTORY STATEMENT: INTERESTS OF AMICUS CURIAE

The National Organization for the Reform of Marijuana Laws (NORML) is a non-profit corporation, incorporated in the District of Columbia. NORML maintains a National Headquarters in Washington, D.C., and active affiliates in more than 40 states, including California. NORML maintains a West Coast regional office in San Francisco.

NORML was organized, and its members joined and continue to support NORML, for the purpose of NORML's representing and advocating, before legislative and judicial forums the personal and collective interests of its members in securing the decriminalization of private possession and use of marijuana and the relegation of such matters to personal choice rather than criminal sanction. NORML is supported by approximately 20,000 dues-paying members, including more than 300 persons who are presently serving sentences in prison for violation of state and federal marijuana laws.

NORML is presently a plaintiff in two California lawsuits seeking declaratory judgments that various provisions of the California Uniform Controlled Substances Law, Health and Safety Code sections 11000 et seq., are unconstitutional insofar as they criminally punish private possession and use of marijuana by adults. Such lawsuits are NORML v Gain, No. 697-445 (Superior Court, City and County of San Francisco), and NORML v Davis,

REUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

No. C140940 (Superior Court, County of Los Angeles).

In various other cases in the courts of this state and other states and in federal courts, NORML has petitioned for and been granted leave to file briefs amicus curiae for the purpose of advancing and representing the interests of its members on the several issues represented therein. For example NORML has recently been granted leave to file briefs amicus curiae in the following cases on the issue of the constitutionality of the record destruction provisions of Health & Safety Code Section 11361.5: In re Goldberg, No. CR 231566 (Superior Court, Los Angeles County); In re Mack, No. 40072 (Superior Court Sacramento County).

STATEMENT OF FACTS

On the evening of January 31, 1969, Thomas R. Mann was arrested in his home for possession of a small amount of marijuana (enough for approximately three cigarettes). At that time he was employed as a tenured teacher by the Rialto Unified School District. He was chairman of the Social Studies Department of Eisenhower High School, where he had taught since 1964. Police officers found the marijuana among Mann's personal papers in a filing cabinet in his bedroom.

A criminal complaint was filed against Mann, and on February 5, 1969, the Governing Board of the school district took action to place him on compulsory leave of absence, pursuant to Section 13409 of the Education Code. In the criminal proceeding, Mann sought to suppress the marijuana seized from his home, under Section 1538.5 of the Penal Code, but was unsuccessful Mann v Superior Court, 3 C.3d 1 (1970). On January 4, 1971, he pleaded guilty to violation of then Section 11530 of the Health and Safety Code, possession of marijuana, a felony. On February 8, 1971, the court placed Mann on probation and noted in the minutes that it would "consider the reduction to a misdemeanor if and when probation is successfully completed."

That same day, February 8, 1971, the Superintendent of the Rialto School District formally alleged in a letter to the district's Governing Board that cause existed to dismiss Mann,

as provided for in Section 13403(h) of the Education Code.[1] On February 17, 1971, the Governing Board gave notice of its intent to dismiss Mann. The Governing Board then filed a complaint in Superior Court on March 26, 1971.

Before a hearing was held on the complaint, Mann successfully completed probation, and on July 14, 1972, the Superior Court, upon the request of the probation officer and pursuant to the provisions of Sections 17[2] and 1203.4[3] of the Penal Code,

1/ Education Code Section 13403(h) provides, in pertinent part:

§13403. Grounds for dismissal of permanent employee

No permanent employee shall be dismissed except for one or more of the following causes:

* * *

(h) Conviction of a felony or of any crime involving moral turpitude.

2/ Penal Code Section 17 provides in pertinent part:

§17. Felony defined: Misdemeanor defined: Commitment to Youth Authority: Effect of granting probation.

(a) A felony is a crime which is punishable with death or by imprisonment in the state prison. Every other crime of public offense is a misdemeanor except those offenses that are classified as infractions.

(b) When a crime is punishable, in the discretion of the court, by imprisonment in the state prison or by fine or imprisonment in the county jail, it is a misdemeanor for all purposes under the following circumstances:

(1) After a judgment imposing a punishment other than imprisonment in the state prison.

* * *

(3) When the court grants probation to a defendant without imposition of sentence and at the time of granting probation, or on application of the defendant or probation officer thereafter, the court declares the offense to be a misdemeanor.

3/ Penal Code Section 1203.4 provides in pertinent part:

§1203.4. Right of discharged probationer to change plea: Vacation of verdict: Dismissal: Release from disabilities: Subsequent offense.

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY

TELEPHONE 465-1300

ordered that the offense be declared a misdemeanor, that probation be terminated, that the plea of "guilty" be set aside, a plea of "not guilty" entered, and the case dismissed.

A hearing on the Governing Board's complaint was held in June, 1973. The four-day hearing dealt primarily with the "moral turpitude" issue. Evidence about marijuana, including scientific reports and expert testimony, was introduced. The Supeior Court held that the Governing Board had cause to dismiss Mann, and the Court of Appeal for the Fourth District affirmed. Governing Board of Rialto Unified School District v Mann, 54 C.A.3d 368 (1976) [hereinafter, Mann].

(a) In any case in which a defendant has fulfilled the conditions of probation for the entire period of probation, or has beendischarged prior to the termination of the period of probation, or in any other case in which a court, in its discretion and the interests of justice, determines that a defendant should be granted the relief available under this section, the defendant shall, at any time after the termination of the period of probation, if he is not then serving a sentence for any offense, on probation for any offense, or charged with the commission of any offense, be permitted by the court to withdraw his plea of guilty or plea of nolo contendere and enter a plea of not guilty; or, if he has been convicted after a plea of not guilty, the court shall set aside the verdict of guilty; and, in either case, the court shall thereupon dismiss the accusations or information against the defendant and he shall thereafter be released from all penalties and disabilities resulting from the offense of which he has been convicted. The probationer shall be informed of this right and privilege in his probation papers. The probationer may make such application and change of plea in person or by attorney, or by the probation officer authorized in writing; provided, that, in any subsequent prosecution of the defendant for any other offense, the prior conviction may be pleaded and proved and shall have the same effect as if probation had not been granted or the accusation or information dismissed.

ARGUMENT

I. DISMISSAL OF THOMAS MANN FROM HIS TEACHING POSITION WAS ONLY PROPER IF HE WAS CONVICTED OF A CRIME INVOLVING "MORAL TURPITUDE."

A. THE JUDGE CASE HOLDS THAT TEACHERS CANNOT BE DISMISSED FOR CONVICTION OF A FELONY UNDER EDUCATION CODE SECTION 13403(h) UNLESS THE FELONY INVOLVES MORAL TURPITUDE.

Board of Trustees v Judge, 50 C.A.3d 920 (1975), involved the attempted dismissal of a teacher by his school board, under Education Code Section 13403(h), on the grounds of his conviction of violation of Health and Safety Code Section 11530.1 (now Section 11358), cultivation of a single marijuana plant, a felony. The Court of Appeal for the Second District held that Education Code Section 13403(h) "applies only to conviction of felonies involving moral turpitude," 50 C.A.3d at 926, that the offense of cultivation of marijuana does not involve moral turpitude as a matter of law, id. at 925-25, and that "conviction of a felony, standing by itself, is not enough to warrant discipline under Education Code Section 13403, Subdivision (h)," id. at 928.

The Court of Appeal based its conclusion that teachers cannot be dismissed under Section 13403(h) unless the felony involves moral turpitude on an analysis of prior cases involving teacher dismissal under the Education Code and other California statutes regulating various trades and professions and containing similar grounds for discipline as those contained in Section 13403(h) of the Education Code. Id. at 926-27 and nn. 3 & 4. Agreeing with the trial court that the factual circumstances did

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

not warrant a finding of moral turpitude, the Court of Appeal affirmed the judgment of the trial court that Judge could not be dismissed from his teaching position.

The Court of Appeal for the Fourth District, in its decision below, expressly disagreed with Judge on the issue of statutory construction, holding that conviction for any felony was sufficient cause for dismissal. Mann, supra, 54 C.A.3d at 375. The Mann court's decision on this point is not based upon any new analysis of the issue, but is merely a "respectful" difference of opinion with the conclusion drawn in Judge. Id. Amicus submits that the Judge holding is better-reasoned and is based upon an extensive analysis of the disciplinary provisions for a wide variety of trades and professions in California, and accordingly should be adopted by this Court.

B. EVEN IF THIS COURT INTERPRETS EDUCATION CODE SECTION 13403(h) AS STATING TWO INDEPENDENT GROUNDS FOR DISMISSAL, THOMAS MANN WAS NOT CONVICTED OF A FELONY AT THE TIME OF HIS DISMISSAL BY THE TRIAL COURT AND CONSEQUENTLY HIS DISMISSAL WAS ONLY PROPER IF THE CRIME OF WHICH HE WAS CONVICTED INVOLVED "MORAL TURPITUDE."

As indicated above, on January 4, 1971, Thomas Mann pleaded guilty to violation of then Section 11530 of the Health and Safety Code, possession of marijuana, a felony. On February 8, 1971, the court placed Mann on probation and stated that it would consider reduction of the charge to a misdemeanor upon the completion of probation. On July 14, 1972, Mann completed probation and the court ordered that the charge be reduced to a misdemeanor that the plea of guilty be set aside and a plea of not guilty

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

entered, and the case dismissed.

The hearing on the Governing Board's complaint in the instant matter was not held until eleven months later, on June 12, 1973. Realizing that the Superior Court had reduced the charge against Mann to a misdemeanor and dismissed the case, and that the charging allegation in paragraph VII of the Board's complaint made reference only to "conviction of a felony" as cause for dismissal, the county counsel, over Mann's objection, successfully moved to amend the complaint to add a "second" cause for dismissal under Section 13403(h), i.e., conviction of a crime involving moral turpitude. Mann, supra, 54 C.A.3d at 374.

As the county counsel evidently understood, and contrary to the rulings of the Superior Court and the Court of Appeal below, the court order reducing the charge against Mann to a misdemeanor and dismissing the case operated to remove from Mann the legal stigma of a felony conviction.

The leading case of People v. Banks, 53 C.2d 370 (1959), is determinative on this point.[4/] This Court discussed the effects of the provisions of Penal Code Section 1203.4 at length, noting that when a defendant charged with an offense punishable either as a misdemeanor or a felony enters a plea of guilty to the felony

4/ Appellant Banks had pleaded guilty to violation of then Section 503 of the Vehicle Code, an offense punishable either as a felony or a misdemeanor. Imposition of sentence was suspended, and Banks successfully completed his term of probation. He did not move to have the charge reduced to a misdemeanor and dismissed, as he was entitled to do under Penal Code Section 1203.4. Banks was subsequently convicted of violation of Penal Code Section 12021, possession of a firearm by a convicted felon, and the issue on appeal was wehther the Vehicle Code conviction was chargeable against Banks as a prior felony. 53 C.2d at 375.

TELEPHONE 482-1300

charge and the court does not impose a prison sentence, but instead grants probation and suspends the proceedings without entry of judgment, the court retains jurisdiction over the defendant and the res of the action. Id. at 383-87. At that time, and unless and until the defendant avails himself of the benefits of Penal Code Section 1203.4, the defendant stands convicted of a felony. Id. at 387. His status as a convicted felon, however, is "not then final, and conditionally subject to expungement..." Id. Such status is "...only provisional; it could, in due course, [be] changed to that of a misdemeanant by pronouncement of a sentence to the county jail or for a fine. And even the record of a misdemeanor conviction could [be] changed to not guilty and the accusation dismissed by compliance with section 1203.4" Id. Thus, a defendant who obtains an order under Penal Code Section 1203.4 for entry of a misdemeanor judgment and dismissal of the charge no longer has the status of a convicted felon. Id. at 380, 383. He is, in the plain words of the statute, "released from all penalties and disabilities resulting from the offense of which he has been convicted." To be sure, he must obtain an appropriate order under Section 1203.4. Id. at 388. Once he obtains the order, however, he is entitled to the full benefits of the statute. Id. Indeed, to hold to the contrary would be to ignore the clear rehabilitative and remedial legislative purposes of Section 1203.4.

In the instant case, the Court of Appeal below apparently misinterpreted the applicable law by assuming that a plea to a felony once entered constitutes an immutable judgment of conviction

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 893-1300

of a felony. Mann, supra, 54 C.A.3d at 879-80. As Banks makes clear, upon appropriate order under Section 1203.4, the status of convicted felon is lifted and the defendant stands, at most, convicted of a misdemeanor. Such was the status of Thomas Mann at the time of the hearing on the Governing Board's complaint. Consequently, he did not at that time stand convicted of "a felony" within the meaning of Education Code Section 13403(h), and he could only be dismissed if the crime of which he was convicted involved "moral turpitude."

II. CRIMES INVOLVING "MORAL TURPITUDE" ARE THOSE WHICH ARE "BASE, VILE, OR DEPRAVED," OR WHICH DEMONSTRATE UNFITNESS TO PRACTICE ONE'S PROFESSION

In a recent case involving an attorney disciplinary proceeding, In re Higbie, 6 C.3d 562 (1972), this Court described the concept of "moral turpitude" as follows:

> "Moral turpitude" is an elusive concept incapable of precise general definition. One dramatic exposition of the term was rendered by this court in 1938, and has since been consistently followed: "an act of baseness, vileness or depravity in the private or social duties which a man owes to his fellowmen, or to society in general, contrary to the accepted and customary rule of right and duty between man and men." (In re Craig (1938) 12 Cal.2d 93, 97...; see also Yakov v Board of Medical Examiners (1968) 68 Cal.2d 67, 73...; In re Boyd (1957) 48 Cal.2d 69, 70...

6 C.3d at 569. The Court particularly emphasized the issue of whether the conduct demonstrated unfitness to practice one's profession:

> "In evaluating conduct that may or may not involve moral turpitude, we must recognize the purpose for which we have established the "moral turpitude" standard: to ensure that the public, the courts, and the profession are protected against unsuitable legal practitioners. (See Hallinan v Committee of Bar Examiners (1966) 65 Cal.2d 447, 471-472...; In re Rothrock, supra, 16 Cal.2d at p. 454; cf. Yakov v Board of Medical Examiners, supra, 68 Cal.2d at p. 75 and fn. 6 (medical doctor).) The objective is not to impose punishment upon members of the profession. To hold that an act of a practitioner constitutes moral turpitude is to characterize him as unsuitable to practice law.

6 C.3d at 570. Accord, Cartwright v. Board of Chiropractic Examiners, 16 C.3d 762, 767 (1976). Thus, in terms particularly appropriate to the instant case, this Court emphasized in

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

Morrison v State Board of Education, 1 C.3d 214 (1969), that private conduct of a teacher may not be the basis for dismissal unless it significantly impairs his ability to teach:

> Terms such as..."moral turpitude" stretch over so wide a range that they embrace an unlimited area of conduct. In using them the Legislature surely did not mean to endow the employing agency with the power to dismiss any employee whose personal, private conduct incurred its disapproval. Hence the courts have consistently related the terms to the issue of whether, when applied to the performance of the employee on the job, the employee has disqualified himself.

Id. at 224-25 (emphasis added).

III. PRIVATE POSSESSION OF A SMALL AMOUNT OF MARIJUANA IS NOT A CRIME INVOLVING "MORAL TURPITUDE."

A. THE HIGBIE CASE HOLDS THAT POSSESSION OR USE OF MARIJUANA IS NOT A CRIME INVOLVING "MORAL TURPITUDE."

In In re Higbie, supra, this court clearly indicated that simple possession or use of marijuana, in and of itself, is not a crime involving moral turpitude:

> Possession or use of marijuana is, of course, unlawful (see Health & Safety Code, §11530 et seq.), but measured by the morals of the day (In re Hatch, supra, 10 Cal.2d at p. 151) its possession or uses does not constitute "an act of baseness, vileness, or depravity...contrary to the accepted and customary rule or right and duty between man and man" (In re Craig, supra, 12 Cal.2d at p. 97), or indicate that an attorney is unable to meet the professional and fiduciary duties of his practice.

6 C.3d at 572.[5/] See also Board of Trustees v Judge, supra, 50 C.A.3d at 923.

There have been a number of important developments--in the legislatures, courts, scientific community, and in public opinion--since the Higbie decision in 1972 which confirm this

5/ The differences between the factual circumstances of Higbie and those of the instant case underline the significance of this Court's statements. In Higbie, this Court held that respondent Higbie's conduct involved moral turpitude because he was intimately involved in a scheme to smuggle marijuana into the United States from Mexico, conduct for which he ultimately pleaded guilty to violations of federal law. 6 C.3d at 567-68, 573. The distinction between such a course of conduct and Thomas Mann's possession of less than an ounce of marijuana in his bedroom is evident. Even considering the nature of Higbie's offense, however, this Court did not disbar Higbie, but instead imposed only a two-year suspension of the practice of law, with the second year being a probationary period during which Higbie was actually allowed to engage in the practice of law. Id. at 574.

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

Court's judgment that possession or use of marijuana is not a crime involving moral turpitude. These developments are discussed in the succeeding sections of this brief.

B. RECENT LEGISLATIVE DEVELOPMENTS IN CALIFORNIA AND OTHER JURISDICTIONS DEMONSTRATE A CLEAR TREND TOWARD GREATLY REDUCED PENALTIES FOR POSSESSION OF MARIJUANA.

In In re Higbie, supra, this Court noted the trend, evident even at that time, toward sharply reduced penalties for marijuana possession offenses:

> ...[T]he possession and use of marijuana at the present time raises controversial questions, to which automatic answers cannot be given. Lawmakers, legal scholars, physicians, and sociologists are divided in opinion as to the wisdom of prohibiting or punishing these acts. In response to demands from sources of the highest integrity that marijuana be treated differently from other drugs, and that punishments for its use be eliminated or significantly ameliorated, the Congress in 1970 reduced the crime of unlawful possession or unremunerated distribution of marijuana from felony to misdemeanor status, providing for the probation and eventual expunging of records of those who are first offenders. (See 21 U.S.C. §§841(b)(4), 844.) The California Legislature had in 1968 similarly responded, reducing the crime of first offense marijuana possession from a felony to a felony-misdemeanor, and providing for incarceration in county jails rather than the state prisons. (Health & Saf. Code, §11530.)

6 C.3d at 571 (footnotes omitted).

This trend toward reduced penalties for marijuana possession has continued and accelerated since the Higbie decision in 1972. In 1972, possession of marijuana was still punishable as a felony in a number of states; as of today, possession of a small amount of marijuana is a misdemeanor in all states except Nevada and Arizona. In Nevada, while possession is still a felony, conditional discharge is authorized for first offenders. In Arizona, possession can be prosecuted as either a felony or misdemeanor.

TREUHAFT, NAWI & HE
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 465-1260

In addition, there are now eight states, including California, which no longer arrest or imprison persons at all for possession of a small amount of marijuana. While the provisions of these eight state laws vary, they are all similar in that possession of a specified amount of marijuana is subject to a citation-enforced fine, rather than arrest and possible imprisonment, and there is no permanent criminal record. The first state to adopt this approach was Oregon in 1973, which provided for a $100 maximum civil fine for possession of up to 1 oz. of marijuana. Since 1973, similar laws have been adopted in Alaska, Maine, Colorado, California, Ohio, South Dakota, and Minnesota. The following chart summarizes the provisions of these laws:

STATE	MAX. FINE IMPOSED	MAX. AMT. POSSESSED	CRIMINAL OR CIVIL VIOLATION	EFFECTIVE DATE
Oregon	$100.00	1 oz.	Civil	Oct. 5, 1973
Alaska	$200.00	Any amount in private for personal use or 1 oz in public	Civil	Mar. 1, 1976
Maine	$200.00	Any amount for personal use[a]	Civil	Mar. 1, 1976
Colorado[b]	$100.00	1 oz.	Class 2 petty offense --no criminal record	July 1, 1975
Calif.[b]	$100.00	1 oz.	Misdemeanor - no permanent criminal record	Jan. 1, 1976
Ohio[b]	$100.00	100 grams (appx. 3-1/2 oz.)	Minor misdemeanor - no crim. record	Nov. 22, 1975
South Dakota	$ 20.00	1 oz.	Civil	Apr. 1, 1977

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

STATE	MAX. FINE IMPOSED	MAX. AMT. POSSESSED	CRIMINAL OR CIVIL VIOLATION	EFFECTIVE DATE
Minn.	$100.00[c]	1-1/2 oz.	Civil	Apr. 10, 1976

[a] There is a rebuttable presumption that possession of less than 1-1/2 oz. is for personal use, and possession of more than 1-1/2 oz. is with an intent to distribute.

[b] Distribution of marijuana by gift, or for no remuneration, is treated the same as possession in four states: California (for up to 1 oz), Colorado (up to 1 oz.), Ohio (up to 20 gr.), and Minnesota (up to 1-1/2 oz.).

[c] Only Minnesota provides for increased penalties for second offenses: 0-90 days in jail and/or a $300 fine for second offense within a two year period.

The provisions of these laws are set out in more detail in Appendix A of this Brief, attached hereto.

Most significant for the instant case, of course, is the substantial change in California law brought about by the enactment law year of Senate Bill No. 95, which became effective January 1, 1976. Passage of S.B. 95 followed an extensive investigation by a Select Committee of the State Senate of the medical and scientific evidence, constitutional and law enforcement considerations, and social policy priorities related to the possession and use of marijuana. The major conclusions of the Select Committee demonstrate a legislative determination to minimize penalties for possession and use of marijuana:

1. The Committee finds, even assuming marijuana has some undesirable or harmful properties, attempts at prohibition through utilization of the criminal law is not a proper approach in controlling these properties and effects.

2. The Committee further finds private use of marijuana is a private act.

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

3. Marijuana use is to be regarded as involving primarily a risk to the individual user.

4. The State does not have sufficient compelling interest to prevent the individual user.

5. Marijuana use is not a threat to public health, safety or morals so as to warrant state intrusion.

6. The use of marijuana is not such a threat to society to warrant the jailing of people as a way to deal with the attendant issues.

7. The State does not have the responsibility to protect an individual against the potentially harmful effects of a drug when these are still unknown and when all the evidence suggests they are no greater in severity, and possibly not so much different in kind, than those from other socially acceptable drugs.

8. If the individual needs to have some deterrent to over-use of a drug, bringing the individual into the criminal justice system does not constitute a desirable way of accomplishing this end.

9. The benefits, compared to the dollars spent by the State and the social costs suffered by the individual, are not worth the use of the criminal process.

10. One cannot justify a law which in actual practice can only be selectively enforced.

California Legislature, Senate Select Committee on Control of Marijuana, Final Report, Marijuana: Beyond Misunderstanding 3-4 (May, 1974).

The enactment of S.B. 95, amending Health and Safety Code Sections 11357 and 11360, and adding Section 11361.5 to the Health and Safety Code, means that possession of up to one ounce of marijuana in California, while still technically a misdemeanor, is subject to a maximum fine of $100.00 enforced by citation, and there is no permanent criminal record of the offense.

Moreover, the new Health and Safety Code Section 11361.5

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 832-1200

now provides a mechanism for the destruction, by the Superior Courts of arrest and conviction records for marijuana offenses. The record destruction provision applies to arrests under the new marijuana law and its statutory predecessors. Section 11361.5 further provides that after the records have been ordered destroyed, no public agency within the State shall deny or limit any license or privilege on account of conviction for marijuana-related offenses. The language of this latter provision is extremely broad, indicating a clear legislative intent to end the imposition of any type of collateral penalties for arrests or convictions of marijuana possession offenses:

> (d) No public agency shall alter, amend, assess, condition, deny, limit, postpone, qualify, revoke, surcharge, or suspend any certificate, franchise, incident, interest, license, opportunity, permit, privilege, right, or title of any person because of an arrest or conviction for a violation of Section 11357 or 11360, or because of the facts or events leading to such an arrest or conviction, on or after the date the records of such arrest or conviction are required to be destroyed by subdivision (a) or pursuant to an order of the court authorized by subdivision (b). As used in this subdivision, "public agency" includes, but is not limited to, any state, county, city and county, city, public or constitutional corporation or entity, district, local or regional political subdivision, or any department, division, bureau, office, board, commission or other agency thereof.

Thus, California law now makes record destruction available, and specifically precludes a school board, or any other public agency, from dismissing an employee on the grounds of a conviction for possession of marijuana after such record destruction has been ordered.

C. STATE AND FEDERAL COURTS HAVE RECOGNIZED THE IRRATIONALITY AND UNCONSTITUTIONALITY OF MARIJUANA PROHIBITIONS.

1. Ravin v State: The Right of Privacy

There have been a number of important judicial decisions involving the marijuana laws since In re Higbie, supra, the most important of which is undoubtedly Ravin v State, 537 P.2d 494 (1975) in which the Supreme Court of Alaska held that the right of privacy protects the personal possession and use of marijuana in the home. After reviewing the testimony of expert witnesses present at the hearing at the trial court and numerous studies and scientific reports on the effects of marijuana, the court concluded:

> It appears that the use of marijuana, as it is presently used in the United States today, does not constitute a public health problem of any significant dimensions. It is, for instance, far more innocuous in terms of physiological and social damage than alcohol or tobacco.

Id. at 506. Upon analyzing federal and state decisions on the right of privacy the court declared:

> It appears that effects of marijuana on the individual are not serious enough to justify widespread concern, at least as compared with the far more dangerous effects of alcohol, barbiturates and amphetamines. Moreover, the current patterns of use in the United States are not such as would warrant concern that in the future consumption patterns are likely to change.
> . . . Thus we conclude that no adequate justification for the state's intrusion into the citizen's right to privacy by its prohibition of possession of marijuana by an adult for personal consumption in the home has been shown. The privacy of the individual's home cannot be breached absent a persuasive showing of a close and substantial relationship of the intrustion to a legitimate governmental interest. Here, scientific doubts will not suffice. The state

FREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

> must demonstrate a need based on proof that the public health or welfare will in fact suffer if the controls are not applied.

Id. at 509-511 (footnote omitted).

The right of privacy has long been recognized by this Court and by the United States Supreme Court. Mr. Justice Brandeis termed it "the right to be let alone -- the most comprehensive of rights and the right most valued by civilized men." Olmstead v United States, 277 U.S. 438, 478 (Brandeis, J., dissenting). See Griswold v Connecticut, 381 U.S. 479 (1965); Stanley v Georgia, 394 U.S. 557 (1969); Eisenstadt v Baird, 405 U.S. 438, 453 (1972); Roe v Wade, 410 U.S. 113 (1973); Doe v Bolton, 410 U.S. 179 (1973); People v Belous, 71 C2d 954 (1969).

Except for the specific nature of the items seized by police, the factul circumstances of the instant case are virtually identical to those in Stanley v Georgia, supra. In Stanley, the defendant had been arrested when police found pornographic films in a desk drawer in his bedroom. 394 U.S. at 558. In the instant case, Thomas Mann was convicted for keeping a small amount of marijuana in a file drawer in his bedroom. In Stanley, the United States Supreme Court said:

> [W]e think that mere categorization of these films as "obscene" is insufficient justification for such a drastic invasion of personal liberties guaranteed by the First and Fourteenth Amendments. Whatever may be the justifications for other statutes regulating obscenity, we do not think they reach into the privacy of one's own home. If the First Amendment means anything, it means that a State has no business telling a man, sitting alone in his own house, what books he may read or what films he may watch.

Id. at 565.

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

Although the Court spoke in terms of First Amendment interests, it is clear that the keystone of the Court's opinion was not the First Amendment's protection of speech and expression, but, rather, the declaration that governmental intrusion into personal conduct in the privacy of one's own home is only justified in extraordinary and compelling circumstances. This is evident because the Court assumed that the films were obscene, thereby placing them outside the scope of First Amendment protection. See, also, In re Klor, 64 C.2d 816, 820-821 (1966).

Moreover, the Alaska Supreme Court's ruling in Ravin v State is particularly relevant to the instant case in view of the specific constitutional basis of the decision. The court held that the possession and use of marijuana in the home was protected by the right of privacy provision recently adopted as an amendment to the Alaska Constitution, Article I, Section 22: "The right of the people to privacy is recognized and shall not be infringed." 537 P.2d at 500, 511.

Like Alaska, California has recently added a right of privacy provision to its constitution. Article I, Section I of the California Constitution, as amended, reads:

> All people are by nature free and independent, and have certain inalienable rights. Among these are enjoying and defending life and liberty, acquiring, possessing, and protecting property, and pursuing and obtaining safety, happiness, and privacy.

In the only case construing the right of privacy amendment to the California Constitution, this Court indicated that the amendment is to be read as having a broad reach. In White v Davis, 13 C.3d 757

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

(1975), this Court concluded that the right of privacy prohibited surveillance and data gathering activities by undercover police on college campuses. The Court considered as part of the legislative history of the amendment the following statement in a brochure advocating adoption of the amendment:

> The right of privacy is the right to be left alone. It is a fundamental and compelling interest. It protects our homes, our families, our thoughts, our emotions, our expressions, our personalities, our freedom of communion and our freedom to associate with the people we choose.

13 C.3d at 774.

This Court has been particularly scrupulous in protecting "the sanctity of a private home" against unwarranted and unjustifiable intrusion. See People v Ramey, 16 C.3d 263, 272 (1976), quoting People v Privett, 55 C.2d 698, 703 (1961). This Court has not ruled on the exact issue whether personal possession and use of marijuana in the privacy of one's own home is constitutionally protected. NORML is presently raising this issue in civil lawsuits filed in San Francisco, NORML v Gain, No. 697-445 (Superior Court, City and County of San Francisco), and Los Angeles, NORML v Davis, No. C140940 (Superior Court, County of Los Angeles).

With respect to the instant case, it is clear that in Alaska, under the Ravin decision, Thomas Mann could neither be prosecuted nor dismissed from a teaching position for possessing or using marijuana in his home. See Comment, "Ravin v State: A Case for Privacy and Possession of Pot," 5 U.C.L.A.-Alaska L. Rev. 178 (1975).

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 465-1200

Amicus curiae NORML submits that the considerations thoroughly discussed by the court in Ravin are equally applicable in the instant case, that Thomas Mann's possession of a small amount of marijuana in his home was constitutionally protected, and that his subsequent dismissal from his teaching position for such possession violated his right of privacy guaranteed by Article I, section I of the California Constitution.

2. Other Significant Judicial Decisions

Several other courts have declared marijuana laws unconstitutional on a variety of grounds.[7] A number of the most significant decisions have focused particularly on the effects of marijuana and the relative harmlessness of the drug when its effects are compared with those of other controlled substances.[8] Thus in State v Zornes,

---

7/ See, e.g., Leary v United States, 395 U.S. 6 (1969).

8/ Although not ruling on constitutional grounds, the New Jersey Supreme Court, in State v Ward, 57 N.M. 75, 270 A.2d 1 (1970), granted certification "primarily to establish guidelines for the sentencing of first offenders who were found guilty of possessing marijuana for their own use." 270 A.2d at 5. Defendant was sentenced to serve a state prison term of two to three years for illegal possesion of marijuana, although a first offender. The Court stated, 270 A.2d at 5:

> [I]t remains the policy of the law to reform the youthful offender. Sentencing judges should direct the punishments they impose to the goal of reformation. Too severe a punishment will do little towards advancing this goal. Incarceration is a traumatic experience for anyone. The effect must be particularly devastating upon young persons such as the defendant here. A sentence of two to three years in State Prison in a case like this will probably be more detrimental to both the offender and society than some other discipline. Even a sentence to a reformatory as suggested by the Appellate Division may be more punitive than is required. We think that generally a suspended sentence with an appropriate term of probation is sufficient penalty for a person who is convicted for the first time of possessing marijuana for his own use. (emphasis added).

REUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

78 Wash.2d 9, 469 P.2d 552 (1970), the defendants had been convicted for possession of marijuana under a statute which classified marijuana as a narcotic. The Supreme Court of Washington compared empirical evidence on the effects of marijuana with evidence of the effects of narcotics and concluded that the effects of the drugs were so different that the statutory classification was arbitrary and irrational. Noting, "It is doubtful whether a legislative declaration contrary to all the evidence can be sustained as constitutional," 78 Wash.2d at 20, the court held that the convictions could not stand.

In People v. McCabe, 49 Ill.2d 338, 275 N.E.2d 407 (1971), the Supreme Court of Illinois held that classification of marijuana with narcotic drugs under the state Narcotic Drug Act was arbitrary and deprived the defendant of the constitutional guarantee of equal protection of the laws. After comparing the effects of marijuana with those of narcotics and other dangerous drugs, the court concluded:

> Observations to be drawn on marijuana are that it is not a narcotic and it is not truly addictive. Its use does not involve tolerance, physical dependence or the withdrawal syndrome. Physical ill effects from its use are, so far as is known, relatively moderate. Its abuse does not have the profound and ill consequences observed in the use of some of the other drugs considered. Its use does not singularly or extraordinarily lead to opiate addiction or to aggressive behavior or criminal activity . . . We do not find a rational basis for the classification . . .

275 N.E.2d at 413.

In People v. Lorentzen, 387 Mich. 167, 194 N.W.2d 827

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 465-1300

(1972), the Supreme Court of Michigan held that the penalty of 20 years imprisonment prescribed by statute for selling a narcotic drug, as it included sale of marijuana, violated constitutional prohibitions against cruel and unusual punishment. After comparing the statute with penalties for the sale of various substances, offenses against persons or property, and provisions of the state Controlled Substances Act of 1971, the court concluded that the term of imprisionment was "in excess of any that would be suitable to fit the crime," 194 N.W.2d at 831, offended "the evolving standards of decency that mark the progress of a maturing society," id. at 832-33, and would not serve the goal of rehabilitation.

At the same time the Supreme Court of Michigan announced the Lorentzen decision, it reversed the defendant's conviction for possession of marijuana in People v Sinclair, 387 Mich. 91, 194 N.W.2d 878 (1972). Two judges were of the opinion that the statutory categorization of marijuana along with "hard drug" narcotics for purposes of imposition of penalties denied defendant equal protection of the laws, one judge was of the opinion that the statute denied defendant the right to liberty and the pursuit of happiness, two judges were of the opinion that incriminating evidence should have been excluded as evidence obtained as a result of illegal entrapment, and two judges were of the opinion that the minimum sentence of 9-1/2 years constituted cruel and unusual punishment. The opinion of the court, written by Swainson, J., declared:

> Comparison of the effects of marijuana use on both the individual and society with the effects of other drug use demonstrates not only that there is no rational

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

> basis for classifying marijuana with the 'hard narcotics' but, also, that there is not even a rational basis for treating marijuana as a more dangerous drug than alcohol.

194 N.W. 2.d at 881 (emphasis added).

The court concluded, "We agree with the Illinois Supreme Court in People v McCabe, supra, that marijuana is improperly classified as a narcotic and hold that (the Michigan statute prohibiting possession of marijuana) in its classification of marijuana violates the equal protection clasue. . ." Id. at 887. Subsequent Michigan decisions indicate that the McCabe holding, i.e., that marijuana cannot rationally be classified as a narcotic, has been adopted as a matter of law. See People v Waxman, 41 Mich.App. 277, 199 N.W.2.d 884 (1972), rev'd on authority of People v Sinclair, 388 Mich. 774, 200 N.W. 2.d 322 (1972). See also People v. Griffin, 39 Mich.App. 464, 198 N.W.2.d 21 (1972).

In State v Carus, 18 N.J. Super. 159, 286 A.2d 740 (1972), Carus was convicted of violation of a motor vehicle statute which provided: "No person shall operate a motor vehicle on any highway while knowingly having in his possession or in the motor vehicle any narcotic drug within the meaning of section 24:18-2 of the Revised Statutes . . ." Section 24:18-2 defined narcotic drugs as including "coca leaves, opium, marijuana and every substance not chemically distinguishable from them." Citing empirical studies on the effects of marijuana and recent changes in state drug statutes, the court held that marijuana could not be classified as a narcotic drug within the meaning of the motor vehicle

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 451-1300

statute.

In Sam v State, 500 P.2d 291 (Okla.Ct. Crim.App. 1972) the defendant had been charged with possession of marijuana. At the close of the evidence the trial judge instructed the jury as follows:

> You are instructed that if you believe from the evidence in this case beyond a reasonable doubt that the defendant did . . . possessed (sic) a narcotic drug, to wit: marihuana, you shall find the defendant guilty as charged in the information. If you fail to so find, your verdict shall be not guilty.

500 P.2d at 296.

Sam argued on appeal that the trial court erred in instructing the jury that marihuana was a narcotic, and the Court of Criminal Appeals agreed. Citing State v Carus and People v McCabe, supra, the court concluded that "Marihuana is not a narcotic drug . . . and the trial court's instructions to that effect are error." Id. at 297.

More recently, last year the California Court of Appeal, in People v Ruiz, 49 C.A.3d 730 (1975), held that a provision of the Health and Safety Code, precluding parole consideration for five years for a person convicted of possession of marijuana, who had previously been convicted twice of narcotics violations, violated the constitutional ban against cruel and unusual punishments.

Finally, in State v Anonymous, 32 Conn. Sup. 324 (1976), the Connecticut court held that the classification of marijuana with barbiturates and amphetamines for penalty purposes in the state statute prohibiting possession of marijuana with intent to sell

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1400 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1500

was irrational and unreasonable, and therefore in violation of the equal protection clauses of the state and federal constitutions. Reviewing the testimony of expert witnesses and scientific studies and reports on the effects of marijuana, barbiturates and amphetamines, submitted by the defendant therein, the court concluded that "the overwhelming evidence presented to this court indicates that experimental, intermittent and moderate use of marijuana 'carries minimal risk to the public health' and 'neither the marijuana user nor the drug itself can be said to constitute a danger to public safety.'" Id. at 337 (footnotes omitted). The court went on to state that there was no state of facts which could reasonably be conceived to justify the statutory classification. Id. at 346.

The cases discussed above indicate that statutory marijuana prohibitions may suffer a number of constitutional infirmities. 9/ See generally, Soler, "Of Cannabis and the Courts: A Critical Examination of Constitutional Challenges to Statutory Marijuana Prohibitions," 6 Connecticut L. Rev. 601 (1974). With respect to the instant case, People v Ruiz, supra, and other recent California cases on the constitutional ban on cruel and unusual punishments, suggest that the constitutional prohibition may be applicable to the imposition of severe punishment for possession of a small amount of marijuana. See People v Anderson, 6 C.3d 628 (1972); In re Lynch, 8 C.3d 410 (1972); In re Foss, 10 C.3d 910

9/ See, also, State v Kantner, 53 Hawaii 327, 493 P.2d 306 (1972), cert. denied 409 U.S. 948 (1972); Downey v Perini, 518 F.2d 1288 (6th Cir. 1975), judgment vacated, case remanded to Sixth Circuit for reconsideration in light of amendment to Ohio Revised Code Section 2925.03, effective November 21, 1975, 44 U.S.L.W. 3330 (Dec. 1, 1975).

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY

TELEPHONE 452-1300

(1974); In re Rodriquez, 14 C.3d 639 (1975); In re Grant, 47 C.A.3d 927 (1975). Cf. Weems v United States, 217 U.S. 349 (1910); Trop v Dulles, 356 U.S. 86 (1958); Robinson v California, 370 U.S. 660 (1962); People v Lorentzen, supra. See generally, Comment, "Marijuana Possession and the California Constitutional Prohibition of Cruel or Unusual Punishment." 21 U.C.L.A. L. Rev. 1136 (1974).

These cases indicate that in determining whether the constitutional prohibition has been breached, the court must weigh the harmfulness of the conduct prohibited against the severity of the pubishment imposed. This analysis is particulary significant in circumstances such as those of the instant case in which the constitutional right of privacy is applicable, see Ravin v State, supra, Stanley v Georgia, supra, and where the burden on the government to justify intrusions on personal privacy in the home is, consequently, great. Thus, if the constitutional ban on cruel and unusual punishments is properly applicable in "civil" contexts, see, e.g., Meola v Fitzpatrick, 322 F.Supp. 878 (D. Mass. 1971), then the Governing Board's dismissal of Thomas Mann from his teaching position for his possessing a small amount of marijuana -- in effect, the banishment of Mann from his profession for conduct which may be constitutionally protected -- may well amount to a violation of Mann's rights under the Eighth Amendment to the United States Constitution and Article I, Section 17 of the California Constitution.

ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

D. OTHER RECENT CASES INDICATE THAT POSSESSION OF MARIJUANA IS NOT CONSIDERED A CRIME INVOLVING "MORAL TURPITUDE."

There are a number of recent cases from California and other jurisdictions which involve the question of whether marijuana offenses involve "moral turpitude," or similar language. In Vielehr v. State Personnel Board, 32 C.A.3d 187 (1973), where a tax representative trainee was convicted of the possession of marijuana outside of office hours, in violation of the Health and Safety Code, the court held that this conduct did not constitute such a failure of good behavior as to cause discredit to his employer, and that the employee should be reinstated. The court found no relationship between the tax representative's duties on the job and his possession of marijuana off the job. The court stated that private possession on marijuana, "without more, does not ipso facto cause discredit to the agency for which appellant works or to his employment." 32 C.A.3d at 194.

Two recent decisions from federal agencies are also applicable. The U.S. Energy Research and Development Administration, Personnel Security Board, has recently recommended unanimously that security clearance be granted to an individual who admitted the use of marijuana and other drugs, the sale of small quantities of these substances to friends for no profit, and the cultivation of less than ten marijuana plants. In the Matter of Richard J.D. ***, Findings and Recommendations issued November 13, 1975. At pp. 11-12 of the Board's Findings and Recommendation the Board stated:

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

> [T]he use of the aforementioned drugs, the use and sale of marijuana and hashish and the growing of marijuana plants are express violations of the criminal laws of the State of New Mexico. The Board does not approve of or condone the violation of those laws, however, the expert testimony presented to the Board establishes in the Board's opinion that neither the violation of those laws nor the use of marijuana and hashish cause the respondent to be unreliable or untrustworthy, not that he would therefore be a likely subject of coercion, influence or pressure which may cause him to act contrary to the best interests of the national security.

The U.S. Civil Service Commission's Federal Employee Appeals Authority, Philadelphia Office, has held that a civilian employee (tank cleaner) at the Philadelphia Naval Shipyard who admitted using marijuana was not disqualified under the Civil Service regulations. Appeal of Mr. * * *, PH Ø7315ØØ16, issued December 3, 1974. The Appeals Authority's decision stated at pp. 3-4.:

> It is the responsibility of the Commission to determine whether applicants and appointees are of good conduct and character, and it attempts to evaluate the qualifications and fitness of candidates and appointees in such a manner as to promote good government and yet assure fair, impartial and equitable treatment of individuals. Further, an employee must be evaluated with respect to the effect the particular offense will have on the service, i.e. a rational connection between the employee's conduct and the efficiency of the service.
>
> * * *
>
> The evidence of record also illustrates that there presently exists no rational connection between the appellant's conduct, i.e. continued use of marijuana while off duty, and his ability to more than satisfactorily perform the duties and responsibilities of the position in which he is presently employed, Tank Cleaner. We also find that the appellant's admitted conduct while off duty, and in light of the position he now occupies and performs satisfactorily, neither adversely reflects on the government as his employer for the present position, poses a threat to any other employee, nor threatens the employer-employee relationship.

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW

OAKLAND, CALIF
TELEPHONE 482-1300

See, also, In re Dileo, 307 S.2d 362 (La. 1975) holding that conviction for a failure to pay marijuana transfer tax did not consititute moral turpitude such that the petitioner should be banned from practicing law in the State of Lousiana; and Bush v Minister of Manpower and Immigration, No. A-79-74 (Canadian Federal Court of Appeal, Feb. 24, 1975), holding that possession of marijuana is not a "crime involving moral turpitude," which is one basis for deportation under the Canadian Immigration Act.

E. SCIENTIFIC STUDIES AND GOVERNMENT REPORTS ESTABLISH THAT MARIJUANA IS A RELATIVELY HARMLESS SUBSTANCE.

A number of major scientific studies and government reports on marijuana and other drugs have been published since this Court's ruling in In re Higbie, supra, that simple possession and use of marijuana, in and of itself, is not a crime involving moral turpitude. These studies and reports establish that the effects of marijuana are relatively innocuous, particularly when compared with the effects of other controlled substances such as narcotics and barbiturates. These studies and reports also confirm that marijuana presents no substantial danger to public safety, health, or welfare.[10/] The major findings of these studies and reports will be summarized below.

1. Reports of the National Commission on Marijuana and Drug Abuse

One month after Higbie was decided, the National Commission on Marihuana and Drug Abuse published its report, entitled

10/ See, also, the testimony of Dr. Richard Lance Christie, introduced by Thomas Mann in the Superior Court below.

TREUHAFT, WALKER, NAWI & HENDON

1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 482-1300

Marihuana: A Signal of Misunderstanding (1972). A copy of this report, with appendices, was introduced by Thomas Mann in the Superior Court below.

The National Commission was created by Congress in the Comprehensive Drug Abuse Prevention and Control Act of 1970, 21 U.S.C. §801 et seq., and given a broad mandate to study marijuana and other drugs, and then issue two reports to Congress and the President, the first on marijuana alone, and the second on all other drugs. See 21 U.S.C. §801 note.

The National Commission investigated many aspects of marijuana use, held hearings, both formal and informal, reviewed the research which had been done on marijuana in this country and in other countries, and itself commissioned more than 50 research projects in areas where additional information was needed. The Commission issued its report on marijuana in March, 1972. Among the significant findings of the report were the following:

> A large amount of research has been performed in man and animals regarding the immediate effect of marihuana on bodily processes. No conclusive evidence exists of any physical damage, disturbances of bodily processes or proven human fatalities attributable solely to even very high doses of marihuana.
>
> * * *
>
> These few consistently observed transient effects on bodily function seem to suggest that marihuana is a rather unexciting compound of negligible immediate toxicity at the doses usually consumed in this country. The substance is predominantly a psychoactive drug. The feelings and state of consciousness described by the intoxicated seem to be far more interesting than the objective state noted by an observer.

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 452-1300

> [In a study of very heavy marijuana use in Jamaica, no] significant physical or mental abnormalities could be attributed to marijuana use, according to an evaluation of medical history, complete physical examination, chest x-ray, electrocardiogram, blood cell and chemistry tests, lung, liver or kidney function tests, selected hormone evaluation, and psychological testing. There was no evidence to indicate that the drug as commonly used was responsible for producing birth defects in offspring of users

Marihuana: A Signal of Misunderstanding, supra, at 56-57, 63.

The Commission further concluded that use of marijuana generally does not cause any significant psychological disturbance or aberration. Id. at 59. When study subjects were given high doses of marijuana over several weeks, "no harmful effects were observed on general bodily functions, motor functions, mental functions, personal or social behavior or work performance." Id. at 60. Nor is there evidence that long-term use of marijuana directly causes alienation, "dropping out," or loss of motivation. Id. at 62. The studies failed to demonstrate any significant difference in mental or social functioning, occurence of psychosis, motivation, or behavioral changes between even very heavy, very long-term users of cannabis preparations and the non-using population. Id. at 63-64.

The National Commission recommended that the possession of marijuana for personal use no longer be a criminal offense. Id. at 152-154. After studying other drugs, the Commission then published its second and final report, entitled Drug Use in America: Problem in Perspective (1973). In this report, the Commission concluded:

TREUHAFT, WALKER, NAWI & HENDON

OAKLAND, CALIF
TELEPHONE 893-1300

1. The commission reaffirms its recommendations concerning marijuana as set out in its First Report.

2. The unauthorized possession of any controlled substance except marijuana for personal use should remain a prohibited act...

Id. at 467.

2. Report of the Canadian Commission of Inquiry Into the Non-Medical Use of Drugs

The Canadian Commission of Inquiry into the Non-Medical Use of Drugs also published its report on marijuana, Cannabis, in 1972. The Canadian Commission reached similar conclusions to those reached by the U.S. National Commission. The Canadian Commission stated:

> In summary, at typical doses of cannabis use, few acute physiological effects have been detected. Those which have been identified generally seem to have little clinical significance. Even at relatively high doses, few substantial physiological changes occur.

Id. at 114.

Both the Canadian Commission and the National Commission found that marijuana does not cause criminal or violent behavior, Canadian Commission Report at 110, National Commission Report at 73; does not lead to the use of other drugs, Canadian Commission Report at 130, National Commission Report at 88-89; is not a narcotic or addicting drug, Canadian Commission Report at 123, National Commission Report at 87; and posed no danger of death from overdose, Canadian Commission Report at 113-114, National Commission Report at 56-57.

3. Reports of the U.S. Department of Health, Education, and Welfare.

For the last five years, the U.S. Department of Health Education and Welfare has issued annual reports on the health consequences of marijuana use, as required by Title V of the Marijuana and Health Reporting Act, P.L. 91-296. These annual reports have confirmed the findings of the National and Canadian Commissions concerning the relative harmlessness of marijuana. Attached to this brief, as Appendix B, is a recent HEW publication which contains the 8-page summary of the most recent Fifth Annual Report, entitled Marihuana and Health (1975), and the comments of Dr. Robert Dupont, Director of the National Institute on Drug Abuse, at a press briefing releasing this report. Putting the health consequence of marijuana in perspective, Dr. Dupont stated:

> I would say that for all of the drugs we have mentioned there are many people who use them without suffering negative health consequences. For each of the drugs, there is a spectrum of negative health risks that a user takes...I would say today, at our current use levels and our state of knowledge, that there is no question that alcohol and tobacco are causing us far more health problems than marihuana does. There is no question on that point.

Id. at 9.[11/]

4. Report of the Domestic Council Drug Abuse Task Force

The Domestic Council Drug Abuse Task Force submitted a

11/ See, also, Marihuana and Health, Second Annual Report to Congress from the Secretary of Health, Education and Welfare, 111-132 (1972); Marihuana and Health, Third Annual Report to Congress from the Secretary of Health, Education and Welfare, 129-153 (1973); Marihuana and Health, Fourth Annual Report to Congress from the Secretary of Health, Education and Welfare, 93-121 (1974)

REUHAFT, WALKER, NAWI & HENDON

TELEPHONE 452-1300

Id. at 33. Excerpts from the Task Force's Report are also attached hereto as Appendix C.12/

12/ In the past few months, additional studies have been published which indicate that even very heavy use of cannibis over long periods of time does not have deleterious physiological or psychological effects. See, e.g., Mendelson, Behavioral and Biological Concomitants of Chronic Marihuana Use (U.S. Army Medical Research and Development Command 1974) [released to public in November, 1975], finding no significant adverse effects on physiological, cognitive or neurological functioning following chronic marijuana smoking, including no changes in testosterone level following chronic marijuana smoking.

Particuarly significant is a very carefully controlled study conducted in Jamaica for the National Institutes of Mental Health, United States Department of Health, Education and Welfare, in which the study subjects were thirty males who had smoked an average of seven marijuana cigarettes of relatively high potency each day for an average of seventeen years, and thirty controls. The results of the study support the findings of the National and Canadian Commissions: no significant physiological or psychological differences were found between long-term smokers and non-smokers, there was no evidence of physical dependency (addiction), severe overdose reactions, insanity, cerebral atrophy, brain damage, personality deterioration, or "amotivational syndrome." V. Rubin and L. Comitas, Ganja in Jamaica, 83-84, 150-151, 165-166 (1975).

1440 BROADWAY
OAKLAND, CALIF
TELEPHONE 465.1500

CONCLUSION

From the foregoing it is evident that considerations of law and public policy dictate that simple possession and use of marijuana cannot be considered a crime involving "moral turpitude." This Court has explicitly so held, In re Higbie, supra, and the trend in the legislatures toward drastic reductions in penalties for possession and use of marijuana is confirmation of the soundness of this Court's conclusion. Upon reviewing the scientific and medical evidence on the effects of marijuana, several courts have struck down statutory marijuana prohibitations as violative of constitutional guarantees. And the recent scientific studies and government reports on marijuana and other drugs demonstrate that marijuana is a relatively innocuous substance, the private possession and use of which poses no substantial danger either to the user or to the public health and safety.

Indeed, "measured by the morals of the day," In re Higbie, supra, 6 C.3d at 572, the suggestion that possession or use of marijuana is "an act of baseness, vileness, or depravity," id., is ludricrous. Attached to this Brief as Appendix D is a copy of a report of a recent survey on marijuana use in California conducted for the Drug Abuse Council. The survey indicates that almost three out of every ten California adults have tried marijuana, with nine percent of California adults currently using marijuana. With regard to current attitudes toward the marijuana laws, the survey indicates that 46% of California adults favor some form of elimination of penalties for sale and/or possession of small

TREUHAFT, WALKER, NAWI & HENDON
ATTORNEYS AT LAW
1440 BROADWAY
OAKLAND, CALIF.
TELEPHONE 452-1300

amounts of marijuana, while 19% favor the law as it now is regarding possession of small amounts of marijuana, and 29% favor stiffer penalties.

Thus, it is evident that an enormous number of people in California are "guilty" of exactly the same conduct for which Thomas Mann was prosecuted and later dismissed from his teaching position. Obviously, no other course of conduct carrying criminal penalties occurs so often, performed by so many people, as possession and use of marijuana. No other "crime" is prosecuted so rarely in relation to the number of times it is committed, and no other behavior is so obviously rejected as "criminal" by so many Californians.

Moreover, there was no credible evidence introduced at the trial as to Thomas Mann's "unfitness" to teach. Clearly, the fact of his conviction for possession of marijuana does not per se indicate unfitness to teach. In re Higbie, supra. The "experts" called as witnesses by the Governing Board were woefully deficient in their knowledge of marijuana and other drugs. They were subject to the kind of ignorance and misinformation regarding drugs and drug abuse which has stifled reasonable and informed discussion on the subject. See Bonnie & Whitebread, "The Forbidden Fruit and the Tree of Knowledge: An Inquiry Into the Legal History of American Marijuana Prohibition," 56 Virginia L. Rev. 971 (1970). Mann introduced evidence at the trial showing that his arrest and conviction has not impaired his ability to teach, and there is no indication that the events which took place in 1969 "have become

so notorious as to impair petitioner's ability to command the respect and confidence of students and fellow teachers..." Morrison v State Board of Education, supra, 1 C.3d at 237. Indeed, it would appear that Mann would better be able to teach about drug abuse after this incident: he is knowledgeable as to the relevant scientific and medical data, his teaching would not suffer from the hypocrisy which plagues so much drug abuse education, and he can describe the consequences of arrest and conviction from his first-hand experience.

Accordingly, amicus curiae NORML urges this Court to reverse the judgment of the Court of Appeal and rule that Thomas Mann's dismissal under Education Code Section 13403(h) was erroneous and improper.

NORML A SPECIAL REPORT

May, 1976

A COMPILATION OF STATE CITATION LAWS

FOR MINOR MARIJUANA OFFENSES

In October 1973, Oregon became the first state to eliminate criminal arrest and jail penalties for possession of small amounts of marijuana, substituting a citation-enforced civil fine. The results of this innovative approach have been overwhelmingly favorable: there has been no demonstrable increase in marijuana smoking; thousands of young people have been spared the debilitating aspects of a life-long criminal record; and the police have been freed of a costly and time-consuming burden to concentrate on serious crime.

As a result, seven other states have recently enacted similar laws: Alaska, Maine, Colorado, California, Ohio, South Dakota, and Minnesota. The provisions of these laws are summarized below, and copies are available from NORML. In each state, regardless of whether marijuana may now technically be said to be "decriminalized" or not, the person who smokes marijuana or possesses a small amount is no longer subject to arrest or jail, nor left with any permanent criminal record.

SUMMARY CHART - MARIJUANA CITATION LAWS

State	Max. Fine Imposed	Max. Amount Possessed	Criminal or Civil Violation	Effective Date
Oregon	$100.00	1 oz.	Civil	Oct. 5, 1973
Alaska	$100.00	Any amount in private for personal use or 1 oz. in public	Civil	Mar. 1, 1976
Maine	$200.00	Any amount[a] for personal use	Civil	Mar. 1, 1976
Colorado[b]	$100.00	1 oz.	Class 2 petty offense - no criminal record	July 1, 1975
California[b]	$100.00	1 oz.	Misdemeanor - no permanent criminal record	Jan. 1, 1976
Ohio[b]	$100.00	100 grams (approx. 3½ oz.)	Minor misdemeanor - no crim. record	Nov. 22, 1975
South Dakota	$ 20.00	1 oz.	Civil	April 1, 1977
Minnesota[b]	$100.00[c]	1½ oz.	Civil	April 10, 1976

a There is a rebuttable presumption that possession of less than 1½ oz. is for personal use, and possession of more than 1½ oz. is with an intent to distribute.

b Distribution of marijuana by gift, or for no remuneration, is treated the same as possession in four states: California (for up to 1 oz.), Colorado (up to 1 oz.), Ohio (up to 20 gr.), and Minnesota (up to 1½ oz.).

c Only Minnesota provides for increased penalties for second offense: 0-90 days in jail and/or a $300 fine for second offense within a two year period.

PROVISIONS OF STATE LAWS

	First Offense	Subsequent Offense
1. OREGON		
House Bill No. 2936, amending O.R.S. 167.207, effective October 5, 1973.		
Possession (Up to 1 oz.)	$100 fine only	Same

Note: Possession of up to 1 oz. of marijuana is considered a non-criminal "violation" with a maximum fine of $100, enforced by a citation system. Possession of more than 1 oz., cultivation, and sale of any amount, remain criminal offenses, subject to 0-10 years and/or $2500.

2. ALASKA		
Senate Bill No. 350, amending A.S. 17.10.010 et seq., approved May 16, 1975, effective September 1, 1975.		
Possession (any amount in private for personal use, or up to 1 oz. in public)	$100 fine only	Same
Possession (while driving a motor vehicle)	$1000 fine only	Same
Public use	$1000 fine only	Same

Note: The Alaska law is similar to the Oregon law in that it provides for civil fines enforced by citations. The Alaskan Supreme Court has generally held that possession of amounts up to 8 oz.—1 lb. are presumed to be for personal use. The Supreme Court of Alaska's recent decision holding that possession of marijuana by adults in the home is constitutionally protected by the Right of Privacy, appears to invalidate certain of the civil fines involved in the new law. Ravin v. State, 537 P.2d 494 (1975). Possession of more than 1 oz. in public remains a criminal offense, subject to 0-1 yr. and/or $1000. Sale remains punishable by 0-25 yrs. and/or $20,000.

	First Offense	Subsequent Offense
3. MAINE		
Maine Criminal Code revision, Title 17-A of Maine Revised Statutes Annotated, Chapter 45 et seq., approved June 18, 1975, effective March 1, 1976.		
Possession (any amount for personal use—see note)	$200 fine only	Same
Possession (with intent to distribute)	0-1 yr. and/or $500	Same
Sale or distribution	0-1 yr. and/or $500	Same
Sale or distribution (to persons under 16)	0-5 yrs. and/or $1000	Same

Note: Possession of any amount of marijuana for personal use is a civil violation, subject to a maximum $200 fine, enforced by citation. There is a rebuttable presumption that possession of more than 1½oz. is with an intent to distribute. A "usable" amount is required, and residue found in a pipe, or a few seeds, would not be sufficient. The new law also provides that as an alternative to the fines indicated above for sale, a fine of up to twice the "pecuniary gain" involved in the sale may be imposed.

4. COLORADO		
House Bill No. 1027, amending Sec. 12-22-401 et seq., of the Colorado Dangerous Drug Act, effective July 1, 1975.		
Possession (up to 1 oz.)	$100 fine only	Same
Public display or consumption (up to 1 oz.)	$100 fine mandatory and up to 15 days	Same
Possession (more than 1 oz.)	0-12 months and/or $500	0-2 years and $500-$1,000
Transfer "for no consideration" (up to 1 oz.)	$100 fine only	Same
Transfer of more than 1 oz. of of any amount to a minor	3-14 years and up to $10,000	Same (except prison term mandatory)

Note: Possession of up to 1 oz. of marijuana is a non-criminal "violation" punishable by a maximum $100 fine. Transferring not more than 1 oz. "for no consideration" is defined as simple possession, and is subject to the same $100 maximum fine. Transferring more than one ounce, or any amount to a minor, is subject to imprisonment for 3-14 years and up to $10,000. Cultivation is subject to imprisonment for 1-14 years and a fine of up to $1,000.

	First Offense	Subsequent Offense
5. CALIFORNIA		

Senate Bill No. 95, amending Sec. 11357 et seq. of the Health and Safety Code and Sec. 853.6 of the Penal Code, effective January 1, 1976.

Possession (up to 1 oz.)	$100 fine only	Same (see note)
Possession (more than 1 oz.)	0-6 months and/or $500	Same
Possession (hashish)	0-5 yrs. and/or $500	Same
Furnishing "without consideration" (up to 1 oz.)	$100 fine only	Same (see note)
Furnishing "w/c" (more than 1 oz.) or sale of any amount	5 years—life (must serve 3 years)	Same (must serve 5 years)

Note: Possession, furnishing "without consideration", and transporting up to 1 oz. is technically still a misdemeanor, subject to a maximum $100 fine and enforced by citation, although there is no permanent criminal record. If the person charged was previously convicted three or more times for these offenses within a two-year period, he shall be diverted to an educational or treatment program in lieu of the fine, and if no program can be found, the fine is imposed.

Cultivation of any amount remains a felony punishable by a jail term from one to ten years.

The new law abolishes the previous offenses consisting of (1) use of marijuana, (2) possession of marijuana paraphernalia, and (3) being in a place where marijuana is being used. The new law also requires that all records pertaining to the arrest or conviction for possession of marijuana be destroyed within two years, and that no public agency within the State shall deny or limit any license or privilege on account of a conviction for marijuana-related offenses.

	First Offense	Subsequent Offense
6. OHIO		

House Bill No. 300, amending Ohio Rev. Code Ann. Sec. 3719.01 et seq., approved August 22, 1975, effective November 22, 1975.

Possession (up to 100 grams) (up to 5 gr. hashish or 1 gr. hash oil)	$100 fine only	Same
(100-200 gr.) (5-10 gr. hashish or 1-2 gr. hash oil)	0-30 days and/or $250	Same
(200-600 gr.) (10-30 gr. hashish or 2-6 gr. hash oil)	6 mos.-5 yrs. and/or $2,500	1-10 yrs. and/or $5,000
(over 600 gr.) (over 30 gr. hashish or 6 gr. hash oil)	1-10 yrs. and/or $5,000	2-15 yrs. and/or $7,500
Gift (20 gr. or less)	$100 fine only (criminal record maintained)	0-60 days and/or $500
Sale (up to 200 gr.) (up to 10 gr. hashish or 2 gr. hash oil)	6 mos.-5 yrs. and/or $2,500	1-10 yrs. and/or $5,000
(200-600 gr.) (10-30 gr. hashish or 2-6 gr. hash oil)	1-10 yrs. and/or $5,000	2-15 yrs. and/or $7,500
(over 600 gr.) (over 30 gr. hashish or 6 gr. hash oil)	2-15 yrs. (6 mos. mandatory) and/or $7,500	2-15 yrs. (1 yr. mandatory) and/or $7,500
Furnishing to a Minor (who is at least 4 yrs. younger than the transferor)	6 mos.-5 yrs. (3 mos. mandatory) and/or $2,500	1-10 yrs. (3 mos. mandatory) and/or $5,000
Cultivation (any amount)	6 mos.-5 yrs. and/or $2,500	1-10 yrs. and/or $5,000

Note: Possession of up to 100 grams of marijuana (approx. 3½oz.) is classified as a "minor misdemeanor", as are possession of up to 5 grams of hashish or 1 gram of hash oil. There is no criminal record for these offenses.

Criminal penalties are maintained, though drastically reduced, for all sale offenses and for cultivation, as well as for possession of over 100 grams.

	First Offense	Subsequent Offense

7. SOUTH DAKOTA

Senate Bill NO. 29, criminal code revision, Chapter 22, approved February 29, 1976, effective April 1, 1977.

Possession (up to 1 oz.)	max. $20 civil fine	Same
(1 oz.-1 lb.)	0-1 yrs. and/or $1,000	Same
(1 lb. or more)	0-2 yrs. and/or $2,000	Same
Distribution (up to ½oz. without consideration)	0-30 days and/or $100	Same
Sale (up to 1 oz.)	0-1 yrs. and/or $1,000	Same
(1 oz.-1 lb.)	0-2 yrs. and/or $2,000	Same
(1 lb. or more)	0-5 yrs. and/or $5,000	Same

Note: Possession of up to 1 oz. is classified as a "petty offense", violations of which are enforced by "civil proceedings" in which the state may be "granted an award not to exceed twenty dollars."

8. MINNESOTA

H.F. No. 749, amending Sec. 152.15 of Minn. Stat. 1974, approved March 11, 1976, effective April 10, 1976.

Possession (up to 1½ oz.)	max. $100 fine only	0-90 days and/or $300
(over 1½oz.)	0-1 yrs. and/or $1,000	0-2 yrs. and/or $2,000
(over .05 oz. while driving a motor vehicle)	0-90 days and/or $300	Same

Note: Possession of up to 1½ oz. is classified as a non-criminal "petty misdemeanor" subject to a fine of up to $100 and participation in a 5-hour general drug education program if appropriate. A second violation within a two year period is classified as a "misdemeanor" subject to 0-90 days in jail, a fine of up to $300, and participation in a diagnostic examination for chemical dependency.

(continued on following page)

Minnesota, continued

The owner of a motor vehicle, or the driver if the owner is not present, who "knowingly keeps or allows to be kept" more than .05 oz. inside the motor vehicle (including the glove compartment, but excluding the trunk) is guilty of a misdemeanor, subject to 0-90 days in jail and/or a fine of up to $300.

Distribution of up to 1½ oz. by gift, or for no remuneration, is treated the same as simple possession (as in California, Colorado, and Ohio).

Penalties for sale are not affected, and remain 0-5 years and/or $15,000 for first offense, and 1-10 years and/or $30,000 for second offense.

Appendix B: Marihuana and Health: In Perspective

Summary and Comments on the Fifth Annual Report to the U.S. Congress from the Secretary of Health, Education and Welfare

MARIHUANA
AND HEALTH:
in perspective
Summary and Comments on the Fifth Annual Report to the U.S. Congress from the Secretary of Health, Education, and Welfare
1975

Foreword

Marihuana use, an issue once marked by emotionalism, is increasingly being examined thoughtfully. Much has been learned about marihuana use and its personal and social consequences. Yet, much remains to be understood. It is clear that marihuana is not a subject for simplistic analysis.

The current edition of *Marihuana and Health* represents the fifth in a series of annual reports from the Secretary of Health, Education, and Welfare to the Congress as required by Title V of Public Law 91–296. Last year, the fourth report in this series raised fundamental questions about the role of cannabis in altering the body's immune response, endocrine functioning, and basic cell metabolism. Although more data are now available, the direct health implications of these earlier laboratory findings are still not certain.

The *Marihuana and Health* Report does not give marihuana a clean bill of health as some would hope. Nor does it support the fear and irrationality that still characterize some of the public debate about marihuana. Instead, it is a progress report on our effort to understand a challenging health problem with immense social, political, and economic implications.

The Report is limited to a discussion of health issues and does not focus on the related social policy issues of decriminalization and law enforcement. Nevertheless, a discussion of any aspect of marihuana prompts concerns and questions about these broader public policy issues. Therefore, we have included a question and answer section from the *Marihuana and Health* Report press briefing to bring this added dimension to our dialogue. While it is important to understand the relationship between health and public policy concerns, it is essential to keep the health issue separate from decriminalization activities. Decriminalization at the State and local levels should not be interpreted as a signal that marihuana is safe.

So far, the public debate on the health aspects of marihuana has itself been misleading because too much of that discussion focuses only on biological changes resulting from marihuana use and not on the immediate hazards of marihuana intoxication. Although areas of serious concern remain, no convincing evidence has been uncovered to indicate permanent biological harm. On the other hand, the evidence on marihuana intoxication shows that it clearly presents a danger. Even with small dosage levels of marihuana, psychomotor performance is impaired.

Such intoxication can have dangerous consequences in such areas as traffic safety and job performance. Even intellectual performance, and in particular, immediate memory, are also impaired while under the influence of marihuana.

Currently 33.6 million Americans have used marihuana and 13.3 million continue to use it on a regular basis. This should cause all of us to rethink the consequences of increased marihuana use. We hope this summary of the *Marihuana and Health* Report will be useful to that end.

Robert L. DuPont, M.D.
Director
National Institute on Drug Abuse

Press Briefing: General Observations

In terms of the public's concern about marihuana and the health consequences, the primary concern appears to be: What does marihuana use do to the body? What are the long-term consequences? There are a number of ways that question gets formulated. One of the most major concerns has been the concept of progression from one drug to another—the idea that somehow if a person uses marihuana, he will go on to use other, presumably more dangerous, drugs. We've had some research reported in the last year that is very interesting on this point. And just to make a very brief summary of that: There are clear stages in drug-using behavior, but this progression does not appear to start with marihuana. Marihuana is a link in a chain, or a step in a stairs if you will, and not unique in itself. It appears that young people, as they are going through adolescence, begin their drug consumption with beer and wine. Following that step, there's a next step in two directions; one is to cigarettes and the other is to hard liquor. The next step for both groups, if the young person goes on, is almost inevitably to marihuana use. Many people, of course, stop at any one of these steps, but for those who continue, the next step is to other illicit drugs—most often tranquilizers, amphetamines, and barbiturates. Then—for those who go on—the next step is to LSD and other hallucinogens, followed by the final step in this progression to the use of what are generally known as the hardest drugs, heroin and cocaine. Similarly, it's interesting that as young people or any people are giving up drug use at each of these steps, they tend to go back down the same series of steps in the reverse order. A person who is giving up heroin tends to do that and comes back down the steps to the use of other illicit drugs, including marihuana, hard liquor, and tobacco, to beer and wine. So our earlier assumptions that there were no stages or progression have not been confirmed. It does indeed look like there is a predictable progression.

The second point in this area has to do with the heavy consumption problem. Here I think we have some new data that are of concern. It appears that people who are using marihuana have somewhat more difficulty limiting their consumption than many of us would have thought. [The statistics show that in contrasting frequent marihuana use with alcohol use,] . . . only 9 percent of the people who had used alcohol at all had used it as many as 20 times, whereas among the marihuana users, this figure was 22.5 percent. This means that almost one-fourth of the people who had used marihuana at all had used it about 20 or more times. That's clearly different from the pattern with alcohol. It is much more like the pattern with cigarettes where about two-thirds of those who had used that drug at all reported using it on a daily basis, or the drug heroin where 33 percent who had used it at all reported use on a daily basis. . . . so that the issue of a progression to very heavy use is one that we are concerned about.

Finally, I will just say a word about the marihuana intoxication area. In our preoccupation with looking for long-term permanent health consequences, we have overlooked the fact that the marihuana user, while using the drug and in the immediate hours after using it; does have a performance deficit associated with the intoxication that is not too different in terms of its effect on performance from that produced by alcohol. Oftentimes, the

accounts that are carried in the press emphasize the absence of negative health consequences. I am concerned that by this process we reinforce the concept that the marihuana user doesn't have to worry about the intoxication effect. There is clearly a problem here that must be of concern to the individual. Of course, most users understand this in the area of driving, the performance in industrial settings, or any other settings which require attention, adequate motor performance, and intellectual performance. These are temporary changes, but nonetheless they are very important. I reviewed the very high levels of marihuana use, particularly in the youth population, and am very gravely concerned about motor vehicle accidents in that population.

Well, with that as a very brief summary, I'm open to questions.

Press Briefing: Some Questions and Answers

Question:

Dr. DuPont, I would like to frame this question very precisely so that we will both be talking about the same thing. Yesterday, in New York, the American Cancer Society released a survey of the smoking habits of teen-aged women, 15–18, and compared it with 1969. They found that not only are more women and more girls smoking but they are also smoking more. Now, taking into account the way that these two drugs, tobacco and marihuana, are normally used, which is the greater public health menace?

Dr. DuPont:

At the current use levels, obviously cigarette smoking is causing more health problems than marihuana. I think, though, that you point out something that I meant to cover in my presentation. These behaviors are linked so that, in fact, this rise in marihuana use among youth, which I described, has also occurred for cigarettes and alcohol and other drugs. The use levels of these drugs have all advanced as a front, and when they go down, they go down as a front also. We once thought that they behaved like a teeter-totter. For example, if a person were using alcohol, he would not also be using marihuana, and the other way around. This is not the case. People who use alcohol tend to use more marihuana; people who use cigarettes tend to use more marihuana; people who use more marihuana are more likely to smoke cigarettes and use alcohol. That is, all drug-using behaviors are linked.

Question:

Dr. DuPont, what is your position on decriminalizing the use of marihuana? Do you fully agree with that?

Dr. DuPont:

I find the word "decriminalizing" one that confuses communication rather than promotes it. So I am going to do my best to avoid using that word, and instead of using the word, I'll describe the concept. With respect to what penalties are talked about when we talk about lessening, there is room for some difference of opinion—some range of ideas. Let me describe briefly what it is I am talking about. A few years ago, there was a very polar extreme in this country in thinking about penalties for marihuana possession ranging from legalization, that is, making it as available as we make cola or cigarettes in this country, to locking possessors up and throwing away the key on the other extreme. We have progressed a long way since then, and the current debate in the United States is very narrow in terms of what the right penalty ought to be for marihuana possession. If I can state it this way, on the extreme of the hard-line view about this is the use of very short prison sentences. For example, S. 1., the new reform legislation in the Senate now includes, as I understand, up to 30-days imprisonment for

marihuana possession, which is a very light penalty. That now represents one extreme. The other extreme is the policy that has been adopted by a number of States to substitute fines for imprisonment. Personally, my view on this is that we do not need to threaten young people with imprisonment to discourage their use of marihuana, and that we should substitute in place of imprisonment a fine, a monetary fine that signals to the public that we as the Government and as a country are opposed to the use of marihuana, but that we do not consider the possession of small quantities for personal use the kind of problem to be dealt with by putting people in prison. For some people that means decriminalization and for others it doesn't. I know I have been too long on this, but one last point. We talk about six States in the United States that have "decriminalized" marihuana. I call your attention to the fact that two of those States, Ohio and California, continue to use the criminal law but have substituted a fine within the criminal law. This is a very complex distinction for some very high-powered lawyers to start making. The point I want to make that does not require the understanding of a high-powered lawyer is that we want to get away from using prison or the threat of prison for the simple possession of marihuana.

Question:

Can we go over again your views on—I won't call it "decriminalization"—what should be done to someone who is arrested for possession of a small amount of marihuana? And what should not be done?

Dr. DuPont:

Yes. There is now a very broad consensus in the United States that marihuana use should be discouraged and that the Government's role is to discourage marihuana use. But there's a question about how the Government does that. Basically, I think most people agree that it does not make sense to put people in prison for the possession of small amounts of marihuana. To some people, that means "decriminalization." I, myself, support the concept of the use of a civil fine, a noncriminal fine of a modest kind, something in the range of $25.00, to convey the message that marihuana use is prohibited behavior, but also not to threaten the young people with a criminal record or incarceration. There is some variation from State to State on that, but I think it is a position that has very broad support throughout the country.

Question:

Do you think that we are getting closer to seeing this?

Dr. DuPont:

Oh yes, it's happening across the country right now. There are six States that have substituted nonimprisonment penalties, and I think there will be more. The problem is that the word "decriminalization" has gotten to be kind of a buzz word—a scare word—that politicizes people and induces a kind of fighting, contentious attitude. That's probably the biggest problem we have right now. We should step aside from that and ask, What do we really want to do to the person, young or old, who is caught with small amounts of marihuana? What should happen to him? When we get to this question, there is very little feeling that that person ought to go to jail.

Question:

(A question about the consequences of marihuana and alcohol use.)

Dr. DuPont:

This is the thrust of the question about cigarettes. I would say that for all of the drugs we have mentioned there are many people who use them without suffering negative health consequences. For each of the drugs, there is a spectrum of negative health risks that a user takes. Marihuana has some of the negative characteristics of both alcohol and tobacco. That is, it is taken in the lungs, so it has the respiratory irritating effects, including the bronchitis and, potentially, the lung cancer problems associated with cigarettes, plus it has the negative intoxicating effects of alcohol. I'll tell you one difference that is very striking: the overdose potential of alcohol. Alcohol really does kill people from overdoses through respiratory suppression. The public does not understand this, but many people are dying from overdoses of alcohol. Marihuana is not that kind of a drug—in fact, the single most striking characteristic about marihuana is the low toxicity in terms of death. It is virtually impossible to die from an overdose of marihuana. So I would try to avoid comparing the drugs because I don't think we know enough about marihuana. I'm as concerned about the potential danger of marihuana as I am about cigarettes and alcohol. I would say today, at our current use levels and our state of knowledge, that there is no question that alcohol and tobacco are causing us far more health problems than marihuana does. There is no question on that point. The question of the potential and the question of new knowledge leaves open the door to the possibility that consequences of marihuana use will be much more serious than we know now. But on the basis of our present facts, it's clear that those traditional drugs cause more health problems than marihuana does.

Question:

Dr. DuPont, you have an interesting chapter in this book on therapeutic aspects, and you do point out that it is likely that if cannabinoids become standard medicine, they would be synthetics rather than derivatives of the natural thing. But, at any rate, do you see any likelihood in the near future of rescheduling cannabis from schedule 1, which states that there is no therapeutic use, to perhaps schedule 2?

Dr. DuPont:

I can imagine rescheduling cannabis. Yes, that's not inconceivable at all. In fact, one of the things we want to do is to apply the routine standards to cannabis. The Government, in the last few years, has gone through a very great, wrenching crisis around the issue of drug use. One of the things we have done through the Controlled Substances Act is to establish some criteria for handling drugs in a rational fashion. I think it is time to apply the same rational decisionmaking to cannabis and to other drugs that we apply to the more conventional pharmaceutical products. That's a process that I very much support. Now let me describe the therapeutic status of marihuana. It is in an investigational status. While it remains in an investigational status, there is no reason for rescheduling it. I can imagine, in the not too distant future, there being approved uses for products derived from or similar to the products that are in marihuana. When that happens, and I think it probably will, that will be the time, it seems to me, to act in terms of rescheduling. We should treat this not in a scary, politicalized, emotion-laden way but treat it just as we would any other pharmaceutical product. After all, opium is the substance that scares the heck out of most people, and yet we use codeine routinely in the United States. Codeine is a product that is derived from opium; heroin is also derived from opium. We don't

want to use heroin, but codeine we do use. And I think the same kind of evolution will go on with marihuana.

Question:

Dr. DuPont, could you succinctly restate what you were saying about the lethal effects of alcohol and tobacco compared to marihuana?

Dr. DuPont:

We have clear evidence of the lethal effects of alcohol and tobacco—alcohol through the overdose effects as well as obviously through intoxication. The overdose effect I'm talking about occurs when people take so much alcohol that their respiratory center is suppressed and they die of the overdose. We do not have any similar evidence for marihuana. In fact, we know that marihuana is not a drug that is susceptible to causing death even in extreme situations. One of the most striking characteristics of marihuana is its freedom from this kind of lethal toxicity.

Question:

Dr. DuPont, the United States Government and society are perfectly happy to allow people to make the decision for themselves with regard to alcohol and tobacco. We know that it is bad for us—we are told that it is bad for us. Why this terrible resistance to something that you've just said we know is not as lethal as tobacco and alcohol?

Dr. DuPont:

Well, it is a great wonder to me how we approach the issue of safety in this recreational drug field. The argument generally goes something like this: If everyone who uses it doesn't keel over, then we must let people make individual decisions. Let me show you another area that is related to that but to which we apply a totally different scale. That's in the pharmaceutical area. We are talking about drugs that are used by the American public. If we find a negative health consequence to a pharmaceutical substance such as the antibiotic, chloramphenicol, a useful antibiotic which produces negative consequences in 1 per 10,000 cases, the drug is removed from the market. For example, there is an argument right now about removing birth control pills from the market because they produce thromboembolism in 1 or 2 or 3 in 10,000 cases. We're not talking about giving people the right to decide individually whether they use these drugs; we're talking literally about taking the drugs off the market. And, yet, here in this other area, we've got a whole different view of the issue of safety. Now I don't know how to put those two things together, but there's obviously something to be said for thinking about risks. Just because we allow people to take risks with one substance, or several substances, is not a very good argument to have more of that go on. On the other hand, it is a good argument for not putting people in jail. I think we can deal with chloramphenicol or with birth control pills without putting the users in prison! And I think that similar kinds of regulatory approaches make a lot of sense for cannabis and for alcohol and tobacco.

Question:

Dr. DuPont, what kind of ammunition does this report give to a parent of a teenaged child to discourage him from consuming marihuana for purely health reasons if the use is recreational, infrequent, not taken before an

examination, or while driving. What ammunition does this still give to the parent of that teenager to discourage the use, and if you were the parent of the teenager and your child came home and said, "I'm going to take one of the three—booze, cigarettes, or marihuana," which one would you choose for your child?

Dr. DuPont:

Well, I think that a parent in relating to a child really has to approach the drug problem as a whole and not pick out any particular drug. One should recognize the fact that the child is going to be exposed to a wide variety of substances, both legal and illegal, and that many children will use a variety of these substances. I think it's important for the parent not to get so terribly uptight about whether the child does or does not use any particular drug once or twice, or even a number of times, recreationally. This is certainly the approach I have to my children, although they are a little young for that, the oldest being 10. The parent should talk with the young person about the consequences of the decisions that he or she is making, and will have to make, in the context of his adolescence. And personally, my advice with respect to any of these substances—if you are not using them—I would recommend that you not begin. Drug use is expensive, it's messy, it's of very limited value in terms of the person's lifestyle, and there are serious health risks associated with all the drugs. On the other hand, I think that if a person does decide to use them, and this applies to my children or myself or anyone in my family, I would say to use as little as possible and as responsibly as possible. Now with respect to my family and all of us, unfortunately everybody does not have the ability to control their consumption of these drugs the way they would like. This is the point I was making about marihuana earlier, about the likelihood of going on to heavy use. The same thing is true of alcohol, as many of you know. Not all people can control their consumption of alcohol. Before they start using alcohol, there is no way for them to know that it can have a very disastrous effect—they may be one of those who cannot control their consumption. So I would say that this is one of the things that I'm concerned about. If a young person does use any of these drugs, then I want to help him in a nonhysterical, nonscary way, to use them responsibly. I would encourage him to use less of them. But that, I think, is an individual matter. I think we have got to get into that frame of mind and out of the hysterical-scare approach. Rather than seeing things as extreme, I've heard people say, "Well, if my child used one marihuana cigarette, I'd throw him out of the house." I think that's ridiculous. If a parent thinks a little about that, he would appreciate how ridiculous that approach is. Parents of teenaged children are not unfamiliar with these kinds of problems, not that they like them, but they can't avoid them. The same kinds of issues come up about work, about sexuality, about friends. They are all very complex issues for a young person who is deciding who he is and how he is going to conduct his life.

Question:

(Question about young people's attitudes toward drug penalties.)

Dr. DuPont:

Well, I wish I had the study with me about this, but I don't. One of the things that you find, even in young people, is the remarkable polarization on these subjects with amazing percentages favoring relatively harsh penalties for users of these drugs. I've never quite understood that, but the polarization that goes on in American society is not just limited to older people but

goes on in youth as well. Obviously, the users tend to have a much more lenient attitude than nonusers on the question of penalties for use. I can get you some statistics; I don't have them with me. We have very good data on precisely what the public attitudes are in various age segments toward the issues of legality and drug-using behavior. I think, though, one point that may need emphasizing is that there is a tendency to get very discouraged about the news of the continual rises in drug use; for example, the recent news of women smoking more cigarettes, and the marihuana use data for youth. There is another side to that. A lot of young people are coming to a more sophisticated view of what drugs are and what their lives are all about than ever before. In the long run, this is going to be a very positive evolution for our society. It will be good for all of us to think a lot more soberly about all of our drug consumption. We must not compartmentalize it into "our" drugs and "their" drugs.

MARIHUANA AND HEALTH, 1975: SUMMARY AND OVERVIEW

EXTENT AND NATURE OF USE

Present evidence indicates that cannabis use has significantly increased among Americans during the last two years.

Throughout most of its history American marihuana use has consistently involved a minority of any national age group; however, the most recent national survey data indicate that in the 18-25 age group a majority (53%) have now tried the drug, up from 48% in 1972. Among those surveyed under 18, nearly one in four (23%) has ever tried marihuana -- an increase from the one in seven (14%) who reported in the 1972 survey ever having done so.

Current use -- defined as use within the past month preceding the survey -- has also significantly increased among those under 18. Seven percent reported such use in 1972, 12% did so in the most recent survey. There does not appear to have been a similar increase in such use among those over 18 -- among whom current use has remained the same or has slightly diminished depending on age, since 1972.

When questioned regarding their plans for future use, one third of those who have used marihuana indicate they definitely intend to do so again. Another third of this group indicate they might do so. Slightly smaller numbers of adults than of youths indicated their intention to continue use (1-1).

While there has been an increase in use by high school and junior high school age groups (attested to by both local and national survey results), future trends of marihuana use in America continue to be uncertain. Despite the other increases noted, use among adults has not increased. In part, this may be explained by research reported in the fourth Marihuana and Health report: changes such as marriage, parenthood and the assumption of other adult roles are inimical to continued marihuana use.

Support for the above interpretations is also found in data garnered from research conducted on a national sample of 20-30 year old men. This nationwide survey found that even within this restricted age group, larger proportions of the men in the younger subgroups used marihuana than did those who were older. Men pursuing more conventional life styles in that they were married and employed full time, were considerably less likely to be using marihuana than were either the unmarried or the unemployed (1-23).

Although there is good evidence of a continuing increase in marihuana use among younger people, there is little indication that such use has come to involve a significant proportion of the older population. For example, if we examine the behavior of those ages 26-34, in contrast to the 18-25 age group less than one third (29%) have ever used marihuana compared to over half (53%) of the younger group. One in four of the 18-25 group had, in fact, used in the month preceding the survey but less than one in twelve (8%) of those 26-34 had done so. In still older age groups use is even less common. Only 7% of those between 35-49 have ever used and only 2% of those over 50 have ever done so. Less than one in one hundred of the over 35 group had used during the month prior to the interview (1-1).

Despite the indications that marihuana has not become popular with older groups and the evidence that its use may be diminished as adult roles are adopted, any prediction regarding the future of cannabis in American society must be hedged with caution. A Gallup poll conducted in 1967 among college students indicated that only one in twenty had ever used the substance, but by 1974 over half (55%) reported use in the Gallup survey (1-9). In seven years, what was once clearly statistically deviant behavior has become the norm for this age group. While in previous years use was correlated with level of education, the percentage now reporting marihuana use is virtually identical for high school drop-outs, high school graduates and college graduates in similar age ranges.

National trends and use patterns mask distinctly different patterns in particular communities or geographical areas. In one Northern California county in which a survey of junior and senior high school students has been conducted each year since 1968, even the earliest findings indicated over one quarter of the ninth grade males (27%) had had some experience with marihuana during the previous year. Among male seniors nearly half (45%) reported use in the year preceding. Current (1975) comparable figures are now 49% for ninth graders and 64% for senior boys. However, the percentage reporting use on 50 or more occasions in the previous year has not markedly increased for the past five consecutive years (1971-1975) (1-4).

During the past five years since the first Marihuana and Health report, cannabis use in the United States has changed in character. Originally marihuana's popularity was concentrated among young people associated with a "counter culture." It was regarded as symbolic of their opposition to traditional values and to the prevailing political climate (Cf. the first Report, 1971).

*Numbers in parentheses refer to the several technical chapters and their lists of references. Thus, 1-1 refers to reference one in Chapter 1. This is the specific study from which the data are abstracted.

As use has spread to involve larger numbers and to more conservative segments — it has now been experienced by a majority in many groups — it has lost some of its nontraditional, antiestablishment symbolism. Early use often involved opposition to more traditional alcohol use. Now those who use marihuana are also very likely to use alcohol -- frequently simultaneously. Marihuana use seems unlikely to displace more traditional alcohol use even among the young. Continuing research on patterns of multiple drug use and drug using contingencies may better enable us to predict both individual and group drug use.

Use patterns in other countries, even those in which cannabis use has been endemic for many years, provide few clues to future use in the United States. In other countries use is typically class related with the lower classes, the traditional users. While in some of these countries of traditional use there are now middle or upper class users, such users seem to have adopted marihuana as part of an international youth culture rather than by diffusion from native users. Expectations with respect to drug effects also differ in that traditional users do not share the recreational orientation that characterizes American users.

CHEMISTRY AND CHARACTERISTICS OF CANNABIS

Although a detailed discussion of developments in cannabinoid chemistry is of primary interest to the specialist, there is a range of developments of more general interest. The plant, cannabis sativa, far from being a simple substance is, in fact, chemically quite complex. The last several years of research have resulted in an increasingly sophisticated knowledge about this complex substance. There is a growing awareness of the need to much more adequately describe several major cannabis constituents if we are to adequately specify the nature of the material. The United Nations has now recommended that all research reports on cannabis describe not only the amount of delta-9-tetrahydrocannabinol (the major psychoactive ingredient) but that of cannabidiol and cannabinol as well.

The ability to synthesize various chemical components of marihuana as well as the drug's metabolites (i.e., compounds resulting from the biological transformation of the originally ingested material) is a significant advance. Availability of such pure substances provides researchers with necessary materials for careful study of the physiological role of marihuana's various components.

While primary interest has tended to center on delta-9-THC because of its role as the principal psychoactive ingredient in cannabis, the part played by several other ingredients may be important in producing other cannabis effects. These other ingredients alone or in combination, may account for possible adverse health consequences or contribute to the possible therapeutic usefulness of the drug.

The detection and analysis of marihuana in body contents such as blood, saliva, urine and breath is a problem important both to basic research and to forensic medical applications. For research, it is important to develop methods that accurately determine how much smoked or otherwise ingested marihuana actually becomes physiologically available. These amounts may be substantially different than the amount ingested because of losses that occur in consuming marihuana, delayed bodily absorption, and individual differences in ability to metabolize the drug.

In the clinical setting, appropriate treatment of the unconscious patient brought to the Emergency Room following an accident may be dependent on knowing whether he or she is marihuana intoxicated. In other medical situations being able to determine with certainty the level or fact of being intoxicated may make the diagnosis of the patient much easier.

The general increase in marihuana use has undoubtedly brought with it an increase in the numbers who drive while cannabis intoxicated. Recent evidence (Cf. Driving Effects) further confirms cannabis adversely affects driving. Thus, there is a real need for the development of one or more roadside methods that can be rapidly employed in much the same way as current tests for alcohol intoxication.

Although simple, rapid detection methods are badly needed, detecting marihuana use is inherently much more difficult than detecting alcohol use. The quantities of drug involved are much smaller and they are very rapidly transformed into metabolites which differ chemically from the originally consumed material. As with alcohol, it is important to quantify the level of use for all of the purposes outlined. During the past year considerable progress has been made in improving detection techniques.

In addition to newer, thin layer chromatography and high pressure liquid chromatography methods, two other techniques have shown unusual promise. Radioimmunoassay (RIA) is a technique in which an antibody specific to a drug or its metabolites is developed and then "tagged" by means of a radioactive molecule in its structure. When a solution of the tagged antibodies and of the body fluid in which the drug to be detected is made, the radioactive markers are displaced proportionately to the drug quantity present. The accuracy of RIA is now being compared with that of more cumbersome procedures.

A second technique under development is called the enzyme multiplied immunoassay test, or EMIT. The antibody reaction which is its basis is similar to that used in the radioimmunosassay technique. EMIT has the added advantages of involving less work, less sophisticated equipment and is more rapid thus making it more suitable for

rapid screening. Field trials on EMIT are ongoing.

A third method which also shows promise of shortly becoming available is likely to be most useful for traffic safety purposes. It utilizes breath samples in a manner roughly analogous to present roadside alcohol intoxication detection.

As has been repeatedly emphasized, marihuana and hashish vary widely in THC content and thus in their ability to intoxicate. This variability results from differences in plant genetic origin, conditions of cultivation and preparation of the material including the degree of concentration of leaves and flowering tops. A relatively recent addition to the illicit market is hashish oil, a substance having a THC concentration of 40-50% as compared to the 1-2% THC content of most marihuana ordinarily available in the United States. Increasing availability of such more potent cannabis preparations may have quite different implications from the more commonly used, weaker preparations that have been available in the past. Use of stronger material, particularly by relatively naive users unaccustomed to its effects, is considerably more likely to result in acute panic and other adverse reactions. Stronger cannabis and cannabis derivatives used under conditions in which the dose is more difficult to control, may also result in marked impairment in driving or other complex psychomotor skills. Such unexpected effects could have serious implications.

ANIMAL RESEARCH

A wide range of research on the effects of marihuana has been conducted with animals because their genetic and learning histories, unlike those of humans, can be accurately specified. Animal models also permit the use of high doses and other procedures not possible in human research. Apart from studies of various physiological effects of the drug which have been discussed primarily in relation to human findings, there are some behavioral observations in animals that are of interest.

Because there has been some question about the role of marihuana as a possible releaser of aggression, studies of animal aggression following marihuana or THC administration have been done. Generally, these drugs have been consistently found to suppress aggression when the animals are not under stress. When animals are stressed by a variety of means (e.g., food deprivation, sleep deprivation, morphine withdrawal, etc.) THC or marihuana tends to increase aggression.

The results of behavioral studies in animals suggest that the effects of cannabis on aggression may be complexly related to the degree to which the animal is subject to stress and the length of time over which it has received the drug. The degree to which these observations are relevant to human behavior is unknown although they do provide a basis for devising related human studies.

In an experiment which studied monkeys in three to six member social groups several changes of interest were found. Given oral doses equivalent to very heavy human cannabis use, the monkeys responded much like humans. They slept and rested more frequently; active social interaction such as grooming of others was reduced. Over more extended periods of administration, the monkeys gradually showed less and less of these effects. While aggression was initially reduced, after receiving THC for weeks or months during the year-long study the monkeys became irritable and aggressive (hitting, biting, chasing behavior increased). There was no evidence of the reduction in testosterone levels that has been reported in humans nor were menstrual cycles of females apparently disturbed (4-67).

More detailed discussion of the extensive research that has been done with animals is to be found in the technical chapters of this report.

HUMAN EFFECTS AND HEALTH IMPLICATIONS

Effects of marihuana can conveniently be divided into: 1) the acute effects of cannabis intoxication and 2) the longer range consequences of regular or chronic use. It is considerably easier to study acute effects and so after eight years of intensive investigations many, if not most, of these effects have been elucidated.

Human Acute Physiological Effects

An increase in heart rate and a reddening of the eyes have been the most consistently reported physiological effects of marihuana. Heart rate increases are closely dose related. Early awareness of this marihuana-induced tachycardia created concern over possible adverse cardiovascular effects of the drug especially in those with coronary disease. Several reports issued in the past year have confirmed a preliminary finding from last year. Marihuana use decreases exercise tolerance prior to the onset of chest pain (angina) in those with heart disease (7-137, 3, 4). Use by those with already existing cardiovascular deficiencies, therefore, appears to be unwise. The contrasting finding that marihuana produces minimal changes in heart function (aside from a rate increase) in young, healthy men illustrates that the drug's effects may significantly differ in persons with pre-existing medical problems from those in normals.

A number of reports have confirmed and extended initial evidence that smoked marihuana when acutely administered, results in improved pulmonary function as measured by bronchodilation (7-156, 157, 158). Optimism created by this finding has since been tempered by evidence that under conditions of more chronic use pulmonary function is impaired, rather than enhanced (7-62).

Evidence that marihuana and especially its principal psychoactive ingredient, delta-9-THC, are effective in reducing intraocular pressure in both normals and in glaucoma patients has been further confirmed. While some question exists whether this effect is due to a nonspecific drug-induced relaxation shared with other sedative drugs or to a more specific marihuana reaction, more recent evidence suggests it is THC-specific (Cf. Therapeutic Aspects).

Understanding of the metabolism and the mechanisms of action responsible for various marihuana effects has increased although many questions remain open.

More sophisticated attempts to measure various aspects of psychological and psychomotor performance have been generally consonant with subjective reports. Impaired memory, altered time sense and performance decrements on a variety of tasks have been experimentally confirmed. Generally, the more complex the task, the greater the degree of disruption produced by acute intoxication. Tasks which are relatively simple and with which the person is familiar are minimally affected. As the task becomes more demanding and novel and/or the dose of drug increases, performance decrements become larger. At lower doses, evidence confirms users' assertions that they are often able to "suppress the marihuana high" when the situations so demand.

Although users have reported enhanced auditory, visual and tactual awareness and sensitivity, experimental research has not confirmed these reports.

Driver Performance and Traffic Safety

Because of the prominent role the automobile plays in our society, the possible implications of marihuana intoxication for traffic safety have been emphasized. Early reports were more optimistic about driver performance than recent evidence. Those consuming alcohol to the level of legal intoxication were originally found to make significantly more driving errors in a driving simulator situation than those who had consumed a "social dose" of marihuana. While the marihuana-intoxicated subjects indicated that their driving performance was affected, they felt they could compensate by driving more slowly and cautiously.

Present evidence, whether derived from driver test course performance, from actual traffic conditions or from the experimental study of components of the driving task, all indicates that driving under the influence of marihuana is hazardous (7-90). The increasing simultaneous use of both alcohol and marihuana by drivers poses a threat that may well exceed that of either substance alone. While the parameters of risk connected with the use of marihuana alone or in combination with alcohol prior to driving are not yet known, discouragement of such use appears justified. A more accurate determination of the extent of risk involved in the various levels of intoxication would be desirable. Such studies are complicated by individual differences but are by no means impossible to execute.

Although there has been little systematic study of the relationship of marihuana smoking to possible pilot error, evidence related to driving is at least partially germane. Such skills as detection of peripheral stimuli and complex psychomotor coordination involved in driving are probably equally important in flying. In fact, the inherently greater complexity of flying suggests that performance is even more likely to be impaired under conditions of marihuana intoxication than is driving. Only one preliminary report of pilot performance has appeared in the research literature. This report indicates that under flight simulator test conditions experienced pilots show marked deterioration in their performance while marihuana intoxicated (7-103). More detailed studies are planned to better understand the nature of the performance deficits produced and their duration. A danger common to both driving and flying is that some perceptual or other deficits may persist for some time beyond the period of subjective intoxication. Under such circumstances an individual may attempt to fly or drive without realizing that his functioning is still impaired although he no longer feels "high."

Chronic Use-Special Problem Areas

Last year's report singled out several special problem areas involving potentially serious adverse consequences of chronic cannabis use. Subsequent research has not definitively resolved the questions raised but has expanded our knowledge base.

Some apparent inconsistencies in research findings regarding reduced plasma levels of the male hormone, testosterone, may be explained by the differing length of time users had been smoking before such levels were assessed. For example, the findings of one study that did not show a decrease during a several week period were matched by those in another study in which there were early negative findings. However, after four weeks elapsed a definite drop occurred (7-100). The decreases that have been found have still been within what are generally conceded to be normal limits. Their biological significance remains in considerable doubt. A preliminary finding that a marked reduction of sperm count (58%) occurred in five cannabis smokers following controlled conditions of smoking has been reported (7-171). While this poses the possibility of diminished fertility in chronic users, the small size of the sample and the study's preliminary nature make the work inconclusive.

With regard to hormonal aspects, two other adverse effects remain possibilities: 1) Inter-

ference with normal growth and sexual development of adolescent heavy users and, 2) Abnormal sexual differentiation of the male fetus developing in a mother who heavily uses marihuana during early pregnancy. No actual evidence for either of these speculative possibilities has yet appeared in the scientific literature.

The question of a cannabis induced impairment of the body's immune response remains important because of its potentially far reaching clinical implications. While a number of investigators have published findings that suggest that marihuana may interfere with cell-mediated immunity, other investigators have not found such evidence. Some of these differences may reflect procedural variations; nevertheless, the clinical significance of the positive findings remains in considerable doubt. At least one study of experienced marihuana smokers under well-controlled, closed experimental ward conditions found initial evidence of impaired immunity upon their admission to the study. However, by the 63rd day of controlled cannabis administration, their immune response had apparently returned to normal (8-39). This finding suggests that the impairment of immunity initially detected in these and other marihuana smokers may be related to factors other than marihuana use.

The implications of laboratory findings of inhibition of DNA, RNA and protein synthesis, all basically related to cellular reproduction and metabolism, are at present unknown. These findings based on in vitro (outside the body) study of animal and human tissue cultures are also being followed up and extended.

Similarly, no conclusive evidence exists regarding damage to human genetic functioning (i.e., chromosomal damage produced by marihuana). While the most carefully controlled studies have failed to demonstrate such damage, the research to date must be regarded as insufficient to permit definitive conclusions.

Presently, preliminary evidence of a range of potentially serious consequences of marihuana use exists. As indicated, these include: Disruption of basic cell metabolism through interference with DNA and RNA synthesis, possible interference with pituitary function, in turn, affecting testosterone production and possibly having other endocrine effects and interference with the body's disease defenses by affecting the immune response. Despite this laboratory evidence, the clinical implications remain in doubt. While no evidence has appeared indicating that marihuana users here or abroad suffer from unusually high rates of infectious disease or cancer which might result from defects in the immune response, carefully controlled large scale clinical studies have not yet been conducted. Similarly, there is no evidence — but neither have there been adequate systematic studies — to establish whether users have significantly lower fertility rates or more serious problems with impotence than non-users.

The failure to detect gross clinical findings that might be expected does not, of course, mean that these issues have been resolved. To date systematic studies of matched samples have been modest in size. Detection of rarer consequences of use is less likely in studies of limited size and extent. As the number of chronically using Americans increases, larger scale epidemiological studies are becoming feasible. Plans for such studies are underway.

OTHER CHRONIC HUMAN EFFECTS

Tolerance and Dependence

Tolerance to cannabis — diminished response to a given repeated drug dose — has been substantiated by research evidence. Development of tolerance to marihuana's effects was originally suspected because of the obvious ability of cannabis users overseas to ingest larger quantities of the drug without disruptive effects than was possible for less experienced American users. Systematic, controlled studies in which known doses of marihuana or THC were administered over extended periods have now confirmed this (8-53, 80, 109, 111).

The meaning of cannabis dependence is often somewhat vague. If we define it as a physical dependency manifested by physical symptoms following drug withdrawal, there is now evidence that it can occur. The symptoms that have been reported following discontinuance of high dose chronic administration of delta-9-THC include: Irritability, restlessness, decreased appetite, sleep disturbance, sweating, tremor, nausea, vomiting and diarrhea (8-80). It should be noted, however, that the after effects reported followed unusually high doses of orally administered THC under research ward conditions. Such changes have not commonly been observed in other studies nor has a "withdrawal syndrome" typically been found among users here or abroad.

Psychopathological and Neurological Aspects

The question of possible prolonged behavioral effects of chronic cannabis usage has been an area of fundamental concern throughout the American cannabis research program. As indicated in earlier reports, foreign observers have argued that a range of such effects occurs, including a specific cannabis psychosis, diminished intellectual performance and an "amotivational syndrome" (characterized by a loss of interest in work and other conventional activity). Interpretation of such reports has unfortunately been complicated by the lack of adequate control groups, poor research design, use of opium and other drugs, poor diagnostic criteria, nutritional deficiencies and other differing factors of life style.

Even when a particular consequence is correlated with marihuana use, it is often erroneously attributed to the drug use. A recent study of 38 first admissions to a psychiatric hospital illustrates the problem of interpretation involved: While there was a correlation between marihuana and subsequent psychiatric illness, it was less than with such causally unrelated variables as having danced and having drunk beer (7-2).

The acute panic anxiety reaction, previously mentioned in the discussion of acute effects, is probably the most common adverse reaction. However, a more prolonged cannabis psychosis has been reported in Eastern literature. It appears to occur under conditions of unusually heavy use or as a result of ingesting a larger amount than usual. Descriptions do not always distinguish between an acute brain syndrome or toxic delirium marked by clouded mental processes, disorientation, confusion and marked memory impairment and a more prolonged psychotic reaction precipitated by cannabis use. Often it is difficult to isolate the causative role of marihuana from that of pre-existing psychopathology or other drug use (7-64, 112).

Three NIDA-supported research studies of heavy chronic users conducted in Jamaica, Greece and Costa Rica have failed to detect evidence for a cannabis psychosis. However, given the comparative rarity of this syndrome and the small sample sizes used, it is possible that such a consequence was missed.

Studies of college student performance have generally failed to prove evidence of impaired intellectual performance related to marihuana use.

While there was no evidence of differences in grade point average or in educational achievement, marihuana users in one major study had greater difficulties than non-users in deciding career goals and were more likely to have dropped out of college to reassess their goals (7-11). Some of these studies suffer from several shortcomings, however; the samples studied may not have adequately emphasized college drop-outs thus excluding the very group that might have been most adversely affected by heavy use. A second consideration is that students typically have higher levels of ability than the general population. Particularly in more competitive academic environments, they may have above average motivation allowing them to better compensate for cannabis effects. Finally, even moderately heavy American student users use this drug less frequently, in less potent forms and in lesser quantity than more heavily using overseas populations.

Assessing the psychosocial effects of marihuana use in chronically using populations can be complicated. Changes in values and behavior attributed to marihuana use may, in fact, have preceded use rather than the use affecting the change in values. Especially in earlier years, users were much more likely to hold counter-culture, antiestablishment views. For these users marihuana had symbolic value as a means of indicating their disdain for the prevailing value system. This disdain was frequently accompanied by a rejection of the traditional work ethic with its emphasis on competitive achievement. The group dynamics of marihuana use may, however, reinforce these counterculture views of more conventional motivation rather than result from any pharmacological action of the drug itself.

Similarly, attempts to create experimental models for testing the existence of such an "amotivational syndrome" have had serious limitations. Tasks chosen as tests may significantly depart from more realistic work tasks; the artificial environment of the research setting may not provide more typical motivational conditions. Two studies involving marihuana administration coupled with monetary reward for work performance did find a decline in productivity with heavier marihuana consumption. In one the task was simple and relatively undemanding, involving repetitive button pushing that could be carried on simultaneously with other activity (7-111). In the other, a more typical work task -- the making of wooden stools -- was carried on (7-13). The distinction between a direct effect on performance as a result of marihuana and on performance as a result of a decline in motivation is not easily made, however. In a third, quite limited study of agricultural performance undertaken in connection with the Jamaican study of chronic users, researchers found some decline in work performance although the decline was not dramatic (7-141).

When one turns to the neurological evidence there is little question that there are acute effects of marihuana intoxication although these are not easily distinguished from those of other psychoactive drugs as measured by conventional electroencephalograms. The EEG changes resulting from electrodes implanted deeply in the brain are dissimilar to other psychoactive drugs (7-67). The behavioral significance of the EEG changes that have been found in chronically using monkeys and in very limited human studies is not presently known.

Work in Greece has not supported previously cited evidence suggesting that brain damage marked by enlarged ventricles may result from marihuana use. The Grecian study, using non-invasive echo-encephalographic techniques for measurement of ventricle enlargement, found no evidence of such brain damage in heavily hashish using men matched with non-using controls (7-49).

Field Studies of Chronic Users

Although other portions of this and previous reports touch on one or another of the three Federally sponsored studies of chronic marihuana use in Jamaica, Greece and Costa Rica, it may be useful to summarize their findings, strengths and weaknesses here. The Jamaican study has been extensively reported in previous Marihuana and

83-217 O - 77 - 29

Health reports, a recently published book and in the research literature (7-141). A report on the Greek study was delayed in order to make the data base as complete as possible. The third study in Costa Rica was just completed; its detailed findings will be released by Spring, 1976. In each of these research efforts, an attempt was made to match drug-using subjects with appropriate non-using counterparts. In the Jamaican and Costa Rican projects rather careful matching was done; in the Greek study such matching was less possible. All subjects were males because male use predominates in the cultures studied. Numbers of subjects were necessarily limited by the detailed procedures followed (Jamaica: 30 experimental, 30 control; Greece: 47 experimental, 40 control; Costa Rica: 40 experimental, 40 control, although 80 and 140 users and non-users respectively were actually examined).

The Jamaican study found few physiological or psychological differences between the matched smoker nonsmoker populations. A rather extensive battery of tests of physical and psychological functioning found no differences that could be directly attributed to marihuana use as such. While an attempt was also made to assess chromosomal abnormalities, that portion of the study must be regarded as inconclusive because of technical deficiencies in the methodology for that phase of the project.

The Greek study arose from a clinical impression by Greek observers that Greek hashish users, because of their heavy use patterns and already established researcher-subject rapport, would make a good study population for examining the effects of unusually heavy cannabis use.

A variety of neurological, psychological and physical measures found few changes attributable to cannabis use. Heavy emphasis was placed on possible brain damage as measured by electroencephalographic, echo-encephalographic (Cf. preceding section) and psychological test procedures. None of these measures showed evidence of brain damage (7-49).

The most recent Costa Rican study also examined matched samples of users and non-users especially carefully matched on such variables as age, marital status, education, tobacco smoking and alcohol use. Emphasis was placed on extensive medical examinations with special attention to pulmonary and neuropsychological functioning. Although detailed results have not yet been published, no evidence for a greater incidence of disease or of psychological deterioration has been found in the cannabis-using group (7-23).

None of the three studies found evidence of increased psychopathology or of an amotivational syndrome stemming from the use of cannabis.

While results of these studies must be regarded as somewhat reassuring of the lack of grossly adverse consequences of marihuana use, they can not, of course, be regarded as conclusive for several reasons. All three studies involve relatively small numbers of subjects. Equally limited studies of cigarette smoking, for example, which is known to have serious adverse health consequences, would not have been likely to detect those consequences. Psychological testing techniques are less apt to be satisfactory when used with subjects markedly different from the original standardization samples. To the extent that they are not culture free, performance for both experimental and control groups in cultures unlike those on which they were standardized may both show a culturally derived deficit. This deficit may mask a drug-related deficit in performance. Thus, the tests used may not be sufficiently sensitive to detect a difference that may in fact exist. Finally, it may be argued that the demands of a less technologically oriented society are less complex than those of the industrialized United States. Thus, the failure to find a drug-related decrement in social or work performance may reflect an unimpaired ability to meet the demands of a simpler situation that would not be true under more demanding circumstances.

THERAPEUTIC ASPECTS

Although cannabis has been used for over 3,000 years as a medicinal herb in native and scientific medicine, its use in Western medicine sharply declined in modern times. By the 1930s, American medicine had largely supplanted cannabis with more convenient and more stable pharmaceutical preparations. Our relatively recent concern with marihuana as a drug of abuse has led to scientific investigation into its properties by means of modern pharmacological techniques. Synthesized constituents of the natural material have been produced enabling researchers to study the properties and effects of each of the components of this complex material. This recent study has reawakened scientific interest in possible therapeutic uses for the natural material or its synthesized ingredients.

Although some of marihuana's properties -- notably its psychoactivity and its tendency to accelerate heart rate -- are undesirable for most medicinal purposes, cannabis has one highly desirable property. Compared to most pharmaceuticals it is very low in biological toxicity. Indeed, it is questionable whether any deaths can be directly attributed to an overdose of marihuana or hashish.

Whether or not cannabis or perhaps some modified constituent again becomes useful in medical practice will depend on whether some of the drug's promising therapeutic properties prove to be sufficiently persistent and its side effects controllable. Marihuana's usefulness as a medication for chronic disorders may also prove to be limited by the development of tolerance to its therapeutic effects.

The most promising therapeutic applications of the drug are in the treatment of glaucoma, as an anti-emetic for cancer patients receiving chemotherapy and possibly in the treatment of

asthmatics. Other applications as a sedative-hypnotic, an anticonvulsant, an antidepressant, an analgesic and in connection with the treatment of alcoholics have been attempted, but the results have either been inconsistent or highly preliminary.

The use of cannabis and THC in treating the elevated intraocular pressures in glaucoma patients arose from the observation in normals that internal eye pressures were reduced by the drug. Subsequent research with patients has confirmed that the effect is also produced in the diseased eye and is as great as that produced by more traditional medications. Topical preparations applied to the eyes of rabbits have successfully reduced pressure raising the possibility of using such a preparation with humans. Human experimentation is not, however, expected in the immediate future because of the formidable problems in making certain that such a preparation is safe and can meet regulatory requirements (9-12, 25, 26).

The use of THC as an anti-emetic with cancer patients receiving chemotherapy shows unusual promise. One of the undesirable side effects of chemotherapeutic agents administered to cancer patients is that they produce marked nausea and vomiting. This side effect is very difficult for patients to tolerate and is also debilitating. Standard anti-emetic drugs have not, unfortunately, been notably successful in reducing this side effect. THC, by contrast, was found in a recent double-blind study (neither patient nor physician knew whether the drug received was active or inert) to be effective in virtually all of the patients receiving it. While 13 of the 16 patients receiving the drug became "high" and one third developed drowsiness, these effects were viewed as minor compared to the therapeutic benefit achieved (9-58).

Use of THC in the treatment of asthmatics is predicated on the observation that it dilates pulmonary air passages and decreases airway resistance (9-64). Based on observations in normals, research with asthmatics has demonstrated that marihuana relieves bronchospasm and has a more persistent action than traditional medication (9-65). Since smoked marihuana has obvious lung irritant properties, more recent research has employed aerosolized THC, also with promising results (9-46).

There has been a growing awareness that constituents other than delta-9-THC may have valuable therapeutic properties if freed of some of the undesirable side effects noted with THC. It is also possible for the organic chemist to produce a very wide range of chemical compounds which are broadly based on the chemical structure of the cannabinoids, but with changes in that structure which can markedly alter their action. Such chemically more remote compounds may ultimately prove more useful therapeutically than either the natural material itself or its synthesized ingredients. Because they are not the parent compounds they must, of course, be carefully tested for toxicity and therapeutic properties like any other new compound.

September 1975

A REPORT TO THE PRESIDENT
FROM
THE DOMESTIC COUNCIL DRUG ABUSE
TASK FORCE

THE VICE PRESIDENT
WASHINGTON

September 29, 1975

Dear Mr. President:

I am pleased to submit for your consideration the White Paper on Drug Abuse prepared at your request by the Domestic Council Drug Abuse Task Force. The White Paper documents the principal findings of the Task Force, assesses the current extent of drug abuse in America and presents a number of recommendations for improving the Federal government's overall program to reduce drug abuse.

Drug abuse is one of the most serious and most tragic problems this country faces. Its cost to the nation is staggering: counting narcotics-related crime, health care, drug program costs and addicts' lost productivity, estimates range upwards of $17 billion a year. In addition to these measurable costs, the nation bears an incalculable burden in terms of ruined lives, broken homes and divided communities.

The Task Force believes that the optimism about "winning the war on drugs" expressed so eloquently and confidently only a few years ago was premature. It urgently recommends that the federal government reaffirm its commitment to combatting drug abuse and that public officials and citizens alike accept the fact that a national commitment to this effort will be required if we are to ultimately succeed.

The Task Force submits this White Paper in the knowledge that it does not provide all of the answers to solving the drug abuse problem. The issues are complex and changing and the Federal effort represents only part of the nation's total response. However, I believe that the recommendations contained in the White Paper provide a solid base upon which a re-invigorated national effort can be built.

The Members of the Task Force, the contributors to the White Paper and I appreciate the opportunity to have participated in this vital undertaking.

Respectfully submitted,

Nelson A. Rockefeller

The President
The White House
Washington, D. C.

DOMESTIC COUNCIL DRUG ABUSE TASK FORCE

RICHARD D. PARSONS, Chairman, Associate Director and Counsel, Domestic Council.

Special Assistant for Coordination of Foreign Narcotics Information, Central Intelligence Agency.

WILLIAM A. CARLSON (to July 31), Director, Office of Planning and Evaluation, Department of Agriculture.

JOHN FEDKIW (Dr.) (from August 1), Assistant Director, Economic Analysis and Program Evaluation, Office of Management and Finance, Department of Agriculture.

JAMES R. COWAN (Dr.), Assistant Secretary, Health and Environment, Department of Defense.

THEODORE COOPER (Dr.), Assistant Secretary for Health, Department of Health, Education, and Welfare.

ROBERT L. DUPONT (Dr.), Director, National Institute on Drug Abuse, Department of Health, Education and Welfare.

JONATHAN C. ROSE, Deputy Assistant Attorney General, Anti-Trust Division, Department of Justice.

JOHN R. BARTELS, JR. (to May 30), Administrator, Drug Enforcement Administration.

HENRY S. DOGIN (from June 1), Acting Administrator, Drug Enforcement Administration.

ABRAHAM WEISS (to August 12), Assistant Secretary for Policy, Evaluation and Research Department of Labor.

WILLIAM KOLBERG (from August 13), Assistant Secretary for Manpower Department of Labor.

SHELDON B. VANCE (Ambassador), Senior Adviser to the Secretary and Coordinator for International Narcotics Matters, Department of State.

DAVID R. MACDONALD, Assistant Secretary, Enforcement Operations, and Tariff Affairs, Department of the Treasury.

VERNON D. ACREE, Commissioner of Customs Department of the Treasury.

JOHN D. CHASE (Dr.), Chief Medical Director Department of Medicine and Surgery Veterans Administration.

HAROLD HORAN, Senior Staff Member, National Security Council.

EDWARD E. JOHNSON, Assistant to the Deputy Director, for Federal Drug Management, Office of Management and Budget.

Ex-Officio

RAYMOND P. SHAFER, Counsellor to the Vice President.

MARIHUANA [10]

Marihuana is the most widely used illicit drug, with an estimated 20 percent of Americans above the age of 11—25 to 30 million people—

[9] The phrase "as currently used" is important. The effects of cocaine if used intensively—particularly if injected—are not well known, but recent laboratory studies with primates, as well as reports of the effects of chronic cocaine injection during the early 1900's suggest that violent and erratic behavior may result. For this reason, the apparently low current social cost must be viewed with caution; the social cost could be considerably higher if chronic use began to develop.

[10] A great deal of controversy exists about marihuana policy. On the one hand, recent research indicates that marihuana is far from harmless, and that chronic use can produce adverse psychological and physiological effects. Therefore, its use should be strongly discouraged as a matter of national policy.

However, in light of the widespread recreational use—and the relatively low social cost associated with this type of use—the Federal Government has been deemphasizing simple possession and use of marihuana in its law enforcement efforts for several years. For example, very few persons are arrested by Federal agents for simple possession and use; those who are charged with this offense normally are also being charged with some other, more serious offense as well. However, vigorous law enforcement aimed at major *traffickers* has been and should continue to be undertaken at the Federal level.

The task force endorses this moderate view and expects the lower priority that has been established for marihuana will also be reflected in our demand reduction efforts by the elimination of many non-compulsive marihuana users now in our treatment system.

having used it at least once. In short, marihuana has joined alcohol and tobacco as one of the most widely used drugs in the United States.

Historical Trends

National attention first focused on marihuana following reports of widespread use during the mid-1930's. Discussion culminated in legislation which imposed Federal criminal sanctions against both the distribution and use of marihuana. Although proscribed by Federal law, the use of marihuana continued during the ensuing years, but at relatively low levels. Marihuana use was most common among urban minority groups and Mexican-American workers in the Southwest during this period.

A significant increase in the use of marihuana began to occur during the mid-1960's when its use became associated with artistic and anti-establishment life-styles; use then rapidly spread across geographic, demographic, and social boundaries.

The sources of supply have traditionally been Mexico, the Caribbean and South America. They remain so today.[11]

Current Situation

Rates of marihuana use have been rising steadily over recent years as shown in chart 10.

Chart 10

TRENDS IN THE USE OF MARIHUANA

EVER USED

	1968	1969	1970	1971	1972	1973	1974
National Sample of Adults	—	—	—	15%	16%	—	19%

Regional Sample of High School Graduates	32%	40%	43%	50%	51%	55%	—
National Sample of High School Graduates	—	20%	35%	—	—	—	62%

CURRENTLY USED

	1968	1969	1970	1971	1972	1973	1974
National Sample of Adults	—	—	—	5%	8%	—	7%
National Sample of Youths	—	—	—	6%	7%	—	12%
Regional Sample of High School Graduates	18%	25%	25%	33%	35%	36%	38%
National Sample High School Graduates	—	6%	9%	—	—	—	21%

[11] In addition, there is an unknown but presumed small amount of domestic growth.

Current estimates suggest that up to 20 percent of the general population over the age of 11 has used marihuana at least once, and that use is encountered in nearly all population groups. Over 40 percent of those who have ever used marihuana are current users, and at least half of the current users use it at least once a week.

Rates of use may be considerably higher or considerably lower, depending on the segment of the population under study. The highest rates of use have been reported among so-called "hippies" and high school dropouts. There appears to be a slight preponderance of males among marihuana users, although this distribution varies considerably from study to study. Other findings which occur consistently include the following:

- Urban residents use at higher rates than rural residents;
- Use is greater among those with higher levels of education and income;
- Use is more frequent in the northeastern and western United States than in other regions.

A recent development which is cause for great concern is the increasing availability of the much more potent marihuana derivations—hashish, and other preparations of high THC (tetrahydrocannabinol) content. Unlike common forms of marihuana, these potent drugs are known to have serious physical and social effects on the user.

DAWN provides some interesting data on various drug crises attributed to marihuana. During the nine months between July 1973 and March 1974, marihuana comprised only one percent of all emergency room drug mentions, but 51 percent of all crisis center drug mentions. This distribution of mentions by facility type reflects the kind of acute psychological problems likely to occur in association with the use of marihuana, with panic reactions or "bad trips" predominating over the more life-threatening reactions which would lead to appearance in an emergency room.

From a treatment point of view, data show that approximately 17 percent of patients admitted to Federally funded drug treatment programs from January to April 1975, reported marihuana as their primary drug of abuse.[12] There is considerable controversy regarding the interpretation of these data for a number of reasons. The frequency of use reported by these "primary marihuana abusers" is less than once a week for nearly 45 percent of the patients. It seems clear that these people do not have a serious drug problem and should not be in treatment. Most likely, they were referred to treatment by the criminal justice system, by schools, or by parents who were concerned about

[12] This includes NIDA, VA, and DOD. When NIDA is viewed alone, the marihuana figure is 21 percent.

the marihuana use. But when treatment facilities are full, this is a poor utilization of resources and these occasional marihuana users should not be occupying treatment slots. (Chapter 4 will develop this concept further.)

OTHER DRUGS

In addition to these four major categories of drugs, Americans abuse a variety of other substances.

Hallucinogens [13]

Except for the use of peyote in the religious ceremonies of some American Indian tribes, the use of hallucinogens is a recent development in the United States.

Limited, nonmedical use of LSD began in California in the 1950's, but was greatly accelerated in the early 1960's as publicity associated with its use grew. In the early 1960's this drug was diverted from legitimate research sources, but by 1964 illegal manufacture of LSD was established. Today, virtually all LSD in the United States is produced illicitly and, because only very small amounts are needed to produce an effect, it is easily concealed.

Hallucinogen use is very different from most other drugs. Addiction, or even extended regular use is very unusual. These drugs are rarely used more than twice a week. Since a major reason people use these drugs is to experience unusual mental effects, most users stop taking these drugs entirely after the "trips" lose their novelty.

Surveys of hallucinogen use show that most who use do so less than once a month, and that weekly use is very rare. None of the surveys support conclusively the widespread belief that these drugs are not as popular as they once were, but there has been a definite decline in the number of hallucinogen-related medical problems.

Hallucinogens can cause a number of side effects, including panic reactions and long psychotic or depressive episodes. Most reactions are unpredictable and the negative side effects can occur after several "safe trips." The possibility of medical side effects such as chromosomal or genetic change has neither been thoroughly documented nor entirely eliminated.

Solvents and Inhalants

These are chemicals that are used for a variety of medical, industrial, and household purposes, and can also be inhaled to produce intoxication. The ingredients of these products are often unknown to the purchaser, abuser or doctor treating an adverse reaction.

---

[13] LSD, (Lysergic Acid Diethylamide Tartrate), mescaline, psilocybin, peyote, etc.

Very little is known about the pharmacology of solvents. Partial tolerance may develop, and the effects of these substances are intensified when used with other depressants, especially alcohol.

Data on solvent use are sparse. The few available surveys indicate that about 7 percent of junior and senior high school students may have inhaled solvents once or twice and that about one percent of these experimenters continue to inhale periodically.

Volatile substance abuse occurs almost exclusively among the young, perhaps because solvents are often the most readily available intoxicants to children. Accordingly, maturing out of the inhalant habit is the general rule. Even heavy users will persist for only a few years, and then abandon solvent sniffing by their teens. (Many of these individuals, however, then begin the excessive use of alcohol, barbiturates or other substances.)

The fact that solvent inhalation lasts for such a short time for most users leads to the conclusion that it is primarily a reflection of the immaturity of those young people who become involved with it. Nonetheless, abuse must be monitored and action taken as appropriate. One simple action might be to use unpleasant additives in the manufacturing process. Further, the task force believes that the intervention efforts using peer groups discussed in chapter 4 will help some young people resist the pressure to experiment with these substances if and when the inhaling of solvents becomes temporarily popular among their friends.

B — DRUG PRIORITIES

One of the major themes of the Federal strategy discussed in chapter 1 was the importance of differentiating in terms of the particular drug of abuse, and the frequency and quantity of use. Implicit in that decision to differentiate is the assumption that public policy should be most concerned with those drugs which have the highest costs to both society and the user, and with those individuals who have chronic, highly intensive patterns of drug use.

In order to determine the social cost of a particular drug, we should consider the following factors:

- *The likelihood that a user will become a compulsive user, either physically or psychologically dependent on the drug:* closely linked to this concept is the ability of the drug to produce tolerance, requiring successively higher intake to achieve the same result.
- *Severity of adverse consequences of use, both to the individual and to society:* in terms of criminal behavior, health consequences, economic dependence and the like. (This is discussed in greater detail below.)

- *Size of the core problem:* the number of compulsive users who are currently suffering (or causing others to suffer) adverse consequences.

ADVERSE CONSEQUENCES TO THE INDIVIDUAL

The adverse consequences of drug use are of two types: consequences which are the direct result of drug use, and indirect consequences which are associated with drug use. *Direct* consequences include:

- *Illness or death:* Illness or death can occur from overdose, a severe toxic or allergic reaction to a drug, or from rapid withdrawal. In New York City, drug-related deaths are a major cause of death for males aged 15 to 25. Death due to drug abuse is often the result of ignorance—ignorance of possible contaminants in drugs, ignorance of the danger of using combinations of drugs, ignorance of the strength of the drug purchased and of techniques to determine nonlethal doses. If drug use affects reproductive organs, or when certain drugs are taken during pregnancy, a second generation may suffer casualties.
- *Acute behavioral effects:* The paranoia produced by intravenous injection of amphetamines can cause violent behavior and consequent criminal acts such as rape and homicide. Acute paranoia and extreme anxiety from the effects of hallucinogenics, and depression (in the withdrawal state) from stimulants such as amphetamines, are other examples of behavior effects.
- *Chronic behavioral impairment:* Adverse behavioral effects may also be chronic as with the inertia, apathy and depression associated with long-term heroin use. Also, impairment can be measured in things such as loss of productivity, health costs, welfare assistance, and criminal costs.
- *Intellectual Impairment:* Some evidence of intellectual impairment has been reported by clinicians on the West Coast. Specifically, mental status evaluations of chronic users of hallucinogens who stopped after two or more years revealed a clinical impression not unlike that of mild chronic brain disease.

Indirect consequences include:

- *Injury or death associated with impaired judgment:* Potent, mind-altering drugs such as LSD can affect judgment, which may for example, result in accidental death by succumbing to bizarre hallucinations, such as believing one can fly. Even a "mild" drug such as marihuana may distort preception and thus increase the risk of death in automobile accidents of either a driver or pedestrian.
- *Injury or death associated with conditions of use:* Poor nutrition and neglected hygiene stemming from the total focus of energy

on obtaining drugs can cause damage to vital organs. Transmission of viral hepatitis from shared needles is another medical problem of drug abusers. Young people in the drug culture are particularly susceptible to pneumonia. Infections associated with injections using unsterile needles may be fatal.

- *Developmental difficulties:* The potential for personality impairment due to drug use is an important consequence, but one difficult to assess. There are crisis periods in the course of every individual's development, but adolescence is a particularly vulnerable period because the individual seems inundated with crises. These crises provide an opportunity for growth, formation of new ideas, and the emergence of a healthier and more mature personality. The use of drugs as a means to deal with these crises may diminish, delay, or prevent this maturation process.
- *Barriers to social acceptance:* The public image of the drug user is extremely negative; thus, the user is often stigmatized, making it extremely difficult for a current or former drug user to find acceptance in society. Moreover, arrest and conviction for violation of drug laws results in the creation of a criminal record which may follow a user for the rest of his life.

ADVERSE CONSEQUENCES TO SOCIETY

Obviously the above adverse effects to individual drug users are society's loss, too. But there are also more directly measurable costs to society. A recent study estimated that the total measurable cost of drug abuse—direct program costs, health care costs, property losses attributable to drug-related theft, and lost productivity—was $10 billion to $17 billion per year.[14]

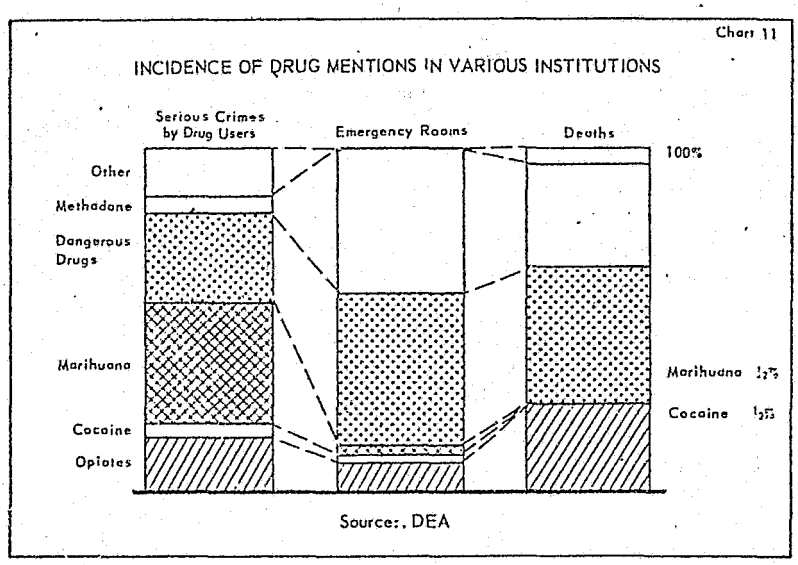
Still another way to look at the social cost of drug abuse—one which is of particular interest in this discussion of drug priorities because it can be broken down by drug—is to look at drug users' appearances in the various institutions we have established to deal with people in trouble.

Among the largest and most important of these institutions are the welfare system, the criminal justice system, and the health care delivery system. Drug users often appear in these institutions, and may be identified as users. If we assume that at least part of the reason for their appearance is drug use, the frequency of appearance provides one rough indicator of the magnitude of the social cost of drug abuse.

[14] Social Cost of Drug Abuse, Special Action Office for Drug Abuse Prevention, 1974: This excellent survey is summarized in the *Federal Strategy, 1975.*

83-317 O - 77 - 30

Our capability to monitor these appearances is irregular and limited in scope, but some data exist. Chart 11 illustrates the fraction of drug users who had used various drugs prior to their appearance in three different places where people in trouble show up: the criminal justice system (serious crimes only);[15] emergency rooms and medical examiners' offices.



SUMMARY: DRUG PRIORITIES

Chart 12 ranks the various drugs according to the following criteria: (1) likelihood that a user will become physically or psychologically dependent; severity of adverse consequences, both (2) to the individual and (3) to society; and (4) size of the core problem.

[15] The large proportion of marihuana mentioned is probably a reflection of its widespread use in society.

Chart 12

SUMMARY OF DRUG PRIORITIES

		DEPENDANCE LIABILITY	SEVERITY of CONSEQUENCES		SIZE OF CORE PROBLEM
			PERSONAL	SOCIAL	
HEROIN		HI	HI	HI	HI 460,000
AMPHETAMINES	NEEDLE	HI	HI	HI	HI
	ORAL	LOW	MED	MED	500,000
BARBITURATES	MIXED	HI	HI	HI	MED
	ALONE	MED	HI	MED	300,000
COCAINE		LOW	LOW	MED	LOW
MARIHUANA		LOW	LOW	LOW	LOW
HALLUCINOGENS		MED	MED	MED	LOW
INHALENTS		MED	HI	MED	LOW

Though the data are flawed and the rankings therefore imprecise, a clear pattern emerges.

- Heroin ranks high in all four categories;
- Amphetamines, particularly those injected intravenously, also rank high in all four categories;
- Mixed barbiturates rank high three out of four categories;
- Cocaine,[16] hallucinogens, and inhalants rank somewhat lower; and
- Marihuana is the least serious.

On the basis of this analysis, the task force recommends that priority in Federal efforts in both supply and demand reduction be directed toward those drugs which inherently pose a greater risk to the individual and to society—heroin, amphetamines (particularly when used intravenously), and mixed barbiturates—and toward compulsive users of drugs of any kind.

This ranking does not mean that *all* efforts should be devoted to the high priority drugs, and none to the others. Drug use is much too complicated and our knowledge too imprecise for that. Some attention must continue to be given to all drugs both to keep them from exploding into major problems and because there are individuals suffering severe medical problems from even a low priority drug, such as marihuana.

[16] This ranking is on the basis of current use patterns. As mentioned earlier, if intensive use patterns develop, cocaine could become a considerably more serious problem.

However, when resource constraints force a choice, the choice should be made in favor of the higher priority drugs. For example:

- In choosing whom to treat, we should encourage judges and other community officials not to overburden existing health facilities with casual users of marihuana who do not exhibit serious health consequences. (But, a person who is suffering adverse consequences because of intensive marihuana use should have treatment available.)
- In assigning an additional law enforcement agent, preference might be given to Mexico, which is an important source of both heroin and "dangerous drugs", rather than to Miami, where an agent is more likely to "make" a cocaine or marihuana case.

This drug priority strategy is essential to better targeting of limited resources and it will be further addressed in relation to supply and demand reduction activities in chapters 3 and 4. Further, the process of assessing the current social costs of drug abuse should be a continuing one, to ensure that resources are allocated on the basis of priorities which reflect current conditions and current knowledge.

MARIJUANA SURVEY - STATE OF CALIFORNIA

Washington, D.C. . . . March 8 . . . The results of a statewide marijuana use and attitude survey released today by the independent national Drug Abuse Council show that almost three out of every ten California adults have tried marijuana. Of those adults who currently do not use marijuana, only 12 percent cite the possibility of legal prosecution or the lack of availability as their primary reasons for not using. Forty-six percent of those surveyed favor the elimination of criminal penalties for the possession of small amounts of marijuana and use in private.

The survey, commissioned with Field Research Corporation, San Francisco, is part of an on-going series of activities sponsored by the Drug Abuse Council to provide public information on current drug issues. The survey consisted of 1,004 personal in-home interviews, representing a balanced sample of the California population. Interviews were conducted between February 5-11, 1975.

Twenty-eight percent of California adults report having at least tried marijuana, with nine percent currently using it. In Washington, Dr. Thomas Bryant, President of the Drug Abuse Council, stated that this level of current use is the same as was recently determined in a national survey as the national average level of current use. The percentage of the California population who have tried marijuana is higher than the national average.

A sharp difference in marijuana usage is observed between younger adults and older adults and between men and women. Some differences in usage can also be seen among regions of the state.

The possibility of legal prosecution and the lack of marijuana availability rank low as reasons given for not using marijuana by those who have either never used it or those who have stopped using it. Lack of interest is cited by 50 percent of non-users as the reason for not currently using marijuana and possible health dangers is named by 38 percent.

REASON FOR NOT CURRENTLY USING MARIJUANA*

	Current Non-users
	%
Possibility of legal prosecution	8
Not available/Not exposed	4
Not interested/Don't need it	50
May be dangerous to my health	38

Don't smoke/Don't smoke anything	4
Tried/Didn't like it	3
Religious/Moral reasons	2

*Adds to over 100 percent since some respondents gave more than one reason.

Of the five choices of optional legal approaches regarding sale and/or possession of small amounts of marijuana and use in private, 46 percent of adults favor some form of elimination of criminal penalties: 15 percent favor making the sale and possession of small amounts legal; 20 percent favor making the possession only of small amounts legal; and 11 percent favor making the possession of small amounts subject to a fine, like getting a traffic ticket. Nineteen percent favor the California law as it now is regarding possession of small amounts of marijuana and 29 percent favor stiffer penalties.

The division on legal choices is particularly sharp between those who either have or currently use marijuana and those who have never used it. Young adults - ages 18 through 29 - take a more lenient view than do older adults, particularly those 50 and over.

The Drug Abuse Council, located in Washington, D.C., was established in 1972 by a consortium of private foundations to serve as an independent source of information, policy evaluation and research funding in the field of drug use and misuse. Similar marijuana surveys have recently been completed on the national level and in the State of Oregon, which in 1973 adopted a system of civil fines as the sanctions for possession and use of small amounts of marijuana.

The Budding Marihuana Bar

(By Larry Simonberg)

Not since Prohibition has there been so enormous a group of affluent criminals as the one created by current marihuana laws in most of the United States. And it is a group that, despite an apparent lessening of police efforts in some large cities, continues to grow. The number of marihuana arrests nationwide skyrocketed from a mere 18,815 in 1965 to more than 420,000 in 1973.

Not surprisingly, a new class of lawyers has emerged to defend these new criminals. Statutory variations from state to state and inconsistent enforcement make the field a tricky one, but dozens of sympathetic practitioners specialize in the law of pot. They are for the most part young, street-wise, hip to the plea bargain and the constitutional challenge, and almost uniformly committed to decriminalization—no matter what the effect on their pocketbooks. "These are guys who are making money from marihuana," says Frank Fioramonti, New York legislative counsel for the Washington-based National Organization for the Reform of Marihuana Laws (NORML), "and yet they still want to see the laws changed."

In October 1973 Oregon became the first state to actually decriminalize possession of marihuana, making it a civil violation subject to a maximum fine of $100. In every other state, those in possession of even the smallest quantity still risk expenses for bail and legal fees, a damaging criminal record, and possible imprisonment. So far, generational conflict, hypocrisy, and scientific controversy have frustrated efforts to repeat the Oregon breakthrough. Although Draconian laws have been eased in many states, the threat of an arrest—called in the drug subculture a bust—looms large and is still a traumatic affair, especially in rural areas.

"In Georgia," says Tim Skidmore, "rural people regard marihuana in the same light as they regard rape and heroin." A 29-year-old native of Elmira, New York, the moustachioed Skidmore attended law school at Emory University in Atlanta, and decided to settle there. One of three or four pot specialists most heavily in demand in his area. Skidmore has handled 250 cases in only two years. Why does he spend so much time defending these clients? "Partly for compassionate reasons," he says. "A $1,000 fine for an ounce is a ridiculous situation." While probation is still the usual penalty for simple possession in Atlanta, fines are far more common elsewhere. "It's a great revenue medium for small cities," Skidmore explains. "My definitive approach in a marihuana case outside Atlanta is finding every possible technical means of throwing out the case."

Skidmore claims that the "emotional" reactions of rural judges tend to lead them into reversible error in pot cases. Since he thinks that federal judges are less susceptible to political pressure than locally elected officials, he tells all clients that if the case gets to the federal level, "we're probably going to win on appeal, if at all."

Although he does make a point of trimming his hair and moustache for small-town appearances, Skidmore still finds his cases listed on the docket after those of local attorneys. "Judges," he comments, "think of me first as an Atlanta lawyer." He has been told, he says, by more than one district attorney that those judges "enjoy being able to send Atlanta attorneys home with their tails between their legs."

Skidmore is concerned about the possible grim after effects of arrests. "Rather than face the criminal process," he explains, "clients commit suicide. Twice that's happened." He is also aware of police attempts to apprehend dealers by turning users into informers. "There's a tremendous need to expose issues of entrapment," he says, recalling a client arrested at a rock festival after undercover agents persuaded him to sell them marihuana.

Personal experience has also led him to worry that pot arrests breed bewilderment and contempt for the law among young people. Some years ago, Skidmore took custody of a 16-year-old boy from the juvenile court. His ward, now in college, has been arrested several times for possession, which "made me more committed to defending marihuana cases."

As NORML's Georgia coordinator, Skidmore spends "probably 60 percent of my professional working hours" on pot matters, defending clients, speaking at high schools, working for law reform, and helping other attorneys. He frequently

takes cases involving the children of his colleagues' business clients. But even though it would mean a loss in fees (he charges between $100 and $500 as a pretrial retainer), Skidmore would prefer to see civil attorneys take up the cudgels. "I'd much rather they learn," he says. Once you take on a pot case, he explains, you become committed to reforming the laws that have made an estimated 26 million people actual or potential criminals. "I get more and more fed up with each case that produces an inhuman result."

Bill Risner of Tucson, Arizona is another pot practitioner who is dismayed by the state of the law. "It's just manifestly unfair," he says. "You have people who drink alcohol passing laws against a drug they just don't understand." In Arizona, simple possession can be either a misdemeanor or, at the judge's discretion, a felony carrying a sentence of one to ten years.

"I'm in Pima County, and that's the liberal part of the state," Risner points out. "For any small quantity at all, the result is probation. There's so much pot around here they just can't put people in jail. It's quite an industry in Tucson. In Maricopa County [Phoenix]—that's the conservative Republican area—they can really do some strange things."

Tucson's location near the Mexican border often leads to seizures of huge amounts of marihuana. Risner recalls clients who were arrested for possession of two tons of it. Four defendants got off without jail terms, but two—one of whom was already on probation—were given stiff sentences—six to eight years, with parole eligibility after two. "It's just terribly sad," laments Risner.

A graduate of the University of Arizona Law School, Risner, 31, says that his long hair and moustache have been no problem in court. "In a way, Tucson is a small town," he says. "The judges know me and I know them. The first several cases I had, I sort of won a reputation, and they started coming in." His four-lawyer firm, Risner, Wolf & Raven, gets more than half its business from marihuana cases; Risner himself has handled about 150 in five years. His fees are similar to those of others in his field, ranging from $300 to $500. In complicated cases, however, he has charged as much as $20,000. But there is satisfaction even in cases that don't bring in big money. "If I keep somebody out of jail," Risner concludes simply, "I feel good."

Alan Ellis of State College, Pennsylvania agrees. Ellis attended Villanova Law School, clerked for several judges, and taught at Golden Gate College School of Law in San Francisco before deciding two years ago to enter private practice. State College, home of Pennsylvania State University, has its share of people who sell drugs, says Ellis, "because this is the way to become a big man on campus." The bearded 31-year-old attorney says that the prevalence of marihuana in the community produces a strong reaction. "The police use binoculars," he says. "They sit up on a roof and scan student apartments for marihuana plants." Fortunately, he reports, "the small cases in Pennsylvania are generally dealt with under a probation-without-verdict section of the new law," a two-year-old reform statute. For simple possession, a defendant can start out again with a clean record after a month's probation.

Despite this comparatively lenient punishment, Ellis says his student clients are anything but blase. " 'Will my parents find out?' That's their first concern," he says. "Jail isn't the problem. It's the stigma of the arrest." And, of course, they have Ellis's $500 fee to consider.

Ellis says he has no trouble with small-town authorities because "we're dealing with them on a professional, human level," and hopes to parlay his reputation into a county judgeship in the 1976 elections. "I find that whenever a client comes in with an out-of-town lawyer, they know they're going to get a fight," Ellis says. "My clients ask, 'Should I shave?' I tell them I'm not going to; once they hear lawyer or doctor, they don't see the beard or long hair."

According to Bill Rittenberg of New Orleans, such enlightenment has not penetrated rural Louisiana. In the cities, juries are increasingly reluctant to convict, and suspended sentences have become the rule. But possession is still a tough rap to beat elsewhere. "It's a substitute for the speed trap in the country," he explains. "We have a conditional discharge on the books, but it's very difficult to get. The judges like that $100 fine." Like many of his colleagues, 29-year-old Rittenberg, a graduate of Tulane Law School, doesn't bother to cut his hair for court appearances in rural areas; he doesn't think it's necessary. "When I go out into the country, I'm not looking for a deal," he says. "They know that whenever somebody from New Orleans takes a case, they've got a fight."

Rittenberg's marihuana cases make up about a quarter of his business. He says he gets so many because rural lawyers have an unpopular habit of collecting

$2,000 retainers and then pleading the client guilty. "It's a real ripoff," he says. "The worst lawyers charge the most and do the least. I'd say a couple of times a month I got a call from a friend of a friend, or from the client himself, who's paid another lawyer and pleaded guilty and wants to to know what to do."

Rittenberg has had success in discrediting inexpert witnesses on identification of the drug. And he finds that feigning inexperience can be an effective ploy, lulling the prosecution into careless errors. And "if you're willing to take a low hourly fee and make half a dozen court appearances," Rittenberg advises, "your chances for acquittal are improved. There are so many variables."

Energetic tactics like Rittenberg's often tempt the prosecution to let a case fade away after arraignment. He points to the case of a young woman who was caught with two marihuana plants and charged with intent to distribute. After several months' delay, she was indicted for simple possession. After several months more, following Rittenberg's motion to suppress evidence (no search warrant could be found), the case was dropped.

"I think that's the key thing," Rittenberg explains. "It's all a bluff. If you call their bluff, many times they're going to fold." Rittenburg is clearly willing to hustle for his $250 or $500.

"You do a lot more work and you make mistakes," he says, but "you learn how to practice by doing it. I tried my first jury case without ever having seen a jury."

Although he's a former staff counsel for the ACLU, Rittenberg is "trained in the gut-alleys of private practice. I think you have a much more realistic view than you do as a movement lawyer. Do-good movement lawyers have a tendency to be very self-righteous and won't talk to the other side."

But not all the attorneys concerned with marihuana law are specialized "hustlers" like Rittenberg. Dave Weiner of Cleveland, for example, spends a good deal of time working with reform efforts like NORML, although he does not practice in the field. An unabashedly straight corporate lawyer, Weiner sees no conflict whatever between his practice and his reformist activities. "We have a referral system throughout the state with lawyers who will take the cases," he says, "We get a lot of calls, and we make a lot of referrals."

On a nationwide scale, NORML headquarters in Washington is probably the readiest and most comprehensive source of referrals and information. Staff counsel Peter Meyers says that lists of individual attorneys and state coordinators are available, and that NORML can also supply briefs, transcripts, law review articles, scientific reports, bibliographies, and summaries of "commonly reoccurring issues and defenses."

Last November, at NORML's third annual national conference, pot practitioners traded ideas on strategy and evaluated the progress of legal reform. Their chief concern was still to determine and increase the chances for the continued spread of decriminalization sentiment among legislators and police officials. "This past year was not a very good year," admitted Frank Fioramonti, "because it was an election year." The 1975 campaign will be directed primarily toward getting Congress to pass the Hughes-Koch-Javits bill, which would decriminalize marihuana on the federal level.

NORML is also anxious to remove marihuana from its current classification as a narcotic. Although most attorneys who handle drug cases see hashish and marihuana in the same light, cases involving hard drugs are, as Bill Risner puts it, "a whole different thing." It's a matter of "moral judgment," adds Tim Skidmore. "It would be very hard for me to accept a heroin sales case."

NORML continues to lobby for reform in state legislatures, eager to develop a nationwide consensus that the use of pot should be no more criminal than the use of alcohol or tobacco. NORML has been supported in its hope that public opinion will swing toward decriminalization by support from such prestigious organizations as the American Bar Association, the American Medical Association, and the National Council of Churches, and such prominent public figures as William F. Buckley, Jr. and Ann Landers.

Recent research studies alleging serious effects of marihuana on the male sex hormone and on human immunity have threatened to slow the liberalizing trends, but NORML's distinguished medical supporters have dismissed them as biased and unscientific. Like any drug, they argue, marihuana has potential side effects, but that is surely no reason to make outlaws out of the millions of otherwise law-abiding people who use it.

According to Pat Horton, district attorney in Eugene, Oregon, decriminalization of marihuana has been accepted quite well by the public, and has actually

helped to clear court calendars and allow police and prosecutors to concentrate on more pressing problems. There has been no measurable influx of users from other states, says Horton, and no significant increase in the use of marihuana among Oregonians since the new law took effect. "I think it is inevitable in the next few years," he predicts, "that the legislatures in the vast majority of states are going to decriminalize marihuana."

Anyone who has ever worried about a bust will be delighted by that prospect. And that includes, oddly enough, the pot practitioners themselves.

[From Juris Doctor, May 1975]

THE CASE FOR MARIHUANA

(By Graham Hughes)

Few issues have more vexed public opinion in the United States in recent years than the spread of drug abuse. There may be parts of the country that have scarcely been touched by the problem, but in large urban centers the prohibited use of drugs has become a great breeder of misery and crime and a constant preoccupation of law enforcement authorities.

The one feature that virtually all of the abused drugs have in common is that they are mood altering. If they were not, there would be little reason to take them. People in Western society, and probably in most human societies, have always indulged in taking such psychoactive drugs. The report of the Task Force on Narcotics and Drug Abuse, published in 1967, contains the provocative but surely accurate comment that the really abnormal behavior in our society would be to take no mood-altering drugs at all.

Side by side with restrictions on the use of some drugs, however, we manage to be very permissive about the use of others, including that very powerful mood-altering drug, alcohol. This ambivalence in our approach surely stems from an uneasy connection between drugs and our notion of what it means to be happy. Happiness is an inner state, but we traditionally connect it with certain valued social arrangements. We think it includes having good and loving relationships with other people, in one's family and outside the family. And the notion of the good life, the happy life, has encompassed, particularly in the Western world, the idea of doing good work, which takes many different forms. This may be artistic or intellectual work, but most people are not gifted with that kind of talent. They may still do good work in the sense that what they do is useful, that it helps others either in an immediate individual way or by making a contribution to the well-being of society in some collective sense. A lack of any feeling of accomplishing such good work no doubt contributes significantly to personal feelings of unhappiness.

Historically there has been an important link between the pursuit of happiness and the ingestion of mind- or mood-altering drugs. The explanation is not hard to find. The stress that ordinary life imposes on most of us often makes the components of happiness frustratingly elusive. Certain drugs have remarkable capacities for liberating us so that we can achieve joy and peace, at least fleetingly.

Traditionally in Western society the great mood-altering drug of fashion has gained such social acceptance that it plays a central part in the most solemn sacrament of the Christian religion. The established place of alcohol in our social life is a recognition that the sensible and moderate use of a drug can, by relieving us of tension and anxiety, liberate us better to pursue happiness. But there is a conflict here, for we have also known, as far back as history goes, that mood-altering drugs may at times work in a quite contrary way. When we take them excessively on one occasion or consistently over a long period, we may become besotted or enslaved to them so that they cripple us in our attempt to lead a good and happy life.

Our dilemma is sharpened by the grip that fashion and tradition have on us. Alcohol is still our primary drug of addiction. The number of alcoholics enormously exceeds the number of heorin addicts, and the total damage done by alcohol in society is incalculably greater than that done by heroin. In the simplest terms of lives cut short, lives that are crippled, work hours lost, the infliction of accidental death and injury on others, and the unhappiness caused to family members, alcohol wins the race by a vast distance. But while we maintain

a polite level of lip service to the dangers of alcohol, we are not frenziedly preoccupied with it in the way that many of our public spokesmen have been with heroin, or for that matter, marihuana. The *prima facie* strangeness of this contrast in attitudes makes it important for us to heed some preliminary cautions.

In the first place, it makes no sense to think in terms of one appropriate solution to the drug problem. The properties and effects of marihuana, barbiturates, cocaine, and heroin are so different that widely differing schemes of regulation may be appropriate for each of these drugs.

Second, the alternatives are not as simple as a start choice between criminalization and decriminalization. There are many habitable way stations between these terminals. One would be to make the use of marihuana and heroin, and possession of small quantities for use, no crimes at all, while retaining criminal penalties for dealing in the drugs. A slightly more generous step would lift the criminal ban from "casual transfers" of small amounts of marihuana for personal use that do not indicate a pattern of dealing for profit.

Here the contrast between heroin and marihuana becomes crucial. For while heroin remains for most Americans (and with some good reasons) a drug that inspires fear and revulsion, cannabis has become as familiar to millions as alcoholic drinks are to others. The chasm between official legal condemnation and popular attitudes may not yet yawn as wide as in the days of Prohibition, for there is a generation gap, with middle-aged and older people, who grew up on a diet of whisky and martinis, remaining suspicious of the newfangled psychoactive substitute used by their children. In many rural areas this popular suspicion and, indeed, distaste may still be very strong. But unless fashion veers off in another direction, each year is likely to see more widespread community contempt and disdain for the marihuana laws.

Cannabis has come under the most intensive scrutiny by public commissions of inquiry in Britain (1968), Canada (1970), and the United States (1972). The commissions examined with considerable thoroughness every contention of harmfulness that had been made about using the drug and every argument that could be advanced for decriminalization. They all came to the conclusion that, while cannabis use should not be encouraged, there was no good case for making its use and possession of small quantities or casual transfers offenses of any gravity. The British and Canadian commissions recommended that use and possession of small quantities be a very minor offense, while the United States commission advocated the complete removal of penalties for private use. All three studies, however, were in favor of continuing severe penalties for private trafficking or possession of large quantities with intent to sell.

No professional authority would assert that there is a finally proven case of marihuana's total harmlessness. Majority scientific opinion holds that there is no convincing evidence of any harm to the user from regular moderate use; but there remains a substantial element of doubt about the possibility of deleterious effects from continued heavy usage. In *United States* v. *Kiffer* (1973), the Second Circuit Court of Appeals, on the question of the constitutionality of the marihuana laws, considered evidence on the harmfulness of use. The principal defense witness had been Dr. Lester Grinspoon, a clinical professor of psychiatry at Harvard Medical School and the author of a leading text on marihuana. The court said: "In addition it was stipulated that five other experts would have supported Dr. Grinspoon's conclusions . . . that marihuana is neither physically nor psychologically harmful to most users and not particularly susceptible of abuse, and that those few who might suffer ill effects through overindulgence probably have personality disorders that would lead them to abusive use of whatever drugs they might succeed in obtaining."

In rebuttal a government witness, also a psychiatry professor, testified that use of high-grade marihuana by volunteers in a study in which he was engaged often induced psychotic episodes. Dr. Grinspoon himself conceded that an article in a British medical journal asserted that long-term use of marihuana led to brain damage. While Dr. Grinspoon did not believe that article to be credible, he agreed that "the effect of marihuana regarding brain damage is not known."

J. W. Fairbairn has pointed out that what we know about marihuana would give us considerable pause if it were a new substance that a drug house was wanting to release for medical use: "Suppose a pharmaceutical firm proposed to releasse a drug with the possible side effects reported at Stockholm [a symposium on cannabis in 1971] or in the World Health Organization Technical Report No. 478, 1971—accumulation in body fat, interference with microsomal

enzymes, tachycardia, teratogenecity, serious effects on driving skill, amotivation which may be related to actual brain damage, and sometimes unpleasant psychotic effects. Although some of this evidence is based on animal work, some on humans, there would be quite enough warning signals to resist approval."

These comments are obviously important, but the analogy is misleading. We may agree that we should scrutinize with a supercritical eye any new substance that a commercial house wishes to launch into the world solely for claimed therapeutic purposes. But marihuana occupies a quite different social setting. Hardly anyone claims that we ought to discount the possible harmful effects of its long-term use because we need it for medical reasons. Marihuana is already in use as a drug of choice for reasons of pleasure by a substantial minority of the population, who seem strongly disinclined to give it up in spite of the existence of criminal penalties. For this reason the only realistic comparison is with licit and licensed pleasure-giving drugs.

All experts agree that whatever may be said about the possible harmful effects of marihuana can be topped by much more horrifying pictures of the damage done by cigarette smoking, the use of alcohol, and perhaps even caffeine. Cigarettes, alcohol, and coffee are legal, so how, some ask, can we without hypocrisy and injustice ban marihuana and punish its users?

But this, in its turn, is also too simple a response. Cigarettes, alcohol, and coffee are deeply ingrained in our culture and are used by millions of people. Though we now know enough about at least cigarettes and alcohol to realize that it would be much better for most people if they did not use them at all, it may be too late to go back and attempt by penal legislation to wipe out such familiar and cherished accouterments of our way of life. But marihuana use has hardly yet reached such an entrenched status. Even if its use is less dangerous than that of cigarettes and alcohol, the argument might run, there is no warrant for reversing an existing situation of illegality when there is still considerable doubt about how harmful it may be. The doctrine of equal protection, after all, does not demand that government continue to make equal mistakes.

Another hallowed argument holds that marihuana smoking has a tendency to lead to the use of more dangerous drugs, notably heroin. It may well be true that most heroin users smoked marihuana before they first used heroin, but, as someone has pointed out, most of them also drank milk before they used heroin. A sequence of events in itself tells us nothing about cause and effect. Most searchers have not been impressed by the claim that the use of marihuana leads people to heroin. The truth is more likely that certain people have a disposition to experiment with drugs and to become imprisoned by them. It is natural for such people to work their way up the ladder of available substances. But it would be rash to assume that if marijuana were unavailable, the move onward and upward could be frustrated. To put this more strongly, one might assert that the sort of person who is likely to experiment with heroin is very unlikely to be diverted in his progress by knowledge that the use of marihuana is prohibited by a criminal penalty.

The arguments in favor of legalizing at least the private use of marihuana are impressive. Advocates point to the fact that the drug is widely used and accepted and is, at the least, probably less harmful than legal drugs such as alcohol and tobacco. Its use is certainly a victimless crime, and the only possible justification for continuing criminal liability is the fragile one of protecting the user from him/. Young people, it is said, are led into contempt for the law when they di er the apparent harmlessness of a substance they have been told must be pro ited because it is so dangerous. This cynicism about teaching on the subj may positively encourage young people to use drugs (such as barbiturates and amphetamines) that are extremely dangerous, simply because officially disseminated information about these drugs will have lost credibility.

The present state of the law also opens an extra market for organized crime and induces young people to make contact with criminals in order to obtain the drug. Law enforcement in this area is expensive, resource depleting, and extremely ineffectual. A few unlucky users and dealers suffer disgrace and punishment, while the vast majority remain untouched.

The most modest proposal, that of the United States Commission, would legalize only private use, while retaining penalties for dealing and possession of large quantities. The most radical advocates would allow legal sale. So sweeping a change would involve a host of subsidiary questions, including who

should control the commercial distribution (free enterprise or a government monopoly), what the quality of the substance should be, and what regulations should surround the commerce in the nature of licensing.

The problem here is in one important sense very different from those of heroin law reform. With heroin we are dealing with addicted persons, and much of the discussion has to do with affording them some legal access to the drug or a satisfactory substitute. With marihuana, the claim is not that it is cruel or useless to deny addicts access to what they crave, but rather that people have a legitimate claim to pursue a pleasure that is not vicious or self-destructive.

In this way, the case for decriminalization of marihuana is at once both simpler and more complex than with heroin. It is simpler in that marihuana lacks the powerful chemistry with which heroin may impose addiction and enslave the user. And so we have naturally regarded marihuana as much less dangerous and have been inclined toward legalization. But this very lack of a powerful addictive property also speaks against legalization—we cannot view the marihuana user as being a sick person, driven by an irresistible impluse to pursue the drug. This makes it seem more defensible to punish him. In the end, the only way we can resolve this problem is by returning to a consideration of the proper boundaries of licensed pleasure.

There are many substances—including alcohol, tobacco (nicotine), and marihuana (cannabis)—that many people have come to find supportive, tranquilizing, relaxing, and thus a prop and a shield when confronted with the discomforts and tensions of ordinary life. Alcohol and marihuana have the capacity to induce euphoria and alteration of mood, the extent of which depends on the amount ingested. Regular users are able, through experience, to control the extent of this mood alteration to a point where it is usually pleasurable. None of these drugs appears to be significantly harmful if used in small quantities occasionally. But the regular use of them in substantial quantities poses different degrees of danger. With tobacco such use markedly increases the risk of heart disease, lung cancer, or other pulmonary afflictions. Alcohol, used in such a way, may cause a variety of illnesses and lead to debility and death in extreme cases. Less is known about the long-term heavy use of marihuana, but, as we have seen, some researchers suggest there is a possibility of brain damage. Other studies point to the fact that substances contained in marihuana are built up over a long period of time in the body and may cause damage to offspring, if not disease in the user.

To this we must add that of the three drugs, the most powerfully addicting is tobacco. Alcohol is not necessarily physiologically addictive, though psychological dependence on it may habituate a minority of users to such regular intake of large quantities that they become in fact addicted and can suffer severe withdrawal symptoms. Marihuana has no addictive properties, though a small minority of users may become so dependent that their lives become largely devoted to the drug.

If mankind were clamoring for a tranquilizing, mildly euphoric substance and only one of these drugs could be legalized, which would we choose? Imagine that a national commission, set up to respond to the public demand, studies all that is known about tobacco, alcohol, and marihuana, with a view to selecting one for legal production and distribution. It is difficult to see how the choice could rationally not be marihuana.

Tobacco has little to commend it. It has no euphoric effect and little capacity to induce mild and pleasant alterations of mood or consciousness. Its tranquilizing effect has to be learned, and for many users eventually wears off as use becomes a mere satisfaction of a physical need, as with heroin. It is extremely addicting and very dangerous to health. Surely tobacco would not be the winner of the contest.

Alcohol appears more attractive. It is transquilizing and euphoric and may be pleasantly effective in altering consciousness. Its use is surrounded with agreeable and elaborate social rituals that have to do with food, conversation, and erotic encounters. For the majority of people who are able to maintain a controlled relationship with the drug, alcohol has a soothing, humanizing, and enriching impact on their lives. But against this must be set the fact that the powers of alcohol are as great for evil as for good. Occasional excessive use may lead to the disease of alcoholism, which works huge amounts of social and physiological damage. An authoritative decision maker would probably strike it from the list.

Marihuana we admittedly know much less about, precisely because it has no history of legal use. But what we do know tends to show that it has considerable powers for tranquilizing and producing pleasurable states of consciousness. A minority of users may become heavily dependent on it, but there is no evidence that marihuana destroys their bodies or that occasional excessive use has the potential, as does alcohol use, to lead to violence. On the existing evidence, the Commission of Choice ought to pick marihuana.

The use of marihuana may have a longer Western history than many suppose, but it has been a submerged, working-class one, never breaking through into circles of fashion until recent years. The seventeenth-century Dutch peasants who are depicted in the paintings of Adriaen Brouwer as being "drunk on tobacco" had probably added a little of the hemp plant to the contents of their pipes. Much more important is the fact that it is now the drug of choice of a great many people.

We suggested earlier that we ought not to legalize marihuana only because it is less harmful or no more harmful than tobacco and alcohol, which are already legal. But we should now add that, given the fact of actual use by many people, the comparative harmlessness of marihuana does become an argument that should count for something. The claim to use a drug of pleasure no more harmful than others that are legal may not be ripe for constitutional recognition as a claim to equal protection, but it is a social argument of some cogency for a legislature to ponder. The drug of choice of the young and many minority groups is banned, while the drugs of the white, middle-aged, middle class are legal. This exaggeration contains an uncomfortable grain of truth.

So, on the one hand, we hear the clamor of those who claim a right to have their pleasure in a way that is not demonstrably more harmful than other people's way of getting their pleasure. From the other side comes the reasonable-sounding caution that the licit presence of dangerous drugs on the social scene is not a very good reason for liberating another substance of some unknown degree of danger. But it is not impossible to accommodate both sides of the argument in a compromise.

The argument that it is unfair to punish the use of marihuana while we permit the use of alcohol and tobacco is persuasive, and we ought, therefore, to abolish penalties for the use of marihuana and possession of small quantities for the purpose of personal use or casual transfer. But the warnings about the unknown dangers and the unknown number of people who might be turned on if there were full legalization have good utilitarian roots and deserve some accommodation. This can be done by retaining the penalties for sale of marihuana or possession of substantial quantities for sale.

Certainly this would leave the situation in a somewhat perverse posture. It would be legal to use a drug for which there is no legal source of supply. In practice this would mean that the user would have to go to some trouble to obtain the drug and have to pay a somewhat inflated price. This may have precisely the desired effect in inhibiting an increase in use and a growth in the number of users. The formal paradox of the solution may be a price worth paying for the practical sense of the outcome—at least in the short run. But such a position should only be retained for a stipulated number of years, while marihuana research is vigorously pressed. In a reasonably short time, we should know enough to make a final decision on legalizing sale and distribution.

Growing recognition of the comparative harmlessness of marihuana will no doubt in time dilute our perception of its dangers. But drug use in general is not likely to diminish, only to change its forms. If life in America leads many young people to experiment foolishly and dangerously with drugs of destructive potential, certainly some organized public response is called for. This can be best shaped by dropping the obsession with marihuana, and heroin as well, and concentrating instead on the provision of services to deprived and disturbed people. We should remember that there are ways in which drugs for a time do help people to cope with or escape from their problems. In the long run the remedy is usually worse than the disease, but while we offer no alternatives, it is natural enough that this foolish self-medication will be tried. While penal law enforcement has a place of some importance in the overall attack on the danger from drugs, it should be much less central than the provision of services to help the unhappy and bewildered members of our society.

MARIJUANA POSSESSION AND THE CALIFORNIA CONSTITUTIONAL PROHIBITION OF CRUEL OR UNUSUAL PUNISHMENT*

I. INTRODUCTION

The use of marijuana in the United States has increased at an extraordinary rate in recent years. It has been estimated that 24,000,000 Americans over eleven years of age have used marijuana, including about one-half of those individuals in the eighteen to twenty-five age group.[1] The increased use of marijuana, and

* Research for this Comment was made possible, in part, by a grant from the California Council on Criminal Justice, administered by the UCLA Corrections Law Program. The opinions and conclusions expressed herein are solely those of the author and do not necessarily reflect those of the California Council on Criminal Justice, the California Department of Corrections, or the UCLA Corrections Law Program. The author wishes to express his appreciation for Professor Henry Rossbacher's advice and assistance in the preparation of this Comment.

[1] NATIONAL COMM'N ON MARIHUANA AND DRUG ABUSE, FIRST REPORT: MARIHUANA: A SIGNAL OF MISUNDERSTANDING 32 (1972) [hereinafter cited as FIRST COMM'N REPORT]; NATIONAL COMM'N ON MARIHUANA AND DRUG ABUSE, SECOND REPORT: DRUG ABUSE IN AMERICA: PROBLEM IN PERSPECTIVE 65 (Joint Comm. Print 1973) [hereinafter cited as SECOND COMM'N REPORT].

The National Commission on Marihuana and Drug Abuse was established by the Comprehensive Drug Abuse Prevention and Control Act of 1970, 84 Stat. 1236, 1280-81. The Commission consisted of two members of the United States Senate, two members of the House of Representatives, and nine persons appointed by President Richard M. Nixon.

The literature on marijuana is vast and sometimes contradictory. The controversial nature of the "marijuana question" often casts doubt upon otherwise "objective" conclusions reached in marijuana studies and commentaries. Problems of bias induced by the predominant selection of favorable research source material appear to be particularly troublesome in articles considering the use and effects of marijuana. Furthermore, scientific studies are often subject to criticism for their use of inappropriate research methodologies. To minimize the use of biased source material, and to avoid the problems inherent in the selection of "accurate" scientific studies, this Comment relies principally on the conclusions drawn by the National Commission on Marihuana and Drug Abuse for the following reasons:

(a) The Commission's Reports constitute the most comprehensive and recent study of the marijuana problem in the United States. The First Commission Report was accompanied by a two-volume Appendix of Technical Papers, consisting of more than 1,200 pages of the results of the various studies conducted for the Commission, as well as an analysis of the studies conducted previous to the Commission's investigation. In addition, a budget of $1 million was authorized by Congress for the Commission's activities. *See* Comprehensive Drug Abuse Prevention and Control Act of 1970, § 601(f), 84 Stat. 1236, 1281.

(b) The National Commission on Marihuana and Drug Abuse has the official status of a United States Government commission.

the attendant increase in arrests for its possession,[2] have intensified the controversy surrounding the propriety of statutes subjecting marijuana users to criminal punishment. In response to these problems, Congress established the National Commission on Marihuana [*sic*] and Drug Abuse to study, among other things, the extent of marijuana use and the efficacy of existing marijuana laws.[3] After intensive study, the Commission concluded that private possession of marijuana for personal use should no longer be a criminal offense.[4] The Commission determined that "criminalization of possession of marihuana for personal use is socially self-defeating as a means of [discouraging its use]."[5]

The Commission further observed that "several recent [judicial] opinions have confirmed our judgment that the possession penalty for marihuana is constitutionally suspect."[6] Indeed, many legal commentators have condemned the constitutionality of possession statutes on a variety of grounds,[7] concluding that such

---

(c) The Commission's Reports are the most credible, objective, and nonpartisan of all such studies available. The Commission recognized the importance of "an independent, nonpartisan appraisal of the nature of marihuana and the consequences of its use . . . ." FIRST COMM'N REPORT, *supra* at 3. It is also interesting to note in this connection that most of the Commission members had been previously opposed to the decriminalization of personal use and possession of marijuana, and that President Nixon had stated before the issuance of the Reports that should the Commission recommend decriminalization, he would decline to follow that recommendation. *See* U.S. NEWS & WORLD REPORT, Feb. 21, 1972, at 75.

[2] *See* note 107 *infra*.

[3] *See* Comprehensive Drug Abuse Prevention and Control Act of 1970, §§ 601(d)(1)(A), (d)(1)(B), 84 Stat. 1236, 1281.

[4] FIRST COMM'N REPORT, *supra* note 1, at 154.

[5] FIRST COMM'N REPORT, *supra* note 1, at 167. The Commission's reasoning was quite similar to that of John Stuart Mill, who argued over a century earlier:

> Nor is there anything which tends more to discredit and frustrate the better means of influencing conduct, than a resort to the worse. If there be among those whom it is attempted to coerce into prudence or temperance, any of the material of which vigorous and independent characters are made, they will infallibly rebel against the yoke. No such person will ever feel that others have a right to control him in his concerns, such as they have to prevent him from injuring them in theirs; and it easily comes to be considered a mark of spirit and courage to fly in the face of such usurped authority, and do with ostentation the exact opposite of what it enjoins . . . .

J.S. MILL, ON LIBERTY (1859), *quoted in* R. WASSERSTROM, MORALITY AND THE LAW 17-18 (1971).

L. REV. 29, 30 (1968); *Possession & Privacy*, *supra* note 7, at 762.

[13] CAL. HEALTH & SAFETY CODE § 11357 (West Supp. 1973) provides, in relevant part, as follows:

> Every person who possesses any marijuana, except as otherwise provided by law, shall be punished by imprisonment in the county jail for a period of not more than one year or the state prison for a period of not less than one year or more than 10 years.

The provisions of Health and Safety Code section 11530, the former marijuana possession statute, were substantially the same as those of section 11357. Section 11357 was added by [1972] CAL. STAT., ch. 1407, § 3.

[14] Article I, section 6 of the California constitution provides, in relevant part, as follows: "Excessive bail shall not be required, nor excessive fines imposed; nor shall cruel or unusual punishments be inflicted." The significance of determining the validity of Health and Safety Code section 11357 under article I, section 6 of the California constitution lies in the fact that the state constitution provides a basis independent of the eighth amendment to the United States Constitution for invalidation of the statute. Should the California Supreme Court invalidate section 11357 on the basis of article I, section 6 of the California constitution, such decision could not be reviewed by the United States Supreme Court; the "adequate state ground" rule prescribes that "there can be no [United States Supreme Court] review if the state court has decided the case exclusively on some ground of state law, and has never reached a federal question present in the case." C. WRIGHT, FEDERAL COURTS § 107, at 488 (2d ed. 1970). For a discussion of the significance of challenging cruel or unusual punishment on *state*

their attention. Moreover, despite the constitutional objections expressed by the commentators, the California Supreme Court has never passed upon the constitutionality of California's marijuana possession statute.[15] There are recent indications, however, that the cruel or unusual punishment clause of the California constitution is violated by the California marijuana possession statute.[16]

Accordingly, this Comment will examine the effect of article I, section 6 of the California constitution with respect to the existing prohibition against the possession of marijuana, as em-

---

constitutional grounds, and an analysis of the "adequate state ground" rule in this context, see Bice, Anderson *and the Adequate State Ground*, 45 S. CAL. L. REV. 750 (1972); Packer, *The Aims of The Criminal Law Revisited: A Plea for a New Look at "Substantive Due Process"*, 44 S. CAL. L. REV. 490 (1971).

[15] In 1967, two commentators noted that "there has never been a definitive constitutional review of the California marijuana possession statute. . . . [J]udicial finger-tapping where marijuana is concerned has all the signs of continuing indefinitely." Boyko & Rotberg, *supra* note 7, at 774. Unfortunately, the justices of the California Supreme Court are still "tapping."

A number of California Court of Appeal cases have rejected challenges of the marijuana possession statute brought on the basis of the cruel or unusual punishment clause. *See, e.g.*, People v. Tharp, 272 Cal. App. 2d 268, 78 Cal. Rptr. 412 (2d Dist. 1969); People v. Sheridan, 271 Cal. App. 2d 429, 76 Cal. Rptr. 655 (4th Dist. 1969), and cases cited therein. It should be noted, however, that these cases rejected the cruel or unusual punishment challenge in rather summary fashion; most cases decided the issue with only a few sentences of discussion. In addition, these cases were all decided prior to People v. Anderson, 6 Cal. 3d 628, 493 P.2d 880, 100 Cal. Rptr. 152, *cert. denied*, 406 U.S. 958 (1972), and *In re* Lynch, 8 Cal. 3d 410, 503 P.2d 921, 105 Cal. Rptr. 217 (1972), discussed in Sections II(*A*) & II(*B*) *infra*.

[16] The California Supreme Court has acknowledged changing social attitudes with respect to the possession and use of marijuana. *See, e.g., In re* Higbie, 6 Cal. 3d 562, 493 P.2d 97, 99 Cal. Rptr. 865 (1972), in which the court held that an attorney's conviction for failure to pay the federal marijuana transfer tax did not demonstrate, per se, moral turpitude. The court noted:

> [T]he possession and use of marijuana at the present time raises controversial questions, to which automatic answers cannot be given. Lawmakers, legal scholars, physicians, and sociologists are divided in opinion as to the wisdom of prohibiting or punishing these acts. . . .
>
> . . . Possession or use of marijuana is, of course, unlawful, but measured by the morals of the day its possession or use does not constitute "an act of baseness, vileness or depravity . . . contrary to the accepted and customary rule of right and duty between man and man", or indicate that an attorney is unable to meet the professional and fiduciary duties of his practice.

6 Cal. 3d at 571-72, 493 P.2d at 102-03, 99 Cal. Rptr. at 870-71 (citations and footnote omitted).

In addition, in *In re* Jones, 35 Cal. App. 3d 531, 110 Cal. Rptr. 765 (1st Dist. 1973), Brown, J. (dissenting), became the first California judge to express the view that a defendant's sentence upon conviction for sale of marijuana under Health and Safety Code section 11531 (currently renumbered section 11360 (West Supp. 1973)) constituted cruel or unusual punishment under article I, section 6 of the California constitution. Although the majority of two judges rejected petitioner's challenge to his sentence, the dissenting judge would have held that petitioner's sentence was invalid under the tests announced in In re *Lynch*, discussed in Section II(*B*) *infra*. 35 Cal. App. 3d at 542-54, 110 Cal. Rptr. at 772-80 (dissenting opinion). *See* notes 56-57 & accompanying text *infra*.

bodied in section 11357 of the California Health and Safety Code.[17] First, the indicia of cruel or unusual punishment, as disclosed by major judicial decisions, will be reviewed. This consideration will focus on two recent opinions of the California Supreme Court: *People v. Anderson*[18] and In re *Lynch*.[19] In addition, recent decisions by other state supreme courts determining the constitutionality of their states' marijuana possession and sale statutes will be discussed. These principles will then be applied in an analysis of the constitutional status of California's marijuana possession statute. Finally, it will be suggested that the punishment prescribed by section 11357 is cruel or unusual in the constitutional sense and, indeed, that any sentence of imprisonment for the private possession of marijuana for personal use is invalid under the California constitution.

II. The Indicia of a Cruel or Unusual Punishment

The prohibition against cruel or unusual punishment may appear, to those unfamiliar with the subtleties of constitutional jurisprudence, to constitute a formidable limitation upon the imposition of punishment. Its place among the "fundamental rights" protected by the Bill of Rights in the United States Constitution, and the Declaration of Rights in the California constitution, suggests the importance which the respective framers attached to the proscription of cruel or unusual punishments. Traditionally, however, the most notable characteristic of the limitation has been its disuse.[20] It has been suggested that the reluctance of the judiciary to invoke the prohibition against cruel or unusual punishment results from the failure of the courts and commentators to develop constitutional standards for determining whether a punishment is unconstitutionally cruel or unusual.[21]

---

[17] Although many of the constitutional objections to section 11357 discussed in this Comment may be equally applicable to California Health and Safety Code sections 11358 (cultivation of marijuana), 11359 (possession of marijuana for sale), and 11360 (transportation, sale, and importation of marijuana), a consideration of the constitutionality of those statutes is beyond the scope of this Comment. In addition, although this Comment deals primarily with the constitutionality of the present sanctions for *first offense* marijuana possession, the constitutional objections discussed in this Comment should be equally applicable to the sentence which can be imposed for second and subsequent offenders under section 11357. *See* notes 123 & 132 *infra*.

[18] 6 Cal. 3d 628, 493 P.2d 880, 100 Cal. Rptr. 152, *cert. denied*, 406 U.S. 958 (1972).

[19] 8 Cal. 3d 410, 503 P.2d 921, 105 Cal. Rptr. 217 (1972).

[20] *See* Note, *Revival of the Eighth Amendment: Development of Cruel-Punishment Doctrine by the Supreme Court*, 16 STAN. L. REV. 996, at 996 (1964).

[21] *Id.* at 996; Bonnie & Whitebread, *supra* note 7, at 1133-34. *See* Note, *The Cruel and Unusual Punishment Clause and the Substantive Criminal Law*, 79 HARV. L. REV. 635 (1966).

These "constitutional standards," however, have been refined and expanded in a remarkable series of recent developments. Justice Mosk of the California Supreme Court accurately predicted these developments when he observed that "there are straws in the wind to suggest the next section upon which legal fashions focus will be the eighth amendment."[22] The increase in judicial invocation of the cruel and/or unusual punishment clauses within the past three years bears witness to the accuracy of his augury.[23] The cruel or unusual punishment clause of the California constitution has been significantly clarified and developed by the supreme court in the recent cases of *People v. Anderson*[24] and In re *Lynch*.[25] Discussion of these cases follows, as well as an analysis of the standards for determining whether a given punishment violates California's prohibition against cruel or unusual punishment.

A. Anderson: *Contemporary Standards of Decency and Infrequency of Enforcement*

In *Anderson*, the California Supreme Court held that capital punishment constituted both cruel *and* unusual punishment prohibited by article I, section 6 of the California constitution. The case presented a unique opportunity for the court to consider and apply the cruel or unusual punishment clause.[26] In a lengthy and carefully reasoned opinion, Chief Justice Wright discussed the several factors which must be considered when deciding whether a punishment is cruel or unusual.

Sinclair, 387 Mich. 91, 194 N.W.2d 878 (1972); State v. Ward, 57 N.J. 75, 270 A.2d 1 (1970).

[24] 6 Cal. 3d 628, 493 P.2d 880, 100 Cal. Rptr. 152, *cert. denied*, 406 U.S. 958 (1972).

[25] 8 Cal. 3d 410, 503 P.2d 921, 105 Cal. Rptr. 217 (1972).

[26] For an interesting account (written by one of the participating attorneys) of the litigation culminating in the *Anderson* case, see M. MELTSNER, CRUEL AND UNUSUAL: THE SUPREME COURT AND CAPITAL PUNISHMENT 141-42, 266-85 (1973) [hereinafter cited as MELTSNER]. Not only was the California Supreme Court squarely presented with the issue of whether capital punishment constituted cruel or unusual punishment under the California constitution, but the court also was apparently hurrying to decide the *Anderson* case before the United States Supreme Court decided Furman v. Georgia, 408 U.S. 238 (1972). MELTSNER, *supra* at 267. The California Supreme Court's haste apparently resulted from the belief that "[t]he Justices of the United States Supreme Court could not fail to be influenced by the California decision." *Id.* at 285. *See also* Barrett, *Anderson and the Judicial Function*, 45 S. CAL. L. REV. 739, 740 (1972).

Initially, the court indicated that the use of the disjunctive in the state constitution (*i.e.*, cruel *or* unusual punishment) was a significant and deliberate departure from the language of the eighth amendment to the United States Constitution, which proscribes cruel *and* unusual punishment.[27] The court noted that the drafters of the California constitution of 1849 were concerned not only that *cruel* punishments be prohibited but also that *disproportionate* and *unusual* punishments also be independently proscribed.[28] Thus, the court held that a punishment can be prohibited if *either* cruel *or* unusual.[29]

Chief Justice Wright next turned to a consideration of the role of the judiciary in giving effect to the clause. In response to the argument that prohibiting the imposition of the death penalty on the basis of the cruel or unusual punishment clause would intrude upon the authority of the Legislature, the court stated that "the cruel or unusual punishment clause of the California Constitution . . . operates to restrain legislative and executive action and to protect fundamental individual and minority rights against encroachment by the majority."[30] The important constitutional question, the court held, could not "be avoided by deferring to any other court or to any other branch of government."[31] The court firmly indicated that while the enactment of penal statutes and the specification of punishment for crime constitute a legislative function, the final judgment as to whether the punishment decreed by the Legislature exceeds constitutional limits is a judicial function.[32]

Having asserted its authority to construe and apply the cruel or unusual punishment clause, the court proceeded to consider the standards which should be applied in such cases. Relying principally on *Trop v. Dulles*[33] and *Weems v. United States*,[34] the court stated that the proper test for determining whether a punishment is "cruel or unusual" can be discerned from the "evolving standards of decency that mark the progress of a maturing society."[35] Because the constitution is a "progressive document," it must be "applied consistently with the standards of the age in which the

questioned punishment [is] sought to be inflicted."[36]

Of course, the principal problem with this "decency inquiry" lies in determining precisely what the contemporary standards of decency are. In its attempt to specify these standards, the court held that public acceptance of capital punishment was a "relevant, but not controlling factor."[37] Chief Justice Wright concluded that an essential indicator of contemporary standards of decency is the frequency with which the questioned punishment is actually applied. The infrequency of application of a legislatively prescribed punishment "suggests that among those persons called upon to actually impose or carry out the [punishment] it is being repudiated with ever increasing frequency."[38] Thus, an important element of any "decency inquiry" is the reluctance (if any) of those responsible (*e.g.*, judges and juries) for imposing the questioned punishment actually to inflict such measures.[39] The court stated that the death penalty was suspect because it was rarely imposed, and rarely carried out.[40] The *Anderson* court was impressed in this regard by the Report of the President's National Crime Commission, which concluded that "[t]he most salient characteristic of capital punishment is that it is infrequently applied."[41] On the basis of its investigation of statistics showing that the death penalty was rarely enforced, the court concluded that capital punishment was offensive to contemporary standards of decency, and therefore excessively cruel under article I, section 6 of the California constitution.

In arriving at this conclusion, the court further observed that a "cruel" punishment is not limited to the infliction of bodily pain or mutilation. The "dehumanizing effects" of capital punishment were held to be "often so degrading and brutalizing to the human spirit as to constitute psychological torture."[42] The court noted that the psychological impact of the punishment had been dispositive in *Trop v. Dulles*.[43] It therefore concluded that "[t]he

43 356 U.S. 86 (1958). Trop had been convicted of a violation of section 401(g) of the Nationality Act of 1940, which provided that a citizen "shall lose his nationality" by "[d]eserting the military or naval forces of the United States in time of war, provided he is convicted thereof by court martial and as a result of such conviction is dismissed or dishonorably discharged from the service . . . ." Chief Justice Warren, writing for a plurality of four members of the court, held that deprivation of citizenship as a punishment for wartime desertion was invalid under the cruel and unusual punishment clause of the

dignity of man, the individual and the society as a whole, is today demeaned by our continued practice of capital punishment."[44]

Finally, Chief Justice Wright turned to a consideration of the "unusual" nature of capital punishment. He rejected the state's argument that a punishment is not unusual in the constitutional sense unless unusual in the form or method by which it is imposed.[45] He held that an excessive or disproportionate punishment is "unusual" in the constitutional sense.[46] The dramatic decrease in executions in the United States and California, as well as the world-wide abolition movement, also indicated the "unusual" nature of capital punishment. The death penalty had become unusual because it was rarely imposed or carried out, and hence was proscribed by the cruel or unusual punishment clause.

Thus, *Anderson* laid the foundation for challenging infrequently enforced punishments. Less than a year after the *Anderson* decision, the court in In re *Lynch*[47] held a punishment invalid under the cruel or unusual punishment clause because it was disproportionate to the offense committed. In the course of that opinion, the court provided a series of principles for determining whether such disproportionality exists.

B. *In re* Lynch: *The Proportionality Requirement*

In the *Lynch* case, the California Supreme Court again seized a propitious opportunity to interpret and apply the state constitutional prohibition against cruel or unusual punishment. John Lynch had written a letter to the supreme court explaining the circumstances of his imprisonment. He was serving an indeterminate sentence for his second conviction for indecent exposure. For three and one-half of the five years he had spent in prison for the offense, he had been confined in the maximum security unit at Folsom State Prison.[48] On the basis of this letter, the court decided to hear his case on writs of habeas corpus.[49]

On these facts, for the first time in its history the court struck down the *length* of a sentence when measured against the cruel or unusual punishment clause of the state constitution. Justice Mosk, writing for the court, voided the recidivist provision of California Penal Code section 314 which made a second conviction

49 Remarks of Justice Mosk to student discussion group at UCLA School of Law, April 1973.

for indecent exposure punishable by one year to life imprisonment in the state prison.[50]

Justice Mosk first determined that the constitutional validity of an indeterminate sentence must be judged by the *maximum* sentence which can be imposed for the offense.[51] Because the indeterminate sentence was, in legal effect, a sentence for the maximum term prescribed by the statute, the court held that the "maximum must in the first instance be constitutionally valid."[52] The court thus deemed petitioner to be serving a life sentence.

The court next responded to the petitioner's argument that his life sentence for indecent exposure was constitutionally invalid because grossly disproportionate to the offense. Justice Mosk noted that the court had already held in *Anderson* that " 'punishment of excessive severity for ordinary offenses' may be both cruel *and* unusual within the meaning of article I, section 6, of the California Constitution."[53] After reviewing a number of United States Supreme Court cases,[54] the court stated that " 'it is a precept of justice that punishment for crime should be graduated and proportioned to [the] offense.' "[55]

In support of that observation, the court also considered decisions of other state supreme courts which had invoked the "rule of proportionality." It was in this discussion that the court first implied that the present California penalties for the possession of marijuana might be unconstitutionally disproportionate to the offense. As an example of sentences which had been held impermissibly excessive, Justice Mosk cited *People v. Lorentzen*,[56] a case in which the Michigan Supreme Court held that a mandatory minimum sentence of twenty years was disproportionate to the crime of *selling* marijuana and thus violative of the Michigan cruel or unusual punishment clause. Then, in a footnote, he emphasized his point:

---

[50] 8 Cal. 3d at 439, 503 P.2d at 940, 105 Cal. Rptr. at 236.

[51] The court stated:

> [W]hen a defendant under an indeterminate sentence challenges that sentence as cruel or unusual punishment in violation of the California Constitution, the test is whether the maximum term of imprisonment permitted by the statute punishing his offense exceeds the constitutional limit, regardless of whether a lesser term may be fixed in his particular case by the Adult Authority.

[55] 8 Cal. 3d at 421, 503 P.2d at 928, 105 Cal. Rptr. at 224, *quoting* Weems v. United States, 217 U.S. 349, 366-67 (1910).

[56] 387 Mich. 167, 194 N.W.2d 827 (1972).

> Nor is disproportionality confined to *long* prison sentences: in *State v. Ward* (1970) 57 N.J. 75 [270 A.2d.1], a punishment of *two to three years' imprisonment* for possession of marijuana was held excessive when inflicted on youthful first offenders . . . .[57]

The court thus suggested that a "long" prison sentence for the possession of marijuana could be held to be disproportionate to that offense. As a result of the court's review of these cases, it announced the "proportionality rule":

> [A] punishment may violate article I, section 6 . . . if, although not cruel or unusual in its method, it is so disproportionate to the crime for which it is inflicted that it shocks the conscience and offends fundamental notions of human dignity.[58]

Conceding that the determination of whether a particular punishment violates the "proportionality rule" constitutes a "question of degree," Justice Mosk presented what he described as three "techniques" to be utilized as an aid in administering the rule. First, the court must look to "the nature of the offense and/or the offender, with particular regard to the degree of danger both present to society."[59] In his discussion of this first technique, Justice Mosk added to the implications of his previous footnote.[60] He specifically announced the first technique in the context of a discussion of cases which had held that sentences imposed for the possession and sale of marijuana constituted cruel or unusual punishment.[61] And he again emphasized, with reference to the *Ward* case, that "if the offense is deemed of *minimal danger to society* the penalty may be disproportionate even though the defendant is neither young nor a first offender . . . ."[62] It was further suggested that punishment for the so-called *"victimless crimes"*[63] may be subject to invalidation by this first technique,

62 8 Cal. 3d at 425, 503 P.2d at 931, 105 Cal. Rptr. at 227 (emphasis added).

63 It has been suggested that "victimless crimes" might more appropriately be termed "crimes for which no witnesses exist," or "complaintless crimes," but both of these terms have their own definitional difficulties. Junker, *Criminalization and Criminogenesis*, 19 UCLA L. REV. 697, 698-99 (1972); Kaplan, *Foreword* to *Marijuana Laws: An Empirical Study of Enforcement and Administration in Los Angeles County*, 15 UCLA L. REV. 1501, 1504 (1968) [hereinafter

because "an offender may *'gain nothing'* from this crime and *'injure nobody.'* "[64] Justice Mosk noted that the *minor nature* of the offense in question may be dispositive of the proportionality issue. Also relevant to the question of proportionality is the *nonviolent* nature of the offense in question.[65]

In its application of the first technique to the crime in question, the court noted that at common law indecent exposure was punished as a misdemeanor, and that a similar punishment prevailed in California until 1952.[66] It was also observed that the crime was nonviolent in nature and that although indecent exposure is not a "victimless crime," any harm that it may cause is minimal at most.[67]

The second technique propounded by the court consists of a comparison of the challenged penalty "with the punishments prescribed in the *same jurisdiction* for *different offenses* which, by the same test, must be deemed more serious."[68] Borrowing from *O'Neil v. Vermont*,[69] *Weems*, and *Lorentzen*,[70] Justice Mosk noted that these cases had given great weight to disparities in sentences. He reasoned that the Legislature may be depended upon to act with due and deliberate regard for constitutional restraints in the vast majority of punishments prescribed in the penal statutes it enacts. But, if among this "vast majority" of statutes, some are found which were enacted through "honest zeal generated in response to transitory public emotion, which provide for more serious penalties than the penalties prescribed for "more serious crimes," then the challenged penalty becomes suspect.[71] In applying the second technique, the court conducted an extensive

analysis of the punishments provided for "more serious crimes," and concluded that "the increased punishment provided by section 314 is far more severe than those of other recidivist statutes penalizing conduct that is indisputably more serious."[72]

The third technique for determining proportionality presented by the *Lynch* court is a "comparison of the challenged penalty with the punishments prescribed for the *same offense* in *other jurisdictions* having an identical or similar constitutional provision."[73] The rationale for this technique is that the majority of such other jurisdictions presumably will have prescribed punishments for the questioned offense which are within the constitutional limit of severity. If the challenged punishment is found to exceed the penalties decreed for the offense in a significant number of other jurisdictions, the disparity is a further measure of the excessiveness of the punishment. In applying this third technique, the court noted the unusual severity of California's punishment for second offense exhibitionism when compared with the punishment which could be imposed for the same offense in other states.

In holding the recidivist provisions of the indecent exposure statute void under the cruel or unusual punishment clause of the California constitution, the *Lynch* court laid down three distinct principles which could be utilized in subsequent cases challenging punishments on the basis of their disproportionality to the offense committed. In so doing, the court implied that the present penalties for marijuana possession are suspect. In the ensuing discussion, it will be demonstrated that the principles articulated in the *Anderson* and *Lynch* cases, when applied to the current sentencing provisions of California's marijuana possession statute, render those provisions void under article I, section 6 of the California constitution.

III. The Constitutional Requirements and Marijuana Possession

In applying the principles enunciated in *Anderson* and *Lynch* to section 11357 of the California Health and Safety Code, a considerable array of medical, sociological, and criminological data

---

[72] *Id.* at 431-36, 503 P.2d at 935-38, 105 Cal. Rptr. at 231-34. Crimes which the court considered "far more serious" included, *inter alia*, manslaughter (Penal Code section 193), assault with intent to commit murder (Penal Code section 217), assault on a peace officer or fireman engaged in the performance of his duties (Penal Code sections 241, 243), shooting at an inhabited dwelling (Penal Code section 246), poisoning food or drink with the intent to injure a human being (Penal Code section 347), and drunk driving causing bodily injury (Penal Code section 367e and Vehicle Code section 23101).

[73] 8 Cal. 3d at 427, 503 P.2d at 932, 105 Cal. Rptr. at 228 (emphasis in original).

concerning the questioned offense should be considered. Accordingly, in order that the *Anderson* and *Lynch* principles may be properly applied, the following discussion will present and analyze such data regarding the use and possession of marijuana.

A. The Degree of Danger Presented by Marijuana Use

The first technique set forth in *Lynch* for determining whether a punishment is disproportionate to the crime for which it is imposed consists of an examination of "the nature of the offense and/or the offender, with particular regard to the degree of danger both present to society."[74] In order to ascertain whether or not such dangers exist, an analysis of the medical and social effects which accompany the use of marijuana is necessary.

1. Medical Effects

One of the principal reasons for the initial criminalization of the possession and use of marijuana was the belief that its use resulted in physiological and psychological impairment. It was once thought that marijuana use produced insanity, addiction, and death.[75] Indeed, the first marijuana legislation in California was included in the State Poison Act, which referred to marijuana as "loco weed."[76]

These beliefs are in distinct contrast to the conclusions drawn from the medical evidence by the National Commission on Marihuana and Drug Abuse.[77] The Commission observed that although a large amount of medical research had been conducted on the subject,

> [n]o conclusive evidence exists of any physical damage, disturbance of bodily processes or proven human fatalities attributable solely to even high doses of marihuana. . . .
>
> . . . .
>
> [T]here is little proven danger of physical or psychological harm from the experimental or intermittent use of the natural preparations of cannabis . . . .[78]

77 Regarding this Comment's emphasis upon the findings and conclusions drawn by the National Commission on Marihuana and Drug Abuse, see note 1 *supra*.

78 FIRST COMM'N REPORT, *supra* note 1, at 56-57, 65. *See also* GRINSPOON, *supra* note 75, at 363-84. A research study conducted for the Commission concluded as follows:

Furthermore, the Commission concluded that there is no reliable evidence that marijuana use produces genetic defects,[79] injury to brain tissue or other organs,[80] or significant physical, biochemical or mental abnormalities (even from long term use).[81] These findings are consistent with a number of previous studies conducted by various governmental commissions, which concluded that "the long-term consumption of cannabis in *moderate* doses has no harmful effects."[82]

The Commission contrasted these findings with the known effects of alcohol use, which can result in death by overdose, specific pathology of brain tissue, and withdrawal symptoms.[83] Furthermore, in dramatic contrast to the American experience with alcohol,[84] there is no reliable scientific evidence demonstrating that chronic psychosis can be caused by marijuana use. In short, the Commission concluded that "alcohol dependence is without question the most serious drug problem in this country today."[85]

The National Commission on Marijuana and Drug Abuse also rejected the assumption that marijuana use is addictive. The

[85] SECOND COMM'N REPORT, *supra* note 1, at 143.

Commission categorically concluded that marijuana "does not induce physical dependence and no significant degree of tolerance is developed."[86] No withdrawal symptom follows even the sudden cessation of chronic, heavy use of marijuana.[87] Indeed, the argument that marijuana use can result in addiction has been officially rejected in California.[88] These effects of even heavy marijuana use are clearly distinguishable in type and degree from the effects of alcohol abuse, which can result in severe withdrawal symptoms.[89]

The Commission also discredited the so-called "stepping-stone theory," which holds that the use of marijuana leads to the use of other "harder" drugs. The Commission observed that the "stepping-stone" theory avoids the real issue and has no basis in fact.[90] The Report emphasized that the overwhelming majority of marijuana users do not progress to the use of other drugs, and that if any drug (including marijuana) is associated with the use of other drugs, it is tobacco, followed closely by alcohol.[91] The Commission concluded that "marijuana use *per se* does not dictate whether other drugs will be used; nor does it determine the rate of progression, if and when it occurs, or which drugs might be used."[92]

In summary, marijuana use presents minimal risks to users in terms of its physiological and psychological effects. The "addiction" and "stepping-stone" arguments have been discredited. Present research indicates that the abuse of alcohol and the use of

[88] Boyko & Rotberg, *supra* note 7, at 777.

[89] *See* People v. Sinclair, 387 Mich. 91, 108, 194 N.W.2d 878, 883 (1972), *citing* PRESIDENT'S COMM'N, *supra* note 84. The court noted:

> Acute alcohol abuse can lead to death from overdosage. In addition, chronic alcohol abuse leads to alcoholism where a clear withdrawal syndrome is observable (an easily discernible physical shaking and later *delirium tremens*), and death of brain cells, mental deterioration, and cirrhosis of the liver may occur.

[90] FIRST COMM'N REPORT, *supra* note 1, at 87-88. The Commission observed:

> This so-called stepping-stone theory first received widespread acceptance in 1951 as a result of testimony at Congressional hearings. At that time, studies of various addict populations repeatedly described most heroin users as marihuana users also. The implication of these descriptions was that a causal relationship existed between marihuana and subsequent heroin use. When the voluminous testimony given at these hearings is seriously examined, no verification is found of a causal relationship between marihuana and subsequent heroin use.

Id. at 88.

[91] *Id.* at 87.

[92] *Id.* at 88-89. The court in People v. Sinclair, 387 Mich. 91, 111-12, 194 N.W.2d 878, 885 (1972), arrived at much the same conclusion. *See also* GRINSPOON, *supra* note 75, at 256-80.

tobacco result in significantly more serious physiological consequences than does the use of marijuana. In short, it appears that the use of marijuana in this country constitutes a minimal risk to public health.[93] Yet, marijuana possession remains subject to severe criminal penalties, while possession of alcohol and tobacco is "legal." It will be shown that such disparities in treatment cannot withstand the proportionality test.

2. Social Effects

An examination of the marijuana possession offense, with particular regard to the degree of danger it presents to society, is essential to the application of the first *Lynch* technique. In terms of this first technique, perhaps the most conspicuous aspect of the marijuana possession offense is its status as a "victimless crime."[94] Clearly, the mere private possession or use of marijuana does not directly affect the legally protectible interests of other individuals, whereas theft, physical assaults, and a myriad of other crimes against persons and property clearly affect these interests. A marijuana possessor "gains nothing" and "injures nobody" by his crime.[95] As one judge has observed, marijuana possession constitutes an offense *malum prohibitum;* the possession or ingestion of a natural growing plant can hardly be *malum in se.*[96] It has been demonstrated in the preceding section that marijuana use does not result in significant physical or mental detriments to users; the *malum prohibitum* status of the possession offense must therefore be justified by some other rationale. It might be suggested that the aggregate social effects produced by the total use and possession of marijuana warrant its criminalization.

The principal social effects rationale advanced for criminalizing marijuana possession has been the theory that marijuana use leads to the commission of other crimes.[97] The theory was based

---

[93] *See* FIRST COMM'N REPORT, *supra* note 1, at 91. Despite the considerable evidence that marijuana use does not pose a substantial risk to the health of the user, it has been suggested that the current harsh penalties which can be imposed for marijuana possession are justified because future research may expose presently unknown health dangers. In his dissenting opinion in In re *Jones*, Judge Brown responded to that argument as follows:

> If this court, therefore, is to justify the sentence of five years to life imprisonment in the present case, it must do so, in my opinion, on the ground that marijuana is a danger to society, and not on the basis that future studies may disclose the possibility of physical damage to the user in the far distant future from continued use.

[96] *See* People v. Sinclair, 387 Mich. 91, 152, 194 N.W.2d 878, 905 (1972) (Brennan, J., concurring).

[97] *See, e.g., In re* Jones, 35 Cal. App. 3d 531, 548 n.4, 110 Cal. Rptr. 765,

on the belief that marijuana intoxication induced acts of violence and aggression. Again, the Commission debunked these unfounded allegations:

> Indeed, if any relationship [between the use of marijuana and the commission of violent or aggressive acts] was indicated [by research conducted for the Commission], it was not a positive and direct causal connection but an inverse or negative statistical correlation.
>
> Rather than inducing violent or aggressive behavior through its purported effects of lowering inhibitions, weakening impulse control and heightening aggressive tendencies, marihuana was usually found to inhibit the expression of aggressive impulses by pacifying the user . . . .[98]

Alcohol use presents a substantially greater potential for violent criminal activity than does marijuana: "data show that marihuana users were much less likely to commit aggressive or violent acts than were those who preferred amphetamines or alcohol."[99] Furthermore, statistics indicate that only a small number of marijuana users have been previously arrested or convicted of violent crime.[100] "Indeed, the only crimes which can be directly attributed to marihuana-using behavior are those resulting from the use, possession or transfer of an illegal substance."[101]

The Commission summarized its findings on the social effects of marijuana use by concluding that "neither the marihuana user

776 n.4 (1st Dist. 1973); FIRST COMM'N REPORT, *supra* note 1, at 68-69, 71; Bonnie & Whitebread, *supra* note 7, at 1024-26, 1055-58.

[98] FIRST COMM'N REPORT, *supra* note 1, at 71-72.

[99] *Id.* at 73. The Commission further concluded:

> Various empirical studies on the relationship between the use of alcohol and the commission of violent crimes have shown that, in the case of homicide and other assaultive offenses, alcohol was used by at least half the offenders directly prior to the crime.

SECOND COMM'N REPORT, *supra* note 1, at 157.

Moreover, a study conducted for the United States Bureau of Narcotics and Dangerous Drugs indicated that, in Los Angeles, arrestees charged with violent crimes were proportionately *more* likely to be *non*-drug users than marijuana users. For example, whereas 18.6 percent of all non-drug-using arrestees were arrested for aggravated assault, only 6.2 percent of the arrestees who currently used marijuana were arrested for the same offense. Similar patterns were observed for criminal homicide, forcible rape, larceny-theft, non-aggravated assault, weapons offenses, sex crimes, and other offenses. RESEARCH TRIANGLE INSTITUTE, FINAL REPORT (23U-570), DRUG USAGE AND ARREST CHARGES: A STUDY OF DRUG USAGE AND ARREST CHARGES AMONG ARRESTEES IN SIX METROPOLITAN AREAS OF THE UNITED STATES 228-31 (prepared for Bureau of Narcotics and Dangerous Drugs, U.S. Dep't of Justice, Contract No. J-70-35, 1971).

[100] FIRST COMM'N REPORT, *supra* note 1, at 72. Only 5.6 percent of all California defendants convicted of possession of marijuana in 1972 had been previously incarcerated in state prison. CALIFORNIA DEP'T OF JUSTICE, BUREAU OF CRIMINAL STATISTICS: DRUG ARRESTS AND DISPOSITIONS (1972), at 17 (1973) [hereinafter cited as DRUG ARRESTS AND DISPOSITIONS]. *See also* Note, *Possession of Marijuana in San Mateo County: Some Social Costs of Criminalization*, 22 STAN. L. REV. 101, 107 (1969) [hereinafter cited as *San Mateo Study*].

[101] SECOND COMM'N REPORT, *supra* note 1, at 159.

nor the drug itself can be said to constitute a danger to public safety."[102] Because the use and possession of marijuana do not present a threat to public safety or constitute any other threat of danger to society substantial enough to justify criminalization,[103] application of the "danger to society" element of the first *Lynch* technique to the marijuana issue suggests that the proper "danger" inquiry be directed not toward the dangerous social effects of marijuana use and possession, but toward the threat posed to society by the fact that use and possession is a criminal offense. The more appropriate question in this context is "What danger (or detriments) does the *prohibition* of marijuana use and possession tender society?"

The inquiry into the detriments which society incurs from marijuana criminalization has most frequently been conducted in the context of a "cost analysis." Professor John Kaplan, one of the leading expositors of the marijuana "cost analysis" technique, concludes that social costs incurred by marijuana criminalization far outweigh any conceivable benefits received by society.[104] For example, he observed that one of the principal costs incurred by society is simply that involved in any criminal statute that is enforced. It has been estimated that California spends about $100 million per year to enforce its marijuana laws.[105] One state assemblyman has lamented that the enforcement of California marijuana laws takes up "about twenty percent of the time as well as

---

[102] FIRST COMM'N REPORT, *supra* note 1, at 78.

[103] Following an extensive analysis of the social effects of marijuana use, the Commission concluded:

> [I]t is unlikely that marihuana will affect the future strength, stability or vitality of our social and political institutions. The fundamental principles and values upon which the society rests are far too enduring to go up in the smoke of a marihuana cigarette.

[104] J. KAPLAN, MARIJUANA—THE NEW PROHIBITION (Pocket Book ed. 1971) [hereinafter cited as KAPLAN]. Note in particular chapter II, at 22-53. *See also* Kaplan, *Foreword* to *L.A. Empirical Study*, *supra* note 63, at 1501-06. Professor Kaplan's analysis has proven persuasive to some judges, *see, e.g.*, People v. Sinclair, 387 Mich. 91, 194 N.W.2d 878 (1972), especially concurring opinion of Williams, J., *id.* at 123, 194 N.W.2d at 895; State v. Kantner, 53 Hawaii 327, 493 P.2d 306, *cert. denied*, 409 U.S. 948 (1972), especially dissenting opinion of Kobayashi, J., *id.* at 371, 493 P.2d at 320; to the National Commission on Marihuana and Drug Abuse, *see* FIRST COMM'N REPORT, *supra* note 1, at 143-46; and to the State Committee On The Revision of the Penal Code, *see* STATE OF CALIFORNIA, JOINT LEGISLATIVE COMMITTEE FOR THE REVISION OF THE PENAL CODE, PROPOSED TENTATIVE DRAFT, DRUGS—PART I: MARIJUANA 1-19 (Mimeo 1968), reprinted in S. KADISH & M. PAULSEN, CRIMINAL LAW AND ITS PROCESSES—CASES AND MATERIALS 24-28 (2d ed. 1969). The Committee was very critical of the California marijuana possession statute; it recommended decriminalization. For a discussion of the Committee's work, and the subsequent "dismissal" of the Committee, *see* Bartels, *Book Review*, 17 WAYNE L. REV. 256 (1971); *Letters*, 22 STAN. L. REV. 160 (1969).

[105] Wall Street Journal, Aug. 25, 1971, at 1, col. 1.

the money of our overworked law enforcement people and our backlogged courts."[106] For example, in 1972, marijuana arrests accounted for 22 percent of all state-wide adult felony arrests[107] and 41 percent of all felony arrests in Los Angeles County.[108]

Furthermore, serious and unique enforcement problems are presented by the continued criminalization of the possession of marijuana. Selective enforcement of marijuana statutes constitutes a serious social cost inherent in marijuana prohibition.[109] The Commission noted:

> Possession of marihuana is generally a private behavior; in order to find it, the police many times must operate on the edge of constitutional limitations. Arrests without probable cause, illegal searches and selective enforcement occur often enough to arouse concern about the integrity of the criminal process.[110]

---

[106] 85 L.A. Daily Journal, Nov. 17, 1972, at 1, col. 6 (remarks of State Assemblyman John Burton).

[107] A total of 52,027 of the 240,231 1972 California felony arrests were for marijuana offenses. *See* DRUG ARRESTS AND DISPOSITIONS, *supra* note 100, at 4; CALIFORNIA DEP'T OF JUSTICE, BUREAU OF CRIMINAL STATISTICS: CRIMES AND ARRESTS (1972), at 5 (1973). Note that the term "marijuana offenses" presumably included offenses other than a violation of CAL. HEALTH & SAFETY CODE § 11530 (*now* § 11357 (West Supp. 1973)). However, it has been estimated that more than 95 percent of marijuana-related arrests at the state and local levels are for personal possession and casual sales of marijuana. FIRST COMM'N REPORT, *supra* note 1, at 144. In addition to the 52,027 marijuana felony arrests in 1972, there was an "unknown number of misdemeanor arrests." CALIFORNIA DEP'T OF JUSTICE, BUREAU OF CRIMINAL STATISTICS, THE DRUG DIVERSION PROGRAM: AN INITIAL REPORT 5 (1973) [hereinafter cited as DIVERSION PROGRAM].

Statistics indicate that harsh criminal penalties have failed to deter use and possession of marijuana. There were more than *fifteen times* as many felony marijuana arrests in California in 1972 as there were in 1962. DRUG ARRESTS AND DISPOSITIONS, *supra* note 100, at 4. Furthermore, the United States Senate Internal Security Subcommittee estimated that enough marijuana entered the United States in 1973 to produce 5,000,000,000 marijuana cigarettes, a quantity sufficient to provide over twenty "joints" for every person in the nation. The 17,000,000 pounds of marijuana consumed nationally in 1973 represents roughly ten times the total amount of marijuana seized by law enforcement authorities. The Subcommittee report stated that "consumption [of marijuana] far exceeds any previous estimates" (presumably including estimates made by the National Commission on Marihuana and Drug Abuse). L.A. Times, Jan. 6, 1974, § I-A, at 4, col. 1.

[108] DRUG ARRESTS AND DISPOSITIONS, *supra* note 100, at 7.

[109] *See, e.g.*, FIRST COMM'N REPORT, *supra* note 1, at 143-46; KAPLAN, *supra* note 104, at 40-45; *L.A. Empirical Study*, *supra* note 63, at 1536, 1539-42.

[110] FIRST COMM'N REPORT, *supra* note 1, at 145. The questionable police practices encouraged by marijuana possession statutes were exemplified by the Giglotto-Askew raids of April 1973. The mistaken raids, which received a great deal of attention in the national news media, were conducted by drug agents dressed as "hippies" with long hair. The agents, in search of drugs, first raided the Giglotto home by breaking down the front door, rushing upstairs, handcuffing Giglotto and his wife, and, at gunpoint, threatening to kill Giglotto if he didn't tell the agents where to "find the drugs." The agents ransacked the home for ten to fifteen minutes, then left. At no time did the agents identify themselves. About an hour later, the same agents raided (again "mistakenly") the Askew

In addition, the widespread use of marijuana in itself creates monumental enforcement problems.[111] Other social costs, enumerated and extensively analyzed by Professor Kaplan and others,[112] include the fact that criminalization combined with widespread use makes felons of an unusually large portion of the population (especially young people). This, in turn, engenders unnecessary disrespect for the law, and alienation among citizens who believe that marijuana use and possession do not constitute activities which are serious enough to warrant imprisonment as a penalty. Marijuana criminalization hampers efforts directed toward educating young people about the serious dangers resulting from the use of "hard" drugs.[113] Furthermore, the prohibition of marijuana use and possession encourages the proliferation of organized crime (compare alcohol prohibition in the 1920s). In summary, "the possession offense is of little functional benefit to the discouragement policy and carries heavy social costs."[114]

The negligible danger that marijuana use and possession pose to society, when compared with the costs attributable to the enforcement of the marijuana prohibition, amply satisfies the first *Lynch* proportionality requirement. The marijuana possession offense neatly falls within the principles announced for application of that technique: Marijuana possession constitutes a victimless, minor, nonviolent crime which "gains nothing" for the offender (other than personal pleasure) and "injures nobody."[115] The present punishment is clearly disproportionate to the degree of danger to society presented by the marijuana possession offense and the typical offender.

B. Disproportionate Punishment

The second technique announced in *Lynch* to aid in determining whether a punishment is disproportionate to a given offense is a comparison of the challenged penalty with the punishments pre-

---

home. Mr. Askew noticed some "hippie looking" men outside his house. He tried to hold the kitchen door shut as the men outside attempted to kick it down, while his wife tried to call the police. However, he was restrained by agents pointing guns through the window. Since disclosing these events, the Giglottos and the Askews have been frequently exposed to "mysterious harassment." L.A. Times, Oct. 30, 1973, § I, at 1, col. 1.

111 *See* note 107 *supra.*

112 *See* note 104 *supra.*

113 For an excellent discussion of this effect, see KAPLAN, *supra* note 104, at 38-39.

114 FIRST COMM'N REPORT, *supra* note 1, at 146. For a full analysis of the foregoing (and other) social costs inherent in marijuana criminalization, see authorities cited in note 104 *supra.*

115 *See* notes 62-65 & accompanying text *supra.*

scribed in the same jurisdiction for other "more serious" offenses.[116] A maximum sentence[117] of ten years in state prison can be imposed under Health and Safety Code section 11357 for possession of marijuana. (California criminal offenses for which a maximum sentence of ten years or less in state prison can be imposed are summarized in Table I of the Appendix.)

A comparison of the ten-year maximum sentence which can be imposed for marijuana possession under section 11357 with the maximum sentences which can be imposed for other more serious crimes makes a convincing case for a finding of disproportionality. For example, it is inconceivable that marijuana possession can be considered a more serious crime than the unlawful killing of a human being. Yet, felony drunk driving resulting in death[118] and vehicular manslaughter[119] are each punishable by a maximum imprisonment of five years in state prison. The maximum sentences which can be imposed for violent crimes against the person, such as assault,[120] battery,[121] and willful infliction of unjustifiable physical pain upon a child under circumstances likely to produce death[122] are less than or equal to that which can be imposed for marijuana possession. And a most peculiar example of sentencing priorities is disclosed by a comparison of the ten-year maximum for marijuana possession with the two-year maximum for assault on a fireman or police officer engaged in the performance of his duties.[123]

Crimes constituting a substantial threat to human life, such as incitement to kill a police officer resulting in death of same,[124]

---

116 *See* note 68 & accompanying text *supra*.

117 The validity of an indeterminate sentence under article I, section 6 is determined by the maximum sentence which can be imposed. *See* notes 51-52 & accompanying text *supra*.

118 CAL. VEHICLE CODE § 23101 (West 1970).

119 CAL. PENAL CODE §§ 192, 193 (West 1970).

120 *Id.* § 241 (West Supp. 1973).

121 *Id.* § 243 (West Supp. 1973).

122 *Id.* § 273a (West 1970).

123 *Id.* § 241 (West Supp. 1973).

The disparity between the maximum imprisonment which can be imposed for violent crimes against the person and the maximum sentence which can be imposed for second and subsequent offenses under section 11357 is also apparent. The maximum penalty which can be imposed under section 11357 for a second conviction for marijuana possession is twenty years in state prison; for third and subsequent possession offenses, a maximum of life imprisonment can be imposed. *Cf.* California Penal Code sections 190 (second degree murder; maximum life imprisonment), 193 (manslaughter; maximum 15 years imprisonment), 264 (rape; maximum life imprisonment), 208 (kidnapping; maximum 25 years imprisonment), 217 (assault with intent to commit murder; maximum 14 years imprisonment), 220 (assault with intent to commit rape, robbery, etc.; maximum 20 years imprisonment).

124 CAL. PENAL CODE § 151 (West 1970).

possession of a loaded firearm in the State Capitol or Governor's office,[125] shooting at an inhabited dwelling or at aircraft,[126] drawing a firearm in a threatening manner,[127] and possession of machine guns, bombs, grenades, and tear gas weapons[128] all warrant potential punishment which is significantly less severe than that incident to marijuana possession. Incredibly, poisoning food, drink, or water supplies with the intent that the poisoned substance shall be taken by a person to his injury carries the same maximum penalty as possession of marijuana.[129]

Comparison of section 11357 with statutes regulating the use and possession of other illicit drugs also makes a convincing case for disproportionality.[130] For example, despite the fact that heroin use is much more dangerous in terms of its physiological and social consequences than marijuana use,[131] the maximum imprisonment which can be imposed for first offense heroin possession is the same as that which can be imposed for first offense marijuana possession.[132] Likewise, the maximum punishment which can be imposed for the possession of "harder drugs" such as opium, morphine, codeine, LSD, mescaline, peyote, psilocybin, and amphetamine is equal to that which can be imposed for marijuana possession.[133] Moreover, the possession and use of tobacco and alcohol, activities which most nearly resemble use and possession of marijuana, are not criminal offenses at all.

Finally, the most bizarre instance of sentencing disparity stems from the fact that driving under the influence of a drug (including marijuana), when it results in bodily injury, is punishable by a maximum of five years in state prison,[134] whereas *mere possession* of marijuana is punishable by a maximum of ten years' imprisonment. Surely the use of a drug, when such use results

129 *Id.* § 347 (West 1970).

130 In its application of the "second technique," the *Lynch* court compared the indecent exposure statute at issue in that case with other statutes regulating sexual activity, as well as other statutes designed to protect the same interests which the challenged statute sought to protect. 8 Cal. 3d at 432, 503 P.2d at 935, 105 Cal. Rptr. at 231.

131 SECOND COMM'N REPORT, *supra* note 1, at 175, 193.

132 CAL. HEALTH & SAFETY CODE §§ 11054, 11350 (West Supp. 1973). Also note that the maximum imprisonment which can be imposed for second and subsequent marijuana possession convictions under section 11357 is identical with the maximum which can be imposed for second and subsequent convictions for possession of other "harder" controlled substances under Health and Safety Code section 11350.

133 CAL. HEALTH & SAFETY CODE §§ 11054, 11055, 11350 (West Supp. 1973).

134 CAL. VEHICLE CODE § 23106 (West Supp. 1973).

in bodily injury to another, is a far more serious offense than mere possession of the drug. On the basis of a comparison of the offenses discussed above (as well as those listed in Table I) with the offense of marijuana possession, it is clear that in a substantial number of instances, crimes which are far more damaging to society than marijuana possession are punished less severely. Accordingly, a judicial determination is warranted that the imprisonment which can be imposed under Health and Safety Code section 11357 is disproportionate to the offense.

C. *Punishment in Other Jurisdictions: The National Decriminalization Trend*

The third technique to be used in the proportionality inquiry consists of an examination of the penalties prescribed for the same offense in other jurisdictions.[135] A comparison of the maximum penalty which can be imposed for possession of marijuana in California with the maximum penalties in other states and foreign nations discloses significant disparities in punishment.

As a result of the increased use of marijuana and more extensive knowledge about the effects of the drug, a substantial nationwide trend toward a reduction in penalties, and indeed toward decriminalization, has occurred in recent years.[136] California has participated negligibly in this trend: in 1968, the state amended its marijuana possession statute to provide for alternative felony or misdemeanor penalties.[137] Furthermore, the State Legislature in 1972 passed a bill which would have provided for a maximum imprisonment of six months in county jail upon conviction of possession of marijuana, but the measure was vetoed by the Governor.[138] Thus, despite attempts by the Legislature to enact more rational marijuana possession legislation, the maximum penalty which can be imposed for marijuana possession is as severe today as at any other time in California's history.[139]

The preservation of the ten-year maximum penalty for marijuana possession in California compares unfavorably with the nationwide trend towards a reduction in penalties. Only one state,

[135] *See* note 73 & accompanying text *supra*.

[136] *See* FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 548-50; SECOND COMM'N REPORT, *supra* note 1, at 245-46.

[137] Former CAL. HEALTH & SAFETY CODE § 11530, which provided for mandatory felony punishment prior to 1968, was amended by [1968] CAL. STAT., ch. 1465, at 2930.

[138] A.B. 1778 (Cal. Reg. Sess. 1972), sponsored by Assemblyman Alan Sieroty, was passed by the Legislature on December 1, 1972, but vetoed by Gov. Ronald Reagan on December 29, 1972. FINAL CALENDAR OF LEGISLATIVE BUSINESS 660 (Cal. Reg. Sess. 1972).

[139] *See* Boyko & Rotberg, *supra* note 7, at 783-85.

Rhode Island, maintains a more severe maximum penalty for possession of marijuana (for personal use) than does California, and Arizona is the only other state which provides for the same maximum that California does.[140] With the exception of just six states,[141] every state in the nation provides for a maximum imprisonment of one year *or less* for the possession of marijuana for personal use. Even Texas, which until 1973 prescribed a maximum punishment of life imprisonment for possession of marijuana, reduced its maximum penalty to 180 days for possession of two ounces or less.[142]

Moreover, a number of states have eliminated (or nearly eliminated) imprisonment as a punishment for marijuana possession. Possession of up to one ounce of marijuana is punishable by a maximum fine of $100 in Oregon; incarceration has been eliminated as a sanction.[143] In Massachusetts, probation is mandatory upon first conviction for possession.[144] West Virginia law provides that any first possession or distribution offense (less than fifteen grams) *must* be conditionally discharged.[145] Likewise, a conviction as a "disorderly person," a quasi-criminal non-indictable offense, is the maximum which can be imposed for possession of twenty-five grams or less in New Jersey.[146] Nebraska imposes a maximum penalty of seven days' imprisonment for conviction of possession of up to *one pound* of marijuana.[147] Other states provide for minimal imprisonment.[148] In addition, at least

143 13 CRIM. L. RPTR. 2545-46 (Sept. 19, 1973).

144 MASS. LAWS ANN., ch. 94C, § 34 (Supp. 1972).

145 FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 550.

146 N. J. STAT. ANN. § 24:21-20.(a)(3) (Supp. 1973-74). However, the National Commission on Marihuana and Drug Abuse observed that "[i]t is unlikely that this penalty is often imposed [since the New Jersey Supreme Court held in State v. Ward, 57 N.J. 75, 270 A.2d 1 (1970), that sentences must be suspended for first offenders]." *See* FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 563; note 57 *supra*.

147 FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 554.

148 Examples are Illinois (ninety-day maximum for two and one-half grams or less), Hawaii (maximum of thirty days), New Mexico (maximum of fifteen days for one ounce or less), Michigan (maximum of ninety days), South Carolina (three months maximum for twenty-eight grams or less), and Washington (ninety-day maximum for forty grams or less). *See* FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 552-57.

thirty-two states now have statutes resembling the conditional discharge provisions of the Uniform Controlled Substances Act.[149] These statutes provide for dismissal without an adjudication of guilt upon completion by the arrestee of conditions set by the court. Although California has purportedly enacted the Uniform Controlled Substances Act,[150] the substantially less severe penalties for marijuana possession recommended in the Uniform Act were excluded in the California Act.[151]

A comparison of California penalties with those imposed in foreign nations indicates that the great majority of other countries impose substantially less severe maximum penalties than does California.[152] In five nations—Chile, Denmark, the Netherlands, Sweden, and Nepal—marijuana possession for personal use is either legal, or punishable by only a small fine.[153] In at least twenty-five other countries, possession for personal use is punishable by a maximum of one year's imprisonment.[154]

California retains the second highest maximum punishment for possession of marijuana in the nation. Amidst a clear trend towards decriminalization, California balks at providing a rational maximum punishment for a relatively trivial offense. Under these circumstances, there is a compelling necessity for a judicial finding that the

---

149 FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 548-50; SECOND COMM'N REPORT, *supra* note 1, at 246. Section 407 of the Uniform Act provides:

> Whenever any person who has not previously been convicted of any offense under this Act or under any statute of the United States or of any state relating to narcotic drugs, marihuana, or stimulant, depressant, or hallucinogenic drugs, pleads guilty to or is found guilty of possession of a controlled substance under Section 401(c), the court, without entering a judgment of guilt and with the consent of the accused, may defer further proceeding and place him on probation upon terms and conditions. . . . Upon fulfillment of the terms and conditions, the court shall discharge the person and dismiss the proceeding against him. Discharge and dismissal under this Section shall be without adjudication of guilt and is not a conviction for purposes of disqualifications or disabilities imposed by law upon conviction of a crime, including the additional penalties imposed for second or subsequent convictions under section 408. (There may be only one discharge and dismissal under this Section with respect to any person.)

FIRST COMM'N REPORT, supra note 1, Appendix, vol. I, at 549-50. *Cf.* the California Drug Diversion Program, discussed at note 179 & accompanying text *infra*.

150 CAL. HEALTH & SAFETY CODE §§ 11000 *et seq.* (West Supp. 1973).

151 Prior to the preliminary recommendation for decriminalization made by the National Conference of Commissioners on Uniform State Laws, discussed at note 169 & accompanying text *infra*, the maximum penalty recommended in the Uniform Act for possession of marijuana for personal use was misdemeanor punishment (which presumably would permit a maximum imprisonment of one year in county jail). *See* FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 548-49.

152 *See* FIRST COMM'N REPORT, *supra* note 1, Appendix, vol. I, at 536-42.

153 *Id.*

154 *Id.*

possible imprisonment for possession of marijuana is disproportionate to the offense.

D. *Infrequency of Enforcement*

In *People v. Anderson*,[155] the California Supreme Court held that a punishment can be proscribed as cruel or unusual if offensive to contemporary standards of decency.[156] The principal method used to determine whether contemporary standards of decency were violated in *Anderson* was to investigate the frequency with which the questioned punishment was imposed. Infrequency of actual application of a statutorily prescribed penalty suggests that the punishment is offensive to contemporary standards of decency. The infrequency with which imprisonment is currently imposed for conviction of marijuana possession under section 11357[157] strongly suggests that the statute will not withstand a "contemporary standards of decency" inquiry.

The "evolving standards of decency that mark the progress of a maturing society" test adopted in *Trop*[158] and *Anderson*[159] is particularly appropriate with respect to marijuana criminalization. Early marijuana legislation resulted primarily from misinformation and racism.[160] Today, however, the relative harmlessness of marijuana use has been authoritatively established,[161] and marijuana use is prevalent among all racial groups.[162] Indeed, the widespread

160 FIRST COMM'N REPORT, *supra* note 1, at 91-92; *id.*, Appendix, vol. I, at 481-94; GRINSPOON, *supra* note 75, at 324-84. Bonnie and Whitebread summarized an extensive historical analysis as follows:

> The early laws against the cannabis drugs were passed with little public attention. Concern about marijuana was related primarily to the fear that marijuana use would spread, even among whites, as a substitute for the opiates and alcohol made more difficult to obtain by federal legislation. Especially in the western states, this concern was identifiable with the growth of the Mexican-American minority. It is clear that no state undertook any empirical or scientific study of the effects of the drug. Instead they relied on lurid and often unfounded accounts of marijuana's dangers as presented in what little newspaper coverage the drug received. It was simply assumed that cannabis was addictive and would have engendered the same evil effects as opium and cocaine. Apparently, legislators in these states found it easy and uncontroversial to prohibit use of a drug they had never seen or used and which was associated with ethnic minorities and the lower class.

161 *See* section III(*A*) *supra*.

162 FIRST COMM'N REPORT, *supra* note 1, at 32.

contemporary use of marijuana[163] in itself suggests that imprisonment for marijuana use and possession is contrary to contemporary standards of decency. Furthermore, public opinion surveys conducted for the National Commission on Marihuana and Drug Abuse disclosed that 53 percent of the public are unwilling to give young users a criminal record, and 87 percent object to the incarceration of users.[164] It is apparent that there has been a substantial "evolution" of public attitudes concerning the use and possession of marijuana.

A further indication that the imprisonment penalty is offensive to contemporary standards of decency is contained in the policy statements issued by various public organizations. For example, the National Commission on Marihuana and Drug Abuse recommended that all criminal penalties be abolished for private use and possession, and for distribution in small amounts for no (or insignificant) remuneration.[165] The American Bar Association's

[164] FIRST COMM'N REPORT, *supra* note 1, at 144. Note that the California Supreme Court has held that public opinion is a "relevant, but not controlling" factor in the "decency inquiry." *See* note 37 & accompanying text *supra*. Accordingly, public opinion polls are of only limited value in determining whether contemporary standards of decency are violated by a given punishment. Note, however, that recent public opinion polls conducted in California indicate that 51 percent of all Californians favor reduction in present penalties for marijuana offenses, and that about one-third of the public favors the legalization of marijuana. Recent polls show a "liberalizing trend in public opinion toward marijuana legality" when compared with similar polls taken in 1969. Field, *Tolerance Over Marijuana Grows*, L.A. Times, Feb. 8, 1974, § I, at 3, col. 4. In addition, the court has stated that the cruel or unusual punishment clause operates to protect minority rights against encroachment by the majority. *See* note 30 & accompanying text *supra*.

The results of the Proposition 19 referendum, the so-called marijuana decriminalization initiative in the 1972 California general election, seem ambiguous, and certainly not decisive with respect to the inquiry into contemporary standards of decency. Proposition 19 would have abolished all criminal penalties for the use, possession, cultivation, and transportation of marijuana. However, the measure was defeated, with about two-thirds of the electorate voting against it. NEWSWEEK, Nov. 13, 1972, at 40. Although it might be suggested that the results of Proposition 19 show that public standards of decency are not offended by the present penalties for marijuana possession, it is equally plausible to suggest that the opposite is the case. The rejection of Proposition 19 may have resulted from a belief that cultivation and transportation should remain criminal, despite a voter preference for decriminalization of mere possession of marijuana. Furthermore, the fact that as many as one-third of California voters would decriminalize possession, transportation, and cultivation suggests that contemporary standards of decency are offended by continued criminal penalties for mere possession. In any event, *Anderson* has established that the cruel or unusual punishment clause serves to protect minority rights against encroachment by the majority, a constitutional safeguard which should also apply to marijuana possessors. For the text of Proposition 19, and related discussion, see *Marijuana: A Panel Discussion*, 2 CONTEMP. DRUG PROB. 267, 287, 301 (1973).

[165] FIRST COMM'N REPORT, *supra* note 1, at 154. Public use of marijuana would be subject to a maximum fine of $100.

House of Delegates recommended decriminalization of marijuana possession.[166] The California State Bar Association and the San Francisco Bar Association voted to support the "marijuana decriminalization" initiative in the November 1972 general election in California.[167] The Los Angeles County Grand Jury recommended that "private possession of marijuana for personal use [should] no longer be a criminal offense."[168] The National Conference of Commissioners on Uniform State Laws has given preliminary approval to an amendment to the Uniform Controlled Substances Act, which provides for decriminalization of personal use and possession, and of distribution of small amounts for no or insignificant remuneration.[169] In addition, the Board of Trustees of the American Medical Association approved a recommendation of its Council on Mental Health, submitted by the Committee on Alcoholism and Drug Dependence, that "possession of insignificant amounts of marijuana for personal use should not be a criminal act."[170] Finally, the California Medical Association recommended a reduction of all penalties for possession of marijuana for personal use.[171] These requests for decriminalization by prestigious organizations directly concerned with the marijuana issue indicate that contemporary standards of decency are offended by the current criminalization of marijuana use and possession.

But perhaps the principal indication that imprisonment for possession of marijuana violates contemporary standards of decency can be found in the reluctance of those responsible for imposing the sanction to do so in the overwhelming number of cases.[172] Surveys conducted by the National Commission on Marihuana and Drug Abuse show that the major participants in the criminal justice process reject imprisonment as a sanction. The Commission noted that the nation's judges expressed an overwhelming disinclination to imprison marijuana possessors; only 13 percent thought it appropriate to incarcerate an adult for possession, and only 4 percent would jail a juvenile for marijuana possession.[173] It further found

172 *See* notes 37-41 & accompanying text *supra*, and notes 176-79 & accompanying text *infra*.

173 FIRST COMM'N REPORT, *supra* note 1, at 144. Empirical studies in California have also found that judges are reluctant to impose imprisonment in

that "even among the nation's prosecutors, a substantial majority favor the present trend toward avoiding incarceration for first offenders."[174] The Commission concluded:

> Our empirical study shows that 48% of the adult cases, and 70% of the juvenile cases, were dropped from the system at some point between arrest and conviction. The picture displayed is one of a large expenditure of police manpower to enforce a law most participants further along the line are not anxious to apply.[175]

This nation-wide trend is similar to the infrequency of enforcement of the imprisonment sanction prescribed by California Health and Safety Code section 11357. In 1972, only 1.5 percent of all California defendants *convicted* of violation of the marijuana possession statute received a felony sentence and were committed to state prison.[176] In the same year, about 63 percent of all defendants convicted under the statute received no sentence of imprisonment whatsoever.[177] Furthermore, about two-thirds of all felony complaints issued for marijuana offenses in 1972 were dismissed prior to Superior Court filing without being refiled.[178] Finally, under the terms of the two-year experimental state Drug Diversion Program, an estimated 18,000 persons charged with a violation of section 11357 are annually diverted from prosecution and trial at an annual cost of $4.5 million.[179]

---

marijuana possession cases. *See, L.A. Empirical Study, supra* note 63, at 1562; *San Mateo Study, supra* note 100, at 111-12.

174 FIRST COMM'N REPORT, *supra* note 1, at 145.

175 *Id.*

176 DRUG ARRESTS AND DISPOSITIONS, *supra* note 100, at 19.

177 *Id.*

178 *Id.* at 13. Note that this figure includes convictions for the more serious marijuana offenses such as cultivation, transportation, and sale.

179 DIVERSION PROGRAM, *supra* note 107, at 5. The estimate of 18,000 marijuana possession diversions is based on the fact that 75.3 percent of all persons diverted under the program were charged with a violation of CAL. HEALTH & SAFETY CODE § 11357 (West Supp. 1973); approximately 24,000 persons have been "diverted" annually. *Id.*

The requirements for entry into the Drug Diversion Program are codified in CAL. PENAL CODE §§ 1000-1000.4 (West Supp. 1973). Significantly, the California Department of Justice states that the Drug Diversion Program was instituted "to unclog court dockets," and

> to lower the cost of trials and the administration of justice. However, the chief reason for founding the Diversion Program was to *de-criminalize* "simple possession of controlled substances" for first offenders, who are otherwise good citizens, so that their records will not be permanently marred by one act of indiscretion.

DIVERSION PROGRAM, *supra* note 107, at 23 (emphasis added). In addition, the report notes the increasing reluctance on the part of participants in the criminal justice system to subject those accused of marijuana possession to imprisonment: "In 1972 only 29 percent of those convicted of a drug law violation were placed under probation department supervision for a marijuana offense, compared to the 75.3 percent of those diverted which were charged with possession of marijuana." *Id.* at 9. Furthermore, certain Los Angeles County deputy district attorneys have disclosed that they believe "all or nearly all" of the defendants

The pattern which emerges from these statistics unquestionably shows that present imprisonment penalties for marijuana possession are rarely imposed in California. Under the principles announced in *Anderson*, the infrequency of imposition of imprisonment for violation of section 11357 warrants the conclusion that the present imprisonment penalties violate contemporary standards of decency. This conclusion is supported by a large and growing demand by responsible public groups for the elimination of criminal penalties, and by the widespread use of the drug. Because the imprisonment sanction is rarely invoked, a judicial determination that present penalties prescribed by section 11357 violate the cruel or unusual punishment clause is mandated.

IV. Conclusion

The California Supreme Court never has considered the validity of California's marijuana possession statute, with respect to the cruel or unusual punishment clause of the California constitution. The previous discussion of the *Anderson* and *Lynch* cases demonstrates that the principles announced therein provide ample authority for invalidating the sentencing provisions of Health and Safety Code section 11357. Indeed, all of the four major principles discussed in those cases, when applied to section 11357, militate in favor of invalidation of the imprisonment provisions of the statute.

Assuming that the court were persuaded that the present punishment provisions of section 11357 are disproportionate to the offense of private use and possession of marijuana, the court might next be expected to consider the degree of punishment which could validly be imposed for the offense. The unresolved issue of the extent to which imprisonment would be proportional to the possession offense might be addressed in various ways. Of course, the court might choose merely to declare the present punishment provisions invalid and leave it to the Legislature to prescribe new punishment provisions. This approach, however, seems excessively cumbersome. If no guidance were given the Legislature in its attempt to enact a constitutionally valid punishment, a drawn-out process of legislative prescription and judicial rejection might well

---

arrested for marijuana possession for the first time are diverted from imprisonment under Cal. Pen. Code § 1000 (West Supp. 1973). Future reports on the Drug Diversion program, which will be prepared by the State Department of Justice, will likely provide more accurate statistics on the percentage of section 11357 arrestees who are diverted from prosecution and imprisonment.

It seems patently absurd to expend $4.5 million each year in an attempt to "decriminalize" first offense marijuana possession when the same result can be obtained much more fairly and cheaply by eliminating the present penalties for marijuana possession.

ensue. How much imprisonment would be proportional to the offense? A week? Six months? Six years? There simply would be no judicial suggestion as to the validity of any sentence which subsequently might be prescribed by the Legislature. If the court were to determine that the present punishment provisions of section 11357 are invalid, it would seem only reasonable that the court should suggest a permissible degree of punishment.

The court might instead focus upon the felony-misdemeanor distinction contained within the statute. The case against the felony sentencing provisions of section 11357 is particularly strong. While marijuana use and possession present little danger to the individual user, or to society at large, California nevertheless maintains the second highest maximum sentence in the nation, a sentence which in turn is imposed on only 1.5 percent of all those convicted under section 11357. Furthermore, there is no evidence to indicate that the present trend toward leniency will abate. The fact is that those individuals who are responsible for the imposition of felony penalties (and, indeed, the imposition of *any* imprisonment) almost uniformly refuse to mete out such penalties. The Supreme Court, therefore, should be compelled, on the basis of *Anderson* and *Lynch*, to declare at least the felony sentencing provisions of sections 11357 void under article I, section 6 of the California constitution.

Although the use of the felony-misdemeanor distinction in section 11357 might provide a superficially attractive answer to the punishment dilemma, and a convenient demarcation line for determining a constitutionally valid punishment for marijuana use and possession, the adoption of that distinction would serve to exalt the form of the statute over the substance of the current status of marijuana criminalization. The mere fact that the present felony penalties appear clearly invalid should not serve as a basis for avoiding the question of whether *any* imprisonment is invalid. There is an equally compelling justification for a judicial determination that the imposition of *any* imprisonment for the private use and possession of marijuana is disproportionate to the offense.[180] Such a determination is warranted by the minimal danger resulting from the use and possession of marijuana, the national trend toward decriminalization, and the disuse of imprisonment as a sanction in

[180] This is not to suggest that *any* criminal punishment (*e.g.*, a fine) is proscribed by the cruel or unusual punishment clause. The extent to which criminal punishment can be *totally* proscribed on the basis of the cruel and/or unusual punishment prohibition seems unclear in light of Powell v. Texas, 392 U.S. 514 (1968). *Cf.* Robinson v. California, 370 U.S. 660 (1962); Packer, *Making The Punishment Fit The Crime*, 77 HARV. L. REV. 1071, 1071 (1964); Comment, *The Cruel and Unusual Punishment Clause and the Substantive Criminal Law*, 79 HARV. L. REV. 635, 645-46, 655 (1966).

the great majority of California possession cases. Such a decision would hardly be novel; the New Jersey Supreme Court in *State v. Ward* has already held that imprisonment is an excessive punishment for first offense marijuana possession.[181] In addition, a determination by the court that imprisonment for personal use and possession of marijuana is disproportionate to the offense would obviate any necessity for the court to "draw the line" between terms of imprisonment which would be constitutionally valid and those which would be excessive.

Moreover, the disparate treatment accorded use and possession of alcohol and marijuana suggests that imprisonment for marijuana possession is disproportionate to the offense. For purposes of a proportionality inquiry, possession of alcohol is most closely analogous to possession of marijuana. Both substances are possessed and used for substantially the same reasons, and the use of both substances is widespread. Yet, despite the fact that alcohol use poses a greater threat of physiological harm and anti-social activity than does marijuana, alcohol possession is "legal." The disparity in treatment of alcohol and marijuana possession may well be determinative with respect to the extent to which imprisonment can be constitutionally tolerated. It should, in fact, result in a determination that any sentence of imprisonment is constitutionally impermissible.

The purpose of this Comment has been to demonstrate that there presently exist ample legal authority and compelling justification for the California Supreme Court to invalidate present imprisonment penalties for the private use and possession of marijuana. The "unusual" nature of current criminal penalties, in both the literal and legal sense of the word "unusual," has been demonstrated. Certainly, a criminal law which authorizes the incarceration of enormous numbers of otherwise law-abiding citizens[182] for the commission of a relatively harmless, nonviolent, and "victimless" act is unusual in any conceivable sense of the word. It is difficult to imagine a more appropriate case for the protection of "minority rights against encroachment by the majority." In the words of the National Commission on Marihuana and Drug Abuse, "[w]e must be willing to change when change is indicated."[183]

ROBERT J. ALBRECHT

---

181 *See* note 57 & accompanying text *supra*.

182 The subjection of large numbers of otherwise law-abiding citizens to arrest, imprisonment, and other aspects of the criminal process for the possession of marijuana may be so dehumanizing as to be demeaning to the dignity of man within the proscription of the *Trop* and *Anderson* tests. *See* notes 41-44, 100 & accompanying text *supra*.

183 SECOND COMM'N REPORT, *supra* note 1, at 5.

APPENDIX

TABLE I*

FELONY OFFENSES

California Vehicle Code Section	Offense	Maximum Imprisonment
23101	Driving under influence of alcohol, resulting in death or bodily injury	5 years in state prison
23106	Driving under influence of drug, resulting in bodily injury	5 years in state prison

California Health and Safety Code Section	Offense	Maximum Imprisonment
11368	Forging or altering prescription for a narcotic drug	6 years in state prison; 10 years for second and subsequent convictions

California Penal Code Section	Offense	Maximum Imprisonment
38	Misprision of treason	5 years in state prison
85	Offering bribe to member of the Legislature	10 years in state prison
92	Bribing judges or jurors, etc.	10 years in state prison
132	Offering forged or altered evidence	5 years in state prison
148.3	False report of an emergency resulting in great bodily injury or death	5 years in state prison
148.4	Tampering with fire alarms resulting in great bodily injury or death	5 years in state prison
151	Incitement to kill or injure police officer resulting in death of same	5 years in state prison
171c	Possession of loaded firearm in State Capitol or Governor's office	5 years in state prison
192(3), 193	Vehicular manslaughter with gross negligence	5 years in state prison
214	Train robbery	5 years in state prison
222	Administering stupefying drugs to assist in the commission of a felony	5 years in state prison
237	False imprisonment effected by violence, fraud, or deceit	10 years in state prison
241**	Assault against policeman or fireman engaged in the performance of his duties	2 years in state prison
243**	Battery against a policeman or fireman engaged in the performance of his duties	10 years in state prison
246	Shooting at an inhabited dwelling or occupied building	5 years in state prison
247	Shooting at aircraft	5 years in state prison
273a, 273d	Willful infliction of unjustifiable physical pain on a child under circumstances or conditions likely to produce great bodily harm or death; or willful infliction on a child or by a husband on his wife of any cruel or inhuman corporal punishment or injury resulting in a traumatic condition	10 years in state prison

California Penal Code Section	Offense	Maximum Imprisonment
347	Poisoning food, drink, medicine, or water supply with intent to injure human being	10 years in state prison
401	Aiding or advising suicide	5 years in state prison
424	Embezzlement by public officer	10 years in state prison
489	Grand theft	10 years in state prison
514	Embezzlement	10 years in state prison
520	Extortion	10 years in state prison
631	Wiretapping	3 years in state prison; 5 years for second and subsequent convictions
12020	Possession, manufacture, and sale of certain deadly weapons	5 years in state prison
12220	Unauthorized sale, transportation, or possession of machine gun	5 years in state prison
12303**	Possession of destructive device (bombs, grenades, rockets, "molotov cocktails")	5 years in state prison
12420	Sale, transportation, or possession of tear gas weapons	2 years in state prison

MISDEMEANOR OFFENSES

California Vehicle Code Section	Offense	Maximum Imprisonment
23105	Driving vehicle while under influence of a drug	6 months in county jail for first conviction

California Penal Code Section	Offense	Maximum Imprisonment
70	Solicitation or receipt of gratuities by executive officers or public employees	6 months in county jail
73	Buying appointments to office	6 months in county jail
74	Accepting awards for appointment to public office	$5,000 fine and forfeiture of office
94	Solicitation or acceptance of gratuities by judicial officers	6 months in county jail
135	Destruction of evidence	6 months in county jail
146a	Impersonating public officer	1 year in county jail
148	Resisting or obstructing officer	1 year in county jail
148.5	False report of criminal offense	6 months in county jail
241**	Assault	6 months in county jail
243**	Battery	6 months in county jail
314	Indecent exposure	6 months in county jail; 1 year for second and subsequent offenses
374c	Shooting on public highways	6 months in county jail
403	Disturbance of public assembly or meeting	6 months in county jail
404.6	Incitement to riot	6 months in county jail
408	Unlawful assembly	6 months in county jail

California Penal Code Section	Offense	Maximum Imprisonment
415.5	Disturbance of the peace of community college, state college, or university	90 days in county jail for first conviction
417	Drawing firearm in threatening manner	6 months in county jail
418	Forcible entry and detainer	6 months in county jail
466.3**	Possession of tools for breaking into coin-operated machines with intent to commit theft	1 year in county jail
490	Petty theft	6 months in county jail
602.10**	Obstructing community college, state college, or university students or teachers by physical force	1 year in county jail
12025	Carrying concealed weapon	6 months in county jail for first conviction
12031**	Carrying loaded firearm	6 months in county jail
12551**	Sale of firearm to minor	6 months in county jail

* Table I is divided into two sections. The first section presents selected California felony offenses and the maximum imprisonment which can be imposed for each offense. The second section presents misdemeanor offenses and the maximum imprisonment which can be imposed. This division permits individual comparison of the misdemeanor and felony provisions of California Health and Safety Code section 11357 with other California felony and misdemeanor offenses.

** Indicates citation to West Supp. 1973.

109 Ariz. 59

The STATE of Arizona, Appellee,

v.

Lee Anthony WADSWORTH, Appellant.

No. 2399.

Supreme Court of Arizona,
In Banc.

Jan. 19, 1973.

Rehearing Denied Feb. 27, 1973.

Defendant was convicted in the Superior Court, Coconino County, Cause No. 5844, J. Thomas Brooks, J., of furnishing marijuana, and he appealed. The Supreme Court, Cameron, V. C. J., held, inter alia, that retention of marijuana under Narcotic Drug Act, with its resulting severer penalties, rather than classifying it with drugs listed in Dangerous Drug Act with its lesser penalties, is justifiable and is not violative of equal protection.

Affirmed.

Lockwood, J., did not participate.

1. Drugs and Narcotics ⇐43

Fact that a drug in list of narcotic drugs may be less harmful than those listed in dangerous drug statute does not make

classification unreasonable. A.R.S. §§ 32–1901, subsec. 9, 32–1991, 32–1992, subsec. A, 32–1996, subsec. C, 36–1001, subsecs. 13, 14, 36–1002.07.

2. Drugs and Narcotics ⇐43

There is a reasonable basis for classification of marijuana with narcotic drugs rather than dangerous drugs inasmuch as legislative intent was to proscribe use of marijuana, not to scientifically categorize it according to its composition and effect. A.R.S. §§ 32–1901, subsec. 9, 32–1991, 32–1992, subsec. A, 32–1996, subsec. C, 36–1001, subsecs. 13, 14, 36–1002.07.

3. Criminal Law ⇐304(1)

Supreme Court would take judicial notice of fact that marijuana was one of the most widely used drugs among the young and would also note that Arizona's geographical proximity to Mexico, a primary source of marijuana, contributed to magnitude of problem in State.

4. Constitutional Law ⇐250.1(2)
Drugs and Narcotics ⇐43

Retention of marijuana under Narcotic Drug Act, with its resulting severer penalties, rather than classifying it with drugs listed in Dangerous Drug Act with its lesser penalties, is justifiable and is not violative of equal protection. A.R.S. §§ 32–1901, subsec. 9, 32–1991, 32–1992, subsec. A, 32–1996, subsec. C, 36–1001, subsecs. 13, 14, 36–1002.07; U.S.C.A.Const. Amend. 14.

5. Drugs and Narcotics ⇐133

Accepting proposition that legislature may, under police power, prohibit use of marijuana, it follows that stronger penalties designed to prevent widespread use of marijuana are reasonable. A.R.S. §§ 32–1901, subsec. 9, 32–1991, 32–1992, subsec. A, 32–1996, subsec. C, 36–1001, subsecs. 13, 14, 36–1002.07.

6. Drugs and Narcotics ⇐133

Sentencing defendant to a term of not less than five nor more than five years and one day on conviction of furnishing marijuana was not an abuse of discretion, notwithstanding defendant's age and allegedly "small amount" of marijuana involved, where defendant entered into a plea agreement through his attorney to plead guilty to crime of "possession," which would have allowed court to sentence him to a year in county jail rather than five-year minimum sentence for "furnishing," but, after original charge was withdrawn and "possession" charge filed, defendant refused to plead guilty and "possession" charge was then dropped and "furnishing" charge was refiled. A.R.S. §§ 36–1002.05, subsec. A, 36–1002.07.

Gary K. Nelson, Atty. Gen. by William P. Dixon, Asst. Atty. Gen., Phoenix, and Al Vermeire, Law Student, University of Arizona, Tucson, for appellee.

Lewis & Roca by Paul G. Ulrich, David L. Grounds, Richard L. Parrish and William C. Lewis, Jr., Phoenix, for appellant.

CAMERON, Vice Chief Justice.

This is an appeal from a jury verdict and judgment of guilty to the crime of furnishing marijuana in violation of § 36–1002.07 A.R.S. with a sentence of not less than five years nor more than five years and one day in the Arizona State Prison.

The defendant raises only one question on appeal which he states in his brief as follows:

> "Does the continued classification of marijuana with the 'narcotic drugs' rather than with the 'dangerous drugs' and the attendant draconian penalties for a first conviction for furnishing a small amount of marijuana violate the equal protection clauses of the Arizona and United States Constitutions?"

The facts necessary for a determination of the matter on appeal are as follows: On 16 November 1970, the defendant, in the company of others, including Agent William Greenlee of the Arizona Department of Public Safety, "pulled out a baggie of marijuana, * * * and rolled a cigarette, * * * and passed it around to the people in the room." After the second time the cigarette was passed around, Agent Green-

lee pinched out the fire and placed the butt in his coat pocket.

Thereafter, a conversation ensued between Agent Greenlee and the defendant regarding the possible purchase of a hundred kilograms of marijuana. The defendant provided Agent Greenlee with a second marijuana cigarette before leaving. Upon these facts the defendant was convicted and this appeal followed. Defendant does not deny that he violated the statute in question, § 36-1002.07 A.R.S., but attacks the statute itself.

Arizona has two basic drug statutes. The first, under Title 32, Chapter 18 (Pharmacy), 10 A.R.S., concerns regulation of the so-called "dangerous drugs." Dangerous drugs are defined in § 32-1901, subsec. 9 A.R.S. which lists such compounds as amphetamines, barbiturates, mescaline, and central nervous system depressants and includes the substances commonly called "L.S.D." and "speed." § 32-1992, subsec. A A.R.S. provides:

"Nothing in this chapter shall be construed to relieve any person from any requirement prescribed by or under authority of law with respect to drugs now included or which may hereafter be included within the classifications of narcotic drugs or marihuana as defined in the applicable federal and state laws relating to narcotic drugs and marihuana."

§ 32-1991 A.R.S. provides that the State Board of Pharmacy, the "division of narcotics enforcement and criminal intelligence within the department of public safety, all officers exercising police powers, and county attorneys shall enforce the provisions of" Chapter 18 concerning dangerous drugs.

Persons convicted of selling or delivering or otherwise disposing of dangerous drugs are to be punished by an imprisonment of one year to life, § 32-1996, subsec. C A.R.S.

The second of the Arizona drug statutes is found in Title 36, Chapter 9 (Regulation of Narcotics, Alkalies, Acids and Poisons), 11 A.R.S. Article 1 is titled "Uniform Narcotic Drug Act" and § 36-1001, subsec. 14 A.R.S. states:

"14. 'Narcotic drugs' means coca leaves, opium, cannabis, isonipecaine, amidone, isoamidone, ketobemidone, any other drug of natural or synthetic origin that may be classified as a narcotic by the federal narcotics commissioner, and any substance neither chemically nor physically distinguishable from them."

Cannabis is defined in Section 13 of § 36-1001 A.R.S. as including marijuana.

The furnishing of a narcotic drug is punished under § 36-1002.01 A.R.S. which provides in relevant part:

"A. Except as otherwise provided in this article every person who possesses for sale any narcotic drug other than marijuana shall be punished by imprisonment in the state prison for not less than five years nor more than fifteen years, and shall not be eligible for release upon completion of sentence, or on parole, or on any other basis until he has served not less than five years in prison."

The furnishing of marijuana is punished as follows in § 36-1002.07 A.R.S.:

"A. Every person who transports, imports into this state sells, furnishes, administers or gives away, * * * any marijuana shall be punished by imprisonment in the state prison from five years to life and shall not be eligible for release upon completion of sentence, or on parole, or on any other basis until he has served not less than three years."

Our statutes, then, provide that the sale or furnishing of marijuana, though included in the narcotic drugs section, is punished somewhat less severely than the sale of narcotic drugs "other than marijuana", but more severely than the sale or giving away of dangerous drugs including "L.S.D." and "speed."

In evaluating defendant's claim of denial of equal protection in the classification of marijuana with narcotic drugs, we must

look to the United States Supreme Court for guidance. That court has said:

"The rules by which this contention must be tested, as is shown by repeated decisions of this court, are these:

"1. The equal-protection clause of the 14th Amendment does not take from the State the power to classify in the adoption of police laws, but admits of the exercise of a wide scope of discretion in that regard, and avoids what is done only when it is without any reasonable basis, and therefore is purely arbitrary.

"2. A classification having some reasonable basis does not offend against that clause merely because it is not made with mathematical nicety, or because in practice it results in some inequality.

"3. When the classification in such a law is called in question, if any state of facts reasonably can be conceived that would sustain it, the existence of that state of facts at the time the law was enacted must be assumed.

"4. One who assails the classification in such a law must carry the burden of showing that it does not rest upon any reasonable basis, but is essentially arbitrary.' Lindsley v. Natural Carbonic Gas Co., 220 U.S. 61, 78-79, 31 S.Ct. 337, 340, 55 L.Ed. 369, 377 (1911).

And:

"Although no precise formula has been developed, the Court has held that the Fourteenth Amendment permits the States a wide scope of discretion in enacting laws which affect some groups of citizens differently than others. The constitutional safeguard is offended only if the classification rests on grounds wholly irrelevant to the achievement of the State's objective. State legislatures are presumed to have acted within their constitutional power despite the fact that, in practice, their laws result in some inequality. A statutory discrimination will not be set aside if any state of facts reasonably may be conceived to justify it. (citations omitted)" McGowan v. Maryland, 366 U.S. 420, 425–426, 81 S.Ct. 1101, 1105, 6 L.Ed.2d 393, 399 (1961).

The defendant contends that scientists are now in virtually unanimous agreement that marijuana has fundamentally different effects than heroin, opium, morphine and other so-called "hard drugs," and that in response to this "overwhelming" scientific evidence the continued classification of marijuana with narcotic drugs rather than with dangerous drugs and the resulting severe penalty is a violation of defendant's rights under the equal protection clause of the Fourteenth Amendment of the United States Constitution. The defendant quotes the United States Supreme Court as follows:

"* * * When the law lays an unequal hand on those who have committed intrinsically the same quality of offense and sterilizes one and not the other, it has made as an invidious a discrimination as if it had selected a particular race or nationality for oppressive treatment. * * *" Skinner v. Oklahoma, 316 U.S. 535, 541, 62 S.Ct. 1110, 1113, 86 L.Ed. 1655, 1660 (1942).

Defendant has filed with this court an extensive if not exhaustive appendix on the subject, containing numerous articles by recognized authorities who discuss the alleged arbitrary classification of marijuana with narcotic rather than with dangerous drugs. These articles in the main are concerned with the characteristics of the various drugs discussed and their effects on the human body and resulting behavior of the user. For the purpose of this opinion, we will admit that dangerous drugs such as "L.S.D." and "speed" are more harmful to the user than marijuana, and that scientifically marijuana may not necessarily be included with the drugs defined in the narcotic drug statute, § 36-1001 A.R.S.

[1] This is not, however, persuasive. The fact that a drug in the list of narcotic drugs may be less harmful than those listed in the dangerous drug statute does not make the classification unreasonable.

The classification, we believe, is reasonable and not arbitrary despite the fact that some of the drugs listed could be classified differently. We agree with the dissent of Chief Justice Underwood of the Illinois Supreme Court who said:

"The majority's lengthy discussion of the characteristics and effects of marijuana as compared to other prohibited drugs clearly illustrates that no two drugs are identical and that marijuana is also quite different from the stimulant or depressant drugs with which defendant seeks to classify it. The fact that a substantial body of scientific and medical opinion now considers marijuana to be more nearly like the drugs included in the Drug Abuse Control Act than those prohibited by the Narcotic Drug Act does not, in my opinion, necessitate the conclusion that there was no rational basis for the classification in question. Medical and scientific opinion is even now by no means unanimous in condemnation of classifications of marijuana with 'hard drugs' and, as the majority notes, 'knowledge in this whole area is not nearly complete.' In the absence of more nearly conclusive evidence that the legislative judgment was devoid of any rational basis, a finding of unconstitutionality is unwarranted, for few rules of law are more soundly bottomed than that which proscribes judicial interference with legislative discretion." People v. McCabe, 49 Ill.2d 338, 352, 353, 275 N.E.2d 407, 414 (1971).

[2] The legislative intent in this State was to proscribe the use of marijuana, not to scientifically categorize it according to its composition and effect, and we believe there was a reasonable basis for the classification of marijuana with the narcotic drugs rather than the dangerous drugs.

[3, 4] We believe there is, however, another reason why the classification and especially the penalties imposed can be sustained. The fact that an objectionable practice is widespread may mandate a stiffer penalty in order to discourage its continued use than a more harmful, less often used practice. We take judicial notice of the fact that marijuana is one of the most widely used drugs among our young. Also, we note that Arizona's geographical proximity to Mexico, a primary source of marijuana, contributes to the magnitude of the problem in this State. These are facts which our State legislature may have considered as justification for retaining marijuana under the Narcotic Drug Act, with its resulting more severe penalties, rather than classifying it with the drugs listed in the Dangerous Drug Act with its lesser penalties.

We have stated:

"This court is not concerned with the wisdom of the [legislation] nor may we substitute our judgment for that of the legislature in its choice of method of enforcement * * *. Our inquiry is limited to the question of whether the Act contravenes the state and federal constitutions. Wisdom, necessity, propriety or experience of the Act are matters exclusively within the province of the legislature * * *. If the facts underlying the * * * [Act] * * * are fairly debatable as the number of decisions of appellate courts attests, the judgment of the legislature prevails. * * *" Skaggs Drug Center, Inc. v. United States Time Corporation, 101 Ariz. 392, 397, 398, 420 P.2d 177, 182, 183 (1966). Accord, McKinley v. Reilly, 96 Ariz. 176, 393 P.2d 268 (1964), appeal dismissed, 381 U.S. 276, 85 S.Ct. 1457, 14 L.Ed.2d 431 (1965). See also Patsone v. Pennsylvania, 232 U.S. 138, 34 S.Ct. 281, 58 L.Ed. 539 (1914); Tigner v. Texas, 310 U.S. 141, 60 S.Ct. 879, 84 L.Ed. 1124 (1940); McGowan v. Maryland, supra, Commonwealth v. Leis, 355 Mass. 189, 243 N.E.2d 898 (1969); State v. Kantner, Haw., 493 P.2d 306 (1972).

[5] It should be noted that the defendant does not contend that the legislature lacks the power to prohibit the sale, use or possession of marijuana, but questions the legislative classification with the "at-

tendant draconian penalties." Accepting the proposition, as defendant does, that the legislature may, under the police power, prohibit the use of marijuana, it follows that stronger penalties designed to prevent the present widespread use of marijuana are reasonable. We may doubt whether the legislation is wise and does in fact accomplish the ends desired, but we cannot constitutionally question the reasonableness of the legal classification and the resulting penalty.

[6] We believe that a comment on the sentence in this case is indicated. The statute (§ 36-1002.07 A.R.S.) provides for a statutory minimum of five years, three years of which must be served before the defendant is eligible for parole. The trial court, therefore, was faced with giving defendant either five years or probation. Because of the defendant's age and because of the amount of marijuana involved in the offense, we searched the record carefully to satisfy ourselves that the sentence did not constitute an abuse of the trial court's discretion. The record indicates that the defendant, after having been arrested on the charge of furnishing marijuana, entered into a plea agreement through his attorney to plead guilty to the crime of "possession" (§ 36-1002.05, subsec. A A.R.S.) which would have allowed the court to sentence him to a year in the County Jail rather than the five year minimum sentence in the Arizona State Prison. After the original charge was withdrawn and the "possession" charge filed, the defendant refused to plead guilty and the "possession" charge was then dropped and the "furnishing" charge refiled. At the time of sentencing, the following transpired:

"THE COURT: Mr. Wadsworth, your attorney has mentioned that you were convicted of furnishing only two marijuana cigarettes, and this is correct; but, there was evidence presented at the time of trial, and there are indications in the Presentence Report, that at the time that this incident took place, you were attempting to purchase approximately 100 kilos of marijuana. Do you deny that this was the reason for your visit with the narcotics officer and the other people?

"MR. WADSWORTH: No, sir, I don't deny it.

"THE COURT: Approximately 100 kilos of marijuana would weigh approximately 220 pounds, would it not?

"MR. WADSWORTH: I guess so; something like that.

"THE COURT: And I would assume that this wouldn't have been for your own use?

"MR. WADSWORTH: No, it wouldn't have been.

"THE COURT: Did you have any idea as to the penalty for pushing marijuana when you were arrested?

"MR. WADSWORTH: No, sir.

"THE COURT: Weren't you aware from newspaper publicity and other matters that it was a serious felony?

"MR. WADSWORTH: Yes, I knew it was against the law."

And before passing sentence, the court discussed the defendant's past record:

"THE COURT: Mr. Wadsworth, there have been numerous attempts over the past years, in your situation, to turn you into a good citizen to rehabilitate you; and you have been placed on probation. You were confined for some period of time at the Arizona Industrial School. You were sent from the Industrial School to Northern Arizona University, at a time when the Institute for Human Development at the University was accepting people from Fort Grant for rehabilitation purposes; and apparently, you were there and receiving their counseling for about a year.

Subsequent to this, you had the benefit of psychiatric counseling in Phoenix; having seen a doctor there approximately nine times in 1964, fifteen times in 1965, and six times in 1966. In other words, when you first had your

problems with the law, Mr. Wadsworth, you just weren't locked up in a cell. You were given many opportunities which many people do not have."

We find no abuse of the trial court's discretion in imposing the sentence the defendant received in the instant case.

Judgment affirmed.

HAYS, C. J., STRUCKMEYER and HOLOHAN, JJ., and EINO M. JACOBSON, Court of Appeals Judge, concur.

LOCKWOOD, J., did not participate in the determination of this matter.

Thomas Anderson BOSWELL

v.

STATE of Alabama.

SC 272.

Supreme Court of Alabama.

March 29, 1973.

Rehearing Denied May 10, 1973.

Defendant was convicted in the Circuit Court of Mobile County, Joseph M. Hocklander, J., of selling marijuana, and he appealed. The Supreme Court, Faulkner, J., held, inter alia, that the Uniform Controlled Substances Act is not unconstitutional, either on theory that it fails to contain but one subject clearly expressed in its title or on theory that it arbitrarily classifies marijuana with "hard" narcotic drugs.

Affirmed.

Heflin, C. J., filed concurring opinion.

1. Statutes ⇐107(3)

Uniform Controlled Substances Act satisfies constitutional requirement of having a single subject clearly expressed in its title. Code of Ala., Tit. 22, § 258(25) et seq.; Const.1901, § 45.

2. Statutes ⇐107(1)

Purposes of constitutional provision that each law shall contain but one subject,

which shall be clearly expressed in its title, are notification to the public of nature of pending legislation, avoidance of fraud on the legislature, and prevention of hodgepodge, conglomerate, or "logrolling" legislation. Const.1901, § 45.

3. Statutes ⇐109.1

Title of bill may be very general and need not specify every clause in the statute; it is sufficient if all clauses are referable and cognate to the subject expressed, and when subject is expressed in general terms, everything which is necessary to make it a complete enactment or which results as a complement of the thought contained in the general expression is included in, and authorized by it. Const.1901, § 45.

4. Statutes ⇐107(1)

"Subject" of bill, within constitutional provision that no bill shall contain more than one subject, may include innumerable minor subjects, provided all these minor subjects are capable of being combined as to form only one grand and comprehensive subject. Const.1901, § 45.

See publication Words and Phrases for other judicial constructions and definitions.

5. Drugs and Narcotics ⇐43

Legislature properly could punish sale of marijuana equally with the sale of other controlled substances, and Uniform Controlled Substances Act was not subject to attack on grounds of arbitrary classification in classifying marijuana with "hard" narcotic drugs. Code of Ala., Tit. 22, § 258(47).

6. Criminal Law ⇐1114(1)

Claims were not properly presented for review where there was nothing in the record with respect to such claims.

7. Indictment and Information ⇐86(1), 87(1)

Indictment charging sale of marijuana was not fatally defective in failing to give the place or date of the alleged offense. Code of Ala., Tit. 15, §§ 237, 238.

8. Criminal Law ⇐627(7)

By pleading not guilty, defendant waived any argument that he had not been furnished with a copy of the indictment. Const.1901, § 6.

9. Criminal Law ⇐173

"Jeopardy" begins when the jury has been impaneled and sworn, and the indictment read, and thus defendant was not placed in double jeopardy by the dropping of charges at a preliminary hearing and subsequent indictment by the grand jury.

See publication Words and Phrases for other judicial constructions and definitions.

10. Criminal Law ⇐633(1), 637

No error was shown in that defendant on one occasion prior to trial was brought into court handcuffed, chained, barefoot, dirty, unshaven and disheveled; it could not be assumed that such was other than the way defendant had dressed and groomed himself.

11. Criminal Law ⇐590(2)

Denial of continuance which was requested on ground that counsel had been unable to prepare was within trial court's discretion where any problems defendant had in preparation were caused by his refusal to cooperate with his counsel.

12. Criminal Law ⇐1144.10

Any attorney who has been admitted to practice in state is presumed capable of providing effective and successful representation.

13. Criminal Law ⇐641.13(1)

Relief is available for failure of counsel to provide effective representation only where his conduct reduces the trial to a farce, sham, or mockery of justice.

14. Criminal Law ⇐641.13(1)

Fact that client is ultimately convicted is no reflection on performance of counsel.

15. Criminal Law ⇐37(8)

Fact that course of conduct leading to offense of sale of marijuana began with request by customs agent to buy marijuana did not preclude finding by the jury that there was no entrapment.

16. Criminal Law ⇐991

Defendant's transfer back to federal custody following state trial did not serve to void his state sentence.

17. Criminal Law ⇐1182

Where record was searched for possible error and none appeared, judgment and sentence would be affirmed. Code of Ala., Tit. 15, § 389.

David L. Barnett, Mobile, for appellant.

William J. Baxley, Atty. Gen., and Thomas W. Sorrells, Asst. Atty. Gen., for the State.

FAULKNER, Justice.

Thomas A. Boswell appeals from a judgment of conviction for selling marijuana, in violation of Title 22, § 258(47), Code of Alabama 1940, Recompiled 1958, and sentence of six years in the penitentiary imposed thereon.

The testimony at trial tended to show that Jerry Owensby, an undercover criminal investigator with the U. S. Customs Department, had been working to combat the sale of unlawful drugs in the area of Mobile, Alabama. He testified to having informed the defendant that he wished to buy a pound of marijuana. The defendant, an acquaintance, told Owensby to meet him in twenty minutes. When they met, a conversation ensued:

"Q. What was the essence of that conversation?

"A. The essence of it was that Tommy asked me how much I expected to pay for the pound [of marijuana] and I replied $80.00. He then stated if I would like to buy more than one pound. I stated what would the difference in price be. Tommy then stated that one pound would be $80, five pounds would be $75 per pound, and ten pounds would be $70 per pound.

* * * * * *

"A. I told Tommy that I could purchase three pounds and Tommy stated to me that he would sell it to me for $75 a pound for a total of $225.00 for the three pounds. Tommy then asked me why was an old man like myself purchasing marijuana. He stated usually when old people buy marijuana, they're trying to put people in jail and I just stated that I had some friends in the northern part of Alabama that wanted some marijuana."

Later, the parties met again in the Flaming Hearth Lounge to consummate the deal:

"Q. When he came into the Flaming Hearth, what did you observe him do?

"A. He entered through the rear door and as he walked by me he elbowed me in the back because I hadn't actually seen him and recognized him. I turned to my left as he walked by and I recognized Tommy and I followed him into the men's room which is located to the south of the front entrance.

"Q. Did you have a conversation with him at that time?

"A. Tommy stated to me that he had already placed the marijuana in the truck and had locked the door. I

then gave him the $225.00. He counted it, verified it * * *."

Witness Whatley, hiding in nearby weeds, testified to having observed the defendant placing the marijuana in the back of Owensby's camper.

The defendant himself admitted on the stand to having sold the marijuana to Owensby, but claimed to have turned all of the money over to his supplier, except for $35.00 which he kept as a "commission." Defendant stated in open court:

"I never denied that the transaction was made."

Despite the absence of factual dispute as to the unlawful sale, defendant appealed to the Alabama Court of Criminal Appeals, urging that procedural errors below entitled him to a reversal. On February 28, 1973, the cause was transferred to this court by authority of Title 13, § 111(11a) of our Code.

Appellant's counsel, in his brief, assigns two grounds of error: (1) that the statute defendant was convicted of violating is unconstitutional because it contains more than one subject; and (2) that the statute arbitrarily and unconstitutionally classifies marijuana with "hard" narcotic drugs. Appellant himself, in a 57-page pro se brief, assigns, insofar as we can interpret his turgid and lachrymose prose, at least 21 additional grounds: (3) that he was improperly extradited from Federal prison in Texas to stand trial in Alabama; (4) that he lacked counsel to fight his extradition; (5) that the indictment was vague, and failed to advise him of the nature and cause of the accusation against him; (6) that the indictment was fatally defective in that it lacked the date on which the alleged offense took place; (7) that the indictment was fatally defective in that it omitted the place at which the alleged offense took place; (8) that he never received a copy of the indictment; (9) that he was placed in double jeopardy, because charges at a preliminary hearing were dropped when the judge was advised that the grand jury was indicting defendant for the same offense; (10) that the jury panel composition was improper, lacking young adults; (11) that he was prejudiced by being taken in front of the jury panel handcuffed, chained, barefoot, dirty, unshaven, and disheveled; (12) that the court failed to rule on a motion for his mental examination; (13) that he was given insufficient time to prepare his case; (14) that the performance of his first counsel, Mr. Haas, was so incompetent as to entitle him to reversal; (15) that the performance of his trial counsel, Mr. Alonzo, was so incompetent as to entitle him to reversal; (16) that his appellate counsel, Mr. Barnett, did not communicate with him, and was so incompetent as to deny him due process of law and entitle him to a reversal; (17) that his prosecution was due to a vendetta against him by the district attorney; (18) that certain Negro jurors were Black Muslims, and were railroading him to jail just to punish a "blue-eyed devil" in accordance with the tenets of their faith; (19) that reversible error was made to appear in that two jurors slept soundly throughout the trial; (20) that the whole jury was prejudiced against him; (21) that he was entrapped into committing the offense; (22) that he was denied a transcript to prepare an appeal; and (23) that his transfer back into the Federal penetentiary in Texas after his Alabama trial served to void his state sentence as a matter of law.

The pro se brief sums up:

"Appellant has shown the sordid story of this case in grim relief. Luckless Tom Boswell, a country boy, just back from Alaska, set upon and victimized by the lawless criminal strike force prosecution team paid by tax money extorted from Alabama's citizens—from widows and the working man alike!"

[1] Appellant's initial argument is that the Alabama Uniform Controlled Substances Act, Title 22, § 258(25) et seq. of our Code, under which he was convicted, is

unconstitutional. The Act is divided into five parts: Definitions; Standards and Schedules; Regulation of Manufacture, Distribution and Dispensing of Controlled Substances; Offenses and Penalties; and Enforcement and Administrative Provisions. See "The Uniform Alabama Controlled Substances Act: An Appraisal," 24 Ala.L.Rev. 491 (1972). Appellant contends that covering so many subjects in one statute is violative of the "single subject" clause of our Alabama Constitution, Article 4, § 45:

> "* * * Each law shall contain but one subject, which shall be clearly expressed in its title * * *."

He invokes the case of State v. Welkner, 259 La. 815, 253 So.2d 192 (1971), in which the Louisiana Supreme Court quashed a prosecution for possession of pills under a Narcotics Drug Law provision regulating hard drugs and marijuana. In that case the Louisiana Legislature had amended the body of a law without changing the title to reflect the new contents. This precedent is clearly inapplicable to the Alabama law, which regulates "controlled substances," a term broadly inclusive of all drugs listed therein.

[2] The purposes of this constitutional provision that every law contain but one subject, clearly expressed in its title, have been much commented upon in our case law. They are generally stated to be notification to the public of the nature of pending legislation, avoidance of fraud on the legislature by inadvertent passage of provisions not related to the title thereof, and prevention of hodgepodge, conglomerate, or "logrolling" legislation. State ex rel. Bozeman v. Hester, 260 Ala. 566, 72 So.2d 61 (1954); State ex rel. Bassett v. Nelson, 210 Ala. 663, 98 So. 715 (1923).

[3, 4] Many years ago, in Ballentyne v. Wickersham, 75 Ala. 533 (1883), we stated the test for determining whether a law violates this constitutional provision:

> "[T]he title of a bill may be very general, and need not specify every clause in the statute. Sufficient if they are all referable, and cognate to the subject expressed. And when this subject is expressed in general terms, every thing which is necessary to make a complete enactment in regard to it, or which results as a complement of the thought contained in the general expression, is included in, and authorized by it." 75 Ala. at 536.

Quoting the Kansas Supreme Court with approval, we continued:

> "'The "subject" to be contained in a bill under section 16, article 2 of the Constitution, which provides that "no bill shall contain more than one subject, which shall be clearly expressed in its title," may be as broad and comprehensive as the legislature may choose to make it. It may include innumerable minor subjects, provided all these minor subjects are capable of being so combined as to form only one grand and comprehensive subject; and if the title of the bill, containing this grand and comprehensive subject, is also comprehensive enough to include all these minor subjects as one subject, the bill and all parts thereof will be valid.'" Id.

It is clear that the component subjects, marijuana possession, heroin possession, marijuana sale, heroin sale, etc., do combine into the "grand and comprehensive" subject of regulation of controlled substances, and that the title of the Act does include all the component parts.

All the limbs of this tree belong to the tree. No alien branch is hidden in the foliage. We hold that the Alabama Uniform Controlled Substances Act satisfies the constitutional requirement of having a single subject clearly expressed in its title.

[5] Appellant next contends that the classification of marijuana with so-called "hard" drugs is unconstitutional. He cites People v. Lorentzen, 387 Mich. 167, 194

N.W.2d 827 (1972), where a 20-year prison term for selling marijuana was held excessive. We are unable to ascertain the relevance of that case to the 6-year sentence imposed here, or in what manner it supports the argument based upon classification of differing drug offenses. Appellant also cites People v. McCabe, 49 Ill.2d 338, 275 N.E.2d 407 (1971), where classification of marijuana with hard drugs, rather than with stimulants and depressants, was held unconstitutional. The reasoning of McCabe was rejected in State v. Wadsworth, 109 Ariz. 59, 505 P.2d 230 (1973).

Four principles have been laid down by the United States Supreme Court in Lindsley v. Gas Co., 220 U.S. 61, 78, 31 S.Ct. 337, 340, 55 L.Ed. 369, 377 (1911), to determine whether a statutory classification is proper:

1. The equal protection clause of the 14th Amendment does not take from the state the power to classify in the adoption of police laws, but admits of the exercise of a wide scope of discretion in that regard, and avoids what is done only when it is without any reasonable basis, and therefore is purely arbitrary.

2. A classification having some reasonable basis does not offend against that clause merely because it is not made with mathematical nicety or because in practice it results in some inequality.

3. When the classification in such a law is called in question, if any state of facts reasonably can be conceived that would sustain it, the existence of that state of facts at the time the law was enacted must be assumed.

4. One who assails the classification in such a law must carry the burden of showing that it does not rest upon any reasonable basis, but is essentially arbitrary.

Appellant has fallen far short of carrying the burden of showing that the classifications made by § 258(25) et seq. are invalid. Unlike the statutes in *McCabe*, supra, and *Wadsworth*, supra, which involved different scales of penalties, our statute imposes a single range of punishment for selling different controlled substances. (Code, § 258(47)). We hold that the Legislature properly could punish sale of marijuana equally with sale of other controlled substances, and that the Uniform Controlled Substances Act is not subject to attack on the grounds of arbitrary classification.

[6] Next, appellant contends that he was denied counsel to fight his extradition from Federal prison in Texas to Mobile, Alabama, and that the extradition itself was unlawful. There is nothing in the record that would allow us to pass on either of these claims, hence they are not properly presented for review. Edwards v. State, 287 Ala. 588, 253 So.2d 513 (1971); Walker v. State, 223 Ala. 294, 135 So. 438 (1931).

[7] Appellant argues that the indictment was vague, and was fatally defective in that it omitted the place at which the alleged offense was committed. Unfortunately for this contention, Title 15, § 238 of our Code provides:

"It is not necessary [for an indictment] to allege where the offense was committed * * *."

Appellant further argues that the indictment was fatally defective in failing to give the date of the alleged offense. Our Code, Title 15, § 237, states:

"It is not necessary to state the precise time at which the offense was committed; but it may be alleged * * * generally before the finding of the indictment * * *."

Boswell's indictment stated:

"* * * before the finding of this indictment * * * [Boswell] did unlawfully sell marijuana * * *."

Thus, the statutory requirement was satisfied, and appellant's contention is without merit.

CONTINUED

27 OF 33

[8] Appellant urges that he did not receive a copy of the indictment and thus had no notice of the charges against him, in violation of Article 1, § 6, Alabama Constitution. Again, there is nothing in the record on this question. We do note, however, that he waived the reading of the indictment during his arraignment on September 25, 1972. By pleading not guilty, he waived any argument that he had not been furnished with a copy of the indictment. See Howard v. State, 146 Ala. 149, 41 So. 301 (1906).

[9] Appellant contends that he was placed in double jeopardy by the dropping of charges at a preliminary hearing and subsequent indictment by the grand jury. In this state, jeopardy begins when the jury has been impaneled and sworn, and the indictment read. Scott v. State, 110 Ala. 48, 20 So. 468 (1896). Thus the defendant was not placed in double jeopardy.

Appellant argues that the jury panel composition was improper, because its members were on the whole much older than the average citizen of Mobile County. There is not one word in the record as to this issue; hence we cannot review it. Edwards v. State, supra; Walker v. State, supra.

[10] Appellant complains of having been brought to court on one occasion prior to trial handcuffed, chained, barefoot, dirty, unshaven and disheveled. The record is incomplete on this issue; however, we cannot assume other than that was the way the defendant had dressed and groomed himself, and that he was brought to court "as is." No error appears on this point.

Appellant complains that the trial judge failed to rule on a motion that he be given a mental examination. Both the record and appellant's own brief state that the motion was ruled on and denied.

[11] Appellant next complains that he was given insufficient time to prepare his case. His second counsel was appointed on September 15. On September 26, this counsel complained to the court that he had been unable to prepare:

> "[F]or the entire week in visiting with Mr. Boswell in the Mobile City Jail, I was unable to communicate with him. * * * Maybe you call it lack of cooperation I got from the Defendant, I just call it lack of communication because of his obsession with other points."

The judge then set the trial for the next day, and denied a motion for a longer continuance. The two main grounds for the motion were the unavailability of a witness and a request to examine the alleged contraband. The record shows that by the beginning of proceedings next morning the witness was available and the alleged contraband had been examined by a defense expert. We hold that the trial judge's ruling was within the limits of his discretion. Any problems defendant had in preparation were caused by his refusal to cooperate with his counsel.

Appellant contends that each of the three attorneys he had at various stages of the case was so incompetent that his constitutional right to the assistance of counsel was effectively denied.

[12, 13] Every litigant is not necessarily entitled to counsel with the skill and silver-tongued eloquence of Daniel Webster, Clarence Darrow, or Rufus Choate. Any attorney who has been admitted to practice in this state is presumed capable of providing effective and successful representation. If, through carelessness or indolence he does not do so, relief is available, but only where his conduct reduces the trial to a farce, sham or mockery of justice. Gore v. State, 45 Ala.App. 146, 227 So.2d 432 (1969), cert. denied 284 Ala. 729, 227 So.2d 435 (1969), cert. denied 397 U.S. 966, 90 S.Ct. 1002, 25 L.Ed.2d 258 (1970).

[14] It would be superfluous to review in detail the actions of the three attorneys

whose competence is challenged here. Suffice it to say there is no showing whatever that they did not do their jobs well. Every evidence is that their client was a difficult man to deal with, resulting in frequent breakdowns in attorney-client communication. The fact that the client was ultimately convicted is no reflection on their performance. Aldridge v. State, 278 Ala. 470, 179 So.2d 51 (1965).

Appellant asserts that his prosecution was due to a vendetta against him by the District Attorney. There is nothing in the record regarding this allegation, hence nothing is presented for our review. Edwards v. State, supra; Walker v. State, supra.

Appellant contends that certain Negro jurors were Black Muslims, and were prejudiced against him as a "blue-eyed devil" in accordance with the tenets of their faith. Nothing appears of record to indicate the religious affiliation of the jurors, hence nothing is presented for our review. Edwards v. State, supra; Walker v. State, supra.

Appellant complains of sleeping jurors. There was no objection made to this at the time, if the jurors were in fact sleeping, and the record is silent. Nothing is presented for review on this point. The same is true of the contention that the jurors in general were biased against him.

Appellant complains that he was entrapped into committing the crime.

In Johnson v. State, 36 Ala.App. 634, 636, 61 So.2d 867, 869 (1952), our Court of Appeals stated:

> "[E]ntrapment is not available as a defense to a person who has the intent and design to commit a criminal offense and who in fact does commit the essential acts constituting it, merely because an officer of the law, in his effort to secure evidence against such person, affords him an opportunity to commit the criminal act * * *."

[15] There is no doubt that the course of conduct leading to the criminal activity began with the request by Owensby, the customs agent, to buy marijuana. The defendant sold the marijuana in response to this request. However, the agent's conduct, merely affording defendant the opportunity to commit a criminal act, falls short of what is necessary to constitute entrapment. Johnson v. State, supra. See also Brewer v. State, 23 Ala.App. 100, 123 So. 86 (1929), in which officers induced defendant to sell them liquor, then prosecuted him for violating prohibition laws. No entrapment was found.

In this case the entrapment issue was submitted to the jury with unusually full and fair instructions from the trial judge. The jury found no entrapment. We hold they could properly so find.

Appellant complains of failing to receive a transcript to use in preparing his appeal. The problem appears to have arisen between appellant, jailed in Texas, and his counsel in Mobile, Alabama as to who would use the single transcript available. Appellant ultimately did receive the transcript in Texas, and used it to prepare his 57-page pro se brief. No error appears on this point.

[16] Finally, appellant contends that his transfer back to Federal custody following his Alabama trial served to void his state sentence as a matter of law. We are unaware of any authority in support of this position.

[17] As mandated by Title 15, § 389 of our Code, we have searched the record for possible error. None appearing, the judgment and sentence must be and are affirmed.

Affirmed.

HEFLIN, C. J., and MERRILL, HARWOOD and MADDOX, JJ., concur.

HEFLIN, Chief Justice (concurring):

If "sufficient doubt" of the mental capacity of the defendant to stand trial had been shown then I would have been of the opinion that a hearing should have been held separate from the trial to determine the defendant's mental capacity to stand trial. See Pate v. Robinson, 383 U.S. 375, 86 S.Ct. 836, 15 L.Ed.2d 815. See also my dissenting opinion in Seibold v. State, 287 Ala. 549, 253 So.2d 302.

While the defendant did interpose a plea of not guilty by reason of insanity, he withdrew such plea before it went to the jury. A review of the record in this case indicates that there was not manifested during the trial "sufficient doubt" pertaining to the mental competency of the defendant to stand trial so as to justify a hearing on that issue.

I, therefore, concur in the opinion.

387 Mich. 91

PEOPLE of the State of Michigan, Plaintiff-Appellee,

v.

John A. SINCLAIR, Defendant-Appellant.

No. 19.

Supreme Court of Michigan.

March 9, 1972.

Defendant was convicted before the Recorder's Court of Detroit, Wayne County, Robert J. Colombo, J., of illegal possession of marijuana and he appealed. The Court of Appeals, 30 Mich.App. 473, 186 N.W.2d 767, affirmed. After granting leave to appeal, the Supreme Court held that conviction would be reversed and defendant discharged; two judges being of opinion that statutory categorization of marijuana along with "hard drug" narcotics for purposes of imposition of penalties denied equal protection, one judge being of opinion that statute denied right to liberty and pursuit of happiness, two judges being of opinion that marijuana cigarettes should have been excluded as evidence obtained as result of illegal entrapment, and two judges being of opinion that minimum sentence of 9½ years constituted cruel and inhuman punishment.

Judgment reversed.

Criminal Law ⇐1186(1)

Conviction of unlawful possession of two marijuana cigarettes would be reversed and defendant discharged; two judges being of opinion that statutory categorization of marijuana along with "hard drug" narcotics for purposes of imposition of penalties denied equal protection, one judge being of opinion that statute denied right to liberty and pursuit of happiness, two judges being of opinion that cigarettes should have been excluded as evidence obtained as result of illegal entrapment, and two judges being of opinion that minimum sentence of 9½ years constituted cruel and inhuman punishment. M.C.L.A. §§ 335.1 et seq., 335.106, 335.151, 335.151 et seq., 335.153, 335.301 et seq., 769.1; U.S.C.A. Const. Amends. 4–6, 8, 9, 14; M.C.L.A. Const.1963, art. 1, §§ 2, 16, 17; art. 6, § 5.

William L. Cahalan, Wayne County Pros. Atty., Dominick R. Carnovale, Chief, Appellate Dept., Angelo A. Pentolino, Asst. Pros. Atty., Detroit, for plaintiff-appellee.

Justin C. Ravitz, Detroit, for defendant-appellant.

David Hood, Wayne State University, Detroit, of counsel for Subcommittee on Drug Treatment, New Detroit, Inc., amicus curiae.

R. Keith Stroup, Washington, D. C., National Organization for the Reform of Marijuana Laws, amicus curiae.

Sol Plafkin, Detroit, for Representatives Jackie Vaughn III, William Brodhead, James Bradley, Edward Suski, Mrs. Daisy Elliott, Senators Coleman Young, Basil Brown and Jack Faxon, amici curiae.

Michael Schumann, Highland Park, Gary Roth, Southfield, for YPC–Center House of Ferndale, amicus curiae.

Bernard D. Fischman, New York City, for The American Orthopsychiatric Assn., Inc., amicus curiae.

Philip J. Hirschkop, Alexandria, Va., Executive Director, Penal Reform Institute, amicus curiae in support of appeal.

Joel M. Shere and Sheridan Holzman, Co-Chairmen, Legal Committee, by Wallace H. Glendening, Detroit, American Civil Liberties Union of Mich., amicus curiae.

Ernest Winsor, Boston, Mass., for the Committee for a Sane Drug Policy, amicus curiae.

Goodman, Eden, Robb, Millender, Goodman & Bedrosian by William H. Goodman, Detroit, for Medical Committee for Human

Rights, amicus curiae, in support of the appellant, John Sinclair.

Thomas Meyer, M. Gerald Schwartzbach, Glotta, Adelman & Dingus by Ronald D. Glotta, Gage, Burgess & Knox by Laurence C. Burgess, Neal Bush, Lafferty, Reosti, Jabara, Papakhian, James & Stickgold by Marc Stickgold, Mark Weiss, Colista, Moore & Baum by Warfield Moore, Jr., Detroit, for Detroit Chapter, National Lawyers Guild, amicus curiae.

Before the Entire Bench, except BLACK, J.

PER CURIAM.

For the reasons set forth in our several opinions, the judgment of conviction of defendant Sinclair is reversed and set aside and the defendant discharged.

SWAINSON, Justice.

Defendant, John A. Sinclair, was arrested on January 24, 1967, and charged with the unlawful sale[1] and unlawful possession[2] of two marijuana cigarettes. Defendant was convicted by a jury in the Recorder's Court for the city of Detroit of unlawful possession of the two marijuana cigarettes, on July 25, 1969, and on July 28, 1969, he was sentenced to nine and one-half to ten years imprisonment. During the two and one-half years between his arrest and trial, defendant was free on bond in the amount of $1,000, and never failed to appear when required to do so.

Prior to the trial, a special three-judge panel of Recorder's Court was convened to consider the constitutionality of the Michigan statutes prohibiting sale or possession of marijuana. On April 17, 1968, the panel upheld the statutes against the contentions that they violated the equal protection of the laws;[3] denied defendant due process of law;[4] violated rights of privacy retained by the people;[5] and that the penalty provisions imposed cruel and unusual punishment.[6] Judge Robert J. Colombo a member of the three-judge panel, in a concurring opinion stated that he personally believed that there was a question of whether defendant had been entrapped.[7] The trial judge (Hon. Robert J. Colombo), on June 23, upon motion of defense counsel, dismissed the count for unlawful sale on the ground that the sale was entrapped by the police officers.[8] Defendant was thereafter convicted of the unlawful possession of marijuana based on the two cigarettes introduced into evidence. The Court of Appeals affirmed the conviction. 30 Mich.App. 473, 186 N.W.2d 767. We granted leave to appeal. 385 Mich. 786.

The Detroit Police Department Narcotics Bureau had instructed Patrolman Vahan Kapagian and Policewoman Jane Mumford Lovelace to assist in an investigation of illegal activities involving narcotic violations in an area surrounding Wayne State University and, in particular, an es-

7. "My concurrence in the decision of the Court on the issues raised here are limited solely to the issues raised here, as there appears to this writer to be another important legal issue not raised in this opinion which may well apply to count one in the People's Information, namely, Sale and Possession of Narcotics and that is the issue of unlawful and illegal Entrapment, an issue which suggests itself to this writer and which suggested itself to the learned Assistant Prosecuting Attorney who presented this case on behalf of the People at the preliminary examination of the Defendant Sinclair in this matter."

8. "We've talked a lot about it. It's up to me to come to grips with the problem. I hold that count one, Sale and/or Dispensing of marijuana should be dismissed on the grounds of entrapment."

tablishment known as the Artists' Workshop which was located at 4863 John Lodge, in the city of Detroit. Defendant Sinclair made his residence above the Artists' Workshop, at 4867 John Lodge.

In pursuance of this assignment, Patrolman Kapagian grew a beard and began to let his hair grow long, in late August 1966. On October 18, 1966, using the aliases of Louis Cory and Pat Green, the officers commenced their assignment. They continued working until January 24, 1967, on this particular assignment. The officers assisted in doing typing and other odd chores at the Artists' Workshop, including sweeping floors and collating literature. They sat in at communal dinners and provided the food for one of these dinners. They joined a group called LEMAR, which advocated that marijuana be legalized. They listened to poetry and helped in the preparation of certain literature. Patrolman Kapagian visited the shop and saw defendant approximately two or three times a week until the defendant's arrest. As part of the assignment, Patrol Kapagian took a job at the Candle Shop. Patrolman Kapagian was equipped with a Portatalk radio transmitter which allowed him to keep in contact with other police officers stationed outside and nearby.

Patrolman Kapagian testified at the preliminary examination that on two occasions prior to December 22, 1966, during the investigation, the police officers asked defendant for marijuana. He denied this at the trial, despite the fact that his testimony to that effect at the preliminary examination was read to him from the transcript. Policewoman Lovelace stated that she had asked defendant on previous occasions to obtain marijuana for them.

Officer Kapagian testified that on December 22nd, at about 7:00 P.M., defendant appeared at the Workshop and following an exchange of greetings, defendant asked whether they had received any marijuana the previous night. The officers responded affirmatively and stated that they were looking for some more. At approximately 8:55 that evening, Kapagian told the defendant that they had to leave and defendant asked them to accompany him upstairs to his residence. Once inside the residence, the officers were seated at the kitchen table. Defendant went to a shelf and removed a brown porcelain bowl which he set down on the table before him. Defendant took some cigarette paper and from the contents of the bowl rolled a cigarette, which he gave to Kapagian. Kapagian handed this cigarette to Lovelace, who inserted it into a partially filled Kool pack. Defendant then rolled a second cigarette, lit it, and handed it to Kapagian. The officer said he did not want to smoke it then because he had to drive and the cigarette would make him dizzy. Kapagian gave the cigarette to Lovelace after defendant Sinclair had butted it. She placed the cigarette in the same Kool pack. At that time they said they had to leave, and departed. Sinclair was not arrested for committing a felony in the officers' presence because, as Kapagian stated, he did not want to tip his hand since numerous arrests were to be made as the result of this investigation.

At the trial, the only witnesses were the two police officers.[9] No corroborating evidence was introduced. Although officer Kapagian was equipped in a manner to enable the transmission of his conversation to other officers, no arrangements were made to tape the conversations, which allegedly occurred between defendant and the police officers. In addition, officer Kapagian testified that he did not preserve his log book for the year 1966 because he decided that it was not worth saving. He did admit that if the log book had been preserved, the presence or absence of entries relating to the transactions of December 22nd and all previous transactions during

9. Defendant did not take the stand because the trial court ruled on July 22nd that if he did testify he could be cross-examined on his prior convictions.

the investigation, would either confirm or disprove his testimony.

Prior to trial, the defendant made several motions to quash the information and to exclude the marijuana cigarettes from evidence. These were denied by the trial court.

Defendant raises ten issues on appeal, and the prosecutor lists five. We will deal with two of these:

1) Whether the classification of marijuana as a narcotic under M.C.L.A. § 335.151 violates the equal protection of the laws under the U.S.Const. Am. XIV, and

2) Whether the two marijuana cigarettes should have been excluded from evidence on the ground that they constituted evidence obtained as the result of an illegal police entrapment?

I.

It is not denied that the State of Michigan has the power to pass laws against the sale and use of marijuana. Rather, the issue is whether marijuana may be constitutionally classified as a narcotic drug if, in fact, it is not a narcotic. A threshold question is raised—and that is whether this Court has the power to determine the actual state of facts concerning marijuana and other drugs. It cannot be doubted that the judiciary has the power to determine the true state of facts upon which a law is based. Brown v. Board of Education, 347 U.S. 483, 74 S.Ct. 686, 98 L.Ed. 873 (1954).

A trial court may take judicial notice of any records of the court where it sits. Knowlton v. Port Huron, 355 Mich. 448, 452, 94 N.W.2d 824 (1959). Moreover, it is clear that "an appellate court can properly take judicial notice of any matter which the court of original jurisdiction may take notice." Pennington v. Gibson, 57 U.S. (16 How.) 65, 14 L.Ed. 847 (1853). Const.1963, art. 6, § 1, provides:

"The judicial power of the state is vested exclusively in one court of justice which shall be divided into one supreme court, one court of appeals, one trial court of general jurisdiction known as the circuit court, one probate court, and courts of limited jurisdiction that the legislature may establish by a two-thirds vote of the members elected to and serving in each house."

As such, the records of all courts of this State may be examined by the Supreme Court since they are all part of the record of the "one court of justice" of the State of Michigan. Hence, in addition to the record made by the court below, we may properly look at the evidence introduced and the findings of fact made by the trial court in People v. Lorentzen, Mich., 194 N.W.2d 827 (1972).

We now turn to a comparison of the properties of marijuana and the other drugs classified as narcotics under M.C.L.A. § 335.151, *et seq.*; M.S.A. § 18.1121, *et seq.*

II.

Comparison of the effects of marijuana use on both the individual and society with the effects of other drug use demonstrates not only that there is no rational basis for classifying marijuana with the "hard narcotics," but, also, that there is not even a rational basis for treating marijuana as a more dangerous drug than alcohol. This is not to say that our scientific knowledge concerning any of the mind-altering drugs is at all complete. It is not.[10] Even our society's vast experience with the mind-altering effects of alcohol has not led to complete scientific knowledge of that drug, as the Canadian Government Commission of Inquiry pointed out:[11]

"Little is known as to the specific mechanism by which alcohol produces its

10. People v. McCabe, 49 Ill.2d 338, 275 N.E.2d 407, 409 (1971).

11. Interim Report of the Canadian Government Commission of Inquiry, The Non-Medical Use of Drugs (Penguin ed. 1970), pp. 65-66 [hereinafter referred to as "Canadian Commission Report"].

psycho-pharmacological action. As with most drugs, alcohol effects, especially those resulting from low or moderate amounts, depend to a large extent on the individual and the situation in which the drinking occurs. A drink or two may produce drowsiness and lethargy in some instances, while the same quantity might lead to increased activity and psychological stimulation in another individual, or in the same person in different circumstances. Furthermore, a dose which is initially stimulating may later produce sedation."

Despite our lack of complete knowledge though, we do have sufficient scientific knowledge to categorize drugs according to their relative level of danger to both the individual and society. Proceeding to a comparison of marijuana with other mind-altering drugs, we find marijuana is a euphoria producing, mind-altering drug, whose effects are generally obtained by smoking, but can also be obtained by oral ingestion of the drug, usually mixed with other food or drinks.[12] Coming from the hemp plant, cannabis sativa, the psychoactive strength of the drug varies greatly with the part of the plant used, quality of the seed stock, and the growing conditions.[13]

The psychoactive ingredient of cannabis sativa has been isolated as two isomers of tetrahydrocannabinol (THC although additional active ingredients of cannabis sativa may be discovered and isolated in the future).[14] Thus the strength of any given amount of marijuana depends primarily on the amount of THC it contains. The ordinary street form of marijuana, commonly available and used in the United States, is composed of the leaves and flower clusters of the female plant, which are dried and crushed to make up the variable strength mixture. The resin from the flowering tops of the mature female plants is known as hashish (*charas* in India) and is apparently the strongest form of the naturally occurring drug because it contains the highest concentration of THC. Hashish is as much as eight times as strong as ordinary marijuana.[15]

Consideration of the scientifically observed physical and psycho-motor effects of marijuana indicates that it is overall, the least dangerous mind-altering drug. Observed physical effects of marijuana use include dryness of mouth and throat, slight increase in pulse rate, and slight conjunctival reddening of the eyeball.[16] No known tolerance develops to marijuana—in fact negative tolerance has been observed, that

12. The Illinois Supreme Court in People v. McCabe, *supra* p. 410, point out that knowledge concerning marijuana has been developing rapidly in the last decade. For an example of a case where the United States Supreme Court relied on the current writing of authorities in a then rapidly developing field, see Brown v. Board of Education, 347 U.S. 483, 494, fn. 11, 74 S.Ct. 686, 98 L.Ed. 873 (1954).
L. Grinspoon, M.D., Marijuana Reconsidered (Bantam ed., 1971), p. 46.

13. L. Grinspoon, M.D., Marijuana Reconsidered (Bantam ed., 1971), pp. 39–40.

14. Stipulated Findings of Fact (No. 19) in People v. Lorentzen, *supra*, reads: "There is no proven relationship between the use of marijuana and the use of heroin. As marijuana use has increased greatly in American society, heroin addiction in proportion to the population has remained essentially the same, or only slightly increased."
See, also, L. Grinspoon, M.D., Marijuana Reconsidered (Bantam ed., 1971), pp. 47–61.

15. President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Narcotics and Drug Abuse (1967), p. 3: "Other derivatives of the hemp plant, such as hashish, which are more potent than marijuana, are rarely found in the United States."
See, also, L. Grinspoon, M.D., Marijuana Reconsidered (Bantam ed., 1971), pp. 41–43.

16. People v. Lorentzen, *supra*, Stipulated Findings of Fact (No. 8): "The major physical effect of THC that can be detected is a marked increase in pulse rate."
See, also, Canadian Commission Report, p. 122.

is, a decreased amount of the drug taken on subsequent occasions produces the same level of physical and euphoric effect.[17] No physical dependency is produced by use of the drug and, hence, there are no withdrawal symptoms or "abstinence syndrome" when the drug is unavailable to the user.[18]

No lethal dose for marijuana has been established.[19] The lack of harmful physical effects from marijuana use has been well summarized by Dr. Grinspoon in Marijuana Reconsidered (Bantam ed., 1971), p. 60:

> "What is so striking about the pharmacology of cannabis is that it has such limited and mild effects on human nonpsychic function. This is consistent with the equally striking observation that there has never in its long history been reported an adequately documented case of lethal overdosage. Nor is there any evidence of cellular damage to any organ."

Both the opiates and alcohol provide a dramatic contrast to the lack of physical harmfulness of marijuana. With the opiates[20] high levels of tolerance develop,[21] severe physical addiction results from repeated use,[22] and deaths resulting from overdosage also occur.[23] Occasional social use of alcohol in moderate dosage as a mind-altering drug has few deleterious physical consequences. However, tolerance does develop in alcohol use and the drug is subject to a great, acute and chronic abuse.[24] Acute alcohol abuse can lead to death from overdosage.[25] In addition, chronic alcohol abuse leads to alcoholism where a clear withdrawal syndrome is observable (an easily discernible physical shaking and later *delirium tremens*), and death of brain cells, mental deterioration, and cirrhosis of the liver may occur.[26]

17. People v. McCabe, *supra*, 275 N.E.2d p. 411; People v. Lorentzen, Stipulated Findings of Fact (No. 4): "There is no currently known tolerance to marijuana but the question is still under investigation." Canadian Commission Report, p. 122.

18. People v. Lorentzen, Stipulated Findings of Fact (No. 5): "Marijuana does not produce physical dependency." Canadian Commission Report, p. 123.

19. People v. McCabe, *supra* p. 411; People v. Lorentzen, Stipulated Findings of Fact (No. 7): "Marijuana does not produce death, even with a single large overdose, which is characteristic of depressant drugs including alcohol."

20. "These drugs are obtained from the juice of the unripened seed pod of the opium poppy plant [papaver somniferum] soon after the flower petals begin to fall—no other part of the plant produces psychoactive substances." Canadian Commission Report, p. 137. Heroin, codeine and morphine are all processed derivatives of opium. Isonipecaine and anileridine are synthetic "opiates" whose physicl effects and addictive liability are equivalent to morphine. Stedman's Medical Dictionary (1966), p. 95.

21. Canadian Commission Report, p. 43; Report by the Advisory Committee on Drug Dependence, Cannabis, (Her Majesty's Stationery Office, London, 1968), p. 14 (hereinafter referred to as "British Report").

22. Canadian Commission Report, pp. 153–154; British Report, p. 15.

23. Canadian Commission Report, p. 151; British Report, p. 14; President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Narcotics and Drug Abuse, p. 54: "One of the special features of the opiates (and certain other mind-altering drugs such as barbiturates and some tranquilizers) is that death may also be produced by not giving the drug. That is the classical withdrawal or abstinence syndrome associated with opiate deprivation in an organism which has been receiving heavy doses of the opiate."

24. Canadian Commission Report, pp. 43, 70–72.

25. President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Drunkenness (1967), p. 35.

26. President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Drunkenness, p. 35; J. Kaplan, Marijuana: The New Prohibition (Pocket Book ed., 1971), pp. 275–320, specifically p. 318.

Damaging effects of alcohol on psychomotor coordination are so well known as to need no documentation. The President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Drunkenness, commenting on alcohol, observed that (p. 39):

> "There is probably no other area in the field of drug research and related dangerous behavior where the role of a drug as a precipitating factor in dangerous behavior is so clear."

On the other hand, the evidence available concerning marijuana's effect on psychomotor functions seems to show very little impairment, at least in experienced users.[27]

Psychological Effects:

Marijuana is a mild hallucinogen, which in view of its lack of any other harmful effects, leads us to conclude that there is no rational basis for penalizing it more severely than the other hallucinogens (M.C.L.A. § 335.106; M.S.A. § 18.1106). Indeed, mild hallucinogenic effects are reported almost exclusively from use of more potent hashish type preparations and rarely, if ever, from the use of ordinary street variety marijuana. The Canadian Commission Report states (pp. 116–117):

> "Cannabis is one of the least potent of the psychedelic drugs, and some might object to its being classified with LSD and similar substances. It is often suggested that marijuana is a mild intoxicant, more like alcohol. * * * It would be incorrect to say that cannabis in moderate dose actually produces a mild LSD experience; the effects of these two drugs are physiologically, behaviourally and subjectively quite distinct. Furthermore, since no cross-tolerance occurs between LSD and THC the mechanism of action of these two drugs is thought to be different."

The Canadian Commission Report comprehensively summarized the various possible psychological effects of marijuana use as follows (pp. 117–118):

> "A cannabis 'high' typically involves several phases. The initial effects are often somewhat stimulating and, in some individuals, may elicit mild tension or anxiety which usually is replaced by a pleasant feeling of well-being. The later effects usually tend to make the user introspective and tranquil. Rapid mood changes often occur. A period of enormous hilarity may be followed by a contemplative silence.
>
> "Psychological effects which are typically reported by users include: happiness, increased conviviality, a feeling of enhanced interpersonal rapport and communication, heightened sensitivity to humour, free play of the imagination, unusual cognitive and ideational associations, a sense of extra-ordinary reality, a tendency to notice aspects of the environment of which one is normally unaware, enhanced visual imagery, an altered sense of time in which minutes may seem like hours, changes in visually perceived spatial relations, enrichment of sensory experiences (subjective aspects of sound and taste perception are often particularly enhanced), increased personal understanding and religious insight, mild excitement and energy (or just the opposite), increased or decreased behavioural activity, increased or decreased verbal fluency and talkativeness, lessen-

27. People v. Lorentzen, *supra*, Stipulated Findings of Fact (No. 30): "It is a debatable and equivocal question as to whether or not one under the influence of marijuana and driving on the highway is a better or worse driver. The experienced marijuana smoker performs as well under the influence of the drug as he does when he is not using it. The inexperienced user performs less well."

See, also, R. Bonnie and C. Whitebread, II, The Forbidden Fruit and the Tree of Knowledge: An Inquiry into the Legal History of American Marijuana Prohibition, 56 Va.L.Rev. 971, 1107 (1970).

ing of inhibitions, and at higher doses, a tendency to lose or digress from one's train of thought. Feelings of enhanced spontaneity and creativity are often described, although an actual increase in creativity is difficult to establish scientifically. While most experts agree that cannabis has little specific aphrodisiac (sex stimulating) effect, many users report increased enjoyment of sex and other intimate human contact while under the influence of the drug.

"Less pleasant experiences may occur in different individuals, or possibly in the same individuals at different times. Some of these reactions may include: fear and anxiety, depression, irritability, nausea, headache, backache, dizziness, a dulling of attention, confusion, lethargy, and a sensation of heaviness, weakness and drowsiness. Disorientation, delusions, suspiciousness and paranoia, and in some cases, panic, loss of control, and acute psychotic states have been reported."

There is no reliable scientific evidence demonstrating that chronic psychosis can be caused by marijuana use[28] in dramatic contrast to the American experience with alcohol.[29] The argument that marijuana use causes or contributes to assaultive crime is now largely discredited.[30] Again by contrast, considerable evidence points to a substantial connection between alcohol use and commission of violent crimes.[31]

Finally, the "steppling stone argument" that marijuana use leads to use of "hard narcotics" has no scientific basis. The President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Narcotics and Drug Abuse, found at pp. 13–14:

> "The charge that marihuana 'leads' to the use of addicting drugs needs to be critically examined. There is evidence that a majority of the heroin users who come to the attention of public authorities have, in fact, had some prior experience with marihuana. But this does not mean that one leads to the other in the sense that marihuana has an intrinsic quality that creates a heroin liability. There are too many marihuana users who do not graduate to heroin, and too many heroin addicts with no known prior marihuana use, to support such a theory. *Moreover there is no scientific basis for such a theory.* The basic text on pharmacology, Goodman and Gilman, *The Pharmacological Basis of Therapeutics* (Macmillan 1960) states quite explicitly that marihuana habituation does not lead to the use of heroin." (Emphasis added)[32]

All of the preceding factual findings with respect to the effects of marijuana use, are substantiated by the trial court's findings of fact made after five days of expert testimony in People v. Lorentzen, *supra*.

Virtually every major commission which has studied the effects of marijuana use agrees that it is improperly classified with

President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Narcotics and Drug Abuse (1967), p. 25; British Report, p. 16; Report of the Indian Hemp Drugs Commission (1893–94), p. 264; J. Kaplan, Marijuana: The New Prohibition, pp. 139–141; Bonnie and Whitebread, The Forbidden Fruit and The Tree of Knowledge, p. 1105.

31. President's Commission on Law Enforcement and Administration of Justice, Task Force Report: Drunkenness (1967), p. 41: "On the basis of the present data one can say that there is a strong link between alcohol and homicide and that the presumption is that alcohol plays a causal role as one of the necessary and precipitating elements for violence."

32. People v. McCabe, *supra*, 275 N.E.2d pp. 412, 413. See, also, British Report, pp. 12–13.

the "hard narcotics." The British Report found (pp. 6–7):

"Having reviewed all of the material available to us we find ourselves in agreement with the conclusion reached by the Indian Hemp Drugs Commission appointed by the Government of India (1893–1894) and the New York Mayor's Committee on Marihuana (1944), that the long-term consumption of cannabis in *moderate* doses has no harmful effects." [33]

Further, counsel for the People admitted in oral argument that the differences between marijuana and the opiates call for different classifications:

"ADAMS, J.: If we have two extremes here, and not a gray area in the middle, doesn't that call for different classifications?

"ASSISTANT PROSECUTOR: I think it does, I think it does, and I think every State in the country is graduating to that particular state where they are now recognizing and they are classifying marijuana in a separate statute. The government has done so in its control and abuse act."

Finally, Governor William Milliken, in his Special Message to the Legislature on Alcohol and Drug Abuse (Mar. 4, 1971), recognized that the present classification of marijuana with the opiates is irrational and provided an illuminating comment on the relative danger of alcohol:

"As public officials, we must face squarely the need for a major revision of our laws dealing with marijuana. The hypocrisy of our present law, *which falsely classifies marijuana as a narcotic,* affects the credibility of our entire drug abuse program. Recent federal legislation and the passage of local marijuana ordinances give new urgency to the need for state action in this controversial area. * * *

"Alcohol continues to be a larger problem than drugs. It accounts for more broken homes, wasted lives, accidental deaths, and greater expense for society than any drug. It is an established fact that alcohol can destroy brain tissues and cause cirrhosis of the liver which ultimately produces death. A significant portion of crime is committed by people under the influence of alcohol and alcohol-related problems are estimated to account for 15% to 25% of our welfare costs." (Emphasis added)

The murky atmosphere of ignorance and misinformation which casts its pall over the State and Federal legislatures' original classification of marijuana with the hard narcotics has been well documented in the 250-page article by R. Bonnie and C. Whitebread, II, The Forbidden Fruit and the Tree of Knowledge: An Inquiry into the Legal History of American Marijuana Prohibition, 56 Va.L.Rev. 971 (1970).[34]

We can no longer allow the residuals of that early misinformation to continue choking off a rational evaluation of marijuana dangers. That a large and increasing number of Americans recognize the truth about marijuana's relative harmlessness can scarcely be doubted.[35]

33. People v. McCabe, *supra*, p. 411. Also, the British Report concluded on the classification question (pp. 20–21): "We believe that the association of cannabis in legislation with heroin and the other opiates is *entirely inappropriate* and that new and quite separate legislation to deal specially and separately with cannabis and its synthetic derivatives should be introduced as soon as possible. We are also convinced that the present penalties for possession and supply are altogether too high." (Emhasis added)

34. The unavailability of the Indian Hemp Drug Commission Report and the general lack of information upon which most legislatures criminalized marijuana is pointed out by J. Kaplan's introduction to the 1969 reprint of the Report of the Indian Hemp Drugs Commission 1893–1894, vii–xiii (Jefferson ed., 1969).

35. People v. Lorentzen, *supra*, Stipulated Findings of Fact Nos. 37–42: "From the general public standpoint, the general marijuana user would require no treat-

The truth compels us to conclude at the minimum that marijuana has been erroneously classified with the opiates, and thus it is clear that based on current scientific knowledge, marijuana is not a narcotic drug.

Indeed, the Michigan legislature has recognized the erroneous classification of marijuana as a narcotic by its passage of the "Controlled Substances Act of 1971" (1971 P.A. 196; M.C.L.A. § 335.301 to § 335.367; MSA _____ to _____), effective April 1, 1972, which classifies marijuana as a distinct type of substance and provides drastically reduced penalties for its sale and possession.

We agree with the Illinois Supreme Court in People v. McCabe, *supra*, that marijuana is improperly classified as a narcotic and hold that M.C.L.A. § 335.151; M.S.A. § 18.1121, in its classification of marijuana violates the equal protection clauses of the U.S.Const., Am. XIV and Const.1963, art. 1, § 2.[36]

III.

Defendant contends that that the two marijuana cigarettes should not have been admitted into evidence because they were the result of an illegal police entrapment. The prosecution asserts that the two cigarettes were admissible because the defendant possessed them independently of the undercover officers' request for them.

The trial court ruled that the sale count should be dismissed because the defendant had been entrapped into committing this

ment at all. Most marijuana users do not have problems that would require any treatment from a medical or psychiatric point of view. Those that seek help because they have had an adverse reaction to marijuana or because they think they are using too much of the drug ordinarily need some guidance and some support and not much else. The majority of current marijuana users are using but not abusing the drug in the sense that one would normally think of dangerous drug abuse. To say that marijuana is an absolutely harmless drug is untrue, on the other hand to say it is a horrendous drug is equally untrue. Marijuana is a drug with potential dangers for some people when taken in conventional doses. Marijuana is safe for most people in conventional doses. Occasional, recreational use of marijuana for most individuals will be a pleasurable experience, involving no adverse reactions. The vast majority of recreational marijuana users will emerge from their drug experience without any apparent harm, either to themselves or to society."

J. Kaplan, in "Marijuana: The New Prohibition," p. 338, stated: "Another attempt to measure the deterrent effect of the marijuana laws was a careful study by two law students, Ellen Green and Bruce Blumberg, who sampled the student body at the University of California Law School at Berkeley. They found that seventy-three percent of this student body had used marijuana, a figure that is quite striking when one considers that law students would be expected to be among the most deterrable members of our society. Being involved in the law, they are more likely to know of its consequences; studying for a profession that regards moral character as one of its prerequisites, they they would be risking more than arrest or imprisonment if detected using marijuana; and, finally, at least most observers have considered lawyers and law students to be among the more conservative and cautious groups of our student population."

36. The decision today does not mean that persons arrested for sale or possession of marijuana cannot be prosecuted under the laws of the State of Michigan. Until April 1, 1972, the effective date of 1971 P.A. 196, prosecutions must be commenced under M.C.L.A. § 335.106; M.S.A. § 18.1106, which reads:

"Any person who violates any of the provisions of this act is guilty of a misdemeanor, and upon conviction shall be subject to a fine of not more than $500.00, or imprisonment in the county jail not more than 1 year, or both such fine and imprisonment in the discretion of the court. Any person, firm, partnership, association or corporation who sells, offers for sale, barters or otherwise disposes of or is in possession of d-lysergic acid diethylamide, peyote, mescaline and its salts, dimethyltryptamine, silocyn, or psilocybin or any salt or derivative of any of the aforementioned substances or any other drug possessing similar hallucinogenic properties is guilty of a felony unless in accordance with the federal food, drug and cosmetics act."

offense. Our Court has long recognized the defense of entrapment and the public policy behind this rule. In Saunders v. People, 38 Mich. 218 (1878), the Court reversed Saunders' conviction for breaking and entering by night a court room not connected with a dwelling and "taking therefrom certain recognizances described as contracts in force and public records." The Court held:

> "Decoying, or conniving with persons suspected of criminal designs, for the purpose of arresting them in the commission of the offense, is denounced by the Supreme Court." (syl. 1)

Justice Cooley, writing for the Court, reversed on the grounds that the testimony of a witness named Dunnebacke, should not have been excluded. Two of the Justices held that the conviction should be reversed because of impermissible police conduct. Justice Marston stated (pp. 221–222):

> "I cannot, however, silently permit the extraordinary course adopted by the police officers in this case to pass unnoticed and uncondemned. * * *
>
> "The course pursued by the officers in this case was utterly indefensible. Where a person contemplating the commission of an offense approaches an officer of the law, and asks his assistance, it would seem to be the duty of the latter, according to the plainest principles of duty and justice, to decline to render such assistance, and to take such steps as would be likely to prevent the commission of the offense, and tend to the elevation and improvement of the would-be criminal, rather than to his farther debasement. Some courts have gone a great way in giving encouragement to detectives, in some very questionable methods adopted by them to discover the guilt of criminals; but they have not yet gone so far, and I trust never will, as to lend aid or encouragement to officers who may, under a mistaken sense of duty, encourage and assist parties to commit crime, in order that they may arrest and have them punished for so doing. The mere fact that the person contemplating the commission of a crime is supposed to be an old offender can be no excuse, much less a justification for the course adopted and pursued in this case. If such were the fact, then the greater reason would seem to exist why he should not be actively assisted and encouraged in the commission of a new offense which could in no way tend to throw light upon his past iniquities, or aid in punishing him therefor, as the law does not contemplate or allow the conviction and punishment of parties on account of their general bad or criminal conduct, irrespective of their guilt or innocence of the particular offense charged and for which they are being tried. Human nature is frail enough at best, and requires no encouragement in wrong-doing. If we cannot assist another and prevent him from violating the laws of the land, we at least should abstain from any active efforts in the way of leading him into temptation. Desire to commit crime and opportunities for the commission thereof would seem sufficiently general and numerous, and no special efforts would seem necessary in the way of encouragement or assistance in that direction."

Chief Justice Campbell stated (p. 223):

> "[T]he encouragement of criminals to induce them to commit crimes in order to get up a prosecution against them, is scandalous and reprehensible."

Two theories have been advanced concerning the issue of entrapment. The first view was articulated by Chief Justice Hughes in Sorrells v. United States, 287 U.S. 435, 451, 53 S.Ct. 210, 216, 77 L.Ed. 413 (1932), when he stated:

> "[T]he defense of entrapment is not simply that the particular act was committed at the instance of government officials. That is often the case where the proper action of these officials leads to

the revelation of criminal enterprises. * * * The predisposition and criminal design of the defendant are relevant. But the issues raised and the evidence adduced must be pertinent to the controlling question whether the defendant is a person otherwise innocent whom the Government is seeking to punish for an alleged offense which is the product of the creative activity of its own officials. If that is the fact, common justice requires that the accused be permitted to prove it. The Government in such a case is in no position to object to evidence of the activities of its representatives in relation to the accused, and if the defendant seeks acquittal by reason of entrapment he cannot complain of an appropriate and searching inquiry into his own conduct and predisposition as bearing upon that issue."

In Sherman v. United States, 356 U.S. 369, 78 S.Ct. 819, 2 L.Ed.2d 848 (1958), the majority of the Court adopted the position of Chief Justice Hughes in *Sorrells, supra.* Thus, according to the majority view, whenever the defense of entrapment is raised, the court must look at 1) the conduct of the police, and 2) the predisposition of the defendant. The second view was stated by Justice Roberts in *Sorrells* (287 U.S. pp. 458–459, 53 S.Ct. p. 219):

"It has been generally held, where the defendant has proved an entrapment, it is permissible for the government to show in rebuttal that the officer guilty of incitement of the crime had reasonable cause to believe the defendant was a person disposed to commit the offense. This procedure is approved by the opinion of the court. The proof received in rebuttal usually amounts to no more than that the defendant had a bad reputation, or that he had been previously convicted. Is the statute upon which the indictment is based to be further construed as removing the defense of entrapment from such a defendant?

"Whatever may be the demerits of the defendant or his previous infractions of law these will not justify the instigation and creation of a new crime, as a means to reach him and punish him for his past misdemeanors. He has committed the crime in question, but, by supposition, only because of instigation and inducement by a government officer. To say that such conduct by an official of government is condoned and rendered innocuous by the fact that the defendant had a bad reputation or had previously transgressed is wholly to disregard the reason for refusing the processes of the court to consummate an abhorrent transaction. It is to discard the basis of the doctrine and in effect to weigh the equities as between the government and the defendant when there are in truth no equities belonging to the latter, and when the rule of action cannot rest on any estimate of the good which may come of the conviction of the offender by foul means. The accepted procedure, in effect, pivots conviction in such cases, not on the commission of the crime charged, but on the prior reputation or some former act or acts of the defendant not mentioned in the indictment."

In *Sherman, supra,* Justice Frankfurter, writing for four justices of the court, adopted the views advanced by Justice Roberts in *Sorrells, supra.*

The factual situation confronting us here demonstrates the practical problems that arise when the majority test is employed. The basis of the entrapment defense is that the methods used by the police are repugnant to fair play and justice. As the court stated in United States v. Chisum, 312 F. Supp. 1307, 1312 (C.D.Cal., 1970):

"Entrapment is indistinguishable from other law enforcement practices which the courts have held to violate due process. Entrapment is an affront to the basic concepts of justice. Where it exists, law enforcement techniques become contrary to the established law of the land as an impairment to due process."

In an attempt to discourage these practices and uphold "public confidence in the fair and honorable administration of justice" (Sherman v. United States, *supra*, 356 U.S. p. 380, 78 S.Ct. p. 825 [Frankfurter, J.]), courts refuse to allow convictions based on entrapment. Thus, when the trial court ruled as a matter of law that the defendant was entrapped into giving the two cigarettes to the police officers, count one, sale, was dismissed and the police were prevented from obtaining a conviction based on their reprehensible methods.

However, the defendant was still prosecuted for possession. The two marjuana cigarettes obtained purely as a result of illegal police conduct were the sole basis of defendant's conviction. To allow the conviction to stand, based on this evidence, is to subvert the public policy rule behind the entrapment defense. If the conviction stands, the police can ignore with impunity the doctrine of entrapment in narcotic cases. Citizens could be enticed and entrapped to give marijuana to police undercover agents, using methods condemned by the courts of this State and our sister states.[37] While a court might dismiss the information based on sale, it would still allow the evidence obtained by repugnant methods to be used as the basis of a conviction for possession.

In other areas of the law, the courts have fashioned exclusionary rules against the use of evidence obtained by means of illegal police conduct. Mapp v. Ohio, 367 U.S. 643, 81 S.Ct. 1684, 6 L.Ed.2d 1081, 84 A.L.R.2d 933 (1961); Miranda v. Arizona, 384 U.S. 436, 86 S.Ct. 1602, 16 L.Ed.2d 694, 10 A.L.R.3d 974 (1966).

The People contend that the exclusionary rules set out in *Mapp* and *Miranda* are not applicable to this case because they involve specific constitutional rights.[38] However, there are examples of both State and Federal cases where exclusionary rules have been fashioned under the general supervisory powers of the court.

To illustrate, in McNabb v. United States, 318 U.S. 332, 63 S.Ct. 608, 87 L.Ed. 819 (1943), the United States Supreme Court excluded from evidence a confession obtained from defendant. Although the court held that the confession was not involuntary in the sense that it was factually incorrect, nevertheless the court felt that it should not be allowed into evidence because to do so would be to countenance reprehensible methods of interrogation. The court based this on its specific supervisory powers over procedure in Federal courts.

Likewise in a situation analogous to *McNabb*, our Court applied the same rule depending on its supervisory powers over the courts in People v. Hamilton, 359 Mich. 410, 411, 102 N.W.2d 738, 739 (1960). In *Hamilton*, Justice Black, speaking for a unanimous Court, relied on United States Supreme Court cases which stated:

> "'The aim of the requirement of due process is not to exclude presumptively false evidence, but to prevent fundamental unfairness in the use of evidence whether true or false.' Lisenba v. People of State of California, 314 U.S. 219, 236, 62 S.Ct. 280, 290, 86 L.Ed. 166, quoted in Blackburn v. State of Alabama, 361 U.S. 199, 80 S.Ct. 274, 280, 4 L.Ed.2d 242, 248."

Const.1963, art. 6, § 5, grants to this Court general supervisory powers over the practice and procedure in this case.[39] The

37. For examples of cases where the courts have condemned the use of entrapment, see People v. McCord, 76 Mich. 200, 205–206, 42 N.W. 1106 (1889); People v. Pinkerton, 79 Mich. 110, 44 N.W. 180 (1889); United States v. Adams, 59 F. 674 (D.Or.1894); Woo Wai v. United States, 223 F. 412, 415 (CA 9, 1915); Butts v. United States, 273 F. 35, 37–38 (CA 8, 1921); State v. Neely, 90 Mont. 199, 300 P. 561 (1931); and Evanston v. Meyers, 70 Ill.App. 205, 207 (1897).

38. *Mapp* involved the Fourth Amendment right to be free from unreasonable search and seizure. *Miranda* involved the Fifth Amendment right of freedom from self-incrimination and the right to counsel in criminal proceedings guaranteed by the Sixth Amendment.

39. "The supreme court shall by general rules establish, modify, amend and simplify the practice and procedure in all courts of this state. The distinctions between law and equity proceedings shall, as far as practicable, be abolished. The office of master in chancery is prohibited."

excesses of police conduct which the Court in *Hamilton, supra,* held justified exclusion of evidence, were also present in this case. The trial court found as a matter of law that defendant was entrapped into the sale. This case is distinguishable from other entrapment cases where the courts did not exclude the evidence.[40] We are dealing with a limited factual situation. This occurs when a trial court has ruled as a matter of law that a defendant was entrapped into the sale of marijuana or narcotics. In such circumstances, we hold that the evidence thus obtained through the illegal entrapment cannot be used to prosecute a defendant for possession of marijuana or narcotics.

In the case at bar, the trial court determined that defendant was entrapped into the sale of marijuana. The same police misconduct (ante pp. 880–881) that occurred in the sale of the marijuana was also involved in the possession. Defendant did not volunteer the two cigarettes to the undercover agents; he only gave the cigarettes to them after repeated requests by the officers, who had deceived him over a lengthy period of time.

We hold that on the facts of this case the two marijuana cigarettes should not have been admitted into evidence. The judgment is reversed and the defendant is discharged.

WILLIAMS, Justice (for reversal).

This is an opinion concerning a problem whose time has come. The name in the entitling is happenstance as the defendant could have been any mother's son or daughter.

The specific issue this opinion will consider is whether the categorization of marihuana in Public Act No. 310 (1929) [1] along with the "hard drug" narcotics such as heroin, cocaine, and opium with the same penalty is denial of equal protection of the law because of unreasonable classification.

The defendant raised other issues such as entrapment and cruel and unusual punishment but inasmuch as the issue of equal protection is dispositive of the case neither those issues nor the factual details supporting them will be here considered. My Brother Brennan's opinion concerning the issue of cruel and unusual punishment is well-reasoned, and I am in agreement with it as far as it goes, but it goes only to the length of defendant's sentence, not to his conviction.

For the purposes of this opinion the facts of the case are that the defendant prepared two marihuana cigarettes from a jar in his private quarters and handed them to two undercover police personnel. The defendant was subsequently charged on separate counts with sale and with possession of marihuana, the charge of sale being dismissed by the trial court because of entrapment. Defendant was tried, convicted, and sentenced to 9½–10 years in prison.

The Court of Appeals affirmed the defendant's conviction in People v. Sinclair, 30 Mich.App. 473, 186 N.W.2d 767 (1971). This Court granted the defendant's application for leave to appeal on September 1, 1971.

The Michigan statute penalizing the possession of marihuana is M.C.L.A. § 335.153; M.S.A. § 18.1123. It was one of a number of state acts of similar type pass-

40. In none of the cases cited by the People did the police engage in their efforts of entrapment over a prolonged period of time. See People v. McIntyre, 218 Mich. 540, 188 N.W. 407 (1922); People v. Murn, 220 Mich. 555, 190 N.W. 666 (1922); People v. Christiansen, 220 Mich. 506, 190 N.W. 236 (1922); People v. England, 221 Mich. 607, 192 N.W. 612 (1923), and People v. Smith, 296 Mich. 176, 295 N.W. 605 (1941).

1. Public Act No. 92 (1923), as amended by Public Act No. 9 (1925) was the forerunner of this act, but did not include marihuana as a narcotic drug. Marihuana was first grouped with the "hard drugs" in 1929. The Act of 1929 has subsequently been amended in 1931 (Public Act No. 172), in 1937 (Public Act No. 343), in 1952 (Public Act No. 266), in 1957 (Public Act No. 63), and in 1961 (Public Act No. 206).

ed around the time of the passage of the Marihuana Tax Act in 1937.[2]

At the time of passage of the Marihuana Tax Act of 1937, marihuana was linked with heroin and other so-called "hard drugs" based on testimony indicating that marihuana was similarly dangerous. For example, in his testimony before the House Ways and Means Committee Narcotics Commissioner Harry J. Anslinger relied on a number of authorities including a paper by Dr. Frank R. Gomila, at that time Commissioner of Public Safety of the City of New Orleans, and Miss Madeleine Gomila, Assistant City Chemist. That paper among other things said "we find that in comparison with other important habit-forming drugs, heroin, morphine, opium, and cocaine, marihuana has an established place." Taxation Of Marihuana—Hearings Before The Committee On Ways And Means, House of Representatives, 75th Cong. 1st Session on H.R. 6385, 1937, p. 35.

The Commissioner made further points which are summarized by the Congressional Research Service (LRS, 13) as follows:

"1. A person under the influence of marihuana is dangerous behind the wheel of an automobile or while performing other functions which require coordination and judgment.
2. A habitual marihuana user is liable to commit a violent crime while under the influence of the drug.
3. Prolonged use of marihuana may produce 'mental deterioration' or even lead to insanity.
4. The drug may 'operate to destroy the will' and 'gradually weaken physical powers.'"

Based on such data it may not have been unreasonable for the Congress and the state legislatures at that time to have passed legislation coupling marihuana with opium and similar "hard drugs" in penal offenses. However, the situation today is quite the opposite. While experts cited in the briefs and appendices for plaintiff, defendant and *amici curiae* are not in complete agreement as to the exact properties of marihuana, it is quite clear that today few, if any, responsible experts would classify marihuana in the same category with opium and similar "hard drugs."[3]

2. The passage of the Marihuana Tax Act of 1937 and numerous similar state statutes took place in a climate of ignorance and misconception. See The Forbidden Fruit And The Tree of Knowledge: An Inquiry Into The Legal History of American Marijuana Prohibition, 56 Va.L.Rev. 971 (1970).

3. We are well aware of the great wealth of written material which exists concerning marihuana. The vast majority of these works are in agreement that marihuana is not a narcotic drug. We have relied upon the National Institute of Mental Health as the most authoritative spokesman for establishing this fact.

We have quoted the 1969 statement of Dr. Yolles, Director, National Institute of Mental Health, because it is the most pertinent comparison of marihuana with the hard drugs. However, since the original filing of this opinion, new authority has become available. The NIMH produced Second Annual Report to Congress from HEW (released February 11, 1972) continues to classify marihuana separate from hard drugs and states ". . . there seems to be agreement that physical dependence comparable to that produced by the opiates, alcohol and barbiturates does not exist with Cannabis" (p. 190). This report incidentally notes the recent British report of cerebral atrophy in ten young cannabis smokers as serious but requiring further research as eight out of the ten youths were multiple drug users (pp. 22, 23).

We note also the findings of the National Commission on Marihuana and Drug Abuse. In its first report released on March 22, 1972, the Commission recommended as follows:

"I. Reclassification of Cannabis

"Recommendation: The Commission Recognizes that Several State Legislatures have Improperly Classified Marihuana as a Narcotic, and Recommends that They Now Redefine Marihuana According to the Standards of the Recently Adopted Uniform Controlled Substances Law.

"Scientific evidence has clearly demonstrated that marihuana is not a narcotic drug, and the law should properly reflect this fact. Congress so recognized in the Comprehensive Drug Abuse Prevention and Control Act of 1970, as did The Conference of Commissioners on Uniform State Laws in the Uniform Controlled Substances Law.

The United States Congress, particularly the House of Representatives, has been especially concerned with the properties and effects of marihuana, apparently in connection with H.R. 14012, a bill to provide for the establishment of a commission on marihuana. Stanley F. Yolles, M.D., Director of the National Institute of Mental Health appeared before the Sub-Committee on Public Health and Welfare of the Interstate and Foreign Commerce Committee on September 17, 1969, more than two years ago to testify on this general subject. His testimony establishes quite clearly that "in the past, dangerous drugs were grouped arbitrarily sometimes by historical accident rather than with regard for their differing characteristics and their specific and distinct effects." He then went on to outline as well the present significant knowledge concerning the characteristics of marihuana. This Court can certainly take judicial notice that the characteristics of marihuana are quite different from narcotic drugs like heroin.

Dr. Yolles discusses this in his statement in brief form. The pertinent part of Dr. Yolles' statement is as follows:

"In the past, dangerous drugs were grouped arbitrarily, sometimes by historical accident rather than with regard for their differing characteristics and their specific and distinct effects. The bill before you today, Mr. Chairman, if read in conjunction with H.R. 13742, now before the House Ways and Means Committee, would provide for the first time a more logical grouping of substances according to the degree of danger in the abuse of each. It also wisely requires all decisions to add, delete, or reclassify a substance to be made by the Attorney General *only after* obtaining the advice of the Secretary of Health, Education, and Welfare, and of the Attorney General's own scientific Committee.

"There is one comment which I must make with regard to the content of the schedules. One substance which I know is being considered by another House Committee—because through historical accident it has been traditionally regulated as a narcotic—is marihuana.

"There is total agreement among competent scientists and physicians that marihuana is not a narcotic drug like heroin or morphine but rather a mild hallucinogen. To equate its risks—either to the individual or to society—with the risks inherent in the use of hard narcotics is neither medically nor legally defensible. I am certainly not advocating the removal of all restrictions on marihuana. It can be a dangerous drug. We need to know much more about the long-term effects of marihuana and other forms of Cannabis, particularly the more potent hashish. Based on what we already *do* know about the substance, however, it should not be dealt with [illegible]ally or medically, as a narcotic. [illegible]mphasis supplied.)

* * * * * *

"Mr. Chairman, the patterns of marihuana use, as well as the properties of the drug, are very different from the other substances under consideration here. No one really knows how many people smoke marihuana in the United States today. From collegiate studies and other sources, it can be estimated that the number of people who have smoked marihuana at least once is something between 8 and 12 million; and it may be closer to 20 million.[4]

"In those states where the Uniform Controlled Substances Law has not yet been adopted, twelve of which continue to classify marihuana as a 'narcotic', the Commission recommends that the legislature distinguish marihuana from the opiates and list it in a separate category. The consequence of inappropriate definition is that the public continues to associate marihuana with the narcotics, such as heroin. The confusion resulting from this improper classification helps to perpetuate prejudices and misinformation about marihuana." Marihuana, A Signal of Misunderstanding, p. 177.

4. A recent nationwide survey revealed that 61.7% of the country's college students have used marihuana at least once. Over one-third of the students, 38.6%, stated they had used marihuana 10 or more times. "Playboy's Student Survey; 1971."

"The marihuana debate continues but the differences between the facts about marihuana and the fables surrounding its use are now much more widely recognized than was the case even six months ago."

* * * * * *

The above data indicates that factually the categorization of marihuana with narcotics and other "hard drugs" is not a reasonable classification.

The United States Constitution [5] and the Michigan Constitution [6] each guarantee every citizen of the State of Michigan the equal protection of the law. Both the United States Supreme Court and this Court have held that a classification which does not rest upon a reasonable basis and which is essentially arbitrary in nature constitutes a violation of the Equal Protection Clause. Lindsley v. Natural Carbonic Gas Co., 220 U.S. 61, 31 S.Ct. 337, 55 L. Ed. 369 (1911); Naudzius v. Lahr, 253 Mich. 216, 234 N.W. 581 (1931).

Recent cases have outlined a stricter test in certain cases involving an interpretation of the Equal Protection Clause. These cases have held that when a fundamental constitutional right is in question, any classification which penalizes the exercise of that right is unconstitutional unless it is necessary "to promote a compelling governmental interest." Shapiro v. Thompson, 394 U.S. 618, 634, 89 S.Ct. 1322, 1331, 22 L.Ed.2d 600 (1969); Traverse City School District v. Attorney General, 384 Mich. 390, 185 N.W.2d 9 (1971).

Under either of the above standards the classification of marihuana as a "hard drug" in M.C.L.A. § 335.151; M.S.A. § 18.1121, constitutes a violation of the Equal Protection Clause of the United States Constitution. Such a classification is irrational in view of the present evidence which exists concerning marihuana. This is particularly true since other hallucinogenic drugs such as d-lysergic acid, diethylamide, peyote, and mescaline are grouped together. (M.C.L.A. § 335.106; M.S.A. § 18.1106) The penalties for the use of these drugs are less severe than those for the possession of the narcotic drugs with which marihuana is included. This classification promotes no "compelling governmental interest." Therefore such classification of marihuana deprived the defendant of his constitutional right to equal protection of the law.

The Supreme Court of the State of Illinois recently considered this same issue in its review of a case involving an Illinois statute classifying marihuana with narcotic drugs. In People v. McCabe, 49 Ill.2d 338, 275 N.E.2d 407 (1971), that Court stated, "Marijuana, in terms of abuse characteristics, shares much more in common with the barbiturates, amphetamines and, particularly, the hallucinogens than it does with the 'hard drugs' classified in the Narcotic Drug Act." 49 Ill.2d 347, 275 N.E.2d 412. The Court concluded that the grouping of marihuana with narcotic drugs was irrational and violated the Equal Protection Clause.

It is of interest to note that the Michigan Legislature itself has decided that the classification of marihuana with narcotics and other so-called "hard drugs" is not rational in the light of present scientific knowledge. The legislature has removed marihuana from the category containing "hard drugs," and has lowered the penalties for the marihuana crimes.[7]

The legislature also has recognized the problem arising from the fact that the Controlled Substances Act of 1971 may only be applied prospectively. Aware of its inability to pass a retrospective law, the legislature has wisely called for a committee to review the sentences of those individuals presently incarcerated for drug offenses. Such a committee can make recommendations concerning the commutation of sentences to the Governor. Unlike the legislature, however, this Court does have the authority to apply its decisions retro-

5. United States Constitution, Amendment XIV.

6. Constitution of The State of Michigan, 1963, Art. 1, § 2.

7. See the Controlled Substances Act of 1971, effective April 1, 1972.

spectively. Justice demands that we so apply this decision.

The legislature's action is in line with the following conclusion reached by the United States House of Representatives Select Committee On Crime which in their April 6, 1970 report (91st Congress, 2nd Session H.R. 91-978), concluded as follows:

"Certainly, savagely repressive and punitive laws cannot be defended as a solution to the marihuana problem. It destroys our criminal justice system to have penal statutes that are not uniformly enforced—and perhaps in some instances are unenforceable. Our committee heard many general statements of harsh and oppressive prison sentences that had been meted out to young marihuana users or possessors. Many lament that we are 'making criminals of our young people.' The facts, however, do not support these statements. We have observed that the penalties for marihuana possession or even for selling are generally not imposed and that jail sentences are the rare exception rather than the rule.

"This situation is not desirable. Our criminal statutes must be uniformly enforced or they make a mockery of the effective administration of criminal justice. Nothing brings about a disrespect for the law more effectively than penal statutes which are selectively enforced. Those who receive the penalty which the law provides rightfully feel discriminated against if most violators go free. A major and perhaps the most serious need in relation to marihuana is to make the penalties relating to violations rational and then to bring about uniform and even enforcement of the laws. No society can exist if disrespect for its laws is widespread."

Reversed, defendant discharged.

T. M. KAVANAGH, C. J., concurs.

T. G. KAVANAGH, Justice.

John Sinclair was convicted of the crime of possession of marijuana contrary to the provisions of M.C.L.A. § 335.153, M.S.A. § 18.1123, and was sentenced to serve 9½–10 years in prison therefor.

I agree with my brother Brennan that a minimum sentence of 9½ years for the possession of marijuana is cruel and/or unusual punishment prohibited by the U.S. Const., Ann. VIII and the Const.1963, art. 1, § 16, for the reasons he states.

I also agree for the reasons he states, that in the discharge of our duty we have the power to review sentences.

I do not agree that the other issues urged on appeal here were adequately treated by the Court of Appeals or that on the basis of their reasoning—or any other —that the conviction can stand.

My brother Swainson has written that the police procedure followed in this case was tantamount to entrapment and does not meet a standard of practice which we can countenance. I agree with him in this for his stated reasons. His quotations from Justice Marston and Campbell in Saunders v. People, 38 Mich. 218 (1878), and Justice Roberts in Sorrells v. United States, 287 U.S. 435, 53 S.Ct. 210, 77 L.Ed. 413 (1932) strike me as most apt.

Here because of the way it was obtained, the evidence should have been suppressed for all purposes, so defendant's conviction based upon it was improper.

My brothers Williams and Swainson, however, both write to the effect that our statute denied the defendant equal protection and due process of the law on account of its classification of marijuana with heroin and other "hard narcotics", prescribing the same penalty for their possession and use. They demonstrate that the overwhelming weight of scientific opinion today is that marijuana is not a narcotic at all, but rather a mild hallucinogen which should, with propriety, be treated with other hallucinogens. They hold that classification of marijuana with the "hard" drugs is wholly unreasonable and unconstitutional.

Although I am persuaded that our statute is unconstitutional, I cannot agree that my brothers have ascribed the correct or even permissible reasons for this conclusion.

The testimony and data upon which this legislation was based may indeed be out of date and of exceedingly doubtful validity today, but I do not perceive it the prerogative of a court to substitute its assessment of such testimony and data for that of a legislature. Rather I believe our duty is to determine whether what the legislature *did* conformed to constitutional limits.

I find that our statute violates the Federal and State constitutions in that it is an impermissible intrusion on the fundamental rights to liberty and the pursuit of happiness, and is an unwarranted interference with the right to possess and use private property.

As I understand our constitutional concept of government, an individual is free to do whatever he pleases, so long as he does not interfere with the rights of his neighbor or of society, and no government —State or Federal—has been ceded the authority to interfere with that freedom. As has been said:

> ". . . the sole end for which mankind are warranted, individually or collectively, in interfering with the liberty of action of any of these number, is self-protection. That the only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral is not a sufficient warrant." J. S. Mill, On Liberty, Chapter 1.

Whatever the validity of the concept that *traffic* in marijuana is freighted with a proper public interest, it is extending the concept entirely too far to sanction proscription of possession and private use of it. Although it is conceivable that some legitimate public interest might warrant state interference with what an individual consumes, "Big Brother" cannot, in the name of *Public* health, dictate to anyone what he can eat or drink or smoke in the *privacy* of his own home.

In my view when the legislature proscribed the possession and private use of marijuana as a *Public* health measure it did so unconstitutionally.

John Sinclair's conviction should be set aside and the prosecution dismissed.

BRENNAN, Justice.

Defendant was convicted of possession of two marijuana cigarettes in violation of M.C.L.A. § 335.153.

The offense occurred in the defendant's home, and in the presence of two police officers whose identity as such was unknown to the defendant.

Defendant did not testify at his trial.

On July 28, 1969, defendant, in the company of his attorney, appeared before the trial judge for sentencing.

The following is a transcript of that hearing:

"THE CLERK: File No. A-134588, People vs. John A. Sinclair. You were found guilty by a jury July 25th of Possession of Marijuana. You are here today for sentence. Do you have anything to say to the Court?

"THE DEFENDANT: I do.

"THE CLERK: Speak up.

"THE COURT: You want the microphone, Mr. Sinclair?

"THE DEFENDANT: Not particularly.

"THE COURT: All right.

"THE DEFENDANT: I haven't had a chance to say anything and so far I'd like to say a few things for the record. The Court is aware these charges have been fabricated against me by the Detroit Nar-

cotic Squad. He came to me one day and said a month and three days ago, you did this, you gave so and so this, you did that. I had no opportunity, I didn't do that and I had no opportunity to construct a defense. But I know what was going on all along and it was a conspiracy by these people, Warner Stringfellow, Vahan Kapagian and Joseph Brown and the rest of them, to frame me on this case and to bring me right here and to manufacture two marijuana cigarettes and say I gave them to them and then let the rest of you who are in it with them manufacture this cold case and bring me here. The punishment I have received already in the two and a half years since this case started is cruel and unusual, if I had committed the crime of possessing two marijuana cigarettes. And everyone who is taking a part of this is guilty of violating the United States Constitution and violating my rights and everyone else's that's concerned. And to take me and put me in a pigsty like the Wayne County Jail for the weekend is a cruel and unusual punishment, to sleep on the floor, to have no sheets, no blankets, pig swill to eat. You see, but you can get away with this and you can continue—I don't know what sentence you are going to give me, it's going to be ridiculous, whatever it is. And I am going to continue to fight it. The people are going to continue to fight it because this isn't justice. There is nothing just about their, there is nothing just about these courts, nothing just about these vultures over here.

"THE COURT: One more word out of the crowd and I will clear the courtroom.

"THE DEFENDANT: Right. And that will continue in the tradition that's been established here. I am not done, but no sense talking any more.

"MR. RAVITZ: If your Honor please, Mr. Sinclair is twenty-seven years of age, he is married, he has one child in the audience today, two years of age. A beautiful child, she is there. His wife is pregnant. He's lived in the State of Michigan all his life. He has three prior convictions, two are for marijuana. In each instance, he pled guilty. In the second instance, he never, ever should have pled guilty. It was the subject of illegal entrapment by Vahan Kapagian. He was induced, he was seduced, he was led by Kapagian to be an intermediary. To be an intermediary to a transaction which he never would have been a party to. To be an intermediary to a transaction which the major person on both sides of the transaction were, of course, not charged with an offense.

"John Sinclair stands convicted in Oakland County of assaulting a police officer who wasn't even a police officer. Of assaulting a person who assaulted him. He's been given a sentence of thirty days in that case, which is on appeal. The Court knows something about the history of cases involving alleged assaults upon police officers where the alleged assailants were persons of the nature of John Sinclair.

"If there are two crimes in this country which are political prosecutions, they are in one instance, those of claimed assaults against police officers and in another instance, those cases which can be proved easily by fabricated stories and not easily disproved by citizens. Namely, offenses such as the one before this Court.

"John Sinclair has another pending case. That pending case is an oddity in the annals of jurisprudence in this country or anywhere else. That case is for violation of the Federal law, which is on its face, palpably unconstitutional. It stated as many as twelve years ago in the case of Lamberg versus California, by the Supreme Court, I wonder who it was who came up with the clever notion of saying that John Sinclair is a criminal because he kept a business engagement in another state, in Canada, and went across the line not registering as a person convicted of a narcotic offense? Who else has been charged with that case and when and who is behind that case? I wonder? But one need not wonder, one need only look.

The community's attitude and the establishment's attitude and the narcotics officer's attitude and the unmitigated power which they have to exercise. The only way that power can be checked is by having an independent judiciary. The only way that power can be checked is by having jurors who aren't going to be servants to police state power that are going to stand as a bullwark against the improper exercise of that power. And we don't have that in America today. We didn't have that in this court this past week and that's regrettable.

"In America, which has never known anything but the history of racism, and in America which practices those imperialistic and those brutalistic and inhumane wars in Asia and elsewhere around the globe, and in America which sends a man to the moon while millions of its citizens starve, John Sinclair is brought before this Court and he is said to be a criminal. He isn't a criminal. He isn't a criminal at all. The criminals with respect to this law, are the doctors, the legislators, the attorneys who know, who know, because they have knowledge that these laws are unconstitutional. That these laws defy all knowledge of science. That this sumptuary legislation, like its predecessors and like other forms of sumptuary legislation, are on the books to go after and to impress politically unpopular people and groups and minorities. That's the only reason they are on the books.

"This very day, 25% of the future doctors of America who are studying medicine at Wayne State University Medical School, have possessed marijuana. Twenty-five percent of the future lawyers, indeed future judges who will be sitting on that bench some day, have possessed and have smoked marijuana.

"THE COURT: That's your opinion.

"MR. RAVITZ: That's my opinion.

"THE DEFENDANT: That's a fact.

"MR. RAVITZ: My opinion and based on studies.

"Persons brought before the bar of the Court aren't the middle-class, aren't the popular, they are the oppressed. They are the unpopular. It's a terrible law, it's a criminal law. I know that the Court might not agree with my evaluation of it. I know and ask and hope for only this, your Honor. I think the Court has been involved in enough of these cases to know that the law itself, whether it's unconstitutional per se, is a cruel law and isn't a law that is properly and fairly dispensed. I know that the Court, and I hope that the Court recognizes that the two cigarettes in this case were really—the officers in this case really had utter disregard for John Sinclair. They never treated him as a human being to whom the Constitution extended itself. What I really hope the Court recognizes is that other judges and other persons of this society charged with responsibilities, come to recognize is that America cannot single out unpopular leaders and go into their arsenal of over-kill, be it through stone or rifles or highly punitive sentences and think that the problems in this country can ever be solved in that fashion. Yet all around this country, we see political prosecutions. We see the Tom Haydens, we see the Huey Newtons, the John Sinclairs singled out. And somewhere in the warped minds of those so-called leaders, they think that they are going to cure the generation gap. They think that they are going to stem the tide of revolution by picking out leaders. Well, they are simply not going to do so because leaders are no longer indispensable in this country. Because there are a great many people who are awake to the crimes and the atrocities committed by governments and because it simply cannot work. The only way to deal with it is to deal with it rationally, to deal with it constitutionally and to follow those laws written by those legislators. And I will ask that the Court do just that. And I would ask that the

Court insulate itself from public pressures which I recognize to be very weighty. But to be equally irrational. Those are the same public pressures that lead to all those acts that called for the conclusions brought forward in the Kerner Commission Report. And yet those conclusions haven't been acted on in any way by government. I hope that this Court in particular begins to act upon them by exercising some degree of rational thought process and by recognizing the realities of the situation.

"Thank you.

"THE COURT: Well, in this matter here, Mr. Sinclair was arrested in January of 1967 in connection with an offense that took place on December 22nd, 1966. It's interesting to me that he, and you, assert that he has been violated of his constitutional rights because all of the rights that he's entitled to as any citizen is under the Constitution, have been asserted in his defense. In addition to that, there have been appeals to the Court of Appeals, to the Michigan Supreme Court on his behalf, which have held up the trial of this case for a long and lengthy period of time.

"Now, Mr. Sinclair is not on trial and never was on trial in this courtroom because of his beliefs. He represents a person who has deliberately flaunted and scoffed at the law. He may think that there is nothing wrong with the use of narcotics, as many people think that there is nothing wrong with the use of narcotics. Although enlightened and intelligent people think to the contrary and otherwise. And medical studies back them up far more completely than they do the people on his side of the particular question.

"The public has recognized that the use of narcotics is dangerous to the people that use it. The public, through its legislature has set penalties for those who violate and traffic in narcotics.

"Now, this man started in 1964, in which he first came to the attention of this Court and upon the offense of Possession of Narcotics, on a plea of guilty, was placed upon probation. We have tried to understand John Sinclair, we have tried to reform and rehabilitate John Sinclair.

"In 1966, while still on probation for that offense, he committed another offense for which he pleaded guilty. And this Court again showed supreme leniency to John Sinclair, placing him on probation again while ordering him to serve the first six months thereof in the Detroit House of Correction.

"This placed him in violation of his other probation, which resulted in that Judge extending that probation on again, so that for you or for John Sinclair to assert that the law has been out to get him, is sheer nonsense. John Sinclair has been out to show that the law means nothing to him and to his ilk. And that they can violate the law with impunity and the law can't do anything about it.

"Well, the time has come. The day has come. And you may laugh, Mr. Sinclair, but you will have a long time to laugh about it. Because it is the judgment of this Court that you, John Sinclair, stand committed to the State Prison at Southern Michigan at Jackson or such other institution as the Michigan Corrections Commission may designate for a minimum term of not less than nine and a half nor more than ten years. The Court makes no recommendation upon the sentence other than the fact that you will be credited for the two days you spent in the County Jail.

"Now, as to bond, in view of the fact that Mr. Sinclair shows a propensity and a willingness to further commit the same type of offenses while on bond, and I am citing you to the case of People versus Vita Giacalone just cited by the Michigan Court of Appeals, this is one instance where there is a likelihood of that type of danger and which the Court of Appeals said that refusal to set bond is a good grounds. And based on that, and my belief that he will continue to violate the law and

flaunt the law in relation to narcotics, I deny bond pending appeal.

"THE DEFENDANT: You just exposed yourself even more. And people know that. You give somebody nine and a half to ten years—(noise in the courtroom)."

Statistics of the Michigan Department of Corrections show that since 1964, 1,663 persons have been convicted in Michigan for violation of M.C.L.A. § 335.153.* Of these, 214 were given short jail terms, fined or given suspended sentences. 982 were placed on probation. 467 were committed to prison.

Of the 467 sent to prison, only 46 received minimum terms exceeding five years. Only five persons have been committed to prison for minimum terms of nine and one-half years, or more, for possession of any amount or species of narcotics since 1964.

Defendant appeals his conviction and sentence on many grounds. All of these have been dealt with adequately by the Court of Appeals, with one exception.

That issue is this: Whether under the circumstances of this case, the imposition of a minimum term of imprisonment of nine and one-half years is prohibited by the U.S.Const., Am. VIII, or Const.1963, art. 1, § 16.

The U.S.Const., Am. VIII, provides:

"Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted."

Const.1963, art. 1, § 16, provides:

"Excessive bail shall not be required; excessive fines shall not be imposed; cruel or unusual punishment shall not be inflicted; nor shall witnesses be unreasonably detained."

Cummins v. People (1879), 42 Mich. 142, 3 N.W. 305 was submitted to the Supreme Court on October 29, 1879, and decided the next day. It involved:

"BURGLARY. Criminal information charging George Linden, Michael Moore, William Cummins and John Seipher with breaking into the dwelling house of Anne McFarlin, in the township of Hamtramck, and feloniously taking therefrom a bottle of sherry and a lot of cigars. Cummins was convicted and sentenced to imprisonment in the State Prison for seven years."

The Court, held, without citation of precedents:

"It is also alleged as error that the sentence was unusually severe, and that, in the light of all the facts, it was in violation of the constitutional provision which declares that 'cruel or unusual punishment shall not be inflicted.' The sentence was not in excess of that permitted by statute, and when within the statute this court has no supervisory control over the punishment that shall be inflicted. The statute gives a wide discretionary power to the trial court upon the supposition that it will be judicially exercised in view of all the facts and circumstances appearing on the trial. Unless the case presented differed materially from what it would appear to have been, as shown by the bill of exceptions, we think the punishment inflicted was unusually severe, and have no doubt but that on a full presentation of the facts to the chief Executive, relief would be promptly and cheerfully granted."

In Robison v. Miner and Haug (1888), 68 Mich. 549, 37 N.W. 21, a provision of the liquor law of 1887 calling for forfeiture of business in addition to fine and imprisonment was struck down as cruel and unusual punishment.

People v. Murray (1888), 72 Mich. 10, 40 N.W. 29, was a case in which:

"The respondent in this case was convicted in the Kalamazoo circuit on the

* State of Michigan, Department of Corrections, Criminal Statistics (1964–1970).

28th day of February, 1888, of the crime of carnally knowing and abusing a young girl under the age of 14 years, and was sentenced to imprisonment at Jackson for the term of 50 years."

The reported decision contains a detailed description of the events which led to the arrest and conviction of the defendant Murray, concluding with these words (p. 13, 40 N.W. p. 31):

"The case does not show the aggravating circumstances which so frequently accompany criminal conduct of the character charged, and especially is this true when we consider the intoxicated condition of the respondent. While this cannot furnish any legal excuse for what he did, it has an important bearing upon the turpitude of the respondent, and the quality of his crime, and should have had an important influence in determining the extent of the punishment to be inflicted after conviction had. Such considerations, however, seem to have been entirely without weight with the court below, as is very clearly manifest from the extent of the punishment meted out to the respondent."

In *Murray*, the Court found errors in the trial, and directed remand for new trial.

But the Court also directed its attention to the punishment issue, in these words (pp. 16–17, 40 N.W. p. 32):

"There is another feature of this case to which we wish to call special attention, and that relates to the sentence imposed. It is for 50 years, and will very likely reach beyond the natural life of the respondent, unrestrained of his liberty, and overreach by 10 or 15 years his natural life if so restrained. We see nothing in this record warranting any such sentence, and it must be regarded as excessive. It will not do to say the executive may apply the remedy in such a case. We do not know what the executive may do, and it is but a poor commentary upon the judiciary when it becomes necessary for the executive to regulate the humanity of the bench.

"But the Constitution has not left the liberty of the citizen of any state entirely to the indiscretion or caprice of its judiciary, but enjoins upon all that unusual punishments shall not be inflicted. Where the punishment for an offense is for a term of years, to be fixed by the judge, it should never be made to extend beyond the average period of persons in prison life, which seldom exceeds 25 years.

"We are all of opinion that the present case shows an abuse of the discretion vested by the statute in the circuit judge in this respect."

The *Murray* decision makes no reference to *Cummins*, although it is clear that the Court took a very different view of the strictures of the cruel and unusual punishment prohibition in the two cases.

In People v. Morris (1890), 80 Mich. 634, 45 N.W. 591, there is a rather extensive discussion of cruel or unusual punishment. There, two defendants pled guilty to larceny of a horse, and were sentenced to seven years and six years nine months, respectively. The statute on horse theft carried a minimum sentence of three and a maximum sentence of 15 years.

It was alleged in *Morris* that the statute was unconstitutional. No claim seems to have been made, as in *Murray*, that the sentence itself constituted the infliction of cruel or unusual punishment.

The historical discussion in *Morris* discloses that the precursor of our constitutional ban on cruel or unusual punishment was originally aimed at the infliction of punishments by judges, and was not a limitation upon the legislative branch of government in defining crimes and declaring punishments.

"'We first find the injunction against cruel and unusual punishment in the

Declaration of Rights, presented by the convention to William and Mary before settling the crown upon them in 1688. That declaration recites the crimes and errors which had made the revolution necessary. These recitals consist of the acts only of the former king and the judges appointed by him, and one of them was that "illegal and cruel punishment had been inflicted." * * * The punishments complained of were the pillories, slittings, and mutilations which the corrupt judges of King James had inflicted without warrant of law, and the declaration was aimed at the acts of the executive; for the judges appointed by him, and removable at pleasure, were practically part of the executive. It clearly did not then refer to the degree of punishment, for the criminal law of England was at that time disgraced by the infliction of the very gravest punishment for slight offenses, even petit larceny then being punishable with death. But the declaration was intended to forbid the imposition of punishment of a kind not known to the law or not warranted by the law.'" (p. 638, 45 N.W. p. 592)

While the Court in *Morris* was only asked to consider the constitutionality of the statute, nonetheless, the Court repeated the *Cummins* rule that any sentence within the statutory limits was beyond appellate consideration.

"But for the disposition of this case we may adopt the rule contended for, and then we must find (in order to declare the law unconstitutional) that the minimum punishment provided by the law is so disproportionate to the offense as to shock the moral sense of the people. Imprisonment for larceny is, and always has been, in this country and in all civilized countries, one of the methods of punishment. There may be circumstances surrounding the commission of larceny where fifteen years would not be considered too severe a punishment. When punishment is commensurate with the depravity of the criminal, as shown in the commission of the act, justice is done. Under most of our criminal laws, cases may arise where the punishment inflicted might be considered cruel, but that does not condemn the law. The judge in such case has acted within the jurisdiction of constitutional law, and other means must be resorted to to right the wrong. Appellate courts cannot interfere if the proceedings have been regular. The law itself must therefore be cruel or unusual to warrant the interposition of the courts." (p. 639, 45 N.W. p. 592)

The *Morris* Court also pointed out that the act of stealing a horse was *malum in se*. Details of the horse theft were not recounted.

The *Cummins* rule was followed again in People v. Cook (1907), 147 Mich. 127, 110 N.W. 514. There a statute calling for indeterminate sentences was upheld. The Court said (p. 133, 110 N.W. p. 517):

"The law does not provide for any unusual punishment. The legislature may fix one definite punishment for any crime, or it may fix a minimum and a maximum. When a constitutional law has fixed the punishment for an offense, a sentence under that law is not cruel or unusual within the meaning of the Constitution. One judge might sentence a man convicted of larceny for one year, and another might sentence the same man for the same offense for five years. When the judge imposes a sentence within the law, his sentence is not a cruel or unusual punishment. It is laws providing for cruel and unusual punishments that the Constitution refers to and prohibits, and not sentences by courts under constitutional laws."

People v. Mire (1912), 173 Mich. 357, 138 N.W. 1066, dealt with a conviction of burglary with explosives. The defendant there argued that the statute provided a

cruel and unusual punishment. Affirming the sentence, the Court said (p. 361, 138 N.W. p. 1067):

"The punishment prescribed in the act in question is imprisonment, a most common and usual method of punishment the world over. The claim that it is cruel and unusual must of necessity be directed, not to its nature, but to its limits of time, 'not less than 15 years nor more than 30.' That class of cruel and now unusual punishments at one time sanctioned and prevalent under the common law of England, such as burning at the stake, drawing and quartering, mutilation, starvation, and lesser forms of physical torture, to which the constitutional prohibitions were primarily directed, is not involved here. Approaching the dividing line, the inquiry as to what does in any particular case constitute cruel and unusual punishment under the constitutional provisions turns, not only upon the facts, circumstances, and kind of punishment itself, but upon the nature of the act which is to be punished."

As in *Morris,* the Court agreed that the minimum term was the measure of the constitutionality of a punishment statute.

"We are not prepared to hold that the punishment prescribed in this act does not fit the crime, or that the minimum punishment, which is the test, should be regarded as so unusual and cruel, and so disproportionate to the offense as to shock the moral sense of the public." (p. 362, 138 N.W. p. 1068)

Also following the lead of *Morris,* the Court in *Mire* discussed the legislative rationale, pointing out the peculiar dangers inherent in the use of explosives.

People v. Smith (1893), 94 Mich. 644, 54 N.W. 487, and People v. Whitney (1895), 105 Mich. 622, 63 N.W. 765, are both cases in which the constitutionality of legislatively determined punishments were considered and upheld. In both cases, the Court said "upon the legislature alone is conferred the power to fix the minimum and maximum of the punishment for all crimes."

In People v. Baum (1930), 251 Mich. 187, 23 N.W. 95, defendant was convicted of violation of the liquor laws, sentenced to pay a fine of $500 and $500 costs. In addition, defendant was placed on probation for five years, during which time it was ordered that he "must leave the State of Michigan within 30 days and not return for period of probation." It was held that such a method of punishment was impliedly prohibited by public policy. The case was remanded with instructions to enter a legal sentence.

In People v. Jagosz (1931), 253 Mich. 290, 235 N.W. 160, defendant was convicted of rape. There was no discussion of the basis for the claim that the sentence imposed was cruel or unusual. The Court said (p. 292, 235 N.W. p. 161):

"It is claimed that the sentences to imprisonment from twelve to thirty years constitute cruel and unusual punishment. There is no merit in this. The statute (3 Comp.Laws 1915, § 15211 [3 Comp. Laws 1929, § 16727]) provides imprisonment for life or any such period as the court in its discretion shall direct."

In People v. Harwood (1938), 286 Mich. 96, 281 N.W. 551, 552, defendant was sentenced five to 15 years for placing a foul and offensive substance in a taxicab, rendering it unuseable for two weeks.

The Court cited United States Supreme Court cases to support its finding that the Eighth Amendment did not apply to the states, then, without discussing the similar provision of the Michigan Constitution, affirmed the conviction on the ground that the "length of imprisonment for felony is for legislative determination and not subject to judicial supervision." Citing *Morris, Smith* and *Whitney.*

Defendant appealed his conviction of rape in People v. Commack (1947), 317

Mich. 410, 26 N.W.2d 924. This was a delayed appeal in which there appeared to have been some possibility of doubt as to the defendant's guilt, based upon certain after discovered evidence. Defendant's appellate counsel asked to withdraw because he did not wish to be a party to a fraud on the Court. Thereafter, the Court made short shrift of the appeal, and disposed of the cruel and unusual argument with the simple statement that the sentence was within the statutory limits, and was not "'cruel, inhuman and unjust punishment' in view of the nature of the crime charged."

In re DeMeerleer (1948), 323 Mich. 287, 35 N.W.2d 255, imposed a sentence of six months to 15 years for manslaughter. The Court reiterated the holding of *Harwood* without discussion.

Defendant was sentenced to a minimum term of eight years in People v. Connor (1957), 348 Mich. 456, 83 N.W.2d 315. He challenged the sentence as an abuse of discretion. The Court there held:

> "The sentence imposed is within the penalty imposed by statute. * * * In such cases the Supreme Court is without power to alter or change a sentence."

In People v. Krum (1965), 374 Mich. 356, 132 N.W.2d 69, defendant was convicted of obstructing an officer. He claimed that his sentence of 30 days in jail, $1,000 fine and $346.20 in costs, was grossly excessive under all the circumstances and taking account of his past exemplary record. That claim was disposed of with one sentence:

> "As to the claim that the sentence was excessive, it is found to be within the limits set by the statute, and that precludes our altering it."

It is apparent that our cases on the subject of cruel or unusual punishments have not considered the parameters of the constitutional prohibition in any great depth.

It is clear from *Murray, Miner* and *Baum* that the Court does have, and will occasionally exercise authority to vacate sentences which are illegal. But it is also clear that our Court has consistently declined to consider punishments challenged as being cruel and unusual where the sentence is within the range permitted by statute.

The conclusion that the prohibitions of the Eighth Amendment and of Const.1963, art. 1, § 16, are directed only to legislative acts and not judicial actions, does not seem warranted.

As pointed out in *Morris*, the history of the "cruel and unusual" punishment bar was otherwise. Moreover, the punishments prohibited by the Constitution are those "inflicted" and not those permitted or authorized by law. The prohibition against "excessive bail" would seem obviously directed against courts and judges who set bail, and not against legislatures which ordinarily leave the amount of bail to judicial discretion.

Further, the action of State courts has been held to constitute State action within the meaning of the Fourteenth Amendment. Shelley v. Kraemer (1948), 334 U. S. 1, 68 S.Ct. 836, 92 L.Ed. 1161.

Since the Eighth Amendment has now been held applicable to the States, via the Fourteenth Amendment (Robison v. California, [1966] 370 U.S. 660, 82 S.Ct. 1417, 8 L.Ed.2d 758), it would follow that the sentence imposed by a State court, could be made the basis for a Federal claim, even though State legislative action is not challenged.

Where the legislature provides an indeterminate sentence, which contains no minimum term, the constitutionality of the legislation would have to be determined on the basis of the maximum penalty established. In such a case, a showing would have to be made that no set of facts could be posited under which the commission of the crime defined in the law would warrant the imposition of the maximum penalty.

In such a case, the legislature leaves the setting of the minimum sentence to the court for the very purpose of creating latitude so as to relieve from the maximum penalty those defendants whose conduct contained some circumstances of mitigation, or at least no circumstances of aggravation.

But it does not follow that because the legislature has left the setting of the minimum term to the courts, no minimum term can ever be excessive.

We reject the proposition that punishments can be "cruel and unusual" in the popular sense, but not in the constitutional sense. The Constitution is a popular document. It must be construed by the courts to have that meaning which the people intended it to have.

It is ludicrous to suppose that the people who prohibited excessive fines and bail and cruel or unusual punishment intended thereby to vest unbridled power in judges to require bail, impose fines and inflict punishments.

It is equally unrealistic to conclude that the people intended to permit the legislature to give such unbridled power to the trial courts in the name of indeterminate sentencing.

Many examples could be given in which maximum statutory punishments are at variance with the realities of the administration of justice.

Traffic violations, for instance, are punishable under the motor vehicle code as misdemeanors, carrying a maximum of 90 days in jail and $100 fine.

While certain aggravated circumstances might be supposed justifying such penalties in some cases, it would be shocking indeed if the maximum penalty should be meted out for a commonplace left turn violation!

Surely this Court would not consider itself powerless to interpose in such a case.

Our constant reiteration that an appellate court is without authority to review a sentence has no basis in law or logic. M. C.L.A. § 769.1 provides that Justices of the Supreme Court have sentencing power, as fully as circuit judges. There is no reason to suppose that such authority is idly given or has no relation to the appellate function.

The authority, indeed the duty, of this Court to vacate sentences which exceed the permissible limits of statutory provisions is clear. Such sentences are illegal. They violate the law. As such, they are null and void.

The Constitution is the fundamental law. It is as explicit and as binding on courts as the pronouncements of the legislature. A sentence of a court which violates the Constitution is illegal. This Court is not without the power to support and observe the Constitution and to apply it to the actions of judges, even when such actions are literally within the discretion vested by statute.

The legislature has no power to invest a court with discretion to violate the Constitution.

This case of *Sinclair* has been given much notoriety. Defendant and his supporters have used his conviction and sentence as a vehicle to attack the wisdom and efficacy of the marijuana laws.

We have declined to enter into that controversy. The judicial fact-finding process is not adaptable to finding mixed questions of fact and policy.

But we do note that the possession of narcotic drugs is a crime *malum prohibitum* only. This is particularly apparent in the case of marijuana. The statute prohibits possession of any part of the cannibus sativa plant. Possession of a natural growing plant can hardly be *malum in se*.

As officers sworn to uphold the Constitution we recognize with understanding, the action of the learned trial judge.

The attitude of hostility and remorselessness displayed by the defendant and the disruption of orderly proceedings by his supporters surely combined to tax the patience of the court. And certainly if reha-

bilitation were the sole purpose of sentencing, the measure of the imprisonment would be more the posture of the defendant than the gravity of the offense.

But rehabilitation is not the only function of punishment. It is not even always possible. Where the defendant is recalcitrant, whether from principle or out of sheer meanness, the law cannot, in a free society, disregard the nature of the offense and address itself only to the character of the offender.

Where a minimum sentence is imposed which is demonstrably and grossly excessive, in the light of the depravity of the criminal as shown in the commission of the act and in light of the usual and customary disposition of those convicted of like conduct, such minimum sentence violates the constitutional prohibition against the inflicting of cruel or unusual punishment, and is illegal and void.

The sentence is vacated, and the cause is remanded for re-sentencing. In the meantime defendant will be admitted to bail with bond in the amount of $1,000.00.

ADAMS, J., concurs.

37 Mich.App. 442

PEOPLE of the State of Michigan,
Plaintiff-Appellee,

v.

Joseph PAYNE, Defendant-Appellant.

Docket No. 9392.

Court of Appeals of Michigan,
Div. 1.

Dec. 22, 1971.

Released for Publication March 9, 1972.

By a judgment of the Recorder's Court of Detroit, Wayne County, George W. Crockett, Jr., J., the defendant was convicted of taking indecent liberties and he appealed. The Court of Appeals held that admission of the concededly hearsay testimony of policewoman as to what victim, with whom defendant allegedly took indecent liberties, told policewoman regarding incident two days earlier was harmless error, if any, in view of fact that policewoman's testimony was largely cumulative of that given by the victim.

Affirmed.

1. Criminal Law ⇐366(6)

In sex offenses, hearsay statements made by victim of tender years to witness who subsequently testifies as to contents of these declarations are admissible as part of res gestae if delay from time of incident to time of conversation is adequately explained.

2. Criminal Law ⇐1169(2)

Admission of the concededly hearsay testimony of policewoman as to what victim, with whom defendant allegedly took indecent liberties, told policewoman regarding incident two days earlier was harmless error, if any, in view of fact that policewoman's testimony was largely cumulative of that given by the victim. M.C.L.A. § 750.336.

3. Criminal Law ⇐260(11)

Where inadmissible hearsay is presented to trial court sitting alone, Court of Appeals can assume that it rendered its verdict upon evidence properly offered and not upon inadmissible testimony.

4. Assault and Battery ⇐59

Penetration is not an element to be proven in an indecent liberties prosecution. M.C.L.A. § 750.336.

5. Assault and Battery ⇐59

In view of amendment of indecent liberties statute to include conduct of females as well as male, amended statute under which defendant was prosecuted could not

timony of the policewoman was largely cumulative of that of the victim.[2] Where inadmissible hearsay of this nature is presented to a trial court sitting alone, we can assume that its verdict rested upon evidence properly offered and not upon the inadmissible testimony. People v. Davison, supra, at 433, 163 N.W.2d 10.

[5–7] Further, defendant attacks the constitutionality of the indecent liberties statute as unduly vague.[3] We cannot accept this contention. The legislation penalizes conduct that is of such character that the common sense of society regards it as indecent and improper. People v. Hicks (1893), 98 Mich. 86, 56 N.W. 1102; People v. Szymanski (1948), 321 Mich. 248, 32 N.W.2d 451; People v. Healy (1933), 265 Mich. 317, 251 N.W. 393; People v. Visel (1936), 275 Mich. 77, 265 N.W. 781; People v. Lakin (1938), 286 Mich. 282, 282 N.W. 149; People v. Brandt (1969), 18 Mich.App. 267, 171 N.W.2d 59; People v. Dexter (1967), 6 Mich.App. 247, 148 N.W. 2d 915; Armstrong v. Bannan (C.A.6, 1959), 272 F.2d 577. A penal statute, proscribing sexually offensive, anti-social conduct, is not unconstitutionally ambiguous because it fails "* * * to graphically outline the acts encompassed by the crime * * *." People v. Green (1968), 14 Mich.App. 250, 251, 165 N.W.2d 270, 271.[4]

[8] Finally, defendant took the stand to deny the allegations of the complainant. The prosecutor on cross-examination and for the purposes of testing defendant's credibility brought defendant's past convictions to light. It remains the law of Michigan that, whenever defendant chooses to testify, his past convictions may be used by the prosecution to impeach his credibility. M.C.L.A. § 600.2158 (Stat.Ann.1962 Rev. § 27A.2158); People v. DiPaolo (1962), 366 Mich. 394, 115 N.W.2d 78; People v. Cybulski (1968), 11 Mich.App. 244, 160 N.W. 2d 764; People v. Roney (1967), 7 Mich. App. 678, 153 N.W.2d 175.

[9] The final allegation of error is that the trial court failed to make specific findings of fact at the conclusion of the case. While GCR 1963, 517.1, requires the court in a nonjury case or in a case tried with an advisory jury to make findings of fact and state separately its conclusions of law thereon, this court rule does not apply to criminal cases.

Affirmed.

2. That the policewoman indicated that defendant entered the victim is not, in and of itself, significant since this fact need not be proven in an indecent liberties prosecution. The testimony as to penetration cannot be said to have influenced the outcome.

3. Defendant also challenges the statute as unconstitutionally discriminatory; we find this totally without merit. While the legislation originally punished the misconduct of *males* only, the legislation was amended in 1954 to include females. P.A. 1954, No. 51, § 1. Defendant's prosecution is under this later, amended version.

4. See also, People v. McMurchy (1930), 249 Mich. 147, 178, 179, 228 N.W. 723, in which it is noted that some crimes by their very nature must necessarily be couched in broad language so that the legislation can accomplish its end of proscribing socially undesirable conduct. No legislation of this genus could ever possibly recite a litany of wrongdoing for which one remained criminally responsible.

Jamie EGAN and Benita Egan, Appellants,
v.
SHERIFF, CLARK COUNTY, Nevada, Respondent.
No. 6970.

Supreme Court of Nevada.
Nov. 17, 1972.

Appeal from an order of the Eighth Judicial District Court; Clark County, Howard W. Babcock, J., denying a pretrial petition for writ of habeas corpus. The Supreme Court, Zenoff, C. J., held that although state obtained a continuance at a scheduled preliminary hearing in justice court because of absence of their expert

(b) If the battery is not committed with a deadly weapon, and serious physical injury to the victim does result, for a gross misdemeanor.

(c) If the battery is committed with the use of a deadly weapon, by imprisonment in the state prison for not less than 2 years nor more than 10 years.

witness, a chemist, and although expert testimony was not essential to establishment of probable cause in respect to sale of marijuana, there was no basis for concluding that affidavit in support of motion to continue was false nor that state became obligated to produce expert testimony before grand jury to establish probable cause once it used absence of expert to gain continuance in justice court, and probable cause for bringing of indictment was established, where testimony of undercover agent before grand jury was sufficient to establish that petitioner had either directly, or by necessary implication, represented that substance he was selling was marijuana; however, mere physical presence of other petitioner during time undercover agent made arrangements to purchase marijuana and statement of other petitioner as to price a "baggie" of marijuana would be may well have subjected her to criminal charges but was insufficient to establish probable cause that she had made a "sale" of marijuana and indictment brought against her charging sale should have been dismissed.

Affirmed as to one petitioner and reversed as to other petitioner.

1. Indictment and Information ⇐10.2(1)

"Non-expert" testimony may be sufficient to establish probable cause for return of an indictment in grand jury proceedings.

2. Indictment and Information ⇐10.2(8)

Standard of probable cause is satisfied if person against whom an indictment charging sale of marijuana is sought either directly, or by necessary implication, represents that substance he is selling is marijuana. N.R.S. 453.030, 453.210, subd. 2.

3. Criminal Law ⇐234
Indictment and Information ⇐10.2(2)

Although state may use an expert to establish probable cause at a preliminary hearing or before grand jury, it is not mandatory that it do so if other testimony meets required standard.

4. Indictment and Information ⇐10.2(8)

Although state obtained a continuance at a scheduled preliminary hearing in justice court because of absence of their expert witness, a chemist, and although expert testimony was not essential to establishment of probable cause in respect to sale of marijuana, there was no basis for concluding that affidavit in support of motion to continue was false nor that state became obligated to produce expert testimony before grand jury to establish probable cause once it used absence of expert to gain continuance in justice court, and probable cause for bringing of indictment was established, where testimony of undercover agent before grand jury was sufficient to establish that petitioner had either directly, or by necessary implication, represented that substance he was selling was marijuana. N.R.S. 453.030, 453.210, subd. 2.

5. Drugs and Narcotics ⇐102

Mere physical presence of petitioner's wife during time undercover agent made arrangements with defendant to purchase marijuana and her statement as to price a "baggie" of marijuana would be may well have subjected her to criminal charges but was insufficient to establish probable cause that she had made a "sale" of marijuana and indictment brought against her charging sale should have been dismissed. N.R.S. 453.030, 453.210, subd. 2.

6. Constitutional Law ⇐50

The legislature has full and exclusive authority in all matters of legislation so long as it does not transgress the bounds of some constitutional limitation.

7. Criminal Law ⇐5

The power to define crimes and penalties lies exclusively in the legislature.

8. Constitutional Law ⇐250.1(2)
Drugs and Narcotics ⇐43

Provision of former statute classifying marijuana as a narcotic was neither arbitrary nor violative of equal protection. N.R.S. 453.011 et seq., 453.020, subd. 2, 453.32½; U.S.C.A.Const. Amend. 14.

9. Criminal Law ⇐15

Although statutes under which petitioner was charged with sale of marijuana were only effective until January 1, 1972, grand jury indictment was not invalid by reason of fact that it was not returned until February 17, 1972, where statute enacted to replace former statutes specifically provided that prosecution for any violation of law occurring prior to effective date of newly enacted statute was not affected or abated. N.R.S. 453.030, 453.210, subd. 2.

Peter L. Flangas, Las Vegas, for appellants.

Robert List, Atty. Gen., Carson City, Roy A. Woofter, Dist. Atty., and Charles L. Garner, Deputy Dist. Atty., Las Vegas, for respondent.

OPINION

ZENOFF, Chief Justice:

An indictment was returned by the Clark County Grand Jury charging appellants with selling marijuana in violation of N.R.S. 453.030 and 453.210(2). In this appeal from the denial of a pre-trial writ of habeas corpus they challenge (1) the sufficiency of the evidence to establish probable cause, (2) the constitutionality of the statute and (3) contend the statute under which they are charged was repealed by Stats. of Nev.1971, ch. 667. [N.R.S. 453.-011 et seq.]

The grand jury heard the testimony of only one witness, John Adamo, an undercover agent for the Clark County Sheriff's office. He testified that on September 22, 1971, he met with appellants and arrangements were made with Jamie Egan to purchase marijuana. While Adamo and Jamie Egan were haggling over the price Bonita Egan stated the price would be $20.00. A rendezvous was scheduled in the parking area of a shopping center. After a brief period the Egans arrived at the parking lot. Bonita went into the grocery store and Jamie entered the Adamo car where he exchanged what he *represented* to be a baggie of marijuana for $20.00.

[1, 2] 1. We have previously held similar "non-expert" testimony sufficient to establish probable cause in grand jury proceedings. "The standard of probable cause is satisfied if the person against whom an indictment is sought either directly, or by necessary implication, *represents* that the substance he is selling is marijuana." Glosen v. Sheriff, 85 Nev. 145, 148, 451 P.2d 841, 842 (1969). [Emphasis added]. We have restated this rule in DuFrane v. Sheriff, 88 Nev. 52, 495 P.2d 611 (1972) and Zampanti v. Sheriff, 86 Nev. 651, 473 P.2d 386 (1970).

[3, 4] Appellants concede *Glosen* is the law in this state but contend that it should not apply to them because of the following circumstances. Prior to the indictment appellants had been charged with the same offense in the justice court.[1] At a scheduled preliminary hearing the state obtained a continuance because of the absence of their expert witness, a chemist. Appellants suggest that since expert testimony was not essential that the affidavit in support of the motion to continue was false and since the state used the absence of the expert to gain the continuance in justice court they became obligated to produce expert testimony before the grand jury, to establish probable cause. This is simply not the law. Although the state may use an expert to establish probable cause at a preliminary hearing or before the grand jury, it is not mandatory that it does so if other testimony meets the standard we required in *Glosen*. Adamo's testimony met that test as to Jamie Egan.

[5] The mere physical presence of Bonita Egan during the negotiations and her statement of the price of a baggie may well subject her to criminal charges; however, such participation is insufficient to establish probable cause that she made a "sale". The charge against her should

1. The justice court proceedings were subsequently dismissed.

have been dismissed in the writ proceedings below. Cf. Tigner v. State, 88 Nev. 280, 496 P.2d 159 (1972).

[6-8] 2. The Uniform Narcotic Drug Act, Stats. of Nev.1937, ch. 23, (N.R.S. 453.020(2)) classified marijuana as a narcotic.[2] Appellants argue that recent scientific knowledge proves that marijuana is not a narcotic and complain that such classification, with its attendant punishment and sentencing provisions is arbitrary and deprives them of equal protection in violation of their Fourteenth Amendment rights. We reject this contention.[3] The legislature has full and exclusive authority in all matters of legislation so long as it does not transgress the bounds of some constitutional limitation. McCormick v. District Court, 67 Nev. 318, 218 P.2d 939 (1950). "The power to define crimes and penalties lies exclusively in the legislature." Lapinski v. State, 84 Nev. 611, 613, 446 P.2d 645, 646 (1968). "The inclusion of marijuana in the statutory definition of 'narcotic' in a class with heroin and other physically addicting drugs is not an unreasonable and arbitrary classification violative of due process and equal protection of the law." Reyna v. State, 434 S.W.2d 362, 366 (Tex.Cr.App.1968) quoted with approval in Hunter v. State, 481 S.W.2d 806 (Tex.Cr.App.1972).

[9] 3. Appellants' final contention is that since the grand jury indictment was not returned until February 17, 1972, and N.R.S. 453.030 and 453.210(2) were only effective until January 1, 1972, that the statute was repealed and they cannot be charged under the old law. The argument is without merit. Stats. of Nev.1971, ch. 667, § 66 specifically provided that "[p]rosecution for any violation of law occurring prior to the effective date of this act is not affected or abated by this chapter." N.R.S. 453.030 and 453.210(2) were fully viable and applicable to the offense charged.

Affirmed as to Jamie Egan.

Reversed as to Bonita Egan.

BATJER, MOWBRAY, THOMPSON, and GUNDERSON, JJ., concur.

2 The Uniform Controlled Substances Act, Stats. of Nev.1971, ch. 667, p. 1660 et seq., supplanted the Uniform Narcotic Drug Act, effective January 1, 1972. Under the new act (NRS 453.011 et seq.) marijuana is no longer classified as a narcotic but marijuana offenses continue to be felonies. NRS 453.321.

3 We are aware of recent contrary decisions in People v. Sinclair, 387 Mich. 91,

MARIJUANA AND THE LAW: A JUDICIAL OPINION †

COMMONWEALTH V. JOSEPH D. LEIS AND IVAN WEISS*

Defendants were convicted in the East Boston District Court for the violations of the Massachusetts Laws on the illegal possession of a narcotic drug (marijuana),[1] conspiracy to violate the narcotic drug-laws of Massachusetts[2] and illegal possession of a narcotic with the intent to sell it.[3] Defendants appealed to the Superior Court and claimed that the Massachusetts laws relating to the possession, use and sale of marijuana are unconstitutional because it is arbitrary, irrational and unsuited to the accomplishment of any valid legislative purpose. They further contend that such laws violate the defendant's rights secured under the Ninth Amendment of the United States Constitution and the Due Process and Equal Protection Clauses of the Fourteenth Amendment. They finally argue that these statutes impose cruel and unusual punishments upon users, possessors and sellers of marijuana in violation of the

TAURO, C.J.:

FUNDAMENTAL RIGHTS

The defendants maintain that among the hierarchy of individual rights guaranteed by the Constitution of the United States, there are certain fundamental rights which may be abridged by the states only upon the showing of a compelling state interest. Those rights encompass those "privileges long recognized at common law as essential to the orderly pursuit of happiness by free men."[4] In addition to those specifically enumerated in the Constitution, they also include the right to travel freely, to contract, to acquire useful knowledge, to marry, establish a home, raise a family, and educate children to earn a livelihood, to exercise the franchise, to read, to inquire, to teach, to associate and to privacy in one's associations.[5] Although no decision appears to have attempted to propound an all inclusive list of fundamental rights, an examination of those cases cited by the defendants indicates that only those rights are to be considered as fundamental whose continuation is *essential* to ordered liberty. In other words, fundamental rights are those without which democratic society would cease to exist. Furthermore, those rights which are recognized as fundamental are also, in many instances, closely related to some commonly acknowledged moral or legal duty and not merely to a hedonistic seeking after pleasure. No claim of any such duty which would demand the possession, use or sale of marijuana has been advanced in this case.[6]

I conclude that the alleged rights of the defendants to

---

[4]Meyer v. Nebraska, 262 U.S. 390, 399 (1923).

[5]*Id.*; Aptheker v. Sec. of State, 378 U.S. 500 (1964); Spevak v. Klein, 35 L.W. 4140 (1967); Griswold v. Connecticut, 381 U.S. 479 (1965) cases cited at 482-83; Harper v. Va. Bd. of Elections, 383 U.S. 663 (1966).

[6]*See* People v. Woody, 61 Cal. 2d 889, 394 P.2d 813, 40 Cal. Rptr. 69 (1964).

possess, use or sell marijuana, which I find to be a harmful and dangerous substance, is neither essential to the preservation of ordered liberty, nor to the orderly pursuit of happiness by free men, nor required by any commonly recognized legal or moral duty. I rule that these alleged rights do not rise to the level of fundamental rights nor fall within the periphery or penumbra emanating from such rights. Therefore, it is not necessary that a compelling state interest be shown in order to subject them to regulation under the exercise of the state's police power.

EXTENT OF POLICE POWER: BURDEN OF PROOF: PRESUMPTION OF VALIDITY: TEST OF VALIDITY

The non-fundamental right to possess, use or sell intoxicating substances such as marijuana or alcohol can be regulated or even absolutely prohibited by the state in the exercise of its police power, provided such statutory restrictions are reasonably suited to achieve a valid legislative purpose.[7]

A properly enacted statute is presumed to be constitutionally valid and the burden is upon its assailants to demonstrate its unconstitutionality. "Unless the act of the Legislature cannot be supported upon any basis of fact that can reasonably be conceived to sustain it, the court has no power to strike it down as violative of the Constitution."[8] Thus, when enacting legislation in the exercise of the state's police power, the legislature is presumably supported by facts known to it "unless facts judicially known or proved preclude that possibility."[9]

Dir. of Div. of Necessities of Life, 319 Mass. 301, 305, 65 N.E.2d

During the course of these proceedings, there was some reference to the legislative history of our narcotic drug laws or rather, more properly, to the lack of any such complete history. While the existence of such a legislative history may be helpful in ascertaining the intent of the legislature when construing a statute, it is not, however, essential to a determination of the points in issue in this case. The court's function in a case such as this is not to conduct an historical survey to determine the facts known or reasonably conceived to exist by the legislature at the time of the statute's enactment. Rather, it is to determine whether facts now exist or could now be reasonably conceived to exist by the legislature which would sustain the statute. To rule otherwise would involve the courts in the absurd position of upholding clearly erroneous statutes on the grounds that they were reasonable in the light of the state of knowledge existing at the time of their enactment, and of striking down presently justifiable statutes on the grounds that the legislature could not have known the facts necessary to sustain them at the time of their enactment.

Since legislative regulations are of continuing effect until they expire by their own terms, are repealed or are invalidated by the courts, I rule that they should be tested according to the facts known or reasonably received to exist at the time of their challenge. This is especially so in view of the fact that amendments were made to MASS. GEN. LAWS c. 94, §197, as late as 1966.[10]

INCLUSION OF MARIJUANA AS A NARCOTIC

The defendants argued that MASS. GEN. LAWS c. 94, §197 is irrational and arbitrary insofar as it defines marijuana as a narcotic drug in the same category with such "hard" narcotics as morphine, cocaine and heroin.

The testimony elicited at the hearing from expert witnesses indicated that the term "narcotic", as currently used,

---

529, 532 (1946); Coffee-Rich Inc. v. Comm'r of Pub. Health, 348 Mass. 414, 422, 204 N.E.2d 281, 287 (1965).

[10]As amended by the Acts of 1966, ch. 71, § § 1,2.

is a legal term with no precise, technical meaning, and is employed to describe a varied assortment of harmful and dangerous drugs. Section 197 makes no effort to provide a generic definition of "narcotic", but resorts to definition by specific inclusion. The fundamental question with regard to such a definition then, is whether those drugs included in it are so distinguishable from one another as to render marijuana's classification as a narcotic so arbitrary and unreasonable as to be unconstitutional.

Despite some pharmacological differences between other drugs, such as heroin, and marijuana and despite the physiological differences in their effects, most notably with regard to physical dependence, I do not find that the inclusion of marijuana in the statutory definition of a narcotic drug is constitutionally offensive.[11]

As with the other drugs included in §197, the use of marijuana does cause psychic disorientation. It is a hallucinogenic, mind altering drug whose common usage and usual effect is to cause a state of euphoria or intoxication and which can lead to the user's habitual, psychological dependence on the drug.

The term "narcotic" is broad enough to include marijuana as well as the other drugs prescribed by §197. The failure to include other known drugs, such as alcohol, or yet undiscovered synthetics in this category either by generic definition or specific inclusion does not make marijuana any less of a narcotic.

REASONABLENESS OF THE LEGISLATION: DANGERS OF MARIJUANA

This Commonwealth's statutory scheme of regulating the possession and sale of narcotic drugs, admittedly a virtual prohibition as applied to marijuana, is predicated upon the premises that its use is harmful or dangerous and that its strict regulation and virtual prohibition is a rational means

[11]People v. Stark, 157 Colo. 59, 66, 400 P.2d 923, 927 (1965) and cases cited therein.

of preventing the harm and damage attendant upon its use. The next and central issue would logically seem to be a determination of whether there are facts in existence or which reasonably could be conceived to exist that would sustain a legislative conclusion that the use of marijuana is harmful or dangerous.

It is my opinion, based on the evidence presented at this hearing, that marijuana is a harmful and dangerous drug.

The effects of marijuana are not readily predictable and, to a great extent, depend upon and accentuate the psychological predisposition of the user. The drug, as it is commonly used, has as its primary and, as far as I can ascertain, its only purpose the induction of a state of intoxication or euphoria. While under the influence of marijuana, a person's mental processes are disoriented, his perception of time and space is distorted, his coordination is impaired, but his strength remains undiminished. Marijuana tends to cause the user to lose perspective and to focus his attention on one object to the exclusion of all others.

The drug has a great attraction for young men and women of college age or less during the formative years when they should be gaining the education and experiences upon which to build their future lives. Furthermore, there is widespread emotional instability among the users of marijuana. The use of the drug allows them to avoid the resolution of their underlying problems rather than to confront them realistically. In addition, users naturally associate with other users, who are also likely to have emotional problems and compound one another's difficulties. In such persons, the use of marijuana may cause temporary psychotic episodes. They develop a drug-oriented culture which is marked by a peculiar proselytism, whereby users strive to introduce non-users to the drug. Marijuana users customarily use the drug with the specific intent of becoming intoxicated. No evidence was introduced to show any significant number of persons who use marijuana to achieve a state of relaxation short of intoxication. Even the so-called regulatory process of "self-titration" is employed

to attain a desired state of intoxication, not to stop short of intoxication.

A great deal of testimony was devoted to the addictive qualities of marijuana. While marijuana is not physically addictive in the sense that heroin is, it can cause psychological dependence in the user. The user can come to depend upon marijuana as a crutch and its usage becomes habitual. It is this form of addiction which modern medical experts assert is the proper definition of the term.

Given the effects of marijuana and the character of its users, the possible dangers associated with its use are clearly discernible. Its tendency to release inhibitions, both verbally and actively, and the dependence of its unpredictable effects on the disposition of the user, marijuana can be especially volatile when used by a despondent, hostile or unstable person. Its impairment of motor coordination, coupled with the retention of muscular strength and the distortion of time and space relationships, makes its use extremely hazardous among those operating machinery, especially automobiles, and among those individuals responsible for the care and custody of other persons, such as the parents of young children.

The propensity of marijuana users to concentrate on one object, while ignoring all others, leads to a loss of awareness and frustrates the formation of rational judgments by them. This narrow, subjective pre-occupation of users, especially the young, with drugs and their effects can cause irreparable distruptions of education, family ties or careers whose adverse personal and social effects can last long beyond the period of actual marijuana use. Further, by centering their attention on the attainment of a state of euphoria through drug consumption, marijuana users are apt to neglect their health and that of others in their care and to submit to a life of indolence. The effects of these patterns of living are not limited to the users themselves. Ultimately, society must assume the burden created by their use of marijuana.

Much of the testimony concerned the relationship between the use of marijuana and the progression to "hard"

narcotics, between its use and crimes other than violations of laws pertaining to marijuana and between its use and sexual promiscuity. There is no allegation by the Commonwealth that physical addiction to "hard" narcotics, crime and promiscuity would disappear if marijuana use were to disappear. Nor is there any claim put forth that marijuana use necessarily and inevitably leads to addiction to "hard" narcotics, crime and promiscuity in each and every case. Nevertheless, there is abundant evidence that marijuana use is closely associated with these other social evils in a great many instances. Although no definitive link of efficient casuality can be demonstrated with scientific exactness at present, the coincidence between addiction to "hard" narcotics, crime and promiscuity is too great to be passed off as merely accidental. The defendants answer that the fault lies not with the nature of the drug but rather with the user and his environment. Admittedly, in such complex and intertwined social problems, no one factor can be singled out as the sole efficient cause. Yet, it is reasonable in the light of facts now known to conclude that the use of marijuana contributes to "hard" narcotic addiction, crimes other than those related to the violation of the marijuana laws and sexual promiscuity. Furthermore, if the fault does lie with the instability of the persons prone to use marijuana, it would seem that this fact would lend added support to the laws prohibiting its use.

REGULATION V. PROHIBITION

The defendants also contend that the prohibition of marijuana exceeds the power of the legislature, that marijuana should be regulated, as is alcohol, not prohibited. This argument merges with the contention that our narcotic drug laws, as applied to marijuana, constitute a denial of the equal protection of the laws and will also be dealt with further in conjunction with that latter contention. However, the state may, in the exercise of its police power, absolutely prohibit the possession and use of alcohol by

individuals.[12] The fact that the legislature has chosen to regulate the use of alcohol and prohibit the use of marijuana does not deny its power to prohibit the use of marijuana. The difference in the legislative treatment of the two substances is reasonable in view of factual differences between them.

The customary use of alcohol, by the glass or bottle, is conspicuous and, thereby, susceptible of regulation and limitations regarding time, place and age. The customary use of marijuana, by smoking, is not conspicuous and is not susceptible of regulation and limitations regarding time, place and age. It can be used in public places, at work, on the streets and in vehicles without detection until its effects are manifested, whereas comparable uses of alcohol can be detected much more readily.

The social harm caused by the abuse of alcohol cannot be denied. The number of alcoholics and of highway fatalities and crimes which occur under the influence of alcohol speak for themselves, but the fact remains that alcohol has uses other than as a means of becoming intoxicated. The vast majority of alcohol users do not consume it with the intention of becoming intoxicated. It has a social value as an relaxant and, in some instances, as a therapeutic. Marijuana, on the other hand, has no generally recognized medical use and is used solely as a means of intoxication.

The history and cultural acceptance of alcohol and marijuana in this country cannot be ignored. Alcohol has been in widespread use among the general population since colonial times. It is customarily consumed with meals and on social occasions which do not center on the avowed purpose of drinking to the point of intoxication. So ingrained is its use in our culture that all prior statutory and constitutional prohibitions of its use have failed. Marijuana also first appeared in our country during the colonial period, but its use was never widespread among the general population. As has been noted previously, its use is not

[12]Crane v. Campbell, 245 U.S. 304 (1917).

associated with any purpose other than to become intoxicated. Nor has its use become so ingrained in our culture as to make laws strictly prohibiting its use impractical.

In view of the undesirable effects attendant upon the use of marijuana, the state has not exceeded its authority or acted arbitrarily and unreasonably by prohibiting the use, sale and possession of marijuana, a harmful and dangerous drug, while merely regulating the use, sale and possession of alcohol, which is also capable of serious abuse.

The defendants maintain that the narcotic drug laws, as applied to marijuana, are not wholesome and reasonable, as required by the Constitution of Massachusetts,[13] in that they are criminogenic. Such an assertion by itself begs the question. Any statute which prohibits certain acts is criminogenic insofar as the commission of the prohibited act constitutes a crime. However, the defendants do raise a worthwhile point. They claim that the link between crime and marijuana use occurs because the marijuana user must resort to criminals for his supply and this contact leads to involvement with other criminal activity. There is undoubtedly some truth in this statement. However, much of the criminal and anti-social activity of marijuana users undoubtedly arises from the instability of the user and the effect of the drug itself as well.

The legislature is faced with a dilemma. It knows from past experience with alcohol that the prohibition of marijuana will create problems. It also knows that the toleration of the use of marijuana, even with regulation, will also create problems. The legislature must balance and weigh the evils attendant upon prohibition against those attendant upon the toleration of its regulated use. I cannot say that the provisions of MASS. GEN. LAWS ch. 94, §§197 to 217E inclusive, as applied to marijuana, are not "reasonable and wholesome".

UNREASONABLE BROADNESS OF DEFINITION

The defendants also maintain that the statutory defini-

[13]MASS. CONST. pt. 2, ch. 1 § 1, art. 4.

tion of marijuana is too broad, and, therefore, arbitrary and irrational in that it proscribes the possession or sale of parts of the female cannabis plant which do not contain the hallucinogenic ingredient of marijuana, tetrahydrocannabinol, as well as the harmless male plant and other harmless species of the cannabis plant. However, there was undisputed testimony that it would take an expert to distinguish marijuana from other processed parts of the female, marijuana-producing plant or of the male plant or of other harmless varieties of the cannabis plant. This broad definition is necessary to provide for effective enforcement. The extension of the definition of marijuana in MASS. GEN. LAWS ch. 94, §197 to include all of the female plant, the male plant and harmless varieties of cannabis is not arbitrary and unreasonable. If the definition were contracted to cover only those specific portions containing the hallucinogenic substance, the enforcement of the statute with regard to marijuana would be a practical impossibility.

In their argument, the defendants set up the hypothetical situation of an individual being prosecuted for a violation of §213A because, unknown to him, harmless varieties of cannabis sativa grew wild on his property. I have never heard of such a case. Nor is any justiciable question in this regard raised in the case at bar. Therefore, I decline to rule on the constitutionality of §§213A and 197 as applicable to such circumstances.[14]

EQUAL PROTECTION

The defendants also argue that the diverse statutory treatment of alcohol and marijuana constitutes a denial of the equal protection of the laws in contravention of the Fourteenth Amendment to the Constitution of the United States. However, the evidence produced at the hearing established that, while both substances are dangerous, there

[14]Bowes v. Secretary of the Commonwealth, 320 Mass. 230, 245, 69 N.E.2d 115, 126 (1946).

is a factual difference between alcohol and marijuana which would sustain the different treatment accorded each by the legislature.

Attempts to compare the dangers and evils associated with these two substances are both medically irrelevant and illogical. The ordinary user of marijuana is quite likely to be a marginally adjusted person who turns to the drug to avoid confrontation with and the resolution of his problems. The majority of alcohol users are well adjusted, productively employed individuals who use alcohol for relaxation and as an incident of other social activities.

The defendants' equal protection argument would fall even if marijuana's nature and effects could not be distinguished from those of alcohol. They rely on *Skinner v. Oklahoma*[15] in which the Supreme Court invalidated a state statute providing for the sterilization of "habitual criminals", a definition including the defendant chicken thief but excluding other criminals, such as embezzlers. There, the Court stated that "when the law lays an unequal hand on those who have committed intrinsically the same quality of offense . . . it has made as invidious a discrimination as if it had selected a particular race or nationality for oppressive treatment."[16] The defendants also cite *McLaughlin v. Florida*[17] in which the Supreme Court invalidated a statutory prohibition of cohabitation between members of different races.

Neither *Skinner* nor *McLaughlin*, in which the denial of equal protection was an intrinsic element of the statutes in question, and which concerned basic rights, can be interpreted as exceptions to the general rule "that a state may direct its law against what it deems the evil as it actually exists without covering the whole field of possible abuses, and it may do so none the less that the forbidden act does not differ in kind from those that are allowed."[18] The state may reach out and treat certain evils without dealing with

---

[15]316 U.S. 535 (1942).
[16]*Id.* at 541.
[17]379 U.S. 184 (1964).
[18]Central Lumber Co. v. So. Dakota, 226 U.S. 157, 160 (1912).

every related evil.[19] A court cannot condemn the legislature's failure to act in one area by invalidating prohibitions it has enacted in other similar or related areas. It would seem apparent that, if the legislature is free to prohibit one activity and ignore another similar or related activity, then *a fortiori*, it may prohibit one and regulate the other.

The defendants attempt to rationalize this line of cases by arguing that they focus on kinds of behavior among which the legislature is free to choose, while the essence of the marijuana—alcohol dichotomy is that the legislature has proscribed the behavior of one class, those who use marijuana as their intoxicant, and tolerates the behavior of another class, those who use alcohol as their intoxicant. There are several defects in this argument. First of all, the law does not permit voluntary intoxication by means of alcohol.[20] Secondly, as has been stated previously, there are substantial differences between the usual users of alcohol and of marijuana. In light of the prevailing patterns of use of the two drugs, it is fair to characterize marijuana as an intoxicant and alcohol merely as a potential intoxicant. The legislature might properly conclude that the consequences of the use of the two drugs are distinguishable and that alcohol is susceptible of regulation and marijuana is not.

In a certain sense, all penal statutes are discriminatory. They differentiate between those who engage in the proscribed forms of behavior and those who do not, but such discrimination is not vulnerable to attack under the Equal Protection Clause if any state of facts can reasonably be conceived to justify it.[21] On the other hand, a statutory discrimination must be found to be arbitrary unless it is based on some distinction bearing a substantial relationship

to the purpose of the legislation.[22] I rule that the legislature was warranted in treating alcohol and marijuana differently.

CRUEL AND UNUSUAL PUNISHMENT

The defendants have raised the contention that the penalties attached to violations of MASS. GEN. LAWS ch. 94, §§205, 213A and 217B constitute cruel and unusual punishments in violation of the Eighth Amendment to the Constitution of the United States and, presumably, in violation of the Declaration of Rights of the Constitution of Massachusetts.[23]

In a somewhat analogous case, *People v. Stark*[24] considered the same contention.

> With reference to the argument that the several offenses defined in the statute are punishable by "cruel and unusual punishments" we hold that until some person has been convicted of a crime and a sentence has been imposed which is then asserted to be "cruel and unusual" there is no justiciable issue presented. . . . Where there is a wide spread between the minimum and maximum punishment, whether any punishment is "cruel and unusual" is a matter to be determined under all the facts and circumstances surrounding each offense.[25]

Prior to sentencing, unless the minimum prescribed sentences are, in themselves, cruel and unusual, the defendants cannot be heard to say that they risk the imposition of a cruel or unusual punishment.

There is little authority to support the defendants' view that they can raise the issue of cruel and unusual punishment at this preliminary stage of the proceedings. In *Weems*

---

[23]MASS. CONST. pt. 1, art 26.

[24]157 Colo. 59, 400 P.2d 923 (1965).

[25]*Id.* at 68, 400 P.2d at 928.

v. United States[26] the Supreme Court did confine its consideration to the minimum sentence for falsifying a public record in the Philippine Islands. There, however, the statute demanded a sentence of twelve years and one day in confinement at *cardena temporal*, a holdover from the Spanish penal system, under which the defendant was not only imprisoned but also forced to work at hard and painful labor in chains and without any assistance whatsoever, and subjected to absolute, perpetual civil disqualification, civil interdiction and surveillance for life upon release. Clearly, even this minimum sentence was cruel and unusual, and Weems had, in fact, been sentenced to 15 years at *cardena temporal*.

The defendants raise another argument, based on *Robinson v. California*[27] which should also be considered. In that case, the Supreme Court held that the punishment of the mere status or condition of being a narcotics addict, a sickness and not a crime in the Court's view, was cruel and unusual. *Robinson* would only be applicable if the legislation in question and as applied prohibited and penalized the status or condition of being a narcotics addict.[28] *Robinson*, however, is restricted to a condemnation of statutes punishing status, conditions or disease as contrasted to acts, such as use, sale or possession. Even if *Robinson* were to be extended to cover those acts constituting or compelled by the status, condition or disease, the expert witnesses have testified, without exception, that there is no status, condition or disease involved in the use of marijuana, that is, it does not cause physical addiction. Moreover, the violations with which the defendants have been charged include possession with intent to sell marijuana[29] and conspiracy to violate the narcotic drug laws of the Commonwealth[30] which involve no question of status,

[26]217 U.S. 349 (1909).

[27]370 U.S. 660 (1962).

[29]MASS. GEN. LAWS ch. 94, § 217b as amended by the Acts of 1960, ch. 204, § 3.

[30]MASS. GEN. LAWS ch. 94, § 213a as amended by the Acts of

condition or disease, even though possession might if it could be shown that marijuana is physically addictive.

Defendants further contend that the penalties are excessive in relation to the seriousness of the offenses with which they are charged and also in relation to similar offenses regarding "hard" narcotics and alcohol. These contentions are closely related to the issues of equal protection and arbitrary classification previously discussed. The defendants attempt to read into the Eighth Amendment the proposition that punishments must not only be graduated and proportionate with regard to the particular offense charged but also in relation to penalties for other offenses. There is scant authority for such a proposition. *Weems v. United States*[31] appears to be the only decision of the United States Supreme Court that even approaches such a result. However, *cardena temporal* for the falsification of a public record, unlike mere imprisonment for a term of years, was there viewed as so barbaric, indecent and conscience-shocking as to be classified as a cruel and unusual punishment in the abstract.

In *Gallego v. United States*[32] the court upheld a statute imposing a minimum five year prison sentence without suspension or probation for the first offense of illegal importation of marijuana. The statute was held not to "exhibit an inclination to visit upon offenders such as appellant a penalty so out of proportion to the crime committed that it shocks a balanced sense of justice."[33]

The right of the legislature to impose apparently disproportionate penalties so long as they are not wholly arbitrary or unreasonable was upheld in *Williams v. Oklahoma*,[34] in which the defendant claimed that the imposition of a death penalty for kidnapping was disproportionate in relation to a previously imposed life sentence for the murder

---

1960 ch. 204, § 2.

[31]217 U.S. 349 (1910).

[33]*Id.* at 918; *See also* United States *ex rel.* Swanson v. Reincke, 344 F.2d 260 (2d Cir. 1965) which clearly distinguishes both *Weems* and *Robinson*.

[34]358 U.S. 576 (1958).

of his victim. "But the Due Process Clause of the Fourteenth Amendment does not, nor does anything in the Constitution, require a state to fix or impose any particular penalty for any crime it may define or to impose the same or 'proportionate' sentences for separate and independent crimes."[35]

In short, as is succinctly stated in the twin cases of *Schultz v. Zerbst*,[36] and *Sansone v. Zerbst:*[37] "The fixing of penalties for crime is a legislative function. What constitutes an adequate penalty is a matter of legislative judgment and discretion, and the courts will not interfere therewith unless the penalty prescribed is clearly and manifestly cruel and unusual."[38]

The minimum penalty for unlawful possession of marijuana is a fine of not more than $1,000.00 (one thousand dollars) or a term of imprisonment of not more than 3½ (three and one-half) years in the state prison or not more than 2½ (two and one-half) years in a jail or house of correction.[39] The minimum penalty for conspiracy to violate the narcotic drug laws is a fine from $500.00 (five hundred dollars) to $5,000.00 (five thousand dollars) or imprisonment for not more than 5 (five) years in the state prison or not more than 2 (two) years in a jail or house of correction.[40] The minimum penalty for the first offense of illegal possession of marijuana with the intent to sell it is a term of imprisonment in the state prison of no less than 5 (five) nor more than 10 (ten) years.[41] For subsequent offenses, the term of imprisonment is from 10 (ten) to 25 (twenty-five) years. In all of these instances, except for the second and subsequent offense of possession with intent to

sell, the execution of the sentence may be suspended and parole and probation may be granted. The penalties provided for in MASS. GEN. LAWS ch. 94, § § 205, 213A and 217B, as applied to the stipulated facts of this case not unconstitutional as being cruel and unusual.

PROTECTION OF PRIVACY

According to the defendants, the enforcement of the virtual prohibition of the possession, use or sale of marijuana must necessarily entail unreasonable invasions of privacy by the police. Although this problem was discussed in *Griswold v. Connecticut*,[42] the holding of that case is not predicated on any invasion of privacy by police searches for evidence of the crime but rather on the absence of the state's authority to interfere with marital relations without a compelling reason.

That marijuana may customarily be used in the privacy of the home does not preclude the prohibition by the state of its use. "Crime, even in the privacy of one's quarters, is, of course, of grave concern to society, and the law allows such crime to be reached on proper showing."[43] Thus, the citizen's right to privacy is not to be protected by excluding otherwise criminal conduct from regulation as long as it is confined to the home, but rather by a strict adherence to the statutory and constitutional provisions relating to the power of the police to arrest and search and of the courts to issue warrants. Furthermore, there is nothing in the allegations or stipulated facts of this case which raise any justiciable issue on this point.

CONCLUSION

To my knowledge, this has been the most extensive judicial inquiry into the legal and factual aspects concerning the use of marijuana. At this hearing, many eminently well qualified experts on the subject from here and abroad have

---

[42] 381 U.S. 479 (1965).

[43] Johnson v. United States, 333 U.S. 10, 14 (1947).

had their opinions subjected to searching cross-examination and careful analysis by learned and thoroughly prepared counsel. One of the principle factual issues presented for determination is whether marijuana is a harmful and dangerous drug. Several legal issues are raised by defendants' motion to dismiss, but basically this is the question which requires an answer.

I found the testimony of the experts in the various branches of science very illuminating and helpful—although often controversial. On the other hand, there were areas of agreement among them, which are delineated elsewhere in this decision.

Of grave and immediately apparent importance is the growing appeal marijuana has for young people of high school and college age and for those having underlying instabilities or personality disorders of varying degrees. In many instances, the ones least capable of coping with the mind altering effects of the drug are the ones most likely to be adversely affected by its use.

The serious effects of marijuana superimposed upon mental and personality disorders have been described at length and in great detail by competent experts. I find this testimony persuasive. Actually, there is little, if any dispute, in this area between the defendants' experts and the Commonwealth's experts. Furthermore, all of them testified that they do not advocate the use of marijuana.

In its application to youngsters of high school and college age, the problems presented by the use of this drug assume tremendous proportions. There is no persuasive evidence that its use produces any beneficial results. The defense asserts that the drug causes no direct physical harm. But neither do heroin and other "hard" drugs, nevertheless few youngsters dare to experiment with these. Unfortunately, many marijuana users do not have the same apprehension or fear concerning its use as they do of the physically addictive drugs. This, I feel, is one of the real dangers which permeates the problem. Marijuana is likely to be used, at least initially, as a lark, as an adventure without fear of serious consequences. Thus, the first and apparently

innocuous step may be taken in a succession of others possibly leading to drastic results.

This phase of the problem is further complicated by those who unwittingly and perhaps unintentionally create the impression that marijuana is harmless, because it is not physically addictive. The young seize upon such utterances to rationalize their conduct.

While it is generally agreed that marijuana does not cause *physical* addiction as do heroin and the other "hard" narcotics, there was ample and compelling testimony that its use causes psychological dependence. Its users may not be driven to its repeated use by a physical craving, but they may come to resort to it habitually in order to compensate for real or imagined inadequacies or to avoid real or imagined problems. This pernicious and insidious form of addiction is sometimes the first step in the direction of the more potent or physically addictive drugs.

It is a universally accepted fact that marijuana is a mind-altering drug and is used for that specific purpose. It is also a generally accepted fact that the drug has no medically recognized therapeutic value. In addition to its adverse effect on ill-adjusted persons, at best, it provides an insubstantial crutch to its user, giving him a feeling of intoxication in varying degrees. It provides a false sense of capabilities, strength and courage. This is of great importance when the drug user is faced with a problem which demands exercise of judgment and where the drug substitutes a euphoric and unreal feeling of exhiliration for the calm and logical thinking required by the circumstances.

In place of positive thinking and positive action, the user's mind is altered and distorted causing serious interference with his powers of perception and coordination and his ability to judge the passage of time and space.

The defendants assert that marijuana provides a certain amount of happiness or relaxation without harmful results. I am not persuaded by the evidence that the resulting euphoria is, in fact, a pleasurable and rewarding experience. I remain unconvinced by the evidence that the average user is made happy or contented—even for a short period of

time. The normal brain function is altered or suspended, making the user more susceptible to the influence of others. The use of the drug also tends to accentuate any tendency toward improper conduct. In addition, it induces an abnormally subjective concentration on trivia. In short, marijuana produces a state which is analogous to a temporary mental aberration. Its prolonged and excessive use may induce a psychotic state, especially in those individuals with pre-existing psychological problems.

In my opinion a proper inference may be drawn from the evidence that there is a relationship between the use of marijuana and the incidence of crime and anti-social behavior. Within the limitations of our present statistical information, we can only speculate as to the precise nature and scope of the relationship. This is, to a certain degree, the hidden aspect of the problem. We cannot, at present, ascertain to what extent marijuana is a contributing factor in motor vehicle and other accidents, school dropouts, criminal activity, cases of "hard" narcotic addiction, broken homes and ruined careers, irrational and deviate acts, or losses of ambition and of the desire to become productive members of society. Although the *extent* of such results may be speculative, it is my opinion that a strong inference may be drawn from the evidence presented at this hearing that a casual relationship does exist between the use of marijuana and these assorted social evils. In order to establish more firmly the nature and scope of this relationship, exhaustive and incisive studies must be undertaken.

In any event, there is no indication from the evidence that the user of marijuana becomes, through its use, a better student, a better worker, more dedicated to the public interest, or more efficient or productive in any undertaking. On the contrary, there is convincing evidence that the converse is true.

Many succumb to the drug as a handy means of withdrawing from the inevitable stresses and legitimate demands of society. The evasion of problems and escape from reality seem to be among the desired effects of the use of marijuana. Its use is not so much a symbol of dissent in

order to effectuate changes in our social system, but rather a manifestation of a selfish withdrawal from society.

The lessons of history and the experiences of other nations teach us that such artificial alteration of the normal brain function by the use of drugs has been harmful both to the individual and to the society in which he lives. The evidence clearly indicates that where a subculture has developed which tolerates the general use of marijuana or its derivatives, the harmful results have become clearly manifest. It is of great significance that the vast majority of nations have outlawed its use.

Although its relevancy is doubtful, there was the unavoidable comparison of marijuana with alcohol. Alcohol has some therapeutic value and its use is not limited solely to the achievement of a state of intoxication or the alteration of the mental processes. Furthermore, the use of alcohol is supported here and elsewhere by many centuries of cultural experience. Admittedly, its misuse has posed serious problems and continues to do so. But these problems, as they now exist, could be greatly expanded and compounded by the legalization of the use of marijuana. It is difficult to justify any law which would permit an expansion in the use of marijuana to the point where conceivably it would fall into the same category as alcohol and become a part of our national culture. That the use of marijuana may have results similar to those associated with the abuse of alcohol is hardly a persuasive argument for its legalization.

Marijuana users must, of necessity, consort with opportunistic pushers and other hardened members of the criminal element. In the case of youngsters, this is especially dangerous. It introduces them to and establishes a rapport with persons whose total influence is apt to be corruptive. As serious, if not morose, as the young user's association with pushers and the criminal element is the frequency, duration and intimacy of his contacts with other basically unstable users who do not only involve him in their problems but compound his own.

The defendants argue that the statutes are also crimino-

genic in nature, as well as cruel and unusual, in that they prescribe serious criminal penalties for what may be relatively minor offenses. These arguments certainly do not apply to pushers. The legislation might profitably be reviewed with regard to the penalties provided for possessors as opposed to pushers or where the evidence indicates a first offense with the improbability of repetition. In such cases, the judge should be given wide discretionary powers so that the imposition of a criminal record may be avoided whenever warranted by the facts.

Because of the harmful and dangerous nature and effects of marijuana, the statutory prohibition of its possession, sale and, thereby, its use does not constitute a legislative interference with any fundamental right of a citizen. Nor do the specific provisions involved, MASS. GEN. LAWS ch. 94, §§205, 213A and 217B as applied to these cases, involve any denial of due process or of the equal protection of the laws. Neither do they present any issue of cruel and unusual punishment. Nor does their proper enforcement necessarily entail any unreasonable invasion of privacy. Sections 205, 213A and 217B of chapter 94 of the General Laws bear a real and substantial relation to public health, safety, morals and the general welfare and are a valid exercise of the police power of the Commonwealth.[44]

On the basis of the findings and conclusions above, I further conclude and rule that the defendants, Joseph D. Leis and Ivan Weiss, are not entitled to have any of the indictments or complaints against them in these cases . . . dismissed on any of the grounds alleged in support of their amended motions to dismiss, which are hereby denied.

COMMONWEALTH V. LEIS & WEISS[1]: THE CASE AGAINST MARIJUANA †

JAMES D. ST. CLAIR*

One of the most perplexing problems facing law enforcement agencies today is the relatively sudden and widespread increase in the use of psycho-active drugs, particularly marijuana, by young people in open defiance of federal and state law. Entire communities have sprung up in several of our major cities consisting of large numbers of young people living a completely drug-oriented existence, in spite of stringent laws prohibiting the transfer, possession and use of such drugs.

Generally speaking, these young people are not, as one might suppose, uneducated persons from the lower economic or otherwise disadvantaged groups. Rather they are often reasonably well educated individuals from middle to upper income groups and are quite able to articulate their views. They have been supported in their use of marijuana by a relatively small but very vocal group of medical doctors, psychologists and sociologists who contend that marijuana is a relatively harmless and innocuous drug.[2] On the other

hand, it is apparent that the great weight of medical opinion supports the view that marijuana is a harmful and dangerous drug.[3]

The reason for such widely divergent views among the professional disciplines involved is attributable to the fact that there has been a surprising lack of medical research and scientific investigation in this country into the causes and effects of chronic use of marijuana. There has been an abundance of literature published on the subject but until very recently little original research has been done. The most significant work that has been done was performed under the auspices and direction of a committee appointed by Mayor LaGuardia of New York in 1938. Their findings were published in 1944.[4] The study made by this committee was conducted by professionally qualified people but it had several serious shortcomings. The number of subjects used for testing and experimentation was limited (77 in the main group) and many of the tests conducted involved the use of orally ingested samples whereas the almost universal method of using marijuana in this country is by inhalation of smoke from a cigarette containing the drug. The latter method has recently been determined to be approximately three times more potent than oral ingestion.[5]

The relative paucity of medical research is probably due to public apathy to the problem following the end of World War II until the early 1960's. During this time, due to overly strict governmental limitations, samples of mari-

[5]Transcript, Vol. 7 at 50, 51, testimony of Dr. Harris Isbell, Professor of medicine in pharmacology at the University of Kentucky Medical Center—Director of the Addiction Research Center at the United States Public Health Service Hospital (Lexington, Ky.) from 1944-63. Dr. Isbell bases his conclusion on the results of an experiment in which he employed a synthetic substance, tetrahydrocannabinol, which produced the same qualitative results as those of the marijuana plant when ingested by smoking or by oral ingestion in liquid form. Vol. 7 at 46.

juana, even for research purposes, were not readily available. The materials that were available were samples of the natural substance which were of varying strengths, thus making it difficult to reach authoritative conclusions. Recently, these conditions have changed. An alarmed public is clamoring for definitive information and governmental authorities, in response, have relaxed controls on drug supplies for research purposes.[6] A synthetic tetrahydrocannabinol, thought to be the active ingredient in marijuana, has been developed recently enabling investigators to use uniform test samples with a greater integrity of result.[7]

The limited authoritative information that has been available has permitted the young people using marijuana to formulate their own conclusions regarding the effects of the chronic use of marijuana. These conclusions have been based on their interpretation of their own experiences and those reported by others. These interpretations, as we have seen, have been relatively free from contradiction because of the lack of medical research and other scientific investi-

Since, for the most part, the older generations have lacked personal experience with marijuana, they are ill-equipped to cope with the contentions made by the young people supporting the drug. Not having the benefit of personal experience, or the backing of authoritative scientific research to support them, the older generations have resorted to asserting exaggerated or unsupported grounds to justify the laws prohibiting marijuana. Since these views are not in accord with the experience of the young people, they have lost confidence in the judgment and wisdom of their elders on the subject of drug use and the laws for which the older generations are responsible.

This conflict between the young people and the laws written and administered by their elders has led to recent challenges to the constitutionality of the laws pertaining to marijuana. The most determined challenge was made recent-

[7] Transcript, Vol. 7 at 15, testimony of Dr. Harris Isbel, *supra* note 5.

ly in a case brought before Chief Justice Tauro of the Massachusetts Superior Court.[8] The challenge was grounded on the argument that marijuana was not a deleterious drug and that the imposition of criminal sanctions was an unwarranted exercise of the police power. Other cases have sought to challenge similar laws, but no case involved a judicial inquiry of the depth and scope of the *Leis* case.[9]

In all, eighteen experts were called; eight by the prosecution and ten by the defendants. They consisted of medical doctors, psychiatrists, psychologists, sociologists, pharmacologists, a botanist, a theologian and philosopher and two foreign experts, one from Greece and one from India.

The case against marijuana outlined by the prosecution dealt principally with the physiological, psychological and sociological effects of chronic marijuana use. The testimony relating to the physiological effects was not remarkable as these effects are probably least significant. Smoking marijuana results in increased pulse rate and blood pressure and other alterations in the function of body organs, however, no effect has been identified on the organs themselves.[10] Dr. Chopra[11] of India, called by the prosecution, based on his studies and observations in his country, attributes bronchitis, along with diarrhea and dysentery to the use of the equivalent drug in his country.[12]

The arguments advanced by the defendants relied in part on the limited evidence available of adverse physiological effects of marijuana. They pointed out that, in this regard marijuana, at least, is not as deleterious as alcohol. The relevance of any comparison of marijuana with other drugs, particularly alcohol, is questionable; however, it should be noted that the knowledge of possible serious adverse physiological effects from the chronic use of a drug acts as a

restraint against abuse of such drugs. The unpleasant after-effects of excessive use of alcohol can hardly encourage continued and repeated abuse. Furthermore, if comparison with other drugs is thought to be relevant, it should be realized that no significant physiological damage or injury has been found to result from the chronic use of heroin, and yet there can be little doubt that heroin is an extremely harmful and dangerous drug.[13]

The most significant effects from the chronic use of marijuana developed in the evidence were psychological in nature. It is not possible to consider those psychological effects without some consideration being given to the psychological make-up of the typical chronic drug user. Scrutiny of the literature on the subject and the testimony of experts in the field is virtually unanimous in the view that the chronic drug user is a person with an unstable personality; he is a marginally adjusted individual with at least a character disorder.[14] It is especially significant that these same unstable persons who are most prone to the chronic use of marijuana are most seriously affected by its mind-altering effects.[15]

[15]Transcript, Vol. 10 at 21, testimony of Dr. Dana L. Farnsworth,

To properly appraise the psychological effects of marijuana, consideration must also be given to the motives of the typical chronic user. It is generally conceded that the motivation of the chronic user is to achieve in each instance a mental state of intoxication sometimes referred to as "euphoria". This state is achieved relatively quickly by inhaling smoke. No other motive is suggested for the regular user. Euphoria is a state of altered mental processes in which the judgment and perceptive abilities of the individual are distorted. It has been described as an "overshooting of self-satisfaction" that leads to over-optimism.[16]

Compare this motivation with the motivation of the regular user of alcohol. One who takes a drink of alcohol in the evening before dinner may do so to achieve a modest measure of relaxation, or perhaps only to be sociable, but in most cases certainly not to become intoxicated. Furthermore, alcohol is often ingested with food which delays or "spreads out" its effects on the central nervous system and the brain. Conversely, marijuana, which is usually smoked, almost immediately begins to affect the mental processes producing a state of intoxication within a relatively short time. Of course the ingestion of food would not ordinarily affect this method of intake.[17]

Director of the University Health Services of Harvard University. Of marijuana users Dr. Farnsworth states, ". . . one might say that many of them are immature, insecure, have strong feelings of inadequacy, they fear and resent the authority of adults, they have a fear of growing up and finding a place in the social system, they are often dependent upon others, are likely to be passive and don't understand their own psychological motivation very well.

And the drugs, while they do not cause the disorders from which they suffer, amplify and complicate them and thus prevent them from attempting sound solutions. They postpone solutions so their problems, as a result of this device or practice, remain." *See also* Dr. Farnsworth, *marihuana and the Law: A Medical Approach,* this edition page 97; Transcript, Vol. 2 at 10, testimony of Dr. Donald B. [17]Transcript, Vol. 2 at 167, testimony of Dr. Joel Fort, Resident Psychiatrist, United States Public Health Service Federal Narcotics Hospital (Lexington, Ky.) 1956-57. Consultant to the World Health Organization on Marijuana.

One of the most serious psychological effects identified with marijuana is the disinhibition of the user.[18] If the chronic user were a reasonably well adjusted person in full control of his inhibitions, this might not be so significant, but, as we have seen, that is usually not the type of person we are dealing with. Consequently, if we have a person who is marginally adjusted and not in good control of his inhibitions, we can expect him to lose some significant measure of control, perhaps with disastrous results.

This tendency to disinhibit is further affected by the tendency of the drug to also expand the mood of the user at the time of becoming intoxicated. Thus, if the user is in pleasant surroundings and in a peaceful and pleasurable mood, his pleasure is expanded, he becomes even happier, and his surroundings become more pleasant. As long as no serious interruptions occur in these arrangements, all is serene and the individual has a "good trip". The tendency toward disinhibition under these circumstances is generally not thought to be dangerous. It is these circumstances that are often cited to support the allegation that marijuana is harmless and relatively innocuous.[19]

This same tendency to expand the existing mood of the user has an obverse side. If the mood of the individual is anti-social or combative and he is or believes himself to be in a stressful situation at the time of becoming intoxicated, we can expect that he will become more prone to anti-social or combative conduct without control of any inhibitions he otherwise would have.[20]

Even the drug intoxicant in the midst of a "good trip" may react violently if there is any such antagonistic distur-

[20]*Id.* at 22.

bance to the peace and tranquility of his immediate circumstances. Police experience in making arrests of persons using marijuana, thus interrupting an otherwise calm and peaceful scene, are often met with forcible resistance.[21]

It is no answer to suggest that the chronic marijuana user will exercise judgment and discretion in choosing the times of his use, for, almost by definition, we are dealing typically with unstable, marginally adjusted individuals whose judgment is impaired by the use of the drug.[22]

This inconsistency of result from the use of marijuana has rendered it relatively useless as a therapeutic agent of any value by the medical profession in this country today. Contrast this with opium and its derivatives which have recognized and significant medical value even though the danger of their continued use is also well recognized.[23]

There is evidence that persons under the influence of marijuana have a distorted ability to judge time and space relationships.[24] In addition, the use of this drug produces a psycho-motor disturbance that, in combination with distorted time-space relationships, renders the individual unfit to operate a motor vehicle or any other machinery with safety to himself and others.[25] It should be further noted that a person under the influence of this drug does not lose muscular strength as a result of his intoxication. Thus he

has the strength to perform acts, even though his judgment and perception may prevent him from performing them safely. This feature is also significant with regard to an individual whose inhibitions controlling a tendency to violence are released by marijuana intoxication; he retains the physical strength to commit acts of violence.[26]

Another psychological effect of the drug shown by the evidence is the *psychological dependence* created by chronic use.[27] Chronic marijuana use normally is not considered to result in addiction in the sense that it does not create a physical demand for the drug. This fact is often seized upon to support the view that marijuana is a relatively harmless drug. The opiate type drugs, particularly heroin, do produce such a physical demand and for that reason are thought to be more dangerous.[28] The fact of the matter is

[26]Transcript, Vol. 7 at 133, 144, testimony of Matthew O'Connor, *supra* note 20.

[27]Transcript, Vol. 7 at 8, Dr. Harris Isbell, in answering the question of whether or not patients at the United States Public Health Service Hospital at Lexington, Ky. have had any dependence on marijuana as distinguished from any other drug, said, "[y]es, sir. The majority of the patients there, of course, are people who have been dependent on opiate type drugs. Most of these have had, in addition to that, dependence on marijuana at one time in their career. Moreover, there were, especially in the 1940's, a number of people who gave histories of being dependent only on marijuana." Transcript, Vol. 10 at 17, Dr. Dana L. Farnsworth, in answering the question of whether or not marijuana is a harmful and dangerous drug, replied that, "[t]hose who stop using marijuana early suffer no demonstrable harm. Those who continue to use it and become dependent upon it all too often lose their ability to use their intellectual capacities constructively and become lost to society. . . ."

[28]Transcript, Vol. 7 at 11, Dr. Harris Isbell, in replying to the question as to the derivation of the word drug dependence, stated that, ". . . it is attaching a new meaning to an old term. . . . We have spoken of people being dependent on opiates for probably the last seventy-five years. However, when we spoke of them being dependent on opiates, we meant they were physically dependent on opiates. . . ."

that if all we were concerned with was the physical demand for the drug, the problem would be far less serious than it is. This is evidenced by the fact that modern medical techniques have been developed that can and do cure heroin addicts of their physical demand in a relatively short time.[29] However, a high percentage of heroin addicts return to the use of heroin after they have been cured of their physical demand because of a psychological dependence they have developed for the drug. This psychological dependence is not susceptible to cure in most cases and represents the real danger of addiction.[30]

Chronic marijuana use, while it does not produce physical addiction, does result in a well recognized psychological dependence on the drug just as in the case of heroin and the other opiate type drugs. The existence of such psychological dependence in connection with chronic use of marijuana has been recognized by all responsible medical authorities and has been defined by the World Health Organization as "psychological dependence of the marijuana type".[31] Even though some have suggested that it is improper and perhaps unconstitutional to classify marijuana and heroin under the same classification, as is done under the Massachusetts statutes,[32] it would seem clear that each drug has substantially similar psychological dependency consequences and are therefore properly included under the same classification. Indeed, they are so classified together by the World Health Organization in the Single Convention

[32]MASS. GEN. LAWS ch. 94, § 197 (1958): "The following words and phrases as used in this section . . . shall have the following meanings unless the context otherwise requires:

"Narcotic drug": shall include . . . opium . . . heroin; and cannabis (sometimes called marihuana or marijuana). . . ."

promulgated by it and subscribed to by sixty nations, including all of the major nations of the world.[33]

Marijuana intoxication also produces mind-altering effects, including hallucinations. This hallucinogenic effect is the principal one sought after by the regular user. As has been noted, it may have its seemingly pleasurable side. Often the user, in the state of euphoria, will fix his attention on a single object, sound, color or odor to the exclusion of all else. The danger to the user and others is apparent if he is operating a motor vehicle or otherwise engaged in mobile activity.[34]

The mind-altering effect of marijuana is further manifested in a marked increase in the susceptibility to suggestion of the person under its influence. Unpleasant experiences of the user may be suggested to be pleasurable while he is under the drug's influence. He will tend to agree, thus deprive himself of the protection of a warning at the outset of illness or danger.[35] Musicians have long been recognized as being susceptible to the suggestion that they play better while using marijuana, although a realistic appraisal of their performance after they have recovered from their intoxication confirms for them that their performance was not at all improved.[36]

The increased receptiveness of the marijuana user to suggestion further enlarges the scope of the dangers to himself and others. While under the influence of marijuana

the typical chronic user being a marginally adjusted individual to begin with, susceptible to suggestion, disinhibited and lacking time-space perception but having physical strength to perform acts can only result in tragedy under the right set of circumstances.

In addition to the foregoing psychological effects, other effects of a serious nature have also been identified. These include temporary psychotic breaks, panic reactions, spells of paranoia and other mental disturbances.[37] As stated in the LaGuardia Report: "The conclusion seems warranted that given the potential personality make-up and the right time and environment, marijuana may bring on a true psychotic state".[38]

The evidence of the psychological effects of chronic marijuana use thus supports the continued imposition of criminal sanctions against marijuana.

The evidence with regard to the sociological effects of chronic marijuana use support the conclusion that marijuana is deleterious. The typical chronic user apparently seeks refuge from his problems in the euphoria of marijuana. This way he imagines he will shed his problems and responsibilities and enjoy a trouble free period of time. When the effect wears off, of course, the problems are not solved and the responsibilities have not disappeared. They may, in fact, be enlarged without solution only to be solved by repeated refuge in drug induced euphoria. Marijuana does not cure the problem but probably prevents effective treatment.[39] The student drug user typically decreases his performance and interest in his studies and eventually drops out of school.[40]

Continued use of marijuana without doubt has and will tend toward stronger and stronger dosages. This would be especially true if criminal sanctions were removed from marijuana. Just as the legal use of alcohol in this country graduated from beer to distilled spirits, so we can expect marijuana use to extend to hashish, which is the pure resin from the flowering top of the female India hemp plant and the most potent form of the drug. No one seriously contends that hashish is not a dangerous drug, producing psychotic breaks and other serious mental disturbances.[41]

Evidence produced by both sides indicated clearly that marijuana is closely associated with the use of other drugs of the hallucinogenic or mind-altering type as well as with heroin and other opiate drugs.[42] Opponents to the continuation of criminal sanctions on marijuana almost uniformly contend that the use of marijuana does not "cause" the use of more dangerous drugs such as heroin. Here they use "cause" in a limited technical sense. Since larger numbers of chronic marijuana users do not become heroin addicts, it cannot be said it "causes" heroin use.[43] On the other hand, nearly 90% of all heroin addicts either started on or used marijuana at some time before becoming addicted to heroin, therefore, it is clear that there is at least an association between the two.[44]

Farnsworth, *supra* note 15.

[41]Transcript, Vol. 9 at 61, hashish is known as ganja in India. In describing ganja uses, Dr. Isawar C. Chopra stated that, "... mental injury is more likely to occur in the case of those individuals who take large doses for prolonged periods, especially by smoking." In detailing the incidence of psychosis among ganja smokers, he stated that, "... emotion and character and judgment are affected more in the case of smokers of ganja. ..."

[42]Transcript, Vol. 3 at 101, testimony of Dr. Nicholas B. Malleson, *supra* note 13; Transcript, Vol. 2 at 28, Dr. Donald B. Louria stated that, "... the use of marihuana unequivocally leads some people on to the use of more dangerous drugs such as heroin or LSD. . . . In our own figures at Bellevue Hospital among heroin users approximately 80 per cent have had experience with marihuana before." Further, he added that, "... the majority of people who use LSD have had experience with marihuana. ..."

[43]Transcript, Vol. 10 at 121, testimony of Dr. John C. Ball, Research Associate at the Addiction Research Center, Lexington, Ky.

[44]Transcript, Vol. 10 at 97, Dr. John C. Ball discussed a two year study of the association between marijuana smoking and the subse-

There can be little doubt that there is also a close association between marijuana use and the use of other hallucinogenic or mind-altering drugs such as LSD. Sociological studies show that the same groups use both drugs, as well as others, interchangeably, thus establishing a sociological connection, at least among this class of drugs.[45]

The evidence produced as to the physiological, psychological and sociological effects of chronic use of marijuana satisfied the trial judge that marijuana was indeed a harmful and dangerous drug and that the statutes under which the defendants were being prosecuted were constitutional.[46]

It is generally recognized that legal controls, although by no means perfect, are one of the most effective aspects for preventing the spread of drug use. If the public policy supporting legislation imposing legal controls is confirmed by increased authoritative research, the public acceptance of such controls will obviously be increased immeasurably and thus make the controls even more effective. The probable cause for widespread defiance of laws pertaining to marijuana is the belief that they represent a public policy of the past, based not on knowledge derived from scientific research, but more from public hysteria.

---

quent use of opiates. He stated, "... our view is that marihuana smoking leads to heroin addiction, in particular, in the same way you might say delinquency often leads to adult criminality." To further clarify, he stated, "So I am not saying that everyone who uses marihuana goes on to heroin addiction but I am saying that most of the people who become heroin addicts have come through the process which includes marihuana use."

Dr. Ball testified that, "... the smoking of marihuana cigarettes is a predisposing influence on subsequent addiction, particularly to illicit drugs, which would mean especially to heroin addiction. ..." Vol. 10 at 103.

Finally, he stated that of those, "... who go on to heroin, approximately 80 to 90 percent have used marihuana first." Vol. 10 at 109.

[45]Transcript, Vol. 3 at 101, testimony of Dr. Nicholas B. Malleson, *supra* note 13; Transcript, Vol. 2 at 142, 143. In describing the association between marijuana and LSD, Dr. Joel Fort said, "... the two drugs have been artificially thrown together by our social and legal policies and the sources of supply have come to overlap, and their being defined as a deviant thing has tended to make both of them attractive in similar ways to some people."

[46]Commonwealth v. Leis and Weiss, partially reported, p. 23, this edition.

Medical research to develop authoritative conclusions, confirmed by laws consistent therewith, is the best and perhaps the only way to deal effectively with this problem.

This is not to say, however, that consideration should not now be given to reappraisal of the existing laws and especially the penalties called for. It is difficult, for example, to justify the five-year mandatory offense under federal law for transferring marijuana.[47] While this statute was undoubtedly aimed at the persons engaged in large-scale commercial traffic in marijuana, its breadth covers the student who hands a marijuana cigarette to another or divides his small supply with a friend. The imposition under Massachusetts law of a larger penalty for being present where marijuana is illegally kept than for actually possessing it is also hard to justify.[48]

Adjustments can and should be made to correct such excesses and inconsistencies. If they are corrected, much of the disrespect for the drug laws now existing among many of the youth of the country may disappear. If at the same time the other interested professions concentrate on research programs to evaluate the effects of the use of marijuana and the other psycho-active drugs and the law is then made consistent with those results, a solid basis will be established to recommend such laws to the youth who predictably will be inclined to accord such laws far more respect.

---

[47] 26 U.S.C. § 4742 (1954).

[48] MASS. GEN. LAWS. ch. 94, § 213A (as amended through St. 1960, ch. 204, § 2) reads as follows:

> Whoever is present where a narcotic drug is illegally kept or deposited, or whoever is in the company of a person, knowing that said person is illegally in possession of a narcotic drug . . . may be punished by imprisonment in the state prison for not more than five years, or by imprisonment in a . . . house of correction for not more than two years or by a fine of not less than five hundred dollars nor more than five thousand dollars.

The Massachusetts Supreme Judicial Court has recently resolved doubts as to the constitutionality of this statute as applied to one not shown to have knowledge of the existence of the illegally kept marijuana by deciding that the statute properly interpreted requires a showing of such knowledge. Commonwealth v. Buckley, 1968 Mass. Adv. Sh. at 981.

THE PURSUIT OF PLEASURE: CONSTITUTIONAL DIMENSIONS OF THE MARIHUANA PROBLEM †

JOSEPH S. OTERI* and
HARVEY A. SILVERGLATE**

AN UNORTHODOX PREFACE

It may be contended with some degree of persuasion that in certain areas of the law, the judicial and judicious reaction of judges and lawyers is finally coming close to the "guts reaction" of many untutored laymen as to what governments can and cannot do. Laymen, of course, resort to something called common sense, while jurists find their guidelines in such concepts as "due process of law".

Thus, let us suppose that the General Court of the Commonwealth of Massachusetts were to pass a law prohibiting citizens from listening to the music of Beethoven in the privacy of their living rooms.[1] Most laymen would probably react with the exclamation—"They can't do that." Yet until relatively recently most judges and lawyers might

** LL.B., Harvard Law School, 1967; Member, Boston, Massachusetts and American Bar Associations.

The authors express their appreciation to Lawrence H. Norris, Esq., Suffolk University Law School, 1964, and Richard L. Zisson, Esq., Suffolk University Law School, 1967, for their assistance and scholarly advice.

[1] The authors are indebted to Stan Freeburg who planted the germ to this analogy.

well have reacted by pointing out that while perhaps the wisdom of such legislation was questionable, nevertheless "they" certainly could pass such a law. Since such a set of facts or circumstances could be conceived which would, in the eyes of a legislature, justify such legislation; and, since listening to Beethoven can hardly be considered one of those "fundamental liberties" upon which Western Civilization is based, the individual citizen does not have any "fundamental right" which would require the state to show a "compelling state interest" before putting the ban on Beethoven.

Beethoven, it may be argued to a legislature or by a legislature, poses some danger to society. His music contains passages which are so powerful that they tend to produce in some people (admittedly not all or even most people) a wild fluctuation of emotion running alternately from the very calm to the extremely violent. In exceptionally unstable individuals such music might conceivably produce psyhotic-like reactions. In other cases, excessive listening to Beethoven has been known to produce a psychological dependence of sorts, such that an avid listener might get somewhat depressed if his stereo set broke for a week, or if the Philharmonic decided for an entire season to leave Beethoven out of its program. He might become a bit irritable, even fidgety, and be driven to his FM radio in a frenzied attempt to satisfy his craving for the great composer.

Even if Beethoven's music in itself could not be proven or shown to be dangerous, nevertheless is there not always the possibility that one of the composer's avid fans might become so excited by the more resonant and powerful sections of the Fifth or Ninth Symphonies and then turn to even louder music, such as our modern "electronic rock", which some ear specialists say produces decibel ratings so high as to threaten permanent damage to the ears of the hip generation? Is it not possible also that a flirtation with Beethoven might lead listeners to seek out still other German composers, with the affect of turning attention away from what the legislature might consider the "genius"

of home-grown American music, thus damaging a significant domestic entertainment industry and a segment of the American economy?

Are we to ignore completely the fact that a legislature might be told and believe that some Beethoven listeners are so lulled by the master's music that they desist from working while under its nefarious influence, and thus become a potential cause of widespread lethargy, and a threat to our activity-oriented culture. And what about those other listeners who might be inspired to go out and introduce Beethoven to a neighbor's youngster, or perhaps attempt to write a symphony of his own, thus propagating the curse by proselytyzing and imitating?

The example need not be drawn out too far. The reader need merely substitute the word "marihuana" for Beethoven's music, and the subject matter of this article comes into focus. Precisely how far can legislature go, in a legal sense, in protecting the public and Western Civilization from a supposed menace, and upon what kinds of evidence is the factual existence of such a menace to be determined? More specifically, where does the concept of due process stop the lawmaker and the police from treading any further?

FACTUAL UNDERPINNINGS OF DUE PROCESS

Constitutional attacks on state marihuana legislation are several faceted.[2] They include claims that the classification of marihuana with narcotics and dangerous hallucinogens is arbitrary and without basis in pharmacology, psychiatry,

[2]While the same arguments used against state marihuana laws may and have been used in attacking federal legislation in this area, it is generally recognized that at the present time the Fifth Amendment provides a better method of attacking the Marihuana Tax Act, 26 U.S.C. § 4701 (1954); and the Marihuana Import and Export Act, 21 U.S.C. § 176*(a)* (1930). Such an attack, which involves a relatively neat question of law and eliminates the necessity of getting involved in a medical dispute on the effects of marihuana on the mind and body, is based upon the doctrine enunciated by the Supreme Court in Marchetti v. United States, 390 U.S. 85 (1968); Grosso v. United States, 390 U.S. 39 (1968); and Haynes v. United States, 390 U.S. 62 (1968). Such an argument is pending before the Supreme Court in

sociology, or even botany; that treating marihuana use as a criminal offense invades the individual's privacy without serving any legitimate state interest; that the imposition of harsh penalties on marihuana use constitutes cruel and unusual punishment; that the entire marihuana law structure is criminogenic in effect and hence harmful to society; that the scope of present marihuana legislation is overly-broad and unnecessarily interfers with protected rights while trying to get at a much narrower abuse; and that there is an inequality of treatment of marihuana users as opposed to alcohol or tobacco users. With the exception of the last argument, all of these lines of attack are rooted in the concept of substantive due process; the latter argument is, of course, based upon the Equal Protection clause of the Fourteenth Amendment.

In Massachusetts, defense lawyers are extraordinarily endowed with constitutional ammunition to supplement the Fourteenth Amendment. Particularly, the Massachusetts Constitution provides, in part, that "further, full power and authority are hereby given and granted to the said general court, from time to time, to make, ordain, and establish, all manner of *wholesome and reasonable* orders, laws, statutes, and ordinances, directions and instructions, either with penalties or without . . ." (emphasis supplied).[3]

Perhaps even more to the point, the Massachusetts Constitution provides that the "Government is instituted for the common good; for the *protection, safety, prosperity and happiness* of the people . . ." (emphasis supplied).[4]

Finally, approaching the nub of the matter frontally, that same revered and time-honored document provides that "All men are born free and equal, and have certain natural, essential, and unalienable rights; among which may be reckoned the right of enjoying and defending their lives and liberties; that of acquiring, possessing, and protecting

Leary v. United States, 36 U.S.L.W. 3466 (1968), but was rejected recently by the Court of Appeals for the Second Circuit in United States v. Minor, (2d Cir. 1968).

[3]MASS. CONST. pt. 2, ch. 1, § 1, art. IV.

[4]MASS. CONST. pt. 1, art. VII.

property; in fine, *that of seeking and obtaining their safety and happiness*" (emphasis supplied).[5]

Yet the combination of these provisions and the Fourteenth Amendment have not yet enabled a marihuana defendant to elicit from a court of record so much as a hint that state marihuana legislation is unconstitutional. It is submitted that the major reason for the lack of success to date is attributable not to the willingness of courts to accept the proposition that the citizen has a right to happiness, but rather to the inability of attorneys to convince the courts that there is not a sufficient state interest to justify legislative intrusion into any "right" that the individual might arguably have to use marihuana.

This article will not re-argue the admittedly troublesome question of whether or not there is a "fundamental right" to use marihuana or any other similar hallucinogen or intoxicant. The entire legal controversy has the air of a semantic dispute. This was particularly evident in perhaps the most comprehensive opinion yet rendered on this question, the opinion of the Massachusetts Superior Court (Tauro, C.J.) in the case of *Commonwealth v. Joseph Leis and Ivan Weiss*.[6] In that opinion, the court, while admitting that "... no decision appears to have attempted to propound an all inclusive list of fundamental rights ..." nevertheless it went on to limit the list to "... those rights which are recognized as fundamental ... [and] are also, in many instances, closely related to some commonly acknowledged moral or legal duty and not merely to a hedonistic seeking after pleasure."[7] Once the court dismissed any claim that a fundamental right was involved, it did not have to examine the question of the state's interest in prohibiting marihuana.[8]

[8]"Therefore, it is not necessary that a compelling state interest be shown in order to subject them to regulation under the exercise of the state's police power." P. 24 this edition. It

Other courts have attempted to deal with the legal issues regarding marihuana without a sufficient appreciation of or inquiry into the factual issues. Some of these courts have not even felt that it mattered very much what the true state of facts turned out to be. Thus, in what is generally a clear and well-written exposition of certain legal principles, a California intermediate appellate court which did not have the benefit of expert testimony[9] stated that in dealing with marihuana "... if reasonable men may entertain the belief that the use of these drugs, once begun, almost inevitably leads to excess, such belief affords a sufficient justification for applying restrictions to these drugs."[10] The California Court went even further in expressing the doctrine that the *actual* truth or falsity of the facts upon which a state interest is based is irrelevant: "The validity of legislation which would be necessary or proper under a given state of facts does not depend upon the actual existence of the supposed facts. It is enough if the law-making body may rationally believe such facts to be established."[11]

This, of course, is an extreme position and would hardly find sanction with the Supreme Court of the United States,

---

should be noted nevertheless despite the fact that Chief Justice Tauro felt that the court did not have to go further, he did go on to consider the question of marihuana on the basis of evidence taken by the court in a unique two and one half week hearing with expert testimony on every phase of the so-called "marihuana problem." While Chief Justice Tauro concluded from the evidence that "marihuana is a harmful and dangerous drug," his finding in this regard will presumably be reviewed by the Supreme Judicial Court, which will have the benefit of the full transcript of evidence before it when the matter reaches the full court. By thus receiving and preserving the evidence given by the experts, Chief Justice Tauro has given the reviewing courts the widest latitude possible.

[9]People v. Aguiar, 257 A.C.A. 691, 65 Cal. Rptr. 171, 172 (1968), opinion written by Molinari, P.J. The court noted that the bulk of the defendant's argument "consists of a law review article." *See*, Boyko and Rotberg, *Constitutional Objections to California's Marijuana Possession Statute*, 14 U.C.L.A. L. REV. 773 (1967).

[10]*Id.* at 695, 65 Cal. Rptr. at 173, citing People v. Mistriel, 110 Cal. App. 2d 110, 241 P.2d 1050 (1952).

[11]*Id.* at 695, 65 Cal. Rptr. at 173, citing *Ex Parte* Yun Quong, 159 Cal. 508, 114 P. 835 (1911), the latter case dealing with opium.

which has stated time and time again that a statute must have sufficient factual underpinnings. As Justice Holmes wrote, even the judge, being bound to declare the law "... must know or discover the facts that establish the law."[12] And as to the proposition that the mere statement of a proposition is sufficient to establish that proposition as a factual justification for a statute, Justice Holmes warned: "Obviously the facts should be accurately ascertained and carefully weighed; and this can be done more conveniently in the Supreme Court of the District than here. The evidence should be preserved so that if necessary it can be considered by this Court."[13]

Unless our trial courts take more seriously their duty to inquire into the facts now known which justify or fail to justify marihuana legislation,[14] all of the effort presently being put into the attempt to bring the use of marihuana within a classification of "protected" or "fundamental rights" will be wasted. For without such inquiry, courts will feel free to give credence to the many myths and misrepresentations which have been promulgated since at least the mid-1930's which have cast marihuana as a villain and an assassin.[15] Unless these myths are discredited in the courts, it is a simple matter for any court, looking to the state of the "evidence", to uphold even the most restrictive marihuana legislation, regardless of whether or not an

---

[12]Chastleton Corp. v. Sinclair, 264 U.S. 543, 548 (1924).

[13]*Id.* at 549.

[14]It might be pointed out here that common sense would dictate that the court look into the factual situation in the light of present day knowledge, and not at the situation as it might have appeared to the legislature when the law was passed or last re-enacted, amended, or revised. This is part of the court's on-going duty to examine legislation in the light of modern developments. One may cite various cases, for example, where legislation which was previously upheld in the face of factual attack was later thrown out because of the discovery of new facts. *See, e.g.*, 264 U.S. 543; Brown v. Board of Educ., 347 U.S. 483 (1954). *See also, In re* Jenison, 267 Minn. 136, 125 N.W. 2d 588 (1963), where the court held that persons whose religious convictions prohibit compulsory jury duty must be exempt "until and unless further experience indicates . . . a serious threat to the effective functioning of our jury system. . . ." *Id.* at 589.

[15]*See* SOLOMON, THE MARIHUANA PAPERS (1966).

abstract inquiry into the question of fundamental rights leads that court to the conclusion that there is a right to happiness and that marihuana may foster happiness, or that there is a right to privacy and that marihuana is used in private and that such use falls within the zone of privacy. For it is axiomatic that where behavior leads to adverse and deleterious social consequences, even a fundamental right embodying such behavior may be limited or proscribed entirely.[16]

It is enlightening to note the nature of some of the evidence which the Massachusetts legislature has relied upon in passing the many versions of the marihuana statute which has been on the books in the Commonwealth continuously for many decades.[17] It appears from the limited legislative history of this statute that it was passed and has been maintained (indeed, made yet more stringent) on the statute books without any investigation by the legislature into the medical and scientific evidence. In view of the substantial amount of evidence available, it would appear that such a procedure violates certain minimal standards of rationality which must be part of the legislative process. It is part of the concept of due process of law that the legislature pass statutes, and periodically revise statutes, in such a way that the laws remain at least roughly consonant with the state of knowledge of mankind.

Marihuana has been illegal within the Commonwealth of Massachusetts at least as early as 1911.[18] There were several narcotic drug commissions appointed subsequent to the passage of the statute. The most extensive and the only one in which cannabis was even considered was Senate Report No. 100 (1930). Hearings were held, interviews and ques-

---

[16]The classic expressions of this proposition are those of Mr. Justice Holmes in his famous illustration explaining that despite freedom of speech, one may not shout "Fire!" in a crowded theatre. Schenk v. United States, 249 U.S. 47 (1919). *See also*, Reynolds v. United States, 98 U.S. 145 (1878).

[17]For the purposes of this article emphasis will be given to the Massachusetts statute on marihuana which is typical of many state statutes.

[18]LAWS AND RESOLVES OF MASS., ch. 372 (1911).

tionnaires taken. Cannabis was not cited as a problem, except that in the entire study two so-called "cannabis indica addicts" were reported. But the Commission was careful to point out that:

> In considering the answers received to the first part of the question,—whether the drugs listed presented problems of addiction,—it should be remembered that "addiction" has many interpretations. It may be defined by some as meaning simply "habitual use". This undoubtedly explains the rather significant number of times that aspirin was inserted in the space left for drugs of addiction other than those specified. "Addiction" in the narrower sense, means a condition in which the body becomes dependent upon the taking of the drug, and reacts with serious symptoms, often with collapse, upon withdrawal of it.[19]

There is no mention of, nor evidence concerning marihuana, in subsequent House Reports.[20]

It would be quite reasonable for a legislature to outlaw murder without hearings on the subject, since that is a crime malum in se and no evidence is needed of the harm caused by the act of killing. But in a case such as the marihuana question, it would seem that some investigation into the facts must be made, and that the findings be considered. True, the Court may not substitute its conclusions for the conclusions of a legislature when examining a state of facts which was before the legislature. But in a case such as this, where the legislature, despite numerous investigations into drugs, which often led to alterations in the narcotic drugs law, never informed itself about marihuana, it becomes the duty of the Court to perform that function. As stated by Karst:

> The urgency of the need for particularization arises out of the rapidity of contemporary social, technological, political and economic changes which require the courts to uncover and delineate in a short period of

---

[19]MASS. LEGISLATIVE DOCUMENTS, S.R. No. 100 at 25 (1931).

[20]MASS. LEGISLATIVE DOCUMENTS H.R. No. 2390 (1954); H.R. No. 2780 (1960); H.R. No. 3075 (1966).

> time many new interests worthy of constitutional protection. It is not an exaggeration to say that the . . . government depends upon the continued success of the judiciary in performing this legislative function.[21]

It is also pointed out that a principal justification for granting a court the power of judicial review over legislation "lies in the ability of a court to weigh constitutional claims on the basis of experience which was not available when the legislature acted."[22] "Although some of the justices have been reluctant, they now appear to be unanimous in accepting the necessity of weighing the factual justification of state regulation."[23] As Mr. Justice Brandeis wrote in *O'Gorman & Young v. Hartford Fire Ins. Co.*,[24] ". . . [if the] evils did not exist . . . for which this statutory provision was an appropriate remedy. . . ." this circumstance, if supported by ". . . some factual foundation of record for overthrowing the statute. . . ."[25] would enable a court to overturn the statute on the basis of the evidence presented.

It is important to note that the kind of case here envisioned is not one where the constitutional attack is directed toward showing that the statutory classification is invalid merely as applied to a particular defendant or merely in a specific single instance.[26] The determination of constitutionality in such a case may turn on the activities or characteristics of the challenging party, and of the effect of the statute upon him. Such facts are adjudicative in nature. The findings thereon can have no effect upon future cases. They are therefore made by the trier of fact—and will be reviewed, as in the ordinary case, only to

discover whether they are warranted by the evidence presented at the trial.[27]

But where, as here, extrinsic factual matter is offered for the purpose of showing the factual basis—or want of one—for a statutory classification or treatment, and where the facts are beyond the sphere of judicial notice in the traditional sense, the matter is properly the subject of a *judicial inquiry*.[28] And because the inquiry is judicial in character it must be conducted by a judge, and not by a jury or trier of fact.[29] So also, the facts as determined at the trial are open to a much broadened form of appellate review.[30] For example, the appellate court may draw its own conclusions as to a state of facts from information obtained at the trial,[31] and/or from additional information received for the first time on appeal.[32]

The reasons for all this are obvious; the Court is deciding a question of general application of which the ultimate determination will and must be *stare decisis*,[33] at least until future experience or discovery demonstrate that the basis for the decision no longer exists.[34]

The sine qua non of this entire process is an expansion of the means and methods by which the Court receives and records relevant information and evidence. The entire process itself is denied by such decisions as *R.C. Tway Co. v. Glenn*,[35] which holds that legislative findings cannot be

impeached, for the supposed reason that the same statute might be found constitutional in one case and unconstitutional in another, depending upon the testimony. Of course, it would be irrational to permit such an issue to be varyingly decided, case by case, on the basis of what different triers of fact might reasonably conclude from testimony (which itself will vary from case to case depending upon the availability of witnesses) offered to them by counsel under the rules of evidence applicable in ordinary *ad hoc* private and criminal litigation. Considerations of equality in the treatment of litigants, at least, demand that the question of a statute's inherent constitutionality not be decided one way in one case and another way in another case.[36] Conversely, it would be no more rational to permit the lottery of such traditional fact finding in one case to become *stare decisis* to another.[37] The only way to avoid either such result is readily apparent. The Court must be informed of all relevant data, and by whatever appropriate means.

In *Chastleton Corp. v. Sinclair*,[38] there was a question whether the facts upon which certain legislation was postulated had ceased to exist, and if so should the statute be rendered unconstitutional. Justice Holmes, speaking for the Court, stated:

> We need not inquire how far this Court might go in deciding the question for itself, on the principles explained in *Prentis v. Atlantic Coast Line Co.*, 211

---

[36]Bickle, *Judicial Determination of Questions of Fact Affecting The Constitutional Validity of Legislative Action*, 38 HARV. L. REV. 6, 11 (1924-25).

[37]Consider the following: in Commonwealth v. Wright, 137 Mass. 250 (1884), a jury was "warranted in finding" a certain definitely described and popularly known game to be a lottery. The game came before the court again in Commonwealth v. Sullivan, 146 Mass. 142, 15 N.E. 491 (1888), where it was said: "This having been determined to be a lottery in *Commonwealth v. Wright*, it is not necessary to go on forever taking the opinion of the jury in each new case that comes up." *Id.* at 145, 15 N.E. at 494. With all due respect, it is submitted that to make the accident of a first jury-type *finding* decisive of a question of law is patently absurd.

[38]264 U.S. 543.

> U.S. 210, 227 [where Holmes, J., had said: "As the judge is bound to declare the law *he must know or discover* the facts that establish the law," (emphasis added)] . . . These cases show that the Court may ascertain *as it sees fit* any fact that is merely a ground for laying down a rule of law. . . . Obviously the facts should be accurately ascertained and carefully weighed, and this can be done more conveniently in the Supreme Court of the District than here. The evidence should be preserved so that if necessary it can be considered by this Court. (Emphasis supplied)[39]

The proponents of the statute in *Chastleton* had prevailed in both the trial and intermediate appellate courts. Even though the Supreme Court has been reluctant to remand in cases of this sort because of the fear that "the trial of legislative facts will be hedged in by restrictive rules of evidence and procedure which would not hamper its own investigation."[40] Nevertheless, here the Supreme Court remanded.[41]

In *Brown v. Board of Education*[42] the Supreme Court relied upon a lower court "finding" that segregation leads to the development of a sense of inferiority among Negro children affecting their motivation to learn. It stated that "this finding is amply supported by modern authority."[43] The decision in *Brown* is obviously *stare decisis*; it could not have been founded on the kind of fact finding which one sees in an ordinary *ad hoc* contest (where only the rights of the immediate contending litigants are at stake) and thus the restrictions imposed by technical rules of evidence were inappropriate.

It is thus apparent that the kind of fact finding hearing required to resolve the "marihuana question" is in reality a kind of legislative hearing held in a courtroom by a judge acting as the finder of fact. Of course, it is often argued

---

[39] *Id.* at 549.
[40] Karst, *supra* note 21, at 96.
[41] 264 U.S. at 549.
[42] 347 U.S. 483.
[43] *Id.* at 494 n.11, where the Court cited a welter of published social psychological materials.

that since this is a matter which lies within the province of the legislature, and since a legislature is better suited to make such fact findings, the courts should decline jurisdiction even to hear such evidence.[44] But where the legislature has clearly avoided a reasonable fact finding process, and where, for reasons political or otherwise, the legislature refuses to investigate the "marihuana problem" with any degree of objectivity or thoroughness, it behooves the judiciary to ensure that the law is changed, even in a rough way, in accordance with the increasing knowledge of mankind.

Indeed, there is a good argument that the courtroom is a better forum for airing the facts in an area such as we deal with here. The profusion of pseudo-experts and "medical politicians" who profess expert knowledge of marihuana and its uses and effects is such that the enormous amount of misinformation spewed forth by such men might be most readily pierced by the skillful and diligent cross-examination of an advocate, rather than by the often timid and acquiescent questioning of a member of a legislative committee aware of the public eye. It is all too common and all too easy for any man with a medical degree or title to make a flat statement on a subject in which he has little or no more knowledge or experience than an ordinary layman; and it is unfortunate when such statements become the "rational" basis for legislation. However, while a legislator may cross-examine and need not believe such "evidence," an advocate would be more likely to probe deeply and expose all sham and falsity. It is therefore quite possible that the "legislative question" of marihuana may be resolved by the judiciary more quickly and more rationally than by the legislative branch. Indeed, the proliferation of recent constitutional attacks on state marihuana legislation indicates perhaps a frustration of attempts to obtain legislative relief and a necessary resort to the courts.[45]

---

[44]Karst, *supra* note 21, and cases cited therein.

[45]Within recent months such attacks have been prosecuted in

LIMITATIONS ON HAPPINESS AND THE LEAST RESTRICTIVE ALTERNATIVE

As has been noted above, a controversy rages over the question of whether or not there is a "right" to smoke or possess marihuana, or whether, if such a right exists, it is a "fundamental" right. The superior court in its opinion in *Commonwealth v. Joseph Leis and Ivan Weiss*[46] appeared to feel that the distinction between "fundamental rights" and other rights or privileges[47] was crucial since that determination defines the burden that the state has to meet in order to prohibit or restrict conduct involving that right. Thus, the court said:

> . . . those rights which are recognized as fundamental are also, in many instances, closely related to some commonly acknowledged moral or legal duty and not merely to a hedonistic seeking after pleasure. No claim of any such duty which would demand the possession, use or sale of marijuana has been advanced in this case. . . .
>
> I conclude that the alleged rights . . . do not rise to the level of fundamental rights nor fall within the periphery or penumbra emanating from such rights. Therefore, it is not necessary that a compelling state interest be shown in order to subject them to regulation under the exercise of the state's police power.[48]

some states. State v. Raines & Borras, Cir. Ct. of 2d Jud. Cir., Leon County (now before the Florida Supreme Court); State (California) v. Knesevich, last year mooted and decided on a search and seizure issue; People (Michigan) v. Sinclair, Recorder's Court for Detroit; In the Matter of the Exemptions of Marihuana (Oregon) from the Application of O.R.S. Chapter 474, before the Oregon State Board of Pharmacy.

[46]On Report to Massachusetts Supreme Judicial Court. Partially reported p. 23 of this Law Review.

[47]One might well ask whether a *non-fundamental right* does not in fact differ from what is commonly known as a mere *privilege*. If, after all, the state can restrict a *non-fundamental right* without a strong showing of a compelling state interest, then it would seem that the *right* becomes in effect a privilege revocable at the will and whim of the state.

[48]Commonwealth v. Leis and Weiss, p. 24 this edition; *see* People v. Woody, 40 Cal. Rptr. 69, 394 P.2d 813 (1964).

The California Court in *People v. Aguiar*,[49] begged the question where it pointed out "... that there is no constitutionally protected right to indulge in the use of euphoric drugs."[50] At another point in the seemingly well-reasoned opinion the court makes what appears to be an untenable distinction:

> An act may not be held to be unconstitutional merely because it may contain provisions which seem to be unjust or oppressive, or because it may be deemed to violate the natural, social or political rights of citizens, unless it appears that those features of the fact contravene rights which are guaranteed by the Constitution.[51]

The inutility of the "fundamental" rights concept is thus demonstrated. The concept of "fundamental" rights loses much of its importance as an analytical tool in an era when the interpretation of due process has gone well beyond a literal reading of the rights specifically enumerated in the first Ten Amendments, and has now encompassed "penumbras" which "emanate" from the enumerated rights.[52]

It is here suggested that Courts must begin to analyze and balance the rights of the individual versus the regulatory or prohibitory powers of the state by resort to the balancing concept of "the least restrictive alternative."[53] Indeed, court decisions in several areas have already begun to adopt this concept, although it was not discussed by the trial courts which rendered either the Massachusetts or California marihuana opinions discussed herein.[54] The doc-

[54]It should be noted, however, that defense counsel in *Commonwealth v. Leis and Weiss* relied heavily on this theory, and presumably this concept will be discussed when the case comes before the Supreme Judicial Court of Massachusetts.

trine is simply a very flexible version of the conventional theory of rights, although it embodies more functional analaysis and less "analysis by label." The basic principle involved is that the state should not and may not restrict the breadth of individual liberties (defined in the broadest sense) without a countervailing justification for doing so.

This question was faced by the California Supreme Court, which saw the conflict between state "police Power" and the demands of the Fourteenth Amendment when the right of an ex-convict to vote was concerned. In *Otsuka v. Hite*,[55] he court held that a California constitutional provision which disfranchises all persons convicted of "infamous crimes" must be narrowly construed to encompass only those crimes which bear a "reasonable relation" to the protection of the integrity of the elective process, such as corruption, bribery, forgery, and malfeasance in office. The court said to include other crimes within this category would violate the Equal Protection Clause of the Fourteenth Amendment. The state could not establish voting qualifications inconsistent with the Equal Protection Clause. Because of the importance of the right to vote, a rigid standard of equal protection has to be applied.[56] The classifications that are created must be reasonable in light of some "compelling state interest."[57]

In a critical analysis of the *Otsuka* case, it was stated that "every inquiry into the reasonableness of a classification should begin with a postulation of all possible purposes; there must be a reasonable relation between any one of these purposes and the characteristics used to define the statutory classification."[58] In *McLaughlin v. Florida*[59] the Supreme Court struck down a Florida statute making

[59]379 U.S. 184 (1964).

inter-racial cohabitation a crime. Mr. Justice White, in delivering the opinion of the Court, pointed out that "[n]ormally the widest discretion is allowed the legislative judgment in determining whether to attack some, rather than all, of the manifestations of the evil aimed at; and normally that judgment is given the benefit of every conceivable circumstance which might suffice to characterize the classification as reasonable rather than arbitrary and invidious." Nevertheless, ". . . we deal here with a racial classification embodied in a criminal statute. In this context, where the power of the State weighs most heavily upon the individual or the group, we must be especially sensitive to the policies of the Equal Protection clause. . . ."[60]

While there is admittedly a multiplicity of possible legislative purposes of the California disfranchisement statute in *Otsuka* there can be little doubt that the Massachusetts Narcotic Drugs Law can serve but one purpose—protection of the public health, safety or morals. Unless marihuana comes under a classification of substances which threaten the public health, safety or morals, it would appear clear that the statute including it as a dangerous drug, and virtually banning its use and sale completely, is unreasonable. Even Mr. Justice Clark, in his dissent in *Robinson v. California*,[61] assumed, and explained that the majority also assumed that a state may punish persons who purchase, possess or use narcotic drugs "because of the grave threat of future harmful conduct which they pose."[62] He specified lying, stealing and violent crime as a frequent result of narcotic use. Unfortunately, cannabis has for so long been erroneously legally classified with the narcotics that we indulge the assumption that it too is dangerous. The logical conclusion from Mr. Justice Clark's statements is that if the drug is found not to be a threat to a vital state interest, the police power may not be turned against the substance or its use.

In view of the medical, psychological, sociological and pharmacological properties of marihuana, and in light of the evidence compiled in the testimony given by the experts in *Commonwealth v. Leis and Weiss*, Massachusetts would be hard pressed to show any compelling state interest which may be protected by this statutory scheme. In *People v. Woody*[63] the California Supreme Court noted that the state provided no evidence that the practice of smoking peyote among the Indians was harmful to the public health. And as Mr. Justice Goldberg noted in *Griswold v. Connecticut*,[64] "Although the Connecticut birth-control law obviously encroaches upon a fundamental personal liberty, the State does not show that the law serves any 'subordinating state interest which is compelling' or that is 'necessary . . . to the accomplishment of a permissible state policy'."[65] Mr. Justice Goldberg went on to discuss the state's contention that the law discourages extra-marital relations, and he dismissed the contention as being of dubious rational, for the law cannot, in fact, deter extra-marital relations, nor is it tailored to foster marital fidelity. In view of Mr. Justice White's contention that "a statute with these effects bears a substantial burden of justification when attacked under the Fourteenth Amendment, . . ." the statute could not stand.[66]

It is interesting to note that in the case of alcoholic beverages, Massachusetts has resorted to licensing procedures in an effort to control use and distribution of alcohol, and has invoked criminal penalties only for the *abuse* of alcohol, i.e., for drunkenness.[67] In a dissenting opinion in *Robinson v. California*[68] Mr. Justice Clark said: " 'Status' offenses have been long known and recognized in the criminal law. . . . A ready example is drunkenness, which plainly is as involuntary as is the taking of drugs."[69]

[63]61 Cal.2d 716, 394 P.2d 813, 40 Cal. Rptr. 69 (1964).
[64]381 U.S. 479 (1965).
[65]*Id.* at 497-98.
[66]*Id.* at 503.
[67]MASS. GEN. LAWS ch. 272, § 48 (1956).
[68]370 U.S. 660 (1962), holding that it is cruel and unusual punishment to convict a man of being a narcotics addict.

Perhaps Mr. Justice Clark answered unwittingly his own puzzlement at how the Supreme Court majority could strike down a state statute which made the status of being a drug addict a crime, while upholding state statutes which made drunkenness (a normal condition of alcohol addicts) a criminal offense. For as Mr. Justice Clark noted earlier in this same dissent: "Although none of these acts [i.e. purchase, possession or use of narcotics] are harmful to society in *themselves*, the State constitutionally may attempt to deter and prevent them through punishment because of the grave threat of future harmful conduct which they pose."[70] Perhaps one explanation of the *Robinson* decision lies in the very fact that the status of being a narcotics addict was considered less harmful to society than the status of being an alcoholic. And perhaps Mr. Justice Clark's assumption that the use, possession or purchase of all "narcotics" is dangerous would not have been so easily made if this factual question was before the Court. Indeed, if the status of being a true, *hard narcotics* addict may not constitutionally be made a crime, what justification is there for making it a crime to possess the non-narcotic cannabis, or for that matter to possess it with intent to sell? The implication here is that only the abusive use of cannabis, as it results in conduct harmful to society, ought to be the target of the police powers.

Licensing schemes for regulatory purposes are often struck down in state courts. In *Abodoo v. The City and County of Denver*[71] the Colorado Supreme Court struck down a municipal ordinance that required licensing of portrait photographers, finding that the business of photography is a lawful activity which is harmless and useful, and that the police power cannot be invoked to regulate its practice, specifying technical or moral qualifications for people wishing to enter that field of endeavor. The statute was held to be an unwarranted invasion of the constitutional freedoms of the individual. Thus, a harmless activity

---

[69] *Id.* at 684.
[70] *Id.* at 683 (emphasis supplied).
[71] 156 Colo. 127, 397 P.2d 222 (1964).

was held to be immune even to mere regulation. Certainly a total prohibition of the occupation of photography would not have survived scrutiny at all.

Other regulatory schemes, involving occupations or activities which are potentially dangerous or subject to abuse, have often been upheld in state courts. In the case of *Norman v. City of Las Vegas*[72] the Nevada Supreme Court held that the business of gambling and of selling intoxicating liquors had a "deleterious tendency" and that the police powers of the state and city could be invoked to regulate these activities. Other cases used only when the business or activity regulated has a tendency to be dangerous to the public health, safety or morals.[73] Adherents to the so-called "incorporation theory"[74] would hold that the specific guaranties of the Bill of Rights are incorporated into the Fourteenth Amendment Due Process clause, and it would appear that the Ninth Amendment would be taking its place now beside the first eight. Adherents to the so-called "ordered liberty"[75] theory would hold that the rights involved in this case are part of the Fourteenth Amendment Substantive Due Process. But lurking beneath these "categories of rights" seems to be a basic balancing process between the interests and rights (fundamental or otherwise) of the individual and the interests of the state.

Perhaps the most important of all is the observation that where the state has no interest at all, the individual interest does not have to be very strong to prevail. Thus, in the recent case of *Fenster v. Leary*[76] the court struck down a vagrancy law on two grounds, one of which was that the vagrant did not harm society, and thus there was no state interest in outlawing his being a vagrant.

From another point of view, the broadness of the sweep of the California disfranchisement statute in *Otsuka v.*

CONTINUED

28 OF 33

Hite,[77] would have been unconstitutional had the court not chosen to save its constitutionality by a narrowing interpretation. As Mr. Justice Douglas wrote in the Court's opinion in *Griswold*, "[s]uch a law cannot stand in light of the familiar principal, so often applied by this Court, that a governmental purpose to control or prevent activities constitutionally subject to state regulation may not be achieved by means which sweep unnecessarily broadly and thereby invade the area of protected freedoms."[78] Mr. Justice Brennan and Chief Justice Warren agreed with this and concurred with Mr. Justice Goldberg in his concurring opinion, where he said, "[i]n any event, it is clear that the state interest in safeguarding marital fidelity can be served by a more discriminately tailored statute, which does not, like the present one, sweep unnecessarily broadly, reaching far beyond the evil sought to be dealt with and intruding upon the privacy of all married couples."[79]

As has been noted, Massachusetts statutory scheme dealing with alcoholic beverages purports to deal with only the abuses and dangerous effects of the substance. Despite the evidence that alcohol is harmful and potentially dangerous even if taken in relatively moderate doses, Massachusetts has narrowed the scope of its alcohol regulatory scheme drastically.[80]

Yet the marihuana statute, dealing with a substance which, according to the present state of medical knowledge, is relatively harmless, unless, perhaps, taken in massive doses or high concentrations; throws a blanket prohibition over use of the substance in any manner and in any quantities; this is so even though there is a lack of evidence on the part of Massachusetts, that ordinary use is deleterious. It might be found by a court that, in the balancing process, marihuana might indeed be susceptible to some kind of regulatory scheme, but it is submitted that in order to be reasonable, the scheme would have to regulate at

[80]*See* note 98 *infra*.

least as leniently as the scheme which regulates alcoholic beverages, rather than prohibit entirely. This is not to ask that a state necessarily leave itself without any controls at all over marihuana. A state should, however, limit itself to a statute which regulates rather than prohibits, and which regulates to an extent that is reasonable and rational in the light of modern scientific and medical evidence. If it is found that such evidence is as yet inconclusive, then a state must await further experimentation and not discourage such experimentation. In justifying any regulatory scheme controlling marihuana, a state has some burden, and it would seem that this burden could be met in a scientific age only by allowing proven facts to enter into the legislative decision, and by relegating myths to the realm of gossip rather than law. The courts may not tell the legislature upon which facts they must rely, but the courts must furnish guidelines outside of which a legislature may not go before it must find a rational basis for curtailing the freedom of its citizens. If marihuana is to be proven dangerous, it will have to be with experimentation by scientists with the substance cannabis, rather than by court experimentation with the liberty of the citizen. This is in accord with Mr. Justice Goldberg's comment when he stated, "I quite agree with Mr. Justice Brandeis that . . . a . . . State may . . . serve as a laboratory, and try novel social and economic experiments. . . . [yet] I do not believe that this includes the power to experiment with the fundamental liberties of citizens. . . ."[81]

The instant case is very much like the problem that faced the New York Court of Appeals[82] when a constitutional challenge was levelled against a section of the Federal Agriculture and Markets Law,[83] which section prohibited canned condensed skimmed milk from being sold in small quantities, which in effect barred the product from house-

---

[81]381 U.S. at 496.

[82]Defiance Milk Products Co. v. DuMond, 309 N.Y. 537, 132 N.E.2d 829 (1956).

[83]N.Y. AGRICULTURE AND MARKETS LAW §64 (McKinney 1954).

hold consumption. The court observed that the answer to this challenge revolved around the Supreme Court's opinions in the two *Carolene Products* cases[84] which decisions upheld a federal statute barring "filled milk" from interstate commerce. The New York Court observed that when the Congress passed the filled milk statute in 1923[85] it put forth as the reasons for the statute that filled milk was harmful, and that it was often confused with whole milk. The New York Court went on to note that the Supreme Court upheld the federal statute only on the latter ground —the confusion between products in the marketplace.

> We must keep in mind that the *Carolene* statute was passed in 1923 and that the two Carolene cases were decided in 1938 and 1944, respectively. Congress had characterized "filled milk" as being "injurious to health" and "a fraud upon the public" [citing 304 U.S. 152]. Time has certainly disproved completely the first of those indictments. Ultimately, the court's basis for the ban was "deception" and fraudulent substitution. . . .[86]

The New York Court noted in the *Defiance* case there was neither harm from the product, nor confusion, and therefore the court could not uphold the statute on the "confusion of products" ground that the Supreme Court found still existing in *Carolene*. The claim of harm could no longer be accepted since "even though a police power enactment may have been or may have seemed to be valid when made, later events or later-discovered facts may show it to be arbitrary and confiscatory."[87] The court then

[87]*Id.* at 541, 132 N.E.2d at 830, citing Abie State Bank v. Bryan, 282 U.S. 765, 772 (1931). The New York court, while noting its feeling that it was highly unlikely, in view of labeling procedures, that the consumer would confuse canned evaporated skimmed milk with whole milk, deferred to the legislative finding to some extent by stating in *dictum* that if more distinctive marking was thought necessary, the Legislature could have demanded other kinds of labels or special sizes, shapes or colors of containers. Instead, it issued its

stated that the heart of its decision was that "the property of a citizen including his right to sell nondeleterious substances may not be taken from him without rhyme or reason."[88]

In a similar vein the Supreme Court of Kentucky in *Commonwealth v. Campbell*[89] held that possession of alcohol could not be banned, while sale of the substance could be prohibited. The court stated:

> It is not within the competency of a free government to invade the sanctity of the absolute rights of the citizen any further than the direct protection of society requires. Therefore, the question of what a man will drink, or eat or own, provided that the rights of others are not invaded, is one which addresses itself alone to the will of the citizen. It is not within the competency of the government to invade the privacy of a citizen's life or to regulate his conduct in a matter in which he alone is concerned, or prohibit him any liberty the exercise of which will not directly injure society.[90]

It has been recently argued that the "less-restrictive alternative" principle should be adopted by the Supreme Court of the United States as a substitution to a balancing test in the area of economic due process.[91]

In an *Opinion of the Justices*, the Supreme Judicial Court of Massachusetts[92] dealt with a statute purporting to prohibit all agencies owning, maintaining or operating cemeteries and their officers, agents and employees from selling or engaging in the business of selling monuments for cemetery lots. The court said that such a statute was

---

fiat that these household size quantities could not be sold at all. Such a prohibition was . . . not a reasonable way of dealing with such confusion . . . as the legislators might have found to exist." *Id.* at 541, 132 N.E.2d at 831.

[91] Struve, *supra* note 53. Furthermore, this principle is not a new one in judicial thinking. *Id.* at 1464 n.7, citing the Opinion of the Justices, 322 Mass. 755, 79 N.E.2d 883 (1948) as an example of the use of the principle in state jurisdictions.

[92] 322 Mass. 755, 79 N.E.2d 883 (1948).

unconstitutional under Articles 1, 10 and 12 of the Declaration of Rights since "[w]e have been unable to perceive in the proposed act any rational tendency to promote the safety, health, morals or general welfare of the public."[93]

The court first proceeded to discuss any possible justifications for the statute, justifications which may have been suggested by the legislature, or which may have come to the minds of the Justices independently of other sources. The court found few reasons to justify it.[94]

Yet in this opinion, the court noted that while the selling of monuments "presents no occasion for special or peculiar regulation," nevertheless cemeteries "are subject to a substantial degree of special and peculiar regulation. . . ."[95] To solve this problem of a mixture within the same statute of subjects some of which were suitable for regulation and others which were not, the court resorted to the less-restrictive-alternative principle:

> If any evils lurk in the association of a cemetery with the selling of monuments we would suppose that they

---

[93] *Id.* at 760, 79 N.E.2d at 887.

[94] Certainly it is not a health regulation. We do not see what evil arises if any individual or a religious society owning or operating a cemetery also sells monuments, perhaps even merely as a convenience to the public and not for profit, since the proposed act makes no distinction in this respect. It is common for an individual or group of individuals to engage in more than one lawful occupation. And we see no incompatibility between the two occupations here involved which might be thought to operate to the public detriment. If it is suggested that a bereaved family seeking a place to bury their dead might possibly be exposed to undesirable importunity in the matter of purchase of a monument or might be discriminated against for refusal to buy, it might equally well be argued that for similar reasons an undertaker should be forbidden to sell caskets or a lawyer to act as an administrator. Equal grounds exist for the separation of many forms of activity which are commonly carried on together without objection and to the general convenience of the public. The reason just suggested for the proposed act seems fanciful rather than real, but we have been unable to think of any other object to be promoted, and neither the order of the Senate nor the proposed act discloses any.

Id. at 760-61, 79 N.E.2d at 887.

[95] *Id.* at 760, 79 N.E.2d at 887.

> could be met by direct attack without the sweeping prohibitions contained in the proposed act. The proposed act is especially drastic in its effect upon officers, agents, and employees. In this respect it seems a regulation more of sellers of monuments than of cemeteries. Under this part of the act no seller of monuments could become a member of a standing committee or a vestryman or warden or even sing for pay in the choir of a church that owned a cemetery, even though he had nothing whatever to do with the cemetery. Such restrictions upon persons carrying on a lawful occupation seem to us unrelated to any public good and unreasonable. For the foregoing causes we are of the opinion that the proposed act would not constitute a valid exercise of the police power.[96]

This principle has been commonly used, and it is in frequent use today, both legislatively and judicially, within Massachusetts and in other jurisdictions. Where restrictions are unreasonable, and not narrowly drawn, they unconstitutionally "burn down the house to roast the pig."[97] Within Massachusetts, many things are regulated narrowly.[98]

[97]Butler v. Michigan, 352 U.S. 380 (1957).

[98]There is a basic statute regulating alcoholic beverages in which commercial sale and manufacturing is included. *See* MASS. GEN. LAWS ch. 138, § 2 (1943). But it is important to note that *private manufacture* or use of alcoholic beverages for *personal consumption* is not prohibited or regulated, MASS. GEN. LAWS ch. 138, § 3 (1935). There is a penalty for adulteration, MASS. GEN. LAWS ch. 138, § 16 (1936). There are restrictions on the sale of alcoholic beverages near churches and schools, MASS. GEN. LAWS ch. 138, § 16C (1965). Peddling is prohibited, MASS. GEN. LAWS ch. 138, § 32 (1934). Sale on Sundays and Legal Holidays are regulated, MASS. GEN. LAWS ch. 138, § 33 (1967), and sales to minors are restricted, MASS. GEN. LAWS ch. 138, § 34A (1962). Tobacco is similarly, although less elaborately, regulated. Sales to minors are prohibited, MASS. GEN. LAWS ch. 270, § 6 (1909). Smoking in a stable is outlawed, MASS. GEN. LAWS ch. 272, § 86C (1924), as well as smoking on a public conveyance, MASS. GEN. LAWS ch. 272, § 43A (1947). Other examples of narrow restrictions include: MASS. GEN. LAWS ch. 270 (Crimes Against Public Health), MASS. GEN. LAWS ch. 94, § § 186-94 (1966) (Adulteration and Misbranding of Food and Drugs) and MASS. GEN. LAWS ch. 269, § 12A (1959) (sale of air rifles to a minor under sixteen). For other examples of judicial rules involving the less-restrictive-alternative principle *see* Commonwealth v. Smith, 163 Ky. 227, 173 S.W. 340 (1915)

In *Schneider v. New Jersey*,[99] the Supreme Court of the United States struck down ordinances of Los Angeles, Milwaukee, and Worcester (Massachusetts), forbidding the distribution of handbills in public places as applied to persons passing out handbills on matters of public interest or in labor disputes. It was argued that these ordinances were intended to prevent the littering of the streets; and the Milwaukee ordinance could be enforced only if the recipients of the handbill actually threw it in the street. Justice Roberts, speaking for the Court stated that, "[a]ny burden imposed upon the city authorities in cleaning and caring for the streets as an indirect consequence of such distribution results from the constitutional protection of the freedom of speech and press. . . . There are obvious methods of preventing littering. Among these is the punishment of those who actually throw papers on the streets."[100]

MARIHUANA INTOXICATION AND EQUAL PROTECTION

Much has been written on the medical, pharmacological, psychological and sociological aspects of marihuana use, and the evidence need not be elaborated upon here.[101] But the available evidence would seem to indicate that in terms of physical and psychological effect, marihuana is basically an intoxicant or a mild hallucinogen. There are many similarities between marihuana and alcohol, although it is widely believed that marihuana is less dangerous, certainly in liability and physical damage.

Given such a factual basis, the question must be asked whether the users of one of these drugs (marihuana) may

---

(possession of alcohol may not be outlawed); *Ex parte* Francis, 76 Fla. 304, 79 So. 753 (1918) (could not outlaw possession of alcohol, but could prohibit possession with intent to sell); State v. Gilman, 33 W. Va. 146, 10 S.E. 283 (1889) (cannot outlaw possession of alcohol); Roberts v. Clement, 252 F. Supp. 835 (E.D. Tenn. 1966) (cannot outlaw nudists).

[99]308 U.S. 147 (1939).

[100]*Id.* at 162.

[101]*See* SOLOMON, THE MARIHUANA PAPERS (1966).

be subject to heavy penalties for indulging in their chosen intoxicant, while the users of the other drug (alcohol) are free to indulge themselves so long as their use does not edge over into abuse.

Put another way, we must ask whether the present laws, by treating unequals (marihuana and the opiates or LSD) as equals, and by treating substantial equals (alcohol and marihuana, although alcohol is generally acknowledged to be the more harmful)[102] as unequals, thereby run afoul of the requirements of equal protection.

If two substances have essentially the same effects and pose essentially the same dangers, and if they would both be regulated (or prohibited) for the very same reason or reasons, and if an examination of the evidence reveals no substantial difference between the two, there is therefore no basis for the statutory distinction. Thus, in the classic case of *Skinner v. Oklahoma*[103] the Supreme Court of the United States struck down as a violation of equal protection, a statute which would apply sterilization to "habitual criminals," and which included certain classes of criminals, such as a chicken thief, but which excluded others, such as embezzlers. The Court said that:

> When the law lays an unequal hand on those who have *committed intrinsically the same quality of offense* and sterilized one and not the other, it has made as invidious a discrimination as if it had selected a particular race or nationality for oppressive treatment. Yick Wo v. Hopkins, 118 U.S. 356; Gaines v. Canada, 305 U.S. 337. Sterilization of those who have thrice committed grand larceny, with immunity for those who are embezzlers, is a clear, pointed, unmistakable discrimination (emphasis supplied).[104]

Similarly, the Supreme Court invalidated a Florida statute which outlawed cohabitation by members of different

[102]FORT, THE USE AND ABUSE OF ALCOHOL AND NARCOTICS AROUND THE WORLD, Proceeding of the Third World Congress of Psychiatry (University of Toronto Press 1964).

[103]316 U.S. 535 (1924).

[104]*Id.* at 541-42.

races only.[105] A lack of equal protection was found, not because the state could not outlaw cohabitation, but rather because if it outlawed it for some, it had to do so for all. The Court noted that there appeared to be "... nothing in [the] suggested legislative purpose [to deal with illicit extramarital and premarital promiscuity] ... which makes it essential to punish promiscuity of one racial group and not that of another."[106]

How then is the Court justified in attaching heavy penalties to those who choose to become intoxicated or relax by using marihuana, while allowing others to indulge in another intoxicant which the marihuana users will not resort to because of its physically debilitating properties?

A state might argue that the legislature may outlaw what appears to it to be an evil without "covering the whole field of possible abuses.... If a class is deemed to present a conspicuous example of what the legislature seeks to prevent, the Fourteenth Amendment allows it to be dealt with although otherwise and merely, logically not distinguishable from others not embraced in the law."[107] Yet all this says is that a legislature may pick and choose the kinds of behavior that it wishes to proscribe. It does not mean that a legislature may actually prescribe behavior of one class of people (e.g., those who choose to obtain a mild state of intoxication with marihuana) and allow another class of people to freely indulge in behavior of an exactly similar nature (e.g., those who choose to obtain a mild state of intoxication with alcohol). The only justification for making any such distinction would have to be more than a mere technical one. It would have to be grounded in fact.

In an *Opinion of the Justices of Massachusetts*,[108] the court said that equal protection requires that all in the same category and the same circumstances be treated alike.

[105]McLaughlin v. Florida, 379 U.S. 184 (1964).

[106]*Id.* at 193.

[107]Central Lumber Co. v. South Dakota, 226 U.S. 157, 160 (1912).

[108]332 Mass. 769, 126 N.E. 2d 795 (1955).

It is true that a statutory discrimination will not be set aside as a denial of Equal Protection if any state of facts reasonably may be conceived to justify it.[109] Yet a statutory classification is arbitrary if it does not rest upon some ground of difference having a fair and substantial relation to the object of the legislation.[110]

It has been recently stated that:

> The equal protection principle of *Skinner* and *McLaughlin* may be stated as follows: the statute must cover all persons who are logically, scientifically or by dint of common sense includable in order to effectuate the legitimate goals of the statute [citations omitted]. In applying this principle, the reviewing court must inevitably pass judgment on the soundness (i.e., legitimacy) of the statutory policy [citations omitted]. Since this role is one of independent fact-finding, courts are often reluctant to expressly challenge the legislature's decision to enact statutes, even those predicated on such questionable bases as superstition or racism. Fortunately, in recent years, the Supreme Court as well as the California appellate courts have been willing to undertake the necessary task of reviewing the completeness of the statutory class in view of the proscribed conduct.[111]

CONCLUSION

Several avenues have been suggested by which a court, without appearing to be taking a totally unprecedented or legally-unsound step, might declare part or all of the drug laws of several states, as they apply to possession and perhaps sale of marihuana, unconstitutional. Other approaches are, of course, available. But it is suggested that none of these legal theories have a chance of success unless accompanied by a sufficient amount of factual information

given to the court in a manner acceptable to a judicial fact-finding forum.

Perhaps the state of scientific knowledge on the marihuana question is still too embryonic for a court to feel easy about overturning a statute which is so controversial and which has such staunch supporters among many segments of the population. However, it is suggested that there is a duty of the courts to intervene where the legislatures have left their task undone. Unless this is done quickly, a whole generation of our youth will be decimated by criminal records and deep-seated hostility to a system which has produced and enforced, often with a vengeance, a law which to many laymen appears irrational, unjust and unwise, and to many lawyers and jurists appears to violate the basic tenets of Due Process and Equal Protection of Law.

49 Ill.2d 338

The PEOPLE of the State of Illinois, Appellee,

v.

Thomas McCABE, Appellant.

No. 42674.

Supreme Court of Illinois.

Oct. 15, 1971.

Rehearing Denied Nov. 24, 1971.

Defendant was convicted in the Circuit Court of Kane County, John A. Krause, J., of unlawful sale of marijuana, and he appealed. The Supreme Court held that classification of marijuana under Narcotic Drug Act, which provides for mandatory ten-year minimum sentence upon first conviction, rather than under Drug Abuse Control Act, which provides for maximum jail term of but one year upon first conviction and does not prohibit probation, was arbitrary and deprived defendant of equal protection.

Reversed.

Underwood, C. J., and Ryan, J., dissented and filed opinions.

Schaefer, J., did not participate.

1. Constitutional Law ⇐48

Determining whether statutory classification violates equal protection clause, court must begin with presumption that the classification is valid and must impose burden of showing invalidity on party challenging classification.

2. Constitutional Law ⇐211

Equal protection clause does not deny states the power to classify in the exercise of their police power, and it recognizes the existence of a broad latitude and discretion in classifying.

3. Constitutional Law ⇐48

If any state of facts may reasonably be conceived which would justify statutory classification, it must be upheld.

4. Constitutional Law ⇐208(1)

There must be reasonable basis for distinguishing class to which a law is applicable from the class to which it is not.

5. Constitutional Law ⇐208(1)

Although appropriate respect should be given to act of a legislative classification, there is a judicial obligation to insure that the power to classify has not been exercised arbitrarily and, if it has been, the legislation cannot be justified under the label of classification.

6. Criminal Law ⇐913(1)

Contention of defendant that classification of marijuana under Narcotic Drug Act rather than under Drug Abuse Control Act was unconstitutional was not the character of claimed error to be raised on a motion for a new trial. S.H.A. ch. 38, § 22–1 et seq.; ch. 111½, § 801 et seq.

7. Criminal Law ⇐1044, 1064(1)

Defendant, who raised constitutional question in his pretrial motion to quash indictment, who argued it and secured the trial court's ruling on the question, and who referred to the constitutional point orally on his posttrial motion for arrest of judgment, preserved the constitutional question for review even though it was not raised in his written motion for new trial.

8. Constitutional Law ⇐250

Poisons ⇐2

Classification of marijuana under Narcotic Drug Act, which provides for mandatory ten-year minimum sentence upon first conviction, rather than under Drug Abuse Control Act, which provides for maximum jail term of but one year upon first conviction and does not prohibit probation, was arbitrary and deprived defendant charged with unlawful sale of marijuana of equal protection. S.H.A. Const.1970, art. 4, § 13; S.H.A. ch. 38, § 22-1 et seq.; ch. 111½, § 801 et seq.

Thomas P. Sullivan and Douglas C. Nohlgren, Chicago (Jenner & Block, Chicago, of counsel), for appellant.

William J. Scott, Atty. Gen., Springfield, and William P. Ketcham, State's Atty., Elgin (Joel M. Flaum, James B. Zagel, and Warren K. Smoot, Asst. Attys. Gen., of counsel), for the People.

PER CURIAM.

Following a jury trial in the circuit court of Kane County the defendant, Thomas McCabe, was found guilty of the unlawful sale of marijuana in violation of the Criminal Code of Illinois. (Ill.Rev.Stat.1969, ch. 38, par. 22-3). Pursuant to the provisions for mandatory minimum penalties for the unlawful sale of a narcotic drug (Ill.Rev.Stat.1969, ch. 38, par. 22-40) the defendant, who had no prior convictions, was sentenced to the penitentiary for a period of ten years to ten years and a day. On this appeal he raises these grounds for reversal: (1) the classification of marijuana in the Narcotic Drug Act (Ill.Rev.Stat.1969, ch. 38, par. 22-1 et seq.), with mandatory minimum statutory penalties for a first conviction, deprives the defendant of due process and equal protection of the law in violation of the constitution of Illinois and the constitution of the United States; (2) the Narcotic Drug Act's mandatory minimum ten-year sentence and its prohibition of probation or the suspension of sentence upon a first conviction for the sale of even a trifling amount of marijuana to an adult constitutes cruel and unusual punishment in violation of the constitution of Illinois (S.H.A. Const. of 1870, art. II, sec. 11) and the constitution of the United States (U.S. Const., amend. VIII); (3) the defendant was deprived of equal protection of the law in that no meaningful post-trial hearing in mitigation was held; (4) the trial court erred in numerous evidentiary rulings; (5) the closing argument of the prosecutor was improperly prejudicial to the defendant; (6) the trial court erred in instructing the jury; and (7) the mandatory minimum penalty provision of the Narcotic Drug Act unconstitutionally interferes with the prerogative and the duty of the judiciary to impose sentence as the exercise of sound discretion may direct.

To begin it will be helpful to exclude some of the potential questions the defendant does not raise regarding the classification of marijuana. It is not denied, for example, that the State has authority under its general police power to prohibit the sale, use, or possession of marijuana. Nor does the defendant contend that the State must limit its exercise of that power to the regulation, as opposed to the prohibition, of the drug. Finally, the defendant does not claim that the State, having chosen to proscribe the use, possession, and sale of marijuana, must similarly act in the cases of substances such as alcohol, tobacco and caffeine, whose use may be harmful.

The equal-protection argument which is raised is narrow and limited. It simply is that the present placing or classifying of marijuana under the Narcotic Drug Act rather than classifying it under the Drug Abuse Control Act (Ill.Rev.Stat.1969, ch. 111½, par. 801 et seq.) with the "stimulant or depressant" drugs is constitutionally invalid as an improper classification, considering the present state of knowledge concerning the comparative natures and ef-

fects of the drugs named in the two statutes. Unlike the Narcotic Drug Act, which provides for a mandatory ten-year minimum sentence upon a first conviction for the sale of marijuana, the Drug Abuse Control Act provides, upon a first conviction for the sale of drugs named in it, a maximum jail term of but one year and probation is not prohibited. The defendant says that there is no rational basis for distinguishing a first sale of marijuana from the first sale of a stimulant or depressant drug under the Drug Abuse Control Act and that the gross disparity between the penalties violates his rights under the equal-protection clause.

[1-5] In determining whether a statutory classification violates the equal-protection clause, we must begin with the presumption that the classification is valid and must impose the burden of showing invalidity on the party challenging the classification. (City of Rockford v. Grayned, 46 Ill.2d 492, 263 N.E.2d 866; Thillens, Inc. v. Morey, 11 Ill.2d 579, 591, 144 N.E.2d 735; People ex rel. Vermilion County Conservation District v. Lenover, 43 Ill.2d 209, 219, 251 N.E.2d 175). The equal-protection clause does not deny the States the power to classify in the exercise of their police power and it recognizes the existence of a broad latitude and discretion in classifying. (Begich v. Industrial Com., 42 Ill.2d 32, 36, 245 N.E.2d 457). If any state of facts may reasonably be conceived which would justify the classification, it must be upheld (see Begich v. Industrial Com., 42 Ill.2d 32, 245 N.E.2d 457). The right of judicial questioning of a classification under the equal protection clause is thus limited. As this court put it in Thillens, Inc. v. Morey, 11 Ill.2d 579, 593, 144 N.E.2d 735, 743, "Whether the enactment is wise or unwise; whether it is based on sound economic theory; whether it is the best means to achieve the desired results, and whether the legislative discretion within its prescribed limits should be exercised in a particular manner are matters for the judgment of the legislature, and the honest conflict of serious opinion does not suffice to bring them within the range of judicial cognizance." But it is required that there be a reasonable basis for distinguishing the class to which the law is applicable from the class to which it is not. (People ex rel. County of Du Page v. Smith, 21 Ill.2d 572, 578, 173 N.E.2d 485.) Appropriate respect should be given to the fact of a legislative classification, but there is a judicial obligation to insure that the power to classify has not been exercised arbitrarily and, if it has been, the legislation cannot be justified under the label of "classification." (Begich v. Industrial Com., 42 Ill.2d 32, 36, 245 N.E.2d 457). It was observed recently: "[A] state may not, under the guise of classification, arbitrarily discriminate against one and in favor of another similarly situated." Lake Shore Auto Parts Co. v. Korzen, 49 Ill.2d 137, 148, 273 N.E. 2d 592.

Measuring by these criteria we must determine whether any rational basis exists to justify the substantially greater penalties imposed for a first conviction for the sale of marijuana than for a first conviction for the sale of a drug named in the Drug Abuse Control Act. This consideration will require an assessment of the relevant scientific, medical and social data found, including the voluminous materials assembled by the parties here, which are pertinent to support and to defeat the classification. We are aware that any compilation and examination of materials cannot comprehend all studies that have been made. We know, too, that knowledge in this whole area is not nearly complete. We proceed not to determine scientific questions, but to judge whether the data presently available provides a reasonable basis for the described classification of marijuana. (*Cf.* Precision Connecting Rod Service v. Industrial Com., 40 Ill.2d 277, 281, 239 N.E.2d 823.) The consideration of this data, of course, will not extend to the wisdom or unwisdom of the legislative classification. We confine our examination to the question whether the challenged classification can be supported on any rational basis.

Knowledge of the characteristics and effects of the drug commonly called marijuana, which is obtained from the leaves of the female hemp plant, *cannabis sativa*, has developed rapidly in the last decade. Studies by Presidential commissions, whose memberships have included psychiatrists, pharmacologists, sociologists and law enforcement officials as well as intensified research in the medical and scientific communities have contributed to this advancement. The consensus is that although marijuana has been commonly associated with the opiates, such as morphine and heroin, there are important differences between the so-called abuse characteristics of the two. Heroin and morphine are true narcotic analgesics in the sense that their use produces a marked indifference to pain. In addition, when injected intravenously a warm flushing of the skin and intense pleasurable sensations in the lower abdomen will result. Repeated usage of these drugs in a comparatively short time will result in the development of a tolerance, that is, a state which requires a gradually increasing dosage to permit the drug to attain the effect desired. Both a psychological and compelling physical dependence result from the use of "hard narcotics." The physical dependence develops in intensity with continued use and requires the continued administration of the drug to avoid withdrawal symptoms. It appears that the subjective action of the morphine-type drugs also involve changes in mood, an inability to concentrate and the development of apathy. Physical degeneration occurs, arising from drug preoccupation, personal neglect, malnutrition and susceptibility to infections. Overdosage can cause death through excessive respiratory depression.

Early withdrawal symptoms include lacrimation, nasal discharge, yawning and perspiration. Later, dilated pupils, loss of appetite, gooseflesh, (thus, the expression "cold turkey") restlessness and increased irritability and tremor will appear. At its peak intensity, the syndrome includes high irritability, insomnia, violent yawning, severe sneezing and lacrimation. Nausea and vomiting are common, as are intestinal spasms and diarrhea. Increased heart heat and elevated blood pressure, as well as muscular spasms, abdominal cramps and pains in the bones and muscles of the back are common. Death due to cardiovascular collapse can result from withdrawal. The symptoms are caused by the drug-induced alterations at the cellular level, most prominently in the central nervous system. Most authorities consider that the drug addict's frequent involvement in criminal activity results from his acute need for the drug rather than because of the action of the drug itself. The term addiction refers to the physical, rather than a psychological dependence on the drug.

Cocaine, which is placed with marijuana and the opiates in the Narcotic Drug Act, is a powerful stimulant, whereas the morphine-type drugs have a depressing action. Too, cocaine is further unlike the opiates in that it does not have effects of tolerance or physical dependence and abstention does not cause acute withdrawal symptoms. However, because of its potent nature, it induces intense physical and mental excitation and a marked reduction in normal inhibitions which often results in aggressive and even violent behavior. Intense hallucinations and paranoid delusions are common and, because of this, cocaine users frequently attempt to dilute the experience with a depressant such as heroin or morphine.

The properties and consequences of the use of marijuana differ from those attending the use of opiates or cocaine. The acute physical symptoms of marijuana use typically induced are an increase in pulse rate, a slight elevation in blood pressure, conjunctival vascular congestion, a rise in blood sugar, urinary frequency, dryness of the mouth and throat. Nausea, vomiting and occasional diarrhea have been observed, as has the inability to coordinate voluntary muscular movements. There is usually a marked increase in appetite.

Deaths due to overdose apparently have not been reported.

The mental or subjective effects of the administration of this drug are variable and depend on the interaction of several factors including the physical and pharmacological properties of the particular marijuana used, the amount of dosage, and more importantly, what has been called the character structure of the user, (including his experience with the drug, his attitude and expectations) and the social setting or environment in which the drug is used. The most common reaction is the development of a euphoric state of altered consciousness in which ideas seem disconnected, uncontrollable and freely flowing. Time perception is distorted with minutes seeming like hours. Spatial conception may also be disturbed. Vivid hallucinations, usually, but not always, pleasant, can occur with increased dosage. There may be marked alterations of mood, usually manifested by an extreme feeling of well being which is often accompanied by uncontrollable laughter. Later a more somber or depressed mood will appear. The drug's influence can cause anxiety, confusion or disorientation, and with larger doses temporary psychotic episodes have been observed in predisposed individuals. Inhibitions are reduced but violent or otherwise aggressive behavior seem to be rare.

Almost all authorities agree that marijuana is not a narcotic or addictive in the sense that the terms are precisely used. Unlike the opiate drugs, it does not produce a physical dependence, and upon abstention there are no withdrawal symptoms. A tolerance to the drug does not develop. Marijuana use does, however, lead to a mild psychological dependence. The short-hand descriptive phrase most often applied to the drug is "mild hallucinogen," although this refers to only one of its many effects.

The depressant and stimulant drugs within the Drug Abuse Control Act include the barbiturates (depressants,), the amphetamines (stimulants), and the hallucinogens. The drugs psilocybin, peyote, mescaline and what is commonly called LSD are examples of the hallucinogens. Frequent use of the barbiturates at high dosage levels leads invariably to the development of physical dependence, tolerance and severe withdrawal symptoms, similar to those associated with heroin use. The effects of barbiturate intoxication resemble those of alcoholic intoxication. There is a general sluggishness, difficulty in concentrating and thinking, speech impairment, memory lapse, faulty judgment and exaggeration of basic personality traits. Irritability and quarrelsomeness are common. Hostile and paranoid ideas as well as suicidal tendencies can occur. Barbiturates are said to be the most frequently used chemical in suicides in the United States. Accidental death from an overdose also can occur. There is a clear association between barbituric intoxication and accidents and traffic fatalities. The drug can depress a wide range of functions, including the nerves, skeletal muscles and the cardiac muscle. Barbiturates are frequently used by heroin addicts to boost the effect of weak heroin.

The consensus of the amphetimines (stimulants) is that, unlike the barbiturates, their abuse does not lead to a physical dependence, but the development of a high tolerance and a strong psychological dependence are common. Occasional dosage under medical supervision causes only an elevation in mood and a state of well-being. Long term dependence, however, leads to serious mental and physical problems. Malnutrition and debilitation due to self-neglect will appear. A well known complication of amphetamine abuse is paranoid schizophrenia. The user may react violently to his persecutive delusions. Visual and auditory hallucinations occur and can persist long after use is discontinued. Although true withdrawal symptoms do not occur, the latter stages of excitement and mental disarrangement are difficult to endure. To take the edge off this tense euphoria, the user will sometimes turn to barbiturates or the opiates.

Special mention should be made of one particular amphetamine, methamphetamine, commonly called "speed." Its effects are generally the same as other amphetamines, only markedly intensified. There is evidence that large doses result in permanent brain damage. The drug's lethal qualities are well documented. The potential for violence, paranoia and physical depletion are substantially more severe.

Also placed under the Drug Abuse Control Act are the hallucinogens or the "psychedelics." LSD is the best known and one of the highly potent forms of these drugs. Less potent hallucinogens include psilocybin, peyote, and mescaline and hashish (another derivative of the plant from which marijuana comes). As with marijuana usage, a true physical addiction does not occur with LSD, in that withdrawal effects do not follow abstinence. Frequent use of LSD will lead rapidly, however, to the development of a high tolerance. Psychological dependence develops as it does with exposure to almost any substance which alters the state of consciousness. During LSD-intoxication severe panic and paranoid reactions are encountered. Attempts at suicide as well as uncontrolled aggression are among the dangers to the intoxicant. Hallucinations are common, accompanied by feelings of grandiosity and omnipotence. Recurrences of the LSD experience weeks or months after the last drug intake are well known. Various emotional disorders have been observed following exposure to LSD. A chronic anxiety state is the most common. Prolonged psychotic reactions also have been identified with LSD. Too, there is also growing evidence that LSD can cause chromosomal damage.

Against this background of comparison one would conclude that neither the chemical properties of the drugs nor their effects on the behavior of the users provides any justifiable or reasonable basis for the sharply disparate penalties which are imposed for a first sale of marijuana and for a first sale of a drug under the Drug Abuse Control Act. Too, the consequences of abusive use of marijuana certainly appear not to be comparable to the demonstrated and profound ill-effects of opiate or cocaine addiction. Marijuana, in terms of abuse characteristics, shares much more in common with the barbiturates, amphetamines and, particularly, the hallucinogens than it does with the "hard drugs" classified in the Narcotic Drug Act. Marijuana does differ from the barbiturates and amphetamines in that it has no established medical use, but neither do LSD, peyote, or mescaline. Thus, one cannot reasonably distinguish marijuana from the substances under the Drug Abuse Control Act on this basis.

Nor is there any reasonable basis for placing marijuana under the Narcotic Drug Act and not under the Drug Abuse Control Act because of any compulsion to abuse. The compulsion associated with marijuana has been described as moderate or mild. The same is true of the amphetamines. The opiates and cocaine, on the other hand, have a maximal compulsive quality in this regard. Barbiturates, too, have this quality. Thus, in this respect, marijuana is dissimilar from the other drugs in the Narcotic Drug Act. Indeed, from this limited standard of comparison it is the barbiturates under the Drug Abuse Control Act, and not marijuana, which approximate the characteristics of the true narcotics.

Another factor which has been frequently advanced to provide a justifiable basis for classifying marijuana under the Narcotic Drug Act rather than under the Drug Abuse Control Act is that the use of marijuana progresses to heroin use and addiction. This thesis, once broadly entertained, has recently encountered serious challenge. Today it is reported that the vast majority of marijuana users do not graduate to the use of heroin. In 1969, Dr. Stanley F. Yolles, then Director of the National Institute of Mental Health, testified before the Congress that there is nothing in the properties of marijuana which predisposes the

use of heroin. He also estimated that only a small percentage of chronic users of marijuana go on to use heroin. This is not to deny any association between marijuana and heroin. The most commonly accepted thesis today is that a drug sequence or movement from one drug to another results from the cumulative effect of several factors, including: the pharmacological properties and effects of the drugs, the personality structure of the user, and the pressures of the so-called host environment. Thus, the chronic use of any drug presents a danger of graduation to other and more dangerous drugs. Observed, for example, has been a clear association between barbiturate abuse and heroin addiction. The barbiturate-heroin connection is also true with respect to the criminal trafficking in these drugs. Whatever can be said of marijuana use leading to the use of other and so-called harder drugs can be applied, and to a probably greater extent, to barbiturates, methamphetamine and LSD.

The extensive criminal involvement of persons addicted to heroin is well known. The intense craving for the drug, and the dread of symptoms following its withdrawal lead addicts to engage in criminal activities to finance their habit. It has been said that marijuana use also causes violence, crime and antisocial acts. However, since tolerance, physical dependence, or withdrawal symptoms do not attend its use, this thesis has been criticized. Some say that since the effect of marijuana is to induce a passivity in the user, the drug has a negative relation to criminality and aggressive behavior. But as marijuana is generally a disinhibitor, it must be recognized that antisocial conduct can occur in a predisposed individual. But this is, of course, equally true regarding the stimulant or depressent drugs and the hallucinogens. And, violent and aggressive conduct is a more common reaction to these latter drugs because of the paranoiac psychosis which they can produce in the user. Thus, it can be concluded that the thesis that marijuana use, as does the use of the opiates and cocaine, leads to criminal activity cannot provide a basis for distinguishing marijuana from the depressant and stimulant drugs or the hallucinogens.

Observations to be drawn on marijuana are that it is not a narcotic and it is not truly addictive. Its use does not involve tolerance, physical dependence or the withdrawal syndrome. Physical ill effects from its use are, so far as is known, relatively moderate. Its abuse does not have the profound and ill consequences observed in the use of some of the other drugs considered. Its use does not singularly or extraordinarily lead to opiate addiction or to aggressive behavior or criminal activity.

Against the entire background of the drugs considered we judge that the classification of marijuana under the Narcotics Drug Act rather than under the Drug Abuse Control Act has been arbitrary. A comparison of the drugs leads to a conclusion that marijuana more closely resembles drugs placed in the Drug Abuse Control Act. It is, comparatively speaking, dissimilar from drugs under the Narcotic Drugs Act. We do not find a rational basis for the classification, a consequence of which is that one first convicted of the sale of marijuana must without qualification receive a sentence ten times greater than one permitted to be imposed on one convicted for the first time of a sale of drugs under the Drug Abuse Act. The absence of a rational basis for distinguishing first convictions for sales of marijuana from first convictions for sales of drugs placed in the Drug Abuse Control Act compels the conclusion that the present classification of marijuana offends the equal-protection clause of the United States constitution and our new constitution of Illinois and was in violation of section 22 of article IV of the former constitution of this State.

We would observe that the legislature has recently removed marijuana from the Narcotic Drug Act and reclassified it under the Cannabis Control Act, H.B. 788,

P.A. 77-758, approved August 16, 1971. Henceforth, a first sale of a small quantity of marijuana to an adult, as was the case here, will result in only minor criminal penalties. This reclassification is not inconsistent with what we have said here.

It is appropriate to note that we are not unmindful of the prior Federal and State decisions which had rejected constitutional attacks on Federal and State statutes classifying marijuana with the "hard drugs." (See United States v. Eramdjian (S.D. Cal.1957), 155 F.Supp. 914; State v. White, 153 Mont. 193, 456 P.2d 54; Borras v. State (Fla.), 229 So.2d 244; Raines v. State (Fla.), 225 So.2d 330; People v. Stark, 157 Colo. 59, 400 P.2d 923; Spence v. Sachs, 173 Ohio St. 419, 183 N.E.2d 363; People v. Walton, 116 Ill.App.2d 293, 253 N.E.2d 537; Gonzales v. State (Tex. Crim.App.) 373 S.W.2d 249; Commonwealth v. Leis, 355 Mass. 189, 243 N.E.2d 898.) We would point out that the constitutional ground raised by the defendant here was not presented in any of the cited cases.

[6, 7] The State contends that the constitutional argument which the defendant has presented here was waived and not preserved for review because it was not raised in his written motion for a new trial. The record shows that the defendant plainly raised the constitutional question in his pretrial motion to quash the indictment, argued it, and secured the court's ruling on the question. It was not the character of claimed error to be raised on a motion for a new trial. (People v. Irwin, 32 Ill.2d 441, 444, 207 N.E.2d 76) He referred to the constitutional point orally in his post-trial motion and we regard that as an oral motion for arrest of judgment. We consider that the defendant preserved the constitutional question for review. People v. Irwin, 32 Ill.2d 441, 444, 207 N.E.2d 76.

[8] We hold that the present classification of marijuana is arbitrary and deprives the defendant of equal protection of the law. The remainder of the Narcotic Drug Act is not affected by this holding, as we judge it is severable (see People ex rel. Adamowski v. Wilson, 20 Ill.2d 568, 170 N.E.2d 605) from that portion of the statute which concerns marijuana.

It will not be necessary to consider the other contentions advanced by the defendant. For the reasons given, the judgment of the circuit court of Kane County is reversed.

Judgment reversed.

SCHAEFER, J., took no part in the consideration or decision of this case.

UNDERWOOD, Chief Justice (dissenting).

Subsequent to defendant's conviction under the Narcotic Drug Act and while this appeal was pending, the General Assembly enacted the Cannabis Control Act, H.B. 788, P.A. 77-758, which provides for substantially reduced criminal penalties for possession and sale of marijuana. Section 18 of that Act provides: "Prosecution for any violation of law occurring prior to the effective date of this Act is not affected or abated by this Act. If the offense being prosecuted would be a violation of this Act, and has not reached the sentencing stage or *a final adjudication*, then for purposes of penalty the penalties under this Act apply if they are less than under the prior law upon which the prosecution was commenced." (Emphasis supplied.)

In my opinion, this provision regarding sentencing may reasonably be interpreted to include all cases still in the appellate process (People v. Bailey, Ill.App., 273 N.E.2d 74; People v. Carleton, 116 Ill.App.2d 450, 252 N.E.2d 702) and would therefore apply to this case. Accordingly, I would not reach the constitutional question presented and would remand for resentencing in compliance with the sentencing provision of the Cannabis Control Act.

However, since the majority concludes that the inclusion of marijuana in the Nar-

cotics Drug Act is an unconstitutional classification, it is necessary to state my further disagreement with that conclusion. Defendant concedes that when the first Illinois drug act was passed in 1931, the combining of marijuana with "hard drugs" seemed to be legitimate, and that if only "hard drugs" were prohibited in Illinois, it still might not be irrational to put marijuana in that category. Defendant contends, however, that after the legislature created a second and lesser category of prohibited drugs by enacting the Drug Abuse Control Act in 1967, it was no longer rational to continue "to assign marijuana to the category with which it has much less in common, rather than to the category with which it has much more in common."

The majority's lengthy discussion of the characteristics and effects of marijuana as compared to other prohibited drugs clearly illustrates that no two drugs are identical and that marijuana is also quite different from the stimulant or depressant drugs with which defendant seeks to classify it. The fact that a substantial body of scientific and medical opinion now considers marijuana to be more nearly like the drugs included in the Drug Abuse Control Act than those prohibited by the Narcotic Drug Act does not, in my opinion, necessitate the conclusion that there was no rational basis for the classification in question. Medical and scientific opinion is even now by no means unanimous in condemnation of classifications of marijuana with "hard drugs" and, as the majority notes, "knowledge in this whole area is not nearly complete." In the absence of more nearly conclusive evidence that the legislative judgment was devoid of any rational basis, a finding of unconstitutionality is unwarranted, for few rules of law are more soundly bottomed than that which proscribes judicial interference with legislative discretion. As this court said in Thillens, Inc. v. Morey, 11 Ill.2d 579, 593, 144 N.E.2d 735, 743: "Whether the enactment is wise or unwise; whether it is based on sound economic theory; whether it is the best means to achieve the desired results, and whether the legislative discretion within its prescribed limits should be exercised in a particular manner are matters for the judgment of the legislature and the honest conflict of serious opinion does not suffice to bring them within the range of judicial cognizance." In the context of current drug knowledge I would uphold the former statutory classification of marijuana within the Narcotics Drug Act as a constitutional exercise of legislative discretion.

Accordingly, I would affirm the conviction and remand for resentencing under the sentencing provision of the Cannabis Control Act.

RYAN, Justice (dissenting).

I join in the dissent of Chief Justice Underwood and add thereto the following:

The majority opinion does not focus on what I consider to be the critical aspect of the question of classification. The majority is concerned with the characteristics of the various drugs discussed and their effects on the human body and behavior pointing out similarities and differences. I do not consider these comparisons important. Instead we must be concerned with the purpose of the classification and the problems the legislature was attempting to alleviate thereby. In Billings v. Illinois, 188 U.S. 97, at 102, 23 S.Ct. 272, at 273, 47 L.Ed. 400, the court stated: "Things may have very diverse qualities, and yet be united in a class. They may have very similar qualities, and yet be cast in different classes. * * * All classification must primarily depend upon purpose—the problem presented".

In 1931 marijuana, opium and cocoa leaves were classified together in the Narcotic Drug Control Law (Ill.Rev.Stat.1931, Ch. 38, par. 192(a) et seq.) and penalties were provided for the illegal sale and possession thereof. In 1957 Illinois adopted the Uniform Narcotic Drug Act. (Ill. Rev.Stat.1957, Ch. 38, par. 192.28-2.17).

The list of drugs brought within the Act had increased to eleven in number and by 1967 the number of drugs included in the classification had grown to fifteen. A reading of these various Acts makes it clear that the legislature was not attempting to classify drugs of similar characteristics and effects but was attempting to classify these drugs for the purpose of combating the social evil found in the illegal sale, possession and use of the same.

In 1967 the legislature enacted the Drug Abuse Control Act, (Ill.Rev.Stat.1967, Ch. 111½, par. 801 et seq.) In this Act, as the Uniform Narcotic Drug Act, drugs of diverse characteristics and effects are grouped together for the purpose of controlling the illegal traffic in the various members of the class. The majority opinion concludes that marijuana more closely resembles the new list of drugs classified under the Drug Abuse Act, thus rendering the present classification of marijuana violative of the equal-protection clause.

The conclusion of the majority ignores the fact that traffic in marijuana had been a social problem of sufficient magnitude to warrant legislative action for many years. Material submitted with the briefs indicates that although a relatively small percentage of marijuana users become addicted to the so-called "hard drugs" a high percentage of "hard drug" addicts first became acquainted with the use of drugs through the use of marijuana. Also, certain studies indicate that marijuana is the most widely used drug among the young drug users. These are facts which the legislature may well have considered as justification for retaining marijuana under the Uniform Narcotic Drug Act and for not classifying it with the drugs listed in the Drug Abuse Control Act. The presumption of the reasonableness of the classification is with the State and the same will not be set aside as a denial of equal protection if any facts reasonably may be conceived to justify it. Salsburg v. Maryland, 346 U.S. 545, 74 S.Ct. 280, 98 L.Ed. 281; Metropolitan Casualty Ins. Co. of New York v. Brownell, 294 U.S. 580, 584, 55 S.Ct. 538, 79 L.Ed. 1070, 1073.

The defendant's brief has also focused on the characteristics and effects of the various drugs and has ignored the problem-to-be-solved approach. The burden is on the defendant to present evidence which shows that the apparently reasonable basis for this classification does not exist. (Williamson v. Lee Optical of Oklahoma, 348 U.S. 483, 75 S.Ct. 461, 99 L.Ed. 563; McGowan v. Maryland, 366 U.S. 420, 81 S.Ct. 1101, 6 L.Ed.2d 393.) The defendant has failed to produce any evidence concerning the nature of the traffic in the various drugs or the need to control the same. The presumption of the validity of the classification must therefore prevail.

A further reason for my dissent concerns the failure of the defendant to present any evidence on the subject of the invalidity of the classification. A motion to quash the indictment raised the question but no evidence was offered by the defendant at the hearing thereon. The evidence offered at the trial concerned the question of guilt or innocence and not characteristics and effects of the drugs. The majority opinion acknowledges that "we must begin with the presumption that the classification is valid and must impose the burden of showing invalidity on the party challenging the classification." This burden is not satisfied by argument or briefs but by coming forward with proof, by presenting evidence. This the defendant has not done so there is no basis in the record for the findings and comparisons set forth in the majority opinion concerning the properties of the various drugs. Both the defendant and the People filed lengthy briefs containing citations to and quotations from many, many articles, reports, and studies. The briefs represent a very detailed and well prepared presentation of the entire subject but *are not evidence*. The burden was on the defendant to present facts and circumstances in evidence from which the determination could be made that the classification in question

violates the equal-protection clause. (Gadlin .. Auditor of Public Accounts, 414 Ill. 89, 95, 110 N.E.2d 234; Thillens v. Hodge, 2 Ill.2d 45, 56, 116 N.E.2d 886; Thillens v. Morey, 11 Ill.2d 579, 591, 144 N.E.2d 735.) In Union Cemetery Ass'n of City of Lincoln v. Cooper, 414 Ill. 23, 110 N.E.2d 239 this court held that a distinction in legislation is not arbitrary if any state of facts can be reasonably conceived that would sustain it, and the existence of that state of facts at the time the law was enacted must be assumed *in the absence of proof or judicial knowledge* to the contrary.

There is a great diversity of opinion as to the effects of marijuana. As the majority opinion states, knowledge in this area is not nearly complete. This court cannot, therefore, take judicial notice thereof. (People v. Price, 257 Ill. 587, 594, 101 N.E. 196.) The defendant having offered no evidence thereon, this court cannot make findings and comparisons of marijuana with the other drugs. With the record in this state, the defendant has not sustained the burden of proving the classification invalid.

Syllabus.

STANLEY *v.* GEORGIA.

APPEAL FROM THE SUPREME COURT OF GEORGIA.

No. 293. Argued January 14–15, 1969.—Decided April 7, 1969.

Under authority of a warrant to search appellant's home for evidence of his alleged bookmaking activities, officers found some films in his bedroom. The films were projected and deemed to be obscene. Appellant was arrested for their possession. He was thereafter indicted, tried, and convicted for "knowingly hav[ing] possession of . . . obscene matter" in violation of a Georgia law. The Georgia Supreme Court affirmed, holding it "not essential to an indictment charging one with possession of obscene matter that it be alleged that such possession was 'with intent to sell, expose or circulate the same.'" Appellant contends that the Georgia obscenity statute is unconstitutional insofar as it punishes mere private possession of obscene matter. Georgia, relying on *Roth* v. *United States*, 354 U. S. 476, argues the statute's validity on the ground that "obscenity is not within the area of constitutionally protected speech or press." *Id.*, at 485. *Held:* The First Amendment as made applicable to the States by the Fourteenth prohibits making mere private possession of obscene material a crime. Pp. 560–568.

(a) Neither *Roth*, *supra*, nor subsequent decisions of the Court were made in the context of a statute punishing mere private possession of obscene material, but involved governmental power to prohibit or regulate certain public actions respecting obscene matter. Pp. 560–564.

(b) The Constitution protects the right to receive information and ideas, regardless of their social worth, and to be generally free from governmental intrusions into one's privacy and control of one's thoughts. Pp. 564–566.

(c) The State may not prohibit mere possession of obscene matter on the ground that it may lead to antisocial conduct, *Roth*, *supra*, distinguished, or proscribe such possession on the ground that it is a necessary incident to a statutory scheme prohibiting distribution, see *Smith* v. *California*, 361 U. S. 147. Pp. 566–568.

224 Ga. 259, 161 S. E. 2d 309, reversed and remanded.

Wesley R. Asinof argued the cause and filed a brief for appellant.

J. Robert Sparks argued the cause for appellee. With him on the brief was *Lewis R. Slaton.*

MR. JUSTICE MARSHALL delivered the opinion of the Court.

An investigation of appellant's alleged bookmaking activities led to the issuance of a search warrant for appellant's home. Under authority of this warrant, federal and state agents secured entrance. They found very little evidence of bookmaking activity, but while looking through a desk drawer in an upstairs bedroom, one of the federal agents, accompanied by a state officer, found three reels of eight-millimeter film. Using a projector and screen found in an upstairs living room, they viewed the films. The state officer concluded that they were obscene and seized them. Since a further examination of the bedroom indicated that appellant occupied it, he was charged with possession of obscene matter and placed under arrest. He was later indicted for "knowingly hav[ing] possession of . . . obscene matter" in violation of Georgia law.[1] Appel-

[1] "Any person who shall knowingly bring or cause to be brought into this State for sale or exhibition, or who shall knowingly sell or offer to sell, or who shall knowingly lend or give away or offer to lend or give away, or who shall knowingly have possession of, or who shall knowingly exhibit or transmit to another, any obscene matter, or who shall knowingly advertise for sale by any form of notice, printed, written, or verbal, any obscene matter, or who shall knowingly manufacture, draw, duplicate or print any obscene matter with intent to sell, expose or circulate the same, shall, if such person has knowledge or reasonably should know of the obscene nature of such matter, be guilty of a felony, and, upon conviction thereof, shall be punished by confinement in the penitentiary for not less than one year nor more than five years: Provided, however, in the event the

lant was tried before a jury and convicted. The Supreme Court of Georgia affirmed. *Stanley* v. *State*, 224 Ga. 259, 161 S. E. 2d 309 (1968). We noted probable jurisdiction of an appeal brought under 28 U. S. C. § 1257 (2). 393 U. S. 819 (1968).

Appellant raises several challenges to the validity of his conviction.[2] We find it necessary to consider only one. Appellant argues here, and argued below, that the Georgia obscenity statute, insofar as it punishes mere private possession of obscene matter, violates the First Amendment, as made applicable to the States by the Fourteenth Amendment. For reasons set forth below, we agree that the mere private possession of obscene matter cannot constitutionally be made a crime.

The court below saw no valid constitutional objection to the Georgia statute, even though it extends further than the typical statute forbidding commercial sales of obscene material. It held that "[i]t is not essential to an indictment charging one with possession of obscene matter that it be alleged that such possession was 'with intent to sell, expose or circulate the same.'" *Stanley v. State, supra,* at 261, 161 S. E. 2d, at 311. The State and appellant both agree that the question here before us is whether "a statute imposing criminal sanctions upon the mere [knowing] possession of obscene matter" is constitutional. In this context, Georgia concedes that the present case appears to be one of "first

jury so recommends, such person may be punished as for a misdemeanor. As used herein, a matter is obscene if, considered as a whole, applying contemporary community standards, its predominant appeal is to prurient interest, i. e., a shameful or morbid interest in nudity, sex or excretion." Ga. Code Ann. § 26-6301 (Supp. 1968).

[2] Appellant does not argue that the films are not obscene. For the purpose of this opinion, we assume that they are obscene under any of the tests advanced by members of this Court. See *Redrup* v. *New York*, 386 U. S. 767 (1967).

impression . . . on this exact point," [3] but contends that since "obscenity is not within the area of constitutionally protected speech or press," *Roth* v. *United States*, 354 U. S. 476, 485 (1957), the States are free, subject to the limits of other provisions of the Constitution, see, *e. g.*, *Ginsberg* v. *New York*, 390 U. S. 629, 637–645 (1968), to deal with it any way deemed necessary, just as they may deal with possession of other things thought to be detrimental to the welfare of their citizens. If the State can protect the body of a citizen, may it not, argues Georgia, protect his mind?

It is true that *Roth* does declare, seemingly without qualification, that obscenity is not protected by the First Amendment. That statement has been repeated in various forms in subsequent cases. See, *e. g.*, *Smith* v. *California*, 361 U. S. 147, 152 (1959); *Jacobellis* v. *Ohio*, 378 U. S. 184, 186–187 (1964) (opinion of BRENNAN, J.); *Ginsberg* v. *New York*, *supra*, at 635. However, neither *Roth* nor any subsequent decision of this Court dealt with the precise problem involved in the present case. Roth was convicted of mailing obscene circulars and advertising, and an obscene book, in violation of a federal obscenity statute.[4] The defendant in a companion case, *Alberts* v. *California*, 354 U. S. 476 (1957), was convicted of "lewdly keeping for sale obscene and indecent books, and [of] writing, composing and publishing an obscene advertisement of them . . . ." *Id.*, at 481. None of the statements cited by the Court in

[3] The issue was before the Court in *Mapp* v. *Ohio*, 367 U. S. 643 (1961), but that case was decided on other grounds. MR. JUSTICE STEWART, although disagreeing with the majority opinion in *Mapp*, would have reversed the judgment in that case on the ground that the Ohio statute proscribing mere possession of obscene material was "not 'consistent with the rights of free thought and expression assured against state action by the Fourteenth Amendment.'" *Id.*, at 672.

[4] 18 U. S. C. § 1461.

Roth for the proposition that "this Court has always assumed that obscenity is not protected by the freedoms of speech and press" were made in the context of a statute punishing mere private possession of obscene material; the cases cited deal for the most part with use of the mails to distribute objectionable material or with some form of public distribution or dissemination.[5] Moreover, none of this Court's decisions subsequent to *Roth* involved prosecution for private possession of obscene materials. Those cases dealt with the power of the State and Federal Governments to prohibit or regulate certain public actions taken or intended to be taken with respect to obscene matter.[6] Indeed, with one

[5] *Ex parte Jackson*, 96 U. S. 727, 736–737 (1878) (use of the mails); *United States* v. *Chase*, 135 U. S. 255, 261 (1890) (use of the mails); *Robertson* v. *Baldwin*, 165 U. S. 275, 281 (1897) (publication); *Public Clearing House* v. *Coyne*, 194 U. S. 497, 508 (1904) (use of the mails); *Hoke* v. *United States*, 227 U. S. 308, 322 (1913) (use of interstate facilities); *Near* v. *Minnesota*, 283 U. S. 697, 716 (1931) (publication); *Chaplinsky* v. *New Hampshire*, 315 U. S. 568, 571–572 (1942) (utterances); *Hannegan* v. *Esquire, Inc.*, 327 U. S. 146, 158 (1946) (use of the mails); *Winters* v. *New York*, 333 U. S. 507, 510 (1948) (possession with intent to sell); *Beauharnais* v. *Illinois*, 343 U. S. 250, 266 (1952) (libel).

[6] Many of the cases involved prosecutions for sale or distribution of obscene materials or possession with intent to sell or distribute. See *Redrup* v. *New York*, 386 U. S. 767 (1967); *Mishkin* v. *New York*, 383 U. S. 502 (1966); *Ginzburg* v. *United States*, 383 U. S. 463 (1966); *Jacobellis* v. *Ohio*, 378 U. S. 184 (1964); *Smith* v. *California*, 361 U. S. 147 (1959). Our most recent decision involved a prosecution for sale of obscene material to children. *Ginsberg* v. *New York*, 390 U. S. 629 (1968); cf. *Interstate Circuit, Inc.* v. *City of Dallas*, 390 U. S. 676 (1968). Other cases involved federal or state statutory procedures for preventing the distribution or mailing of obscene material, or procedures for predistribution approval. See *Freedman* v. *Maryland*, 380 U. S. 51 (1965); *Bantam Books, Inc.* v. *Sullivan*, 372 U. S. 58 (1963); *Manual Enterprises, Inc.* v. *Day*, 370 U. S. 478 (1962). Still another case dealt with an attempt to seize obscene material "kept for the purpose

exception, we have been unable to discover any case in which the issue in the present case has been fully considered.[7]

---

of being sold, published, exhibited . . . or otherwise distributed or circulated . . . ." *Marcus* v. *Search Warrant*, 367 U. S. 717, 719 (1961); see also *A Quantity of Books* v. *Kansas*, 378 U. S. 205 (1964). *Memoirs* v. *Massachusetts*, 383 U. S. 413 (1966), was a proceeding in equity against a book. However, possession of a book determined to be obscene in such a proceeding was made criminal only when "for the purpose of sale, loan or distribution." *Id.*, at 422.

[7] The Supreme Court of Ohio considered the issue in *State* v. *Mapp*, 170 Ohio St. 427, 166 N. E. 2d 387 (1960). Four of the seven judges of that court felt that criminal prosecution for mere private possession of obscene materials was prohibited by the Constitution. However, Ohio law required the concurrence of "all but one of the judges" to declare a state law unconstitutional. The view of the "dissenting" judges was expressed by Judge Herbert:

"I cannot agree that mere private possession of . . . [obscene] literature by an adult should constitute a crime. The right of the individual to read, to believe or disbelieve, and to think without governmental supervision is one of our basic liberties, but to dictate to the mature adult what books he may have in his own private library seems to the writer to be a clear infringement of his constitutional rights as an individual." 170 Ohio St., at 437, 166 N. E. 2d, at 393.

Shortly thereafter, the Supreme Court of Ohio interpreted the Ohio statute to require proof of "possession and control for the purpose of circulation or exhibition." *State* v. *Jacobellis*, 173 Ohio St. 22, 27–28, 179 N. E. 2d 777, 781 (1962), rev'd on other grounds, 378 U. S. 184 (1964). The interpretation was designed to avoid the constitutional problem posed by the "dissenters" in *Mapp*. See *State* v. *Ross*, 12 Ohio St. 2d 37, 231 N. E. 2d 299 (1967).

Other cases dealing with nonpublic distribution of obscene material or with legitimate uses of obscene material have expressed similar reluctance to make such activity criminal, albeit largely on statutory grounds. In *United States* v. *Chase*, 135 U. S. 255 (1890), the Court held that federal law did not make criminal the mailing of a private sealed obscene letter on the ground that the law's purpose was to purge the mails of obscene matter "as far as was consistent with the rights reserved to the people, and with a due regard to the security of private correspondence . . . ." 135 U. S., at 261. The

In this context, we do not believe that this case can be decided simply by citing *Roth*. *Roth* and its progeny certainly do mean that the First and Fourteenth Amendments recognize a valid governmental interest in dealing with the problem of obscenity. But the assertion of that interest cannot, in every context, be insulated from all constitutional protections. Neither *Roth* nor any other decision of this Court reaches that far. As the Court said in *Roth* itself, "[c]easeless vigilance is the watchword to prevent . . . erosion [of First Amendment rights] by Congress or by the States. The door barring federal and state intrusion into this area cannot be left ajar; it must be kept tightly closed and opened only the slightest crack necessary to prevent encroachment upon more important interests." 354 U. S., at 488. *Roth* and the cases following it discerned such an "important interest" in the regulation of commercial distribution of

---

law was later amended to include letters and was sustained in that form. *Andrews* v. *United States*, 162 U. S. 420 (1896). In *United States* v. *31 Photographs*, 156 F. Supp. 350 (D. C. S. D. N. Y. 1957), the court denied an attempt by the Government to confiscate certain materials sought to be imported into the United States by the Institute for Sex Research, Inc., at Indiana University. The court found, applying the *Roth* formulation, that the materials would not appeal to the "prurient interest" of those seeking to import and utilize the materials. Thus, the statute permitting seizure of "obscene" materials was not applicable. The court found it unnecessary to reach the constitutional questions presented by the claimant, but did note its belief that "the statement . . . [in *Roth*] concerning the rejection of obscenity must be interpreted in the light of the widespread distribution of the material in Roth." 156 F. Supp., at 360, n. 40. See also *Redmond* v. *United States*, 384 U. S. 264 (1966), where this Court granted the Solicitor General's motion to vacate and remand with instructions to dismiss an information charging a violation of a federal obscenity statute in a case where a husband and wife mailed undeveloped films of each other posing in the nude to an out-of-state firm for developing. But see *Ackerman* v. *United States*, 293 F. 2d 449 (C. A. 9th Cir. 1961).

obscene material. That holding cannot foreclose an examination of the constitutional implications of a statute forbidding mere private possession of such material.

It is now well established that the Constitution protects the right to receive information and ideas. "This freedom [of speech and press] . . . necessarily protects the right to receive . . . ." *Martin* v. *City of Struthers*, 319 U. S. 141, 143 (1943); see *Griswold* v. *Connecticut*, 381 U. S. 479, 482 (1965); *Lamont* v. *Postmaster General*, 381 U. S. 301, 307–308 (1965) (BRENNAN, J., concurring); cf. *Pierce* v. *Society of Sisters*, 268 U. S. 510 (1925). This right to receive information and ideas, regardless of their social worth, see *Winters* v. *New York*, 333 U. S. 507, 510 (1948), is fundamental to our free society. Moreover, in the context of this case—a prosecution for mere possession of printed or filmed matter in the privacy of a person's own home—that right takes on an added dimension. For also fundamental is the right to be free, except in very limited circumstances, from unwanted governmental intrusions into one's privacy.

> "The makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness. They recognized the significance of man's spiritual nature, of his feelings and of his intellect. They knew that only a part of the pain, pleasure and satisfactions of life are to be found in material things. They sought to protect Americans in their beliefs, their thoughts, their emotions and their sensations. They conferred, as against the Government, the right to be let alone—the most comprehensive of rights and the right most valued by civilized man." *Olmstead* v. *United States*, 277 U. S. 438, 478 (1928) (Brandeis, J., dissenting).

See *Griswold* v. *Connecticut*, *supra*; cf. *NAACP* v. *Alabama*, 357 U. S. 449, 462 (1958).

These are the rights that appellant is asserting in the case before us. He is asserting the right to read or observe what he pleases—the right to satisfy his intellectual and emotional needs in the privacy of his own home. He is asserting the right to be free from state inquiry into the contents of his library. Georgia contends that appellant does not have these rights, that there are certain types of materials that the individual may not read or even possess. Georgia justifies this assertion by arguing that the films in the present case are obscene. But we think that mere categorization of these films as "obscene" is insufficient justification for such a drastic invasion of personal liberties guaranteed by the First and Fourteenth Amendments. Whatever may be the justifications for other statutes regulating obscenity, we do not think they reach into the privacy of one's own home. If the First Amendment means anything, it means that a State has no business telling a man, sitting alone in his own house, what books he may read or what films he may watch. Our whole constitutional heritage rebels at the thought of giving government the power to control men's minds.

And yet, in the face of these traditional notions of individual liberty, Georgia asserts the right to protect the individual's mind from the effects of obscenity. We are not certain that this argument amounts to anything more than the assertion that the State has the right to control the moral content of a person's thoughts.[8] To

[8] "Communities believe, and act on the belief, that obscenity is immoral, is wrong for the individual, and has no place in a decent society. They believe, too, that adults as well as children are corruptible in morals and character, and that obscenity is a source of corruption that should be eliminated. Obscenity is not suppressed primarily for the protection of others. Much of it is suppressed for the purity of the community and for the salvation and welfare of the 'consumer.' Obscenity, at bottom, is not crime. Obscenity is sin." Henkin, Morals and the Constitution: The Sin of Obscenity, 63 Col. L. Rev. 391, 395 (1963).

some, this may be a noble purpose, but it is wholly inconsistent with the philosophy of the First Amendment. As the Court said in *Kingsley International Pictures Corp.* v. *Regents*, 360 U. S. 684, 688–689 (1959), "[t]his argument misconceives what it is that the Constitution protects. Its guarantee is not confined to the expression of ideas that are conventional or shared by a majority. . . . And in the realm of ideas it protects expression which is eloquent no less than that which is unconvincing." Cf. *Joseph Burstyn, Inc.* v. *Wilson*, 343 U. S. 495 (1952). Nor is it relevant that obscene materials in general, or the particular films before the Court, are arguably devoid of any ideological content. The line between the transmission of ideas and mere entertainment is much too elusive for this Court to draw, if indeed such a line can be drawn at all. See *Winters* v. *New York*, *supra*, at 510. Whatever the power of the state to control public dissemination of ideas inimical to the public morality,. it cannot constitutionally premise legislation on the desirability of controlling a person's private thoughts.

Perhaps recognizing this, Georgia asserts that exposure to obscene materials may lead to deviant sexual behavior or crimes of sexual violence. There appears to be little empirical basis for that assertion.[9] But more important, if the State is only concerned about printed or filmed materials inducing antisocial conduct, we believe that in the context of private consumption of ideas and information we should adhere to the view that "[a]mong free men, the deterrents ordinarily to be

[9] See, *e. g.*, Cairns, Paul, & Wishner, Sex Censorship: The Assumptions of Anti-Obscenity Laws and the Empirical Evidence, 46 Minn. L. Rev. 1009 (1962); see also M. Jahoda, The Impact of Literature: A Psychological Discussion of Some Assumptions in the Censorship Debate (1954), summarized in the concurring opinion of Judge Frank in *United States* v. *Roth*, 237 F. 2d 796, 814–816 (C. A. 2d Cir. 1956).

applied to prevent crime are education and punishment for violations of the law . . . ." *Whitney* v. *California*, 274 U. S. 357, 378 (1927) (Brandeis, J., concurring). See Emerson, Toward a General Theory of the First Amendment, 72 Yale L. J. 877, 938 (1963). Given the present state of knowledge, the State may no more prohibit mere possession of obscene matter on the ground that it may lead to antisocial conduct than it may prohibit possession of chemistry books on the ground that they may lead to the manufacture of homemade spirits.

It is true that in *Roth* this Court rejected the necessity of proving that exposure to obscene material would create a clear and present danger of antisocial conduct or would probably induce its recipients to such conduct. 354 U. S., at 486–487. But that case dealt with public distribution of obscene materials and such distribution is subject to different objections. For example, there is always the danger that obscene material might fall into the hands of children, see *Ginsberg* v. *New York*, *supra*, or that it might intrude upon the sensibilities or privacy of the general public.[10] See *Redrup* v. *New York*, 386 U. S. 767, 769 (1967). No such dangers are present in this case.

Finally, we are faced with the argument that prohibition of possession of obscene materials is a necessary incident to statutory schemes prohibiting distribution. That argument is based on alleged difficulties of proving an intent to distribute or in producing evidence of actual distribution. We are not convinced that such difficulties

[10] The Model Penal Code provisions dealing with obscene materials are limited to cases of commercial dissemination. Model Penal Code § 251.4 (Prop. Official Draft 1962); see also Model Penal Code § 207.10 and comment 4 (Tent. Draft No. 6, 1957); H. Packer, The Limits of the Criminal Sanction 316–328 (1968); Schwartz, Morals Offenses and the Model Penal Code, 63 Col. L. Rev. 669 (1963).

exist, but even if they did we do not think that they would justify infringement of the individual's right to read or observe what he pleases. Because that right is so fundamental to our scheme of individual liberty, its restriction may not be justified by the need to ease the administration of otherwise valid criminal laws. See *Smith* v. *California*, 361 U. S. 147 (1959).

We hold that the First and Fourteenth Amendments prohibit making mere private possession of obscene material a crime.[11] *Roth* and the cases following that decision are not impaired by today's holding. As we have said, the States retain broad power to regulate obscenity; that power simply does not extend to mere possession by the individual in the privacy of his own home. Accordingly, the judgment of the court below is reversed and the case is remanded for proceedings not inconsistent with this opinion.

It is so ordered.

MR. JUSTICE BLACK, concurring.

I agree with the Court that the mere possession of reading matter or movie films, whether labeled obscene or not, cannot be made a crime by a State without vio-

[11] What we have said in no way infringes upon the power of the State or Federal Government to make possession of other items, such as narcotics, firearms, or stolen goods, a crime. Our holding in the present case turns upon the Georgia statute's infringement of fundamental liberties protected by the First and Fourteenth Amendments. No First Amendment rights are involved in most statutes making mere possession criminal.

Nor do we mean to express any opinion on statutes making criminal possession of other types of printed, filmed, or recorded materials. See, *e. g.*, 18 U. S. C. § 793 (d), which makes criminal the otherwise lawful possession of materials which "the possessor has reason to believe could be used to the injury of the United States or to the advantage of any foreign nation . . . ." In such cases, compelling reasons may exist for overriding the right of the individual to possess those materials.

lating the First Amendment, made applicable to the States by the Fourteenth. My reasons for this belief have been set out in many of my prior opinions, as for example, *Smith* v. *California*, 361 U. S. 147, 155 (concurring opinion), and *Ginzburg* v. *United States*, 383 U. S. 463, 476 (dissenting opinion).

MR. JUSTICE STEWART, with whom MR. JUSTICE BRENNAN and MR. JUSTICE WHITE join, concurring in the result.

Before the commencement of the trial in this case, the appellant filed a motion to suppress the films as evidence upon the ground that they had been seized in violation of the Fourth and Fourteenth Amendments. The motion was denied, and the films were admitted in evidence at the trial. In affirming the appellant's conviction, the Georgia Supreme Court specifically determined that the films had been lawfully seized. The appellant correctly contends that this determination was clearly wrong under established principles of constitutional law. But the Court today disregards this preliminary issue in its hurry to move on to newer constitutional frontiers. I cannot so readily overlook the serious inroads upon Fourth Amendment guarantees countenanced in this case by the Georgia courts.

The Fourth Amendment provides that "no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized." The purpose of these clear and precise words was to guarantee to the people of this Nation that they should forever be secure from the general searches and unrestrained seizures that had been a hated hallmark of colonial rule under the notorious writs of assistance of the British Crown. See *Stanford* v. *Texas*, 379 U. S. 476, 481. This most basic of Fourth Amendment guarantees was frus-

trated in the present case, I think, in a manner made the more pernicious by its very subtlety. For what happened here was that a search that began as perfectly lawful became the occasion for an unwarranted and unconstitutional seizure of the films.

The state and federal officers gained admission to the appellant's house under the authority of a search warrant issued by a United States Commissioner. The warrant described "the place to be searched" with particularity.[1] With like particularity, it described the "things to be seized"—equipment, records, and other material used in or derived from an illegal wagering business.[2] And the warrant was issued only after the Commissioner had been apprised of more than adequate probable cause to issue it.[3]

There can be no doubt, therefore, that the agents were lawfully present in the appellant's house, lawfully authorized to search for any and all of the items specified in the warrant, and lawfully empowered to seize any such

---

[1] "[T]he premises known as 280 Springside Drive, S. E., two story residence with an annex on the main floor constructed of brick and frame, in Atlanta, Fulton County, Georgia, in the Northern District of Georgia . . . ."

[2] "[B]ookmaking records, wagering paraphernalia consisting of bet slips, account sheets, recap sheets, collection sheets, adding machines, money used in or derived from the wagering business, records of purchases, records of real estate and bank transactions, the money for which was derived from the wagering business, and any other property used in the wagering business, which are being used and/or have been used in the operation of a bookmaking business or represent the fruits of a bookmaking business being operated in violation of Sections 4411, 4412 and 7203 IRC of 1954."

[3] Before the Commissioner were no less than four lengthy and detailed affidavits, setting out the grounds for the affiants' reasonable belief that the appellant was engaged in an illegal gambling enterprise, and that the paraphernalia of his trade were concealed in his house.

items they might find.[4] It follows, therefore, that the agents were acting within the authority of the warrant when they proceeded to the appellant's upstairs bedroom and pulled open the drawers of his desk. But when they found in one of those drawers not gambling material but moving picture films, the warrant gave them no authority to seize the films.

The controlling constitutional principle was stated in two sentences by this Court more than 40 years ago:

> "The requirement that warrants shall particularly describe the things to be seized makes general searches under them impossible and prevents the seizure of one thing under a warrant describing another. As to what is to be taken, nothing is left to the discretion of the officer executing the warrant." *Marron* v. *United States*, 275 U. S. 192, 196.

This is not a case where agents in the course of a lawful search came upon contraband, criminal activity, or criminal evidence[5] in plain view. For the record makes clear that the contents of the films could not be determined by mere inspection. And this is not a case that presents any questions as to the permissible scope of a search made incident to a lawful arrest. For the appellant had not been arrested when the agents found the films. After finding them, the agents spent some 50 minutes exhibiting them by means of the appellant's projector in another upstairs room. Only then did the agents return downstairs and arrest the appellant.

Even in the much-criticized case of *United States* v. *Rabinowitz*, 339 U. S. 56, the Court emphasized that "ex-

---

[4] The fact that almost no gambling material was actually found has no bearing, of course, upon the validity of the search. The constitutionality of a search depends in no measure upon what it brings to light. *Byars* v. *United States*, 273 U. S. 28, 29.

[5] See *Warden* v. *Hayden*, 387 U. S. 294.

ploratory searches . . . cannot be undertaken by officers with or without a warrant." *Id.*, at 62. This record presents a bald violation of that basic constitutional rule. To condone what happened here is to invite a government official to use a seemingly precise and legal warrant only as a ticket to get into a man's home, and, once inside, to launch forth upon unconfined searches and indiscriminate seizures as if armed with all the unbridled and illegal power of a general warrant.

Because the films were seized in violation of the Fourth and Fourteenth Amendments, they were inadmissible in evidence at the appellant's trial. *Mapp* v. *Ohio*, 367 U. S. 643. Accordingly, the judgment of conviction must be reversed.

(Reprinted from the Hastings Law Journal, Vol. 19, No. 3, March 1968)

THE CALIFORNIA MARIJUANA POSSESSION STATUTE: AN INFRINGEMENT ON THE RIGHT OF PRIVACY OR OTHER PERIPHERAL CONSTITUTIONAL RIGHTS?

By

Michael A. Town

The question of the constitutional validity of the California marijuana possession statute in light of recent decisions will be examined in this comment. Before undertaking the constitutional analysis, a review of the statute itself is in order.

Under California law, a person who "plants, cultivates, harvests, dries... processes... or possesses" marijuana[1] is committing a felony,[2] and, if convicted, faces a mandatory sentence of 1 to 10 years in the state prison for a first offense, up to 20 years for a second offense, and 5 years to life imprisonment for a third offense.[3] In contrast to the harsh penalties for offenses involving the possession of marijuana, using marijuana or being under its influence are misdemeanors, punishable by county jail sentences ranging from 90 days to 1 year.[4] The severity of punishment for possession of marijuana may also be contrasted with the misdemeanor penalty assessed for possession of LSD (lysergic acid diethylamide).[5]

---

[1] The statutory definition of marijuana is: "all parts of the plant Cannabis sativa L. (commonly known as marijuana), whether growing or not; the seeds thereof; the resin extracted from any part of such plant; and every compound, manufacture, salt, derivative, mixture, or preparation of such plant, its seed or resin." Cal. Health & Safety Code Section 11003.1.

[2] Under Cal. Pen. Code Section 17 a felony is defined as "a crime which is punishable with death or by imprisonment in the state prison."

[3] Cal. Health & Safety Code Section 11530.

[4] Cal. Health & Safety Code Section 11721. In practice the part of the statute prohibiting use of marijuana has little importance because if the accused possesses marijuana he will be prosecuted under the felony provisions of section 11530; if he does not possess marijuana but is under its influence then section 11721 will be applied. Boyko & Rotberg, Constitutional Objections to California's Marijuana Possession Statute, 14 U.C.L.A.L. Rev. 773, 785 n.63 (1967).

[5] Cal. Health & Safety Code Section 11910 treats a first conviction for the possession of LSD (classified as a restricted dangerous drug in Cal. Health & Safety Code Section 11901 (c)) as a misdemeanor subject to a maximum punishment of a $1000 fine and 1 year imprisonment in the county jail.

If the narcotic possessed is one of the "hard" narcotics such as heroin, morphine, or cocaine, which are addictive whereas marijuana is not,[6] the punishment is quite similar to the penalties for marijuana possession. The statute assesses penalties of 2 to 10 years for a first conviction, 5 to 20 years for a second conviction and 15 years to life imprisonment for a third conviction.[7]

As a further contrast, it is noted that there is no law against the mere possession of alcoholic beverages in spite of the well-known dangers of this intoxicant.[8] Criminal penalties are imposed only when alcohol is used in some abusive manner, such as when a person is intoxicated in public[9] or operates a motor vehicle while under the influence of alcohol.[10]

---

[6] Cal. Welf. & Inst'ns Code Section 3009 states: "A 'narcotic addict,' as used in this subdivision refers to any person, adult or minor, who is addicted to the unlawful use of any narcotic as defined in Division 10 of the Health and Safety Code, except mairjuana." (emphasis added).

[7] Cal. Health & Safety Code Section 11500.

[8] Even where possession by certain groups likely to misuse alcohol is discouraged, the method of control is to restrict the sale of alcoholic beverages to them. For example, Cal. Bus. & Prof. Code Section 25658 (a) makes sale of alcoholic beverages to a minor a misdemeanor, and Cal. Pen. Code Section 397 makes the sale of alcoholic beverages to any habitual drunk a misdemeanor. See In re Luera, 28 Cal. App. 185, 152 P. 738 (1915), holding a municipal ordinance making the possession of alcohol illegal to be an unconstitutional abridgment of the privileges and immunities guaranteed a citizen by U.S. Const. art. IV, Section 2, and amend. XIV, Section 1. But see In re Yun Quong, 159 Cal. 508, 114 P. 835 (1911), where the privileges and immunities argument failed when used to attack a conviction for possession of opium. For an interesting view why different societal attitudes concerning marijuana and alcohol prevail, see not 178 infra.

[9] Cal. Pen. Code Section 647(f) punishes as a misdemeanant one "(w)ho is found in any public place under the influence of intoxicating liquor...."

[10] Cal. Vehicle Code Sections 23101-02.

The legislative history of marijuana regulation shows a trend of increasingly severe penalties for its possession. In 1907 marijuana was first regulated by the California Legislature when it was included within the class of substances which had to be labeled as "poison."[11] Possession of marijuana was lawful until 1915 when possession unless prescribed by a physician was prohibited.[12] In 1929 the legislature passed the State Narcotic Act[13] which regulated the possession of marijuana by including it among habit forming, narcotic and other dangerous drugs and substances. Thus marijuana was at this time first included among the "hard" narcotics such as heroin, morphine, and cocaine.[14]

In 1939 the Narcotics Act was incorporated into the California Health and Safety Code[15] along with the same illicit narcotics gathered together in 1929.[16] Marijuana possession and the planting provisions were placed in section 11530, a separate section, in 1959.[17] The present mandatory felony sentences were part of a scheme by which longer sentences for possession of all narcotics were imposed in 1961.[18] Prior to 1961 the punishment for marijuana possession was in the alternative so that the trial judge in his discretion could make the offense either a misdemeanor or a felony depending on the sentence imposed.[19]

[15] Cal. Stats. 1939, ch. 60, Sections 11000-797, at 755-76.

[16] Cal. Stats. 1939, ch. 60, Section 11712, at 771.

[17] Cal. Stats. 1959, ch. 1112, Section 7, at 3194-95.

[18] Cal. Stats. 1961, ch. 274, Section 7, at 1305.

[19] Cal. Stats. 1959, ch. 1112, Section at 3194-95

It is clear that the most recent development in a long history of regulation of marijuana possession is by far the most severe.[20] But even in the face of felony punishment it appears that more and more arrests are made and convictions obtained in California for the possession of marijuana.[21] Reliable sources claim that use of marijuana and its availability are on the upswing.[22] These facts tend to indicate that the statute is punishing offenders without any significant deterrent effect.

Timeliness of Constitutional Attack

The question of the constitutionality fo the marijuana possession statute is of more than purely academic interest because of the increasing number of arrests,[23] the severity of the punishment,[24] the inconclusive evidence available on the nature of the drug and its effects,[25] and the growing public controversy over the entire subject of marijuana regulation.

---

[20] See Boyko & Rotberg, supra note 4, at 781-85 for a thorough legislative history of the marijuana possession laws in California.

[21] Bureau of Criminal Statistics, Drug Arrests and Dispositions in California 1964, at 51, shows that arrests for possession of marijuana have tripled since 1960. The report also indicates that juvenile arrests for marijuana possession have increase over 500% since 1960. Id. at 88.

[22] Id. at 10. Testimony of Dr. Joel Fort before a hearing of the Assembly Committee on Public Health, San Francisco, September 28, 1967. Dr. Fort has served on the medical staff of the U.S. Public Health Service Hospital in Lexington, Kentucky, and with the United Nations Division of Narcotic Drugs. He has been the director of both the Center for Treatment and Education on Alcoholism in Oakland, California, and the Health Department Center for Special Problems in San Francisco, California. He is a consultant on drug addiction to the World Health Organization.

[23] See note 21 supra.

[24] See text accompanying notes 2-3 supra.

[25] For a discussion of the evidence on the nature of marijuana see Boyko & Rotberg, supra note 4, at 777.

Recently there has been increasing debate across the nation over the harshness of the marijuana possession laws as compared to the alleged effects of the drug.[26] The Commissioner of the United States Food and Drug Administration has said that the "severity of the penalties is inconsistent with the nature of the drug itself."[27] The United States Presidential Commission on Law Enforcement and Administration of Justice has called for a reevaluation of the marijuana laws.[28] Even in the light of increasing arrests and growing public controversy there is little likelihood of immediate repeal of the California marijuana possession statute although there is a possibility that legislation may be introduced making possession of marijuana subject to alternative felony-misdemeanor sentencing or reducing the punishment to a misdemeanor.[29]

Up to the present time there have been no cases raising well-argued constitutional objections to the California marijuana possession statute.[30] Whatever the

[28] President's Comm'n on Law Enforcement and Administration of Justice, The Challenge of Crime in a Free Society 224-25 (1967).

[29] Interview with Mr. Thomas Carroll, consultant to the Assembly Committee on Criminal Procedure, in San Francisco, California, September 28, 1967.

[30] Cases where constitutional objections have been raised include People v. Mitchell, 244 Cal. App. 2d 176, 52 Cal. Rptr. 884 (1966), which involved a challenge to Cal. Health & Safety Code Section 11530 based on the free exercise of religion clause of the first amendment. The appeal failed as the defendant did not show he sincerely believed marijuana was essential to the practice of his religion and that no antisocial consequences were involved. People v. Glaser, 238 Cal. App. 2d 819, 48 Cal. Rptr. 427 (1965), and People v. Mistriel, 110 Cal. App. 2d 110, 241 P.2d 1050 (1952), both involved challenges to marijuana possession statutes on the ground that due process of law was denied the appellants since the state had no basis for making marijuana, an allegedly beneficial herb according to appellants, illegal to possess. The court in each case decided that since possession of marijuana was a public offense, the legislative showing of a rational relationship between the statute and the recognized purpose of the state to legislate for the health, safety and general welfare of the people was sufficient.

reason for the scarcity of constitutional attack, it seems that without legislative action modifying the statute, constitutional objections will be raised with greater frequency.[31]

Constitutional Objections to the Marijuana Possession Statute - A General View

Two possible constitutional defenses to the California marijuana possession statute are raised in this comment. The first defense would bring the possession of marijuana within the right of privacy. This doctrine of privacy as a substantive bar to a criminal statute was first recognized in Griswold v. Connecticut[32] and that case will be used as a starting point for analysis.

The second defense is based on the reasoning of Griswold, not the holding. This defense would bring possession and use of marijuana within other unnamed but fundamental guarantees included in the amendments to the Constitution.[33]

---

[31] Apparently the vast majority of those persons prosecuted under the statute have defended on theories of illegal search and seizure, e.g., People v. Reeves, 61 Cal. 2d 269, 391 P.2d 393, 38 Cal. Rptr. 1 (1964), or lack of knowledge of the actual possession of marijuana, e.g., People v. Redrick, 55 Cal. 2d 282, 359 P.2d 255, 10 Cal. Rptr. 823 (1961) (opium); People v. Perez, 213 Cal. App. 2d 436, 28 Cal. Rptr. 751 (1963). In People v. Rodrigues, 151 Cal. App. 2d 598, 601, 312 P.2d 272, 274 (1957), the court said that it is "essential to the crime... that the defendant have physical or constructive possession, coupled with knowledge of the present and narcotic nature of the substance."

When evidence of possession is dubious or sketchy, Cal. Health & Safety Code Section 11556 is often employed. This section makes it a misdemeanor to visit or be in a place where marijuana is being used. The provision can be resorted to for practical reasons in charging the defendant who might willingly plead guilty to this offense but would contest felony prosecution under the possession statute.

[32] 381 U.S. 479 (1965).

[33] For the discussion of fundamental peripheral rights see text accompanying notes 64-110 infra.

These defenses constitute a two-pronged attack which have the same origins in the Constitution.[34] The reasoning of Griswold is basic to both the right of privacy and the other peripheral yet fundamental rights. The potential success of these constitutional defenses will be best understood by a consideration of how the California courts have applied Griswold and other cases involving personal rights.

Before discussing the two-pronged attack mentioned above it should be amphasized that these are not the only possible constitutional objections to the marijuana possession statute. In a proper case the right to free exercise of religion as expressed in the first amendment could be used to carve out an exception to the statute as was done in People v. Woody[35] where a California statute prohibiting the possession of peyote[36] was under consideration. The right to the free exercise of religion would be applicable to the marijuana possession statute if a user could show that the use of marijuana was essential to his religion as well as showing his sincerity in his religious belief.[37]

---

[34] See Griswold v. Connecticut, 381 U.S. 479, 484, where the Court spells out its penumbra theory in which the peripheral rights, of which privacy is one, are expanded.

[35] 61 Cal. 2d 716, 394 P.2d 813, 40 Cal. Rptr. 69 (1964).

[36] Cal. Health & Safety Code Section 11500.

[37] This was a major point in People v. Wood-, 61 Cal. 2d 716, 720-22, 394 P.2d 813, 817-18, 40 Cal. Rptr. 69, 73-74 (1964). See In re Grady, 61 Cal. 2d 887, 394 P.2d 728, 39 Cal. Rptr. 912 (1964), where the California Supreme Court granted habeas corpus to a defendant in a peyote possession case and remanded the case to the trial court on the question of whether defendant's belief that the use of peyote for religious purposes was honest and bona fide. But see Leary v. United States, 36 U.S.L.W. 2218 (5th Cir. Sept. 29, 1967), where appellant, Dr. Timothy Leary, failed to show to the court's satisfaction that the use of marijuana was essential to his practice of Hinduism; see Finer, 19 Hastings L.J. 667 (1968); State v. Bullard, 267 N.C. 599, 148 S.E.2d 565 (1966), noted in 28 Ohio St. L.J. 369 (1967), where the court refused to follow the Woody case on the grounds that even if defendant were sincere, the first amendment would not protect him in his use of marijuana and peyote.

Also it might be argued that the California marijuana possession statute violates the constitutional guarantee against cruel and unusual punishment found in the eighth amendment. The statute might be invalidated by the guarantee against cruel and unusual punishment if the possession of marijuana is conduct which the court would consider not within the legislative power to punish as a felony. It is the discrepancy between the conduct and the punishment which makes the punishment cruel and unusual under the ruling of Robinson v. California.[38] By making possession of marijuana a felony, thus equating such conduct with the whole spectrum of common law felonies such as rape, arson, larceny and murder, the statute would seem to be imposing cruel and unusual punishment.[39]

There is also an argument that the classification of marijuana as a narcotic in section 11001 and the prohibition of possession in section 11530 of the California Health and Safety Code violate the equal protection clause of the fourteenth amendment. In order to satisfy the equal protection guarantee the statute must "cover all persons who are logically, scientifically or by dint of common sense includable in order to

---

[38] 370 U.S. 660 (1962). The case struck down as unconstitutional a California statute making criminal the status of being "addicted to the use of narcotics." Justice Douglas in a concurring opinion, id. at 676, said: "A punishment all out of proportion to the offense may bring it within the ban against 'cruel and unusual punishments.'" See Driver v. Hinnat, 356 F.2d 761 (4th Cir. 1966), and Easter v. District of Columbia, 361 F.2d 50 (D.C. Cir. 1966), where the cruel and unusual punishment argument was successfully applied to drunkenness prosecutions of alcoholics under local statutes.

[39] For discussion of the cruel and unusual punishment argument, see Boyko & Rotberg, supra note 4, at 791.

effectuate the legitimate goals of the statute."[40] Making possession of marijuana illegal, while excluding other euphorics such as alcohol, might be considered a violation of the guarantee of equal protection, by this test.

In considering the constitutional defense of equal protection the court would have to pass on the legislative policy behind the classification, a step which the courts have been reluctant to undertake in cases where the question of marijuana has arisen.[41] In the two cases where the statutory classification of marijuana has been considered, the court assumed that the classification was rational.[42] In light of recent cases where courts have reviewed legislative policy, it would seem that a court might now take more initiative in reviewing the statutory policy in applying the equal protection test.[43]

[41] People v. Glaser, 238 Cal. App. 2d 819, 48 Cal. Rptr. 427 (1965); People v. Mistriel, 110 Cal. App. 2d 110, 241 P.2d 1050 (1952). Both cases are discussed in note 30 supra.

[42] Id.

[43] E.g., People v. O'Neil, 62 Cal. 2d 748, 401 P.2d 928, 44 Cal. Rptr. 320 (1965), where the court thoroughly reviewed the legislative policy behind the statute in determining the legal test for addiction within the meaning of Cal. Vehicle Code Section 23105, which prohibits the operation of a motor vehicle by a narcotic addict; Wollam v. City of Palm Springs, 50 Cal. 2d 276, 379 P.2d 481, 29 Cal. Rptr. 1 (1963), where pursuant to an examination of municipal policy the court found that there were alternative methods of controlling traffic congestion other than by the broad regulation of loudspeaker trucks by the unconstitutional municipal ordinance in issue. See generally McLaughlin v. Florida, 379 U.S. 184, 191 (1964); Skinner v. Oklahoma, 316 U.S. 535, 541, 543 (1942).

Although the foregoing discussion demonstrates there are a number of potential constitutional objections to the California marijuana possession statutes,[44] this comment will discuss in detail only the two constitutional attacks raised by the Griswold decision, i.e. the right of privacy and the other peripheral rights found within the Bill of Rights. These possible constitutional attacks are more thoroughly examined in the next section.

Griswold v. Connecticut

Support from United States Surpeme Court cases is necessary in order to raise the dual attack of the peripheral fundamental rights and the right of privacy since these rights are not found specifically in the Constitution. As noted, the leading case supporting the existence of the right of privacy and the proposition that there exist other peripheral but fundamental constitutional rights which are not expressly enumerated in the Constitution is Griswold v. Connecticut.[45] Consequently, a thorough understanding of the Griswold decision is necessary before examining how the California courts have applied it.

The Court in Griswold overturned the Connecticut "anti-birth control" statute.[46] This "uncommonly silly law" as it was called by Justice Stewart,[47] was an antiquated, rarely invoked statute making it a criminal offense to use birth control devices for

---

[46] Id. at 485.

[47] Id. at 527 (dissent).

the purpose of preventing conception.[48] It was no surprise that the law was invalidated. The importance of the case lies in the way in which the statute was held unconstitutional.

Privacy was the basis for the Court's decision,[49] and as a substantive right privacy was raised as a defense to any application of the Connecticut statute.[50] The right of privacy relied on in Griswold is not the procedural right of privacy which protects an individual from unreasonable searches and seizures employed in enforcing constitutionally valid statutes.[51] The right of privacy recognized in Griswold is also to be distinguished from the right of privacy found in the law of torts which allows one to recovery monetary compensation for an invasion of his privacy.[52] The right of privacy applied in Griswold is a direct substantive bar to any statute in question.[53]

In Griswold the Court held that the statute infringed on the zone of privacy which a married couple possessed.[54] Within this zone the couple was free to decide whether or not they would use contraceptive devices.[55] Support for this right of

---

[48] Conn. Gen. Stat. Rev. Section 53-32 (1958). "Any person who uses any drug, medicinal article or instrument for the purpose of preventing conception shall be fined not less than fifty dollars or imprisoned not less than sixty days nor more than one year or be both fined and imprisoned."

[54] Id.

[55] Id.

privacy was found by looking to the "specific guarantees in the Bill of Rights having penumbras, formed by emanations from those guarantees that help give them life and substance."[56] The Court found that the right of privacy protected in Griswold was created by "several fundamental constitutional guarantees"[57] and based its decision on five of these guarantees contained in the Bill of Rights:

> Various guarantees create zones of privacy. The right of association contained in the penumbra of the First Amendment is one... The Third Amendment in its prohibition against the quartering of soldiers "in any house" in time of peace without the consent of the owner is another facet of that privacy. The Fourth Amendment explicitly affirms the "right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures." The Fifth Amendment in its Self-Incrimination Clause enables the citizen to create a zone of privacy which government may not force him to surrender to his detriment. The Ninth Amendment provides: "The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people."[58]

The Court reinforced its argument that penumbral zones of privacy existed by showing that past decisions had found fundamental constitutional rights not specifically mentioned in the Constitution.[59] Rights such as freedom of inquiry, freedom of thought, and freedom to teach were designated as peripheral rights.[60] These rights were considered essential because "(w)ithout those peripheral rights the specific rights would be less secure."[61]

---

[56] Id. at 484.

[57] Id. at 485.

[58] Id. at 484.

[59] Id. at 482-83.

[60] Id. at 482, citing Frankfurter's concurring opinion in Wieman v. Updegraff, 344 U.S. 183, 195 (1952).

[61] 381 U.S. at 482-83.

While the language of Griswold is broad, the holding itself is narrow. The case is significant in that six Supreme Court Justices found a right of privacy within the Constitution.[62] Of greater importance than the holding of Griswold is the reasoning of the Court that the peripheral rights do exist and are essential to the specific rights.[63] A close examination of the California cases is necessary in considering the scope of privacy and the other peripheral rights.

California's Treatment of Griswold

The rule of Griswold is clear with regard to the right of privacy in its effect on a statute prohibiting the use of birth control devices. The question presented here is whether or not possession of marijuana can be brought either within the right of privacy, or within any of the peripheral but fundamental

---

[62] Although six justices found privacy, they did not all find it in the same place in the Constitution. Justices Goldberg, Brennan and Chief Justice Warren joined with Justice Douglas in finding privacy supported by fundamental personal rights found in the penumbra of the Bill of Rights. Such personal rights are not confined to the specific terms of the Bill of Rights. Id. at 486.

Justices Goldberg, Brennan and Chief Justice Warren went on to use the ninth amendment as authority for the right of privacy as "there are additional fundamental rights, protected from governmental infringement which exist alongside those fundamental rights specifically mentioned in the first eight constitutional amendments." Id. at 488.

Justice Harlan found support for privacy in the due process clause of the fourteenth amendment. "The Due Process Clause of the Fourteenth Amendment stands... on its own bottom." Id. at 500.

Justice White also relied on the fourteenth amendment as the Connecticut statute deprived married couples of "liberty" without due process of law. Id. at 502.

[63] Id. at 483.

constitutional guarantees. This is the question which will plague the lawyer who has but one significant United States Supreme Court decision on the substantive right of privacy from which to work.

Peripheral but Fundamental Constitutional Rights

In looking to the California cases the right of privacy as a substantive right has not been applied by the courts. Instead two California cases have cited Griswold for the proposition that broad unnamed peripheral rights exist within the Bill of Rights.[64] This reliance on the reasoning of the court in Griswold appears to be the significance of that case to the California courts although it may be that the proper fact situation has not come before the courts where the right of privacy might be applicable. An examination of the actual California cases will better indicate if these two attacks are applicable to the marijuana possession statute.

A key California case using Griswold as authority is In re Klor.[65] The case involved construction of section 311.2 of the California Penal Code dealing with preparation and distribution of obscene material.[66] The trial court interpreted

---

[64] In re Klor, 64 Cal. 2d 816, 820, 415 P.2d 791, 794, 51 Cal. Rptr. 903, 906 (1966); Finot v. Pasadena City Bd. of Educ., 250 Cal. App. 2d 226, 235, 58 Cal. Rptr. 520, 527 (1967).

[65] 64 Cal. 2d 816, 415 P.2d 791, 51 Cal. Rptr. 903 (1966).

[66] Cal. Pen. Code Section 311.2 reads: "Every person who knowingly:... prepares, publishes, prints, exhibits, distributes, or offers to distribute, or has in his possession with intent to distribute or to exhibit or offer to distribute, any obscene matter is guilty of a misdemeanor."

the statute to mean that the accused was guilty if he prepared the obscene photographs found in his possession or intended to distribute the photographs. The alleged error in the trial court's instruction was allowing the jury to find error in the trial court's instruction was allowing the jury to find the accused guilty for mere preparation and possession of the obscene material without the essential intent to distribute it.[67]

The California Supreme Court in Klor held that this construction given by the judge in his instructions to the jury was not what the legislature intended and would attribute to the statute an unwarranted unconstitutional extension.[68] The court said that "(n)o constitutionally punishable conduct appears in the case of an individual who prepared material for his own use or for such personal satisfaction as its creation affords him."[69] Griswold was cited in support of the court's statement that the judge's instruction would be clearly unconstitutional.[70]

The court's theory seems to be that the purpose of the obscenity statute is to prohibit possession of obscene material with the intent to distribute it.[71] This is conduct which is clearly within the legislative power to sanction criminally.[72]

---

[67] 64 Cal. 2d at 818-19, 415 P.2d at 792-93, 51 Cal. Rptr. at 904-5.

[68] Id. at 818, 415 P.2d at 792, 51 Cal. Rptr. at 904.

[69] Id. at 821, 415 P.2d at 794, 51 Cal. Rptr. at 906.

[70] Id. at 820, 415 P.2d at 794, 51 Cal. Rptr. at 906.

[71] For discussion see id. at 820-21, 415 P.2d at 794-95, 51 Cal. Rptr. at 906-07.

[72] Id. at 819-20, 415 P.2d at 793-94, 51 Cal. Rptr. at 905-06.

On the other hand possession without the necessary intent to distribute the obscene photographs must be distinguished. Mere possession of the photographic material, obscene or not, is conduct so essential to the first amendment's freedom of expression that it lies within a constitutionally protected area and therefore is not subject to criminal sanction.[73]

A square decision on the constitutionality of the statute was avoided by the court in Klor. Instead, the statute was construed in such a way as to avoid finding it unconstitutional.[74] Nevertheless material for one's own use or satisfaction would be constitutionally protected is as much a part of the holding of the case as the construction of the statute.[75]

Finot v. Pasadena City Board of Education[76] is a well considered case which finds protected personal rights in the periphery of the constitutional amendments

---

[73] Id. at 821, 415 P.2d at 794, 51 Cal. Rptr. at 906.

[74] Id. at 821, 415 P.2d at 795, 51 Cal. Rptr. at 907, where the court said: "A fundamental canon of statutory interpretation requires that a statute be construed to avoid unconstitutionality if it can reasonably be so interpreted."

[75] The court said, id. at 818, 415 P.2d at 792, 51 Cal. Rptr. at 904: "We hold that the construction placed on the statute by the trial court does violance to the legislative intent and, moreover, would attribute to the statute a gratuitous unconstitutional reach." For a similar case using Klor as authority, see People v. Samuels, 250 A.C.A. 571, 58 Cal. Rptr. 439 (1967). See also State v. Wetzel, 173 Ohio St. 16, 179 N.E.2d 773 (1962), which held that the Ohio obscenity statute does not prohibit the mere possession of obscene material for private gratification. The requisite intent to distribute the material is necessary.

[76] 250 A.C.A. 226, 58 Cal. Rptr. 520 (1967).

using Griswold as authority.[77] In Finot the California Court of Appeal held that a high school teacher could wear a beard without losing his job.[78] This right to wear a beard came within the periphery of the first amendment right of free speech.[79] The wearing of a beard, while not speech, is expression through nonverbal conduct which is brought within the scope of the right of free speech.[80] The court in Finot emphasized this point:

> It seems to us that the wearing of a beard is a form of expression of an individual's personality and that such a right of expression, although probably not within the literal scope of the First Amendment itself, is as much entitled to its peripheral protection as the personal rights established... with respect to the right of parents to educate their children as they fit.[81]

The wearing of a beard was also held to be a liberty protected by the due process provisions of the state and federal constitutions.[82] The court considered this right to be one of the "constitutionally unnamed but constitutionally protected personal liberties."[83]

---

[77] Id. at 235, 58 Cal. Rptr. at 527.

[78] Id.

[79] Id.

[80] Id.

[81] Id. (emphasis added). The cases cited by the court and omitted from the quotation recognize a fourteenth amendment "liberty" to educate one's children as one desires. Pierce v. Society of Sisters, 268 U.S. 510 (1925); Meyer v. Nebraska, 262 U.S. 390 (1923).

[82] 250 A.C.A. 226, 234, 58 Cal. Rptr. 520, 526 (1967), relying on U.S. Const. amend. XIV, Section 1; Cal. Const. art. 1, Section 13.

[83] Id. at 235, 58 Cal. Rptr. 526-27.

By a careful reading of the Klor[84] and Finot[85] cases it is apparent that the California courts are using Griswold as authority for the proposition that fundamental peripheral rights exist within the specific amendments of the Bill of Rights. This approach used by the California courts may be the significance of the Griswold decision in the near future. Instead of finding a right of privacy and relying on the holding of Griswold,[86] the reviewing court can rely on the reasoning of Griswold that there are broader constitutional rights than those embodied in the amendments themselves.[87] For this approach Griswold v. Connecticut is authority, and indeed very good authority.[88]

Notwithstanding the persuasiveness of the Griswold decision that peripheral fundamental rights are necessary and present,[89] the real problem is to demonstrate that possession of marijuana factually comes within these peripheral rights. By considering the nature of marijuana, the reasons for its use and the conduct punished by the statute (i.e. mere possession), it would seem that possession of marijuana could be brought within a constitutional right.

---

[84] 64 Cal. 2d 816, 820, 415 P.2d 791, 794, 51 Cal. Rptr. 903, 906 (1966), citing Griswold v. Connecticut, 381 U.S. 479, 482 (1965).

[85] 250 A.C.A. 226, 235, 58 Cal. Rptr. 520, 527 (1967), citing Griswold v. Connecticut, 381 U.S. 479, 482-83 (1965).

[86] The Griswold decision has been criticized as ill-founded and vague. See for example, the dissent of Justice Black in Griswold v. Connecticut, 381 U.S. 479, 507 (1965); Kauper, Penumbras, Peripheries, Emanations, Things Fundamental and Things Forgotten: The Griswold Case, 64 Mich. L. Rev. 235, 244, 252 (1965).

[87] 381 U.S. at 482-83.

[88] It is quite easy to come to the unwarranted conclusion that the citation of a court to Griswold is a recognition of the right of privacy. See Boyko & Rotberg, supra note 4, at 794, where the authors did just that.

[89] For a discussion, see 381 U.S. at 482-83.

Possession of marijuana is conduct essential to its use. This type of possession is conduct wholly personal to the user or the possessor since no one else is involved. If possession of obscene literature is protected by the first amendment under the freedom of expression as it was in Klor,[90] it is difficult to distinguish the possession of marijuana factually. Expression through the taking of photographs as was the case in Klor and expression through the use of marijuana are both forms of sensory perception. It would seem that possession as conduct absolutely necessary to such personal expression should come within the first amendment whether it is obscene material or marijuana which is possessed.

Possession of marijuana might be protected as a fundamental liberty within the due process clause of the fifth or fourteenth amendment. The court in Finot v. Pasadena City Board of Education[91] held that the wearing of a beard was a liberty within the due process clause of the fourteenth amendment as well as conduct which came within freedom of expression guaranteed by the first amendment.[92] Reliance was placed on the United States Supreme Court decision of Kent v. Dulles[93] where the Court said: "(Travel) may be as close to the heart of the individual as the choice of what he eats, or wears, or reads."[94] Just as the court in Finot found that

appellant had a right to wear a beard which could not be denied him in the absence of a compelling interest on the part of the state,[95] the user of marijuana who smokes or ingests it might bring himself within the scope of the personal liberties of the due process clause of the fifth or fourteenth amendment by similar reasoning.[96]

The Right of Privacy

The right of privacy as a substantive bar to a criminal statute has not been specifically adopted by the California courts in any particular case. In cases where privacy might have been applied, other more historically protected constitutional rights have been relied upon. For example, as has been noted, Klor and Finot relied on the freedom of expression in safeguarding the possession of obscene material and the wearing of a beard. In People v. Woody[97] the free exercise of religion was another long protected constitutional right which the court applied to protect the use of peyote by the members of the Native American Church.

In the absence of California cases the right of privacy as a substantive guarantee has only Griswold v. Connecticut to support it. Earlier United States Supreme Court cases have indicated that within the "spirit" of the Constitution privacy has long been recognized.[98] Justice Brandeis emphasized this in his dissent in Olmstead v. United States:[99]

---

95 250 A.C.A. at 238, 58 Cal. Rptr. at 529.

96 See In re Luera, 28 Cal. App. 185, 152 P. 738 (1915), discussed in note 8 supra.

98 Olmstead v. United States, 277 U.S. 438, 478 (1928) (Brandeis, J., dissenting); Boyd v. United States, 116 U.S. 616 (1886).

99 277 U.S. at 478.

> The makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness. They recognized the significance of man's spiritual nature, of his feelings and of his intellect. They knew that only a part of the pain, pleasure and satisfactions of life are to be found in material things. They sought to protect Americans in their beliefs, their thoughts, their emotions and their sensations. They conferred, as against the Government, the right to be let alone - the most comprehensive of rights and the right most valued by civilized men.[100]

The problem raised with respect to the marijuana possession statute and the Griswold decision is the extension of the zone of privacy from the "sacred precincts of marital bedrooms"[101] to an individual who purposefully induces a mild hallucinatory mental condition through the use of marijuana.

Just as there is now a zone of marital privacy, there are individual zones of privacy which the Court in Griswold went to great lengths to describe.[102] Just as the individual may express himself graphically,[103] verbally,[104] and physically[105] in certain constitutionally protected ways, it can be argued that the individual has a zone of privacy in which he can express himself mentally through the use of marijuana. It may be for spiritual purposes, as was the case in People v. Woody,[106] or for the

mere enjoyment of the experience. Griswold certainly indicates that a zone of privacy exists with respect to conduct essential to free expression.[107] For the reason that expression dealing solely with the mind is the most private form of expression possible, it is submitted that possession of marijuana as a necessary incident to its use is conduct which could be brought within the zone of privacy which exists within the first amendment. With more decisions defining the contours of the right of privacy, the step to possession of marijuana could be made.

Certainly the recent cases which have been decided in California such as In re Klor and Finot v. Pasadena City Board of Education might have applied the right of privacy as a constitutional defense. Instead, as noted earlier,[108] the cases were decided on the basis of rights found in the periphery of the first amendment. It is not surprising that a court would apply a long protected and more specific right such as the freedom of expression rather than the recently enunciated right of privacy. This was clearly the choice of the court in Finot when it said with respect to the right of privacy:

> (T)he unnamed rights retained by the people under the Ninth Amendment generally have received little, if any, specification as such by the United States Supreme Court... (W)e deem it unnecessary to decide whether appellant's right to wear a beard while engaged in classroom teaching... is protected by the Fourth, Fifth and Ninth Amendments to the United States Constitution....[109]

[108] Text accompanying notes 84-88 supra.

[109] 250 A.C.A. at 233, 58 Cal. Rptr. at 525.

It is evident from Finot and Klor that the California courts are reluctant to apply the right of privacy as the sole constitutional basis for a decision.[110] It seems that the right of privacy has been and will be treated only as an additional basis for a court's decision until the United States Supreme Court further defines the right of privacy or a case is raised where the California courts have no alternative but to apply or reject it. The California marijuana possession statute may present such a case.

Personal Rights in Conflict with the Police Power of the State

If a court were to find that possession of marijuana for personal use was within one of the constitutional rights raised above, the marijuana possession statute would not be automatically invalidated. In order to hold the statute unconstitutional the court must also find that the state has no valid reason for prohibiting such conduct.[111] Consequently, it is important to examine the general approach of the courts in handling constitutional questions in which personal liberties are limited by state law.

There seems to be a very similar analysis of questions involving state infringements upon personal liberties by both the United States Supreme Court and the California courts. In this section the approach of the California courts to such constitutional questions is examined generally with the specific consideration of the marijuana possession statute raised in a later section.[112]

The Bagley v. Washington Township Tests

The California Supreme Court expressly provided a three-step analysis for questions involving state infringment of personal liberties in Bagley v. Washington Township.[113] This analysis emphasizes that the state must justify its infringement of the individual's rights by showing a compelling interest and that the infringement, even if justified, must be as narrowly worded as possible.[114] In Bagley Justice Tobriner speaking for the court laid down the tests:

> (W)e hold that a governmental agency which would require a waiver of constitutional rights as a condition of public employment must demonstrate: (1) that the political restraints rationally relate to the enhancement of the public service, (2) that the benefits which the public gains by the restraints outweigh the resulting impairment of constitutional rights, and (3) that no alternatives less subversive of constitutional rights are available.[115]

This test has been followed expressly in Finot v. Pasadena City Board of Education[116] and in other cases involving the right of government employees to keep their jobs irrespective of their political activities[117] as well as in a case involving recipients of social welfare benefits.[118]

[115] Id.

[116] 250 A.C.A. 226, 236, 58 Cal. Rptr. 520, 527 (1967).

[117] E.g., Rosenfield v. Malcolm, 65 Cal. 2d 559, 561, 421 P.2d 697, 698, 55 Cal. Rptr. 505, 506 (1967).

[118] Parrish v. Civil Serv. Comm'n, 66 A.C. 253, 425 P.2d 223, 57 Cal. Rptr. 623 (1967); 18 Hasings L.J. 228 (1966); see Emerson, NineJustices in Search of a Doctrine, 64 Mich. L. Rev. 219, 233 (1965). Professor Emerson was counsel for appellant in the Griswold case.

While the tests of the Bagley decision have not been expressly set out in a decision protecting the personal liberties of an individual citizen who is not a government employee or one receiving government benefits, such tests would seem to apply to criminal legislation. The language of the California Supreme Court in People v. Woody[119] shows that the Bagley type of reasoning is present with special emphasis on the state's compelling interest in a case where no state benefit is in issue. The Woody case is an excellent example of the court's refusal to go off on the mere rational relation of the statute to the state's avowed purpose.[120] Instead the court applied the technique of balancing the infringement on the personal liberty against the interest of the state in regulating the individual's conduct.[121]

The defendant in Woody was convicted for possession of peyote,[122] but contended that the law conflicted with his use of it as a form of religious expression as a member of the Native American Church. The court, considering the record independently,[123] examined the conflicting interests of the state and the individual and reversed the conviction.[124] For the court Justice Tobriner stated:

[120] Id. at 722-23, 394 P.2d at 818-19, 40 Cal. Rptr. at 74-75.

[121] Id.

[122] Cal. Health & Safety Code Section 11500 makes possession of any narcotic other than marijuana a felony. For the planting provisions, see Cal. Health & Safety Code Section 11540. Peyote grows in small buds on the top of a small, spineless cactus, Lophorphora williamsii, in Texas and northern Mexico. When taken internally, it causes vivid hallucinations and beyond this its users experience greater comprehension and even a sense of friendliness towards others. People v. Woody, 61 Cal. 2d 716, 720, 394 P.2d 813, 816, 40 Cal. Rptr. 69, 72 (1964).

[123] 61 Cal. 2d at 722, 394 P.2d at 818, 40 Cal. Rptr. at 74.

[124] Id. at 727, 394 P.2d at 821, 40 Cal. Rptr. at 77.

> We have weighed the competing values represented in this case on the symbolic scale of constitutionality. On the one side we have placed the weight of freedom of religion as protected by the First Amendment; on the other, the weight of the state's "compelling interest." Since the use of peyote incorporates the essence of the religious expression, the first weight is heavy. Yet the use of peyote presents only slight danger to the state and to the enforcement of its laws; the second weight is relatively light. The scale tips in favor of the constitutional protection.[125]

The burden on the state to show a compelling interest why personal liberties should be impaired is found in many United States Surpreme Court decisions as well.[126] For example in Griswold v. Connecticut the Court rejected the minimum rationality standard and reviewed the judgment of the state legislature.[127] Justice Goldberg gave the reason for this in a concurring opinion:

---

[125] Id.

[126] E.g., McLaughlin v. Florida, 379 U.S. 184, 196 (1964); Sherbert v. Verner, 374 U.S. 398, 406 (1963); Gibson v. Florida Legislative Investigative Comm., 372 U.S. 539, 546 (1963); NAACP v. Button, 371 U.S. 415, 438-39 (1963); Bates v. City of Little Rock, 361 U.S. 516, 524 (1960).

[127] 381 U.S. at 482. In cases where economic interests are involved, the Supreme Court has invoked the minimum rationality standard holding that as long as the state law in question is rationally related to some permissible purpose within the police power of the state, the exercise of power is constitutional. E.g., Williamson v. Lee Optical, Inc., 348 U.S. 483, 487-88 (1955); Lochner v. New York, 198 U.S. 45, 64 (1905). The California courts have applied this standard to two of its drug statutes. In re Yun Quong, 159 Cal. 508, 114 P. 835 (1911) (possession of opium); People v. Glaser, 238 Cal. App. 2d 819, 48 Cal. Rptr. 427 (1965); People v. Mistriel, 110 Cal. App. 2d 110, 241 P.2d 1050 (1952) (possession of marijuana).

The reasoning behind this standard lies in the reluctance of the courts to substitute their judgment for that of the state legislature thereby usurping the primary function of the legislature. In Purity Extract & Toxic Co. v. Lynch, 226 U.S. 192, 201-02 (1912) the Court said: "(U)nless it clearly appears that the enactment has no substantial relation to a proper purpose, it cannot be said that the limit of legislative power has been transcended. To hold otherwise would be to substitute judicial opinion of expediency for the will of the legislature, - a notion foreign to our constitutional system." See also Mugler v. Kansas, 123 U.S. 205 (1887).

> In a long series of cases this Court has held that where fundamental personal liberties are involved, they may not be abridged by the States simply on a showing that a regulatory statute has some rational relationship to the effectuation of a proper state purpose. "Where there is a significant encroachment upon personal liberty, the State may prevail only upon showing a subordinating interest which is compelling."[128]

In Griswold the alleged purpose of the Connecticut legislature was to discourage extramarital relations and the statute rationally related to this purpose.[129] In spite of the rational relationship, the state did not carry the burden of demonstrating that the purpose of the statute was compelling enough to warrant the infringement of the individual right of privacy.[130]

Even when a compelling interest is shown by the state, a further test must be satisfied. This is the test enumerated in Bagley that there must be no alternative less subversive of constitutional rights available.[131] Under this test even when the state has a "compelling interest" strong enough to outweigh the intrusion into the citizen's rights, outright prohibition is not permitted if there is a suitable

---

[129] 381 U.S. at 498, 505-06.

[130] Id. at 497-98, where Justice Goldberg said in a concurring opinion: "Although the Connecticut birth control law obviously encroaches upon a fundamental personal liberty, the State does not show that the law serves any 'subordinating (state) interest which is compelling' or that is 'necessary... to the accomplishment of a permissible state policy.'"

[131] 65 Cal. 2d at 501-02, 421 P.2d at 411, 55 Cal. Rptr. at 402.

132

alternative.[132] California recognized this rule in Wollam v. City of Palm Springs.[133] In Wollam a city ordinance banning the use of sound trucks was held unconstitutional as it was too broad a criminal sanction.[134] The court stated:

> An ordinance narrowly drawn may properly reach to the evils which it seeks to avoid. Instead, here, the ordinance sweeps within its broad ambit the constitutional right to tell a whole story by means of this method of communication.[135]

The broad sweep of the Connecticut statute was also a major point in Griswold[136] and Justice Douglas emphasized it in the majority opinion when he said:

> (A) "governmental purpose to control or prevent activities constitutionally subject to state regulation may not be achieved by mea-s which sweep unnecessarily broadly and thereby invade the area of protected freedoms."[137]

The Connecticut legislature sought to attain its avowed purpose through means which had a "maximum destructive impact" on the rights of an individual.[138] In such a situation narrower means are appropriate to achieve the same ends.[139]

Tucker, 364 U.S. 479, 488 (1960), where the Court said: "(E)ven though the governmental purpose be legitimate and substantial, that purpose cannot be pursued by means that broadly stifle fundamental personal liberties when the end can be more narrowly achieved."

[138] 381 U.S. at 485.

[139] Id.; see, e.g., NAACP v. Button, 371 U.S. 415, 433 (1963); Shelton v. Tucker, 364 U.S. 479, 488 (1960); Talley v. California, 362 U.S. 60, 63 (1960); Fort v. Civil Serv. Comm'n, 61 Cal. 2d 331, 339, 392 P.2d 385, 389, 38 Cal. Rptr. 625, 629 (1964).

Independent Review of the Record

When constitutional questions have been presented involving personal liberties, the California Supreme Court has relied on its own evaluation of scientific facts and expert testimony by independently reviewing the whole record.[140] This has also been the approach taken in some United States Supreme Court cases.[141] The courts review the entire record because a constitutional question involving the "compelling interest" of a state is a mixed question of law and fact.[142] Therefore the question before the court is subject to a constitutional judgment in which the lower court's findings are not binding upon the appellate court.[143]

---

[140] See, e.g., People v. Woody, 61 Cal. 2d 716, 720-23, 394 P.2d 813, 816-19, 40 Cal. Rptr. 69, 73-75 (1964); People v. O'Neil, 62 Cal. 2d 748, 401 P.2d 928, 44 Cal. Rptr. 320 (1965), where the court looked to outside sources to determine the definition of a narcotic addict within the meaning of Cal. Vehicle Code Section 23105.

[141] Robinson v. California, 370 U.S. 660, 668-69 (1962) (Douglas, J., concurring).

[142] In reviewing the state's "compelling interest" the court must look to the facts the state has relied on to see if such facts are sufficient to permit an impairment of the individual's constitutional rights. For discussions, see Sherbert v. Verner, 374 U.S. 398, 406 (1963); People v. Woody, 61 Cal. 2d 716, 722, 394 P.2d 813, 818, 40 Cal. Rptr. 69, 74 (1964).

[143] People v. Woody, 61 Cal. 2d 716, 722, 394 P.2d 813, 818, 40 Cal. Rptr. 69, 74 (1964). See also the dissent of Harlan, J. in Roth v. United States, 354 U.S. 476, 497-98 (1957), where he said of the Court's determination of an obscenity issue: "I do not understand how the Court can resolve the constitutional problems now before it without making its own independent judgment upon the character of the material upon which these convictions were based."

A California example of this procedure is People v. Woody where the court looked at the whole record and drew its own inferences from the facts and expert testimony in holding that peyote could not work a permanent deleterious injury on the user.[144] This was contrary to the decision of the trial court. The court in Woody said:

> The state asserts that the compelling reason for the prohibition of Peyotism lies in its deleterious effects..., We set forth the reasons why we believe the contentions to be unfounded.
>
> The record... does not support the state's chronicle of harmful consequences of the use of peyote.[145]

Were the marijuana possession statute to be attacked as depriving an individual of his right of privacy or of one of the other peripheral but fundamental rights, it would appear that the reviewing court would take under consideration the entire record for independent judgment on the constitutional question.[146] The court would then apply the test laid down in Bagley v. Washington Township[147] in analyzing the constitutionality of the statute.

The State's Compelling Interest: What Dangers Does Marijuana Hold for the User and Society?

As this discussion has indicated, even if a court were to find that possession of marijuana comes within the right of privacy or could be included as one of the unnamed but constitutionally protected rights, there would be no assurance that the marijuana possession statute would be declared unconstitutional.[148] If the state can successfully show a "compelling interest"[149] why it can abridge a personal right by methods which are not unnecessarily broad[150] the statute will stand. For this reason it is important to examine the facts and information available which might be introduced into the record as evidence concerning marijuana and its effects on the user and society. By the presence of such evidence in the record on appellate court could independently examine the record in making its decision[151] as was the case in People v. Woody.[152]

It is not within the scope of this comment to delve in detail into the factual bases of the arguments for and against marijuana. This has been done elsewhere.[153]

---

[148] See cases cited notes 140-41 supra.

[149] Cases cited note 126 supra.

[150] Cases cited note 130 supra. It would seem that the presence of alternatives less subversive of the individual liberty is really part of the compelling interest argument. The state cannot have a "compelling interest" strong enough to outweigh the infringement on one's personal liberties if there are other alternatives less subversive to constitutional rights available. See text accompanying notes 131-32 supra.

[151] See text accompanying notes 131-32 supra.

[152] 61 Cal. 2d at 722, 394 P.2d at 818, 40 Cal. Rptr. at 74.

[153] Boyko & Rotberg, supra note 4, at 775-81. See id. at 783 n.44 for citations to authorities supporting the present method of regulating marijuana.

This section will briefly outline and analyze some of the leading arguments which law enforcement agencies,[154] legislative committees,[155] and others[156] have advanced as reasons why the use and possession of marijuana should remain illegal. It must be emphasized that the body of available research concerning marijuana is not extensive and the results are quite inconclusive.[157] This is particularly evident when the information concerning marijuana is compared with what is known about other substances such as alcohol, tobacco and the hard narcotics such as morphine, heroin and cocaine.[158]

The three most frequently advanced and widely publicized arguments against the use of marijuana and therefore its possession, are: (1) that the use of marijuana leads to criminal acts, (2) that the use of marijuana is a steppingstone to addiction to more serious drugs, and (3) that marijuana's use is per se harmful to the user.[159]

[157] President's Comm'n on Law Enforcement and Administration of Justice, The Challenge of Crime in a Free Society 224-25 (1967).

[158] The only authoritative study on marijuana in the United States is the report by the Mayer's Committee on Marihuana, the Marihuana Problem in the City of New York (1944). Better known as the LaGuardia Report, it is based on a controlled study of regular marijuana users in New York City in 1944. The significant parts of the LaGuardia Report are reprinted in The Marijuana Papers 233-360 (Solomon ed. 1966). Reference will be made to that source.

[159] Boyko & Rotberg, supra note 4, at 775-81.

Criminal Activity

The charge that the use of marijuana leads to criminal acts must be divided into two parts. The first argument is that a person under the influence of marijuana is likely to commit serious crimes. This view is roundly criticized in the LaGuardia Report.[160] Although published in 1944 the LaGuardia Report is the only extensive, authoritative study on marijuana and its consequences.

The statistics that the majority of marijuana users arrested are first offenders[161] do not support the charge that it leads to an increase in criminal acts. Such statistics simply show that the use of marijuana may lead to being arrested for the criminal offense of possession of marijuana.

The second part of the charge is that the use of marijuana introduces the user into a criminal underworld. If this is so, it is because the use[162] and possession[163] of marijuana are illegal. The user is naturally going to be involved with those who supply and sell marijuana. Also marijuana is not addictive as recognized by statute

---

160 Conclusions 10 and 11 by the Mayor's Committee on Marihuana, in The Marijuana Papers, supra note 158, at 260 read: "Marihuana is not a determining factor in the commission of major crimes.... Juvenile delinquency is not associated with the practice of smoking marihuana...." For views to the contrary, see H. Anslinger & W. Tompkins, The Traffic in Narcotics 18-26 (1953); The Marijuana Papers 439 (Solomon ed. 1966).

161 Bureau of Criminal Statistics, Drug Arrests and Dispositions in California 1966 at 63. This report indicates that 65.3% of those adults arrested for possession of marijuana had no prior record, and 22.1% had only a record for minor offenses.

162 Cal. Health & Safety Code Section 11721.

163 Cal. Health & Safety Code 11530.

in California[164] and by the legal tests of addiction laid down in recent cases.[165] Therefore the user will not be driven to illegal means to acquire it.

Marijuana as a Steppingstone to Addictive Narcotics

The argument that the use of marijuana leads to heroin addiction and addiction to other disabling drugs has been made by California law enforcement agencies and legislative committees.[166] Recent official state sources discredit this argument.[167] In addition one of the leading texts on pharmacology states that marijuana habituation does not lead to the use of heroin.[168]

Harm to the User

The harmful effects which marijuana might have on the user is one of the most important yet least researched problems. Before considering the physiological effects, if any, which marijuana may have, it is pertinent to examine the immediate psychological effects a person experiences after use. It is for these mental reactions

---

[164] Cal. Welf. & Inst'ns Code Section 3009. The statute is set out in note 6 supra.

[165] People v. O'Neil, 62 Cal. 2d 748, 755, 401 P.2d 928, 932, 44 Cal. Rptr., 320, 324 (1965) (distinguishing habituation from addiction); People v. Victor, 62 Cal. 2d 280, 302-04, 398 P.2d 391, 405-06, 42 Cal. Rptr. 199, 213-14 (1965). Both cases hold that an addict must be one who is physically and emotionally dependent on a narcotic as well as having developed a tolerance for the drug.

[166] Bureau of Narcotic Enforcement, The Narcotic Problem: A Brief Study 12 (4th ed. 1965); California State Assembly Interim Comm. on Public Health, Report of Subcomm. on Narcotics and Dangerous Drugs 11-15 (1959).

[167] Bureau of Criminal Statistics, Drug Arrests and Drug Dispositions in California 1964 at 10. It has been suggested that addiction to narcotics is based on the user's own psychological structure and his environment rather than the fact that he once used marijuana. See Clausen, Social and Psychological Factors in Narcotics Addiction, 22 Law & Contemp. Prob. 34, 43 (1957).

[168] L. Goodman & A. Gilman, The Pharmacological Basis of Therapeutics 300 (3d ed. 1965).

or effects that marijuana is taken. Dr. Joel Fort, a leading authority in the field of drugs,[169] has described these reactions:

> Marijuana is taken for euphoria, reduction of fatigue, and relief of tension... Small to moderate doses also increase appetite, distort the time sense, increase self-confidence and, like alcohol, can relax some inhibitions.[170]

This description is remarkably similar to the reasons why the average individual has a cocktail before dinner.

According to the LaGuardia Report the psychological effects of marijuana are only temporary and:

> (N)either the ingestion of marihuana nor the smoking of marihuana cigarettes affects the basic outlook of the individual except in a very few instances and to a very slight degree... In other words, reactions which are natively alien to the individual cannot be induced by the ingestion or smoking of the drug.[171]

Concerning the more serious question of the permanent effects which marijuana may have on the user, there is very little information available.[172] The LaGuardia Report did not find any direct effect on the organs of the body aside from the psychological experiences temporarily induced by marijuana.[173] Dr. Fort is in accord with this view:

---

169 See note 22 supra for a description of Dr. Fort's qualifications.

170 Fort, Social and Legal Response to Pleasure-giving Drugs, in The Utoplates 213-14 (Blum ed. 1964).

171 The Marijuana Papers, supra note 158, at 334.

172 President's Comm'n on Law Enforcement and Administration of Justice, The Challenge of Crime in a Free Society 224-25 (1967).

173 The Marijuana Papers, supra note 158, at 284.

> (U)nlike alcohol marijuana does not produce, even with prolonged or excessive use, addiction or irreversible physical damage to the boyd, although dependency or habituation and toxic effects can occur.[174]

It is also significant in considering possible harm to the user to remember that California by statute and case law in 1965 recognized that marijuana itself was not an addictive drug.[175]

Clearly the evidence of the effects of marijuana on the user and society is insufficient and inconclusive. While lawyers and judges may speculate on the medical and sociological effects of marijuana, there does remain the fact that possession of marijuana is a felony in California.[176] While it would be preferable to have more evidence on the subject, the statute should be considered in the light of those facts presently available. As one of the few legal articles on marijuana has said:

> Serious questions as to the soundness of legislative judgment arise when the abusive drinker faces few and minor penalties and a cigarette smoker is prompted and cajoled to incur the risk of fatal or incapacitating disease, while, in contrast, onerous reprisals await the marijuana smoker merely for privately using or having possession or control of the drug.[177]

---

[174] Fort, supra note 170, at 213.

[175] See notes 164-65 supra.

[176] Cal. Health & Safety Code Section 11530.

[177] Boyko & Rotberg, supra note 4, at 781.

Inconclusive facts, ignorance and fear of the effects of marijuana are not proper bases for making possession of marijuana criminal and certainly not for making possession of marijuana a felony.[178]

Conclusion

A constitutional attack on the marijuana possession statute would be extremely timely. Considering the legislative inertia in thia area,[170] the harsh penalty assessed for marijuana possession,[180] the recent development of California case law with respect to personal rights as evidenced in People v. Woody,[181] In re Klor,[182]

---

[178] At least one writer feels that the attitude taken towards marijuana in the United States stems from the puitan work ethic and its intolerance of inaction. Murphy, The Cannabis Habit: A Review of Recent Psychiatric Literature, 15 U.N. Bull. on Narcotics 20 (1963). See also W. Eldridge, Narcotics and The Law 13-34 (1962), for the same view with respect to all drugs. These views would suggest the various reasons given for the illegality of marijuana are nothing more than convenient rationalizations when compared with the permissive treatment which alcohol and toabcco receive under the law.

and Finot v. Pasadena City Board of Education,[183] a constitutional objection raised to the marijuana possession statute should receive prompt and perhaps sympathetic judicial consideration.[184]

It is submitted that the advocate would have to emphasize the following points in presenting his case:

(1) Possession of marijuana for mere personal use comes within one of the peripheral but fundamental constitutional rights. Finot v. Pasadena City Board of Education and In re Klor are authority for inclusion of possession as conduct essential to a means of expression within the first amendment's periphery. Finot might also be used as authority for calling the right to possess marijuana a constitutional "liberty" within the fourteenth amendment.[185] In order to bring marijuana within a zone of privacy also implicit in the first and other amendments, Griswold v. Connecticut[186] is the proper authority.

---

[183] 250 A.C.A. 226, 58 Cal. Rptr. 520 (1967).

[184] It would seem significant that most of the California Supreme Court opinions involving personal liberties are presently being written by Justice Tobriner. In these opinions Justice Tobriner has reflected a deep concern for the individual and his creative spirit in the same vein that Justice Douglas has in his United States Supreme Court opinions. See, e.g., People v. Woody, 61 Cal. 2d 716, 727-28, 394 P.2d 813, 821-22, 40 Cal. Rptr. 69, 77-78 (1964), where Justice Tobriner said: "In a mass society which presses at every point toward conformity, the protection of self-expression, however unique, of the individual and the group becomes ever more important. The varying currents of the subcultures that flow into the mainstream of our national life give it depth and beauty. We preserve a greater value than an ancient tradition when we protect the rights of the Indians who honestly practiced an old religion in using peyote one night at a meeting in a desert hogan...." See also Zeitlin v. Arnebergh, 59 Cal. 2d 901, 922-23, 383 P.2d 152, 166, 31 Cal. Rptr. 800, 814 (1963), where, in an obscenity case, he said: "The quicksilver of creativity will not be solidified by legal pronouncement; it will sometimes flow into new and sometimes frightening fields. If, indeed, courts try to forbid new and exotic expression, they will surely and fortunately fail." It would seem that such libertarian views could easily encompass the possession and use of marijuana as a means of "self-expression" or "creativity" within the periphery of the first amendment.

[185] See 250 A.C.A. 226, 235, 58 Cal. Rptr. 520, 527 (1967), where the wearing of a beard is considered such a liberty; see text accompanying notes 91-96 supra.

[186] See text accompanying notes 97-110 supra.

(2) Once the possession of marijuana is considered to be a fundamental constitutional right, then the balancing of the state's interest against the infringement of the individual's rights is in issue. The test of Bagley v. Washington Township is in point. The state must show a "compelling interest" why it should limit the personal rights according to People v. Woody.[187] The appellate court under the Woody decision may make an independent examination of the record in ascertaining whether a compelling interest is shown.[188]

If it is thought that the statute is so broad as to be unnecessarily restrictive of constitutional rights, both Griswold v. Connecticut and Wollam v. City of Palm Springs are good authority that a narrower statute is in order, i.e. one criminally sanctioning abuses of marijuana and not its mere use and possession.[189]

(3) Although the state has the burden of showing a "compelling interest," the advocate would have to assemble the facts on marijuana and introduce them into the record in order to show a lack of harm to the user and society. It is not necessary to show marijuana is absolutely harmless. A showing of slight harm would be sufficient as then the state's "compelling interest" requirement would not be satisfied when balanced with the individual's fundamental rights.[190]

---

[187] See text accompanying notes 113-39 supra.

[188] See text accompanying notes 140-47 supra.

[189] See text accompanying notes 131-39 supra.

[190] See People v. Woody, 61 Cal. 2d 716, 727, 394, P.2d 813, 821, 40 Cal. Rptr. 69, 77 (1964), where the court said that since "(t)he use of peyote presents only slight danger to the state and to the enforcement of its laws... (t)he scale tips in favor of the constitutional protection." (emphasis added).

Whether or not an argument such as that set forth in this comment is feasible in light of practical circumstances is left up to the advocate to decide. Considering the injustice the statute creates through felony arrests and convictions and the abridgment of the individual's freedom to experience and to express himself without harm to others, the California marijuana possession statute ought to be declared unconstitutional in its present form.

Addendum

The case of People v. Aguiar[191] was decided by the California Court of Appeal as this issue went to press. This case held that the equal protection clause of the fourteenth amendment to the United States Constitution did not invalidate the California marijuana possession statute. In answering appellant's argument that marijuana should be classified in the same way as alcohol and other euphorics, the court first examined the power of the state to legislate against drugs in general. This due process analysis of the court depended upon finding some rational relationship between the statute and the state's promotion of the public health, safety, comfort, and welfare.[192] Although it was judicially noticed that respected medical opinion considered that marijuana was neither habit-forming nor harmful,[193] the court concluded that as long as there was "some" evidence upon which the statute could be based then the court must uphold the statute.[194] This conclusion was qualified with the provision

---

[191] 257 A.C.A. 691, 65 Cal. Rptr. 71 (1968).

[192] Id. at 697, 65 Cal. Rptr. at 174.

[193] Id. at 697, 65 Cal. Rptr. at 174.

[194] Id. at 697, 65 Cal. Rptr. at 175.

that such a rule so obtains unless the statute invidiously discriminates against any group (the equal protection argument) and unless it does not intrude on specially protected areas enumerated in the Bill of Rights.[195]

The discussion of constitutionally protected areas is relevant since if possession of marijuana were within such an area, then more than just "some" evidence upon which the legislature could act would be necessary in order for the statute to be upheld. Indeed under the analysis which has been advanced in this comment, the state would have to show a compelling interest why it should infringe upon the constitutional rights.[196] The court found that it was not up to it to weigh fact-finding studies against each other since only some evidence of marijuana's harm was sufficient to uphold the statute.[197] This statement is not borne out by the California cases where the state's compelling interest has been in issue. Where the state must demonstrate a compelling interest to justify the statute then just such a judicial resolution of the factual issues is required in order to determine the interest of the state.[198] This was clearly the situation in People v. Woody[199] discussed in this comment.

The court pointed out that there is no constitutionally protected right to indulge in the use of euphoric drugs. For this proposition a number of United States

[199] 61 Cal. 2d 716, 394 P.2d 813, 40 Cal. Rptr. 69 (1964).

Supreme Court cases were cited which upheld the state's power to legislate against the possession, use and manufacture of alcoholic beverages.[200] These cases dealt with the right of a citizen to use alcohol within the privileges and immunities clause and the due process clause of the fourteenth amendment. In light of the broad interpretation of personal liberties in the intervening years since the decisions of the cases cited and in light of the subsequent incorporation of much of the Bill of Rights into the fourteenth amendment, it is submitted that these cases are very much in doubt today. It can also be noted that since the alcohol possession cases also deal with infringements on the privileges and immunities of citizens rather than the constitutionally protected areas of the Bill of Rights discussed in this comment, the cases can be distinguished.

The opinion also discussed Griswold v. Connecticut[201] and In re Klor[202] In noting that the principles of Griswold did not apply to the possession of marijuana, the court restricted itself to the holding of Griswold that only marital privacy was protected.[203] In fact the court expressly mentioned that appellant invoked no constitutional principle analogous to marital privacy to protect the right to use euphoric drugs.[204] Thus the door was left open for such an argument as that advanced in this comment that a right of privacy exists with respect to expression dealing solely with the mind.[205]

[203] 257 A.C.A. at 700, 65 Cal. Rptr. at 176.

[204] Id.

[205] See text accompanying notes 97-109 supra.

The court's discussion of Klor was limited to deciding that the case did not hold that the United States Constitution protects all private conduct.[206] This is indeed true. As has been suggested in this comment, only conduct essential to freedom of expression is to be protected by the first amendment as construed by Klor.[207] The similarity between possession of obscene material for personal gratification and possession of marijuana for personal use has already been discussed in this comment and was not mentioned by the court in its opinion.

Basically the decision of People v. Aguiar[208] holds that the state has a right to legislate against use and possession of marijuana as long as there is some evidence available that it is harmful, provided that no area of constitutional protection is invaded and provided that the equal protection test is met. The purpose of this comment has been to advance the proposition that areas of constitutional protection do exist with respect to possession and use of marijuana thus requiring the state to come forward and show a compelling interest why it can infringe upon these rights. This proposition is still unanswered in California.

Syllabus.

GRISWOLD ET AL. v. CONNECTICUT.

APPEAL FROM THE SUPREME COURT OF ERRORS OF CONNECTICUT.

No. 496. Argued March 29–30, 1965.—Decided June 7, 1965.

Appellants, the Executive Director of the Planned Parenthood League of Connecticut, and its medical director, a licensed physician, were convicted as accessories for giving married persons information and medical advice on how to prevent conception and, following examination, prescribing a contraceptive device or material for the wife's use. A Connecticut statute makes it a crime for any person to use any drug or article to prevent conception. Appellants claimed that the accessory statute as applied violated the Fourteenth Amendment. An intermediate appellate court and the State's highest court affirmed the judgment. *Held:*

1. Appellants have standing to assert the constitutional rights of the married people. *Tileston* v. *Ullman*, 318 U. S. 44, distinguished. P. 481.

2. The Connecticut statute forbidding use of contraceptives violates the right of marital privacy which is within the penumbra of specific guarantees of the Bill of Rights. Pp. 481–486.

151 Conn. 544, 200 A. 2d 479, reversed.

Thomas I. Emerson argued the cause for appellants. With him on the briefs was *Catherine G. Roraback*.

Joseph B. Clark argued the cause for appellee. With him on the brief was *Julius Maretz*.

Briefs of *amici curiae*, urging reversal, were filed by *Whitney North Seymour* and *Eleanor M. Fox* for Dr. John M. Adams et al.; by *Morris L. Ernst, Harriet F. Pilpel* and *Nancy F. Wechsler* for the Planned Parenthood Federation of America, Inc.; by *Alfred L. Scanlon* for the Catholic Council on Civil Liberties, and by *Rhoda H. Karpatkin, Melvin L. Wulf* and *Jerome E. Caplan* for the American Civil Liberties Union et al.

MR. JUSTICE DOUGLAS delivered the opinion of the Court.

Appellant Griswold is Executive Director of the Planned Parenthood League of Connecticut. Appellant Buxton is a licensed physician and a professor at the Yale Medical School who served as Medical Director for the League at its Center in New Haven—a center open and operating from November 1 to November 10, 1961, when appellants were arrested.

They gave information, instruction, and medical advice to *married persons* as to the means of preventing conception. They examined the wife and prescribed the best contraceptive device or material for her use. Fees were usually charged, although some couples were serviced free.

The statutes whose constitutionality is involved in this appeal are §§ 53–32 and 54–196 of the General Statutes of Connecticut (1958 rev.). The former provides:

> "Any person who uses any drug, medicinal article or instrument for the purpose of preventing conception shall be fined not less than fifty dollars or imprisoned not less than sixty days nor more than one year or be both fined and imprisoned."

Section 54–196 provides:

> "Any person who assists, abets, counsels, causes, hires or commands another to commit any offense may be prosecuted and punished as if he were the principal offender."

The appellants were found guilty as accessories and fined $100 each, against the claim that the accessory statute as so applied violated the Fourteenth Amendment. The Appellate Division of the Circuit Court affirmed. The Supreme Court of Errors affirmed that judgment. 151 Conn. 544, 200 A. 2d 479. We noted probable jurisdiction. 379 U. S. 926.

We think that appellants have standing to raise the constitutional rights of the married people with whom they had a professional relationship. *Tileston* v. *Ullman*, 318 U. S. 44, is different, for there the plaintiff seeking to represent others asked for a declaratory judgment. In that situation we thought that the requirements of standing should be strict, lest the standards of "case or controversy" in Article III of the Constitution become blurred. Here those doubts are removed by reason of a criminal conviction for serving married couples in violation of an aiding-and-abetting statute. Certainly the accessory should have standing to assert that the offense which he is charged with assisting is not, or cannot constitutionally be, a crime.

This case is more akin to *Truax* v. *Raich*, 239 U. S. 33, where an employee was permitted to assert the rights of his employer; to *Pierce* v. *Society of Sisters*, 268 U. S. 510, where the owners of private schools were entitled to assert the rights of potential pupils and their parents; and to *Barrows* v. *Jackson*, 346 U. S. 249, where a white defendant, party to a racially restrictive covenant, who was being sued for damages by the covenantors because she had conveyed her property to Negroes, was allowed to raise the issue that enforcement of the covenant violated the rights of prospective Negro purchasers to equal protection although no Negro was a party to the suit. And see *Meyer* v. *Nebraska*, 262 U. S. 390; *Adler* v. *Board of Education*, 342 U. S. 485; *NAACP* v. *Alabama*, 357 U. S. 449; *NAACP* v. *Button*, 371 U. S. 415. The rights of husband and wife, pressed here, are likely to be diluted or adversely affected unless those rights are considered in a suit involving those who have this kind of confidential relation to them.

Coming to the merits, we are met with a wide range of questions that implicate the Due Process Clause of the Fourteenth Amendment. Overtones of some arguments

suggest that *Lochner* v. *New York*, 198 U. S. 45, should be our guide. But we decline that invitation as we did in *West Coast Hotel Co.* v. *Parrish*, 300 U. S. 379; *Olsen* v. *Nebraska*, 313 U. S. 236; *Lincoln Union* v. *Northwestern Co.*, 335 U. S. 525; *Williamson* v. *Lee Optical Co.*, 348 U. S. 483; *Giboney* v. *Empire Storage Co.*, 336 U. S. 490. We do not sit as a super-legislature to determine the wisdom, need, and propriety of laws that touch economic problems, business affairs, or social conditions. This law, however, operates directly on an intimate relation of husband and wife and their physician's role in one aspect of that relation.

The association of people is not mentioned in the Constitution nor in the Bill of Rights. The right to educate a child in a school of the parents' choice—whether public or private or parochial—is also not mentioned. Nor is the right to study any particular subject or any foreign language. Yet the First Amendment has been construed to include certain of those rights.

By *Pierce* v. *Society of Sisters*, *supra*, the right to educate one's children as one chooses is made applicable to the States by the force of the First and Fourteenth Amendments. By *Meyer* v. *Nebraska*, *supra*, the same dignity is given the right to study the German language in a private school. In other words, the State may not, consistently with the spirit of the First Amendment, contract the spectrum of available knowledge. The right of freedom of speech and press includes not only the right to utter or to print, but the right to distribute, the right to receive, the right to read (*Martin* v. *Struthers*, 319 U. S. 141, 143) and freedom of inquiry, freedom of thought, and freedom to teach (see *Wieman* v. *Updegraff*, 344 U. S. 183, 195)—indeed the freedom of the entire university community. *Sweezy* v. *New Hampshire*, 354 U. S. 234, 249–250, 261–263; *Barenblatt* v. *United States*, 360 U. S. 109, 112; *Baggett* v. *Bullitt*, 377 U. S. 360, 369. Without

those peripheral rights the specific rights would be less secure. And so we reaffirm the principle of the *Pierce* and the *Meyer* cases.

In *NAACP* v. *Alabama*, 357 U. S. 449, 462, we protected the "freedom to associate and privacy in one's associations," noting that freedom of association was a peripheral First Amendment right. Disclosure of membership lists of a constitutionally valid association, we held, was invalid "as entailing the likelihood of a substantial restraint upon the exercise by petitioner's members of their right to freedom of association." *Ibid.* In other words, the First Amendment has a penumbra where privacy is protected from governmental intrusion. In like context, we have protected forms of "association" that are not political in the customary sense but pertain to the social, legal, and economic benefit of the members. *NAACP* v. *Button*, 371 U. S. 415, 430–431. In *Schware* v. *Board of Bar Examiners*, 353 U. S. 232, we held it not permissible to bar a lawyer from practice, because he had once been a member of the Communist Party. The man's "association with that Party" was not shown to be "anything more than a political faith in a political party" (*id.*, at 244) and was not action of a kind proving bad moral character. *Id.*, at 245–246.

Those cases involved more than the "right of assembly"—a right that extends to all irrespective of their race or ideology. *De Jonge* v. *Oregon*, 299 U. S. 353. The right of "association," like the right of belief (*Board of Education* v. *Barnette*, 319 U. S. 624), is more than the right to attend a meeting; it includes the right to express one's attitudes or philosophies by membership in a group or by affiliation with it or by other lawful means. Association in that context is a form of expression of opinion; and while it is not expressly included in the First Amendment its existence is necessary in making the express guarantees fully meaningful.

The foregoing cases suggest that specific guarantees in the Bill of Rights have penumbras, formed by emanations from those guarantees that help give them life and substance. See *Poe* v. *Ullman*, 367 U. S. 497, 516–522 (dissenting opinion). Various guarantees create zones of privacy. The right of association contained in the penumbra of the First Amendment is one, as we have seen. The Third Amendment in its prohibition against the quartering of soldiers "in any house" in time of peace without the consent of the owner is another facet of that privacy. The Fourth Amendment explicitly affirms the "right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures." The Fifth Amendment in its Self-Incrimination Clause enables the citizen to create a zone of privacy which government may not force him to surrender to his detriment. The Ninth Amendment provides: "The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people."

The Fourth and Fifth Amendments were described in *Boyd* v. *United States*, 116 U. S. 616, 630, as protection against all governmental invasions "of the sanctity of a man's home and the privacies of life."* We recently re-

*The Court said in full about this right of privacy:

"The principles laid down in this opinion [by Lord Camden in *Entick* v. *Carrington*, 19 How. St. Tr. 1029] affect the very essence of constitutional liberty and security. They reach farther than the concrete form of the case then before the court, with its adventitious circumstances; they apply to all invasions on the part of the government and its employes of the sanctity of a man's home and the privacies of life. It is not the breaking of his doors, and the rummaging of his drawers, that constitutes the essence of the offence; but it is the invasion of his indefeasible right of personal security, personal liberty and private property, where that right has never been forfeited by his conviction of some public offence,—it is the invasion of this sacred right which underlies and constitutes the essence of

ferred in *Mapp* v. *Ohio*, 367 U. S. 643, 656, to the Fourth Amendment as creating a "right to privacy, no less important than any other right carefully and particularly reserved to the people." See Beaney, The Constitutional Right to Privacy, 1962 Sup. Ct. Rev. 212; Griswold, The Right to be Let Alone, 55 Nw. U. L. Rev. 216 (1960).

We have had many controversies over these penumbral rights of "privacy and repose." See, *e. g.*, *Breard* v. *Alexandria*, 341 U. S. 622, 626, 644; *Public Utilities Comm'n* v. *Pollak*, 343 U. S. 451; *Monroe* v. *Pape*, 365 U. S. 167; *Lanza* v. *New York*, 370 U. S. 139; *Frank* v. *Maryland*, 359 U. S. 360; *Skinner* v. *Oklahoma*, 316 U. S. 535, 541. These cases bear witness that the right of privacy which presses for recognition here is a legitimate one.

The present case, then, concerns a relationship lying within the zone of privacy created by several fundamental constitutional guarantees. And it concerns a law which, in forbidding the *use* of contraceptives rather than regulating their manufacture or sale, seeks to achieve its goals by means having a maximum destructive impact upon that relationship. Such a law cannot stand in light of the familiar principle, so often applied by this Court, that a "governmental purpose to control or prevent activities constitutionally subject to state regulation may not be achieved by means which sweep unnecessarily broadly and thereby invade the area of protected freedoms." *NAACP* v. *Alabama*, 377 U. S. 288, 307. Would we allow the police to search the sacred precincts of marital bedrooms for telltale signs of the use of contraceptives? The

---

Lord Camden's judgment. Breaking into a house and opening boxes and drawers are circumstances of aggravation; but any forcible and compulsory extortion of a man's own testimony or of his private papers to be used as evidence to convict him of crime or to forfeit his goods, is within the condemnation of that judgment. In this regard the Fourth and Fifth Amendments run almost into each other." 116 U. S., at 630.

very idea is repulsive to the notions of privacy surrounding the marriage relationship.

We deal with a right of privacy older than the Bill of Rights—older than our political parties, older than our school system. Marriage is a coming together for better or for worse, hopefully enduring, and intimate to the degree of being sacred. It is an association that promotes a way of life, not causes; a harmony in living, not political faiths; a bilateral loyalty, not commercial or social projects. Yet it is an association for as noble a purpose as any involved in our prior decisions.

Reversed.

MR. JUSTICE GOLDBERG, whom THE CHIEF JUSTICE and MR. JUSTICE BRENNAN join, concurring.

I agree with the Court that Connecticut's birth-control law unconstitutionally intrudes upon the right of marital privacy, and I join in its opinion and judgment. Although I have not accepted the view that "due process" as used in the Fourteenth Amendment incorporates all of the first eight Amendments (see my concurring opinion in *Pointer* v. *Texas*, 380 U. S. 400, 410, and the dissenting opinion of MR. JUSTICE BRENNAN in *Cohen* v. *Hurley*, 366 U. S. 117, 154), I do agree that the concept of liberty protects those personal rights that are fundamental, and is not confined to the specific terms of the Bill of Rights. My conclusion that the concept of liberty is not so restricted and that it embraces the right of marital privacy though that right is not mentioned explicitly in the Constitution [1] is supported both by numer-

[1] My Brother STEWART dissents on the ground that he "can find no . . . general right of privacy in the Bill of Rights, in any other part of the Constitution, or in any case ever before decided by this Court." *Post*, at 530. He would require a more explicit guarantee than the one which the Court derives from several constitutional amendments. This Court, however, has never held that the Bill of Rights or the

ous decisions of this Court, referred to in the Court's opinion, and by the language and history of the Ninth Amendment. In reaching the conclusion that the right of marital privacy is protected, as being within the protected penumbra of specific guarantees of the Bill of Rights, the Court refers to the Ninth Amendment, *ante*, at 484. I add these words to emphasize the relevance of that Amendment to the Court's holding.

The Court stated many years ago that the Due Process Clause protects those liberties that are "so rooted in the traditions and conscience of our people as to be ranked as fundamental." *Snyder* v. *Massachusetts*, 291 U. S. 97, 105. In *Gitlow* v. *New York*, 268 U. S. 652, 666, the Court said:

> "For present purposes we may and do assume that freedom of speech and of the press—which are protected by the First Amendment from abridgment by Congress—are among the *fundamental* personal rights and 'liberties' protected by the due process clause of the Fourteenth Amendment from impairment by the States." (Emphasis added.)

Fourteenth Amendment protects only those rights that the Constitution specifically mentions by name. See, e. g., *Bolling* v. *Sharpe*, 347 U. S. 497; *Aptheker* v. *Secretary of State*, 378 U. S. 500; *Kent* v. *Dulles*, 357 U. S. 116; *Carrington* v. *Rash*, 380 U. S. 89, 96; *Schware* v. *Board of Bar Examiners*, 353 U. S. 232; *NAACP* v. *Alabama*, 360 U. S. 240; *Pierce* v. *Society of Sisters*, 268 U. S. 510; *Meyer* v. *Nebraska*, 262 U. S. 390. To the contrary, this Court, for example, in *Bolling* v. *Sharpe*, *supra*, while recognizing that the Fifth Amendment does not contain the "explicit safeguard" of an equal protection clause, *id.*, at 499, nevertheless derived an equal protection principle from that Amendment's Due Process Clause. And in *Schware* v. *Board of Bar Examiners*, *supra*, the Court held that the Fourteenth Amendment protects from arbitrary state action the right to pursue an occupation, such as the practice of law.

And, in *Meyer* v. *Nebraska*, 262 U. S. 390, 399, the Court, referring to the Fourteenth Amendment, stated:

> "While this Court has not attempted to define with exactness the liberty thus guaranteed, the term has received much consideration and some of the included things have been definitely stated. Without doubt, it denotes not merely freedom from bodily restraint but also [for example,] the right . . . to marry, establish a home and bring up children . . . ."

This Court, in a series of decisions, has held that the Fourteenth Amendment absorbs and applies to the States those specifics of the first eight amendments which express fundamental personal rights.[2] The language and history of the Ninth Amendment reveal that the Framers of the Constitution believed that there are additional fundamental rights, protected from governmental infringement, which exist alongside those fundamental rights specifically mentioned in the first eight constitutional amendments.

The Ninth Amendment reads, "The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people." The Amendment is almost entirely the work of James Madison. It was introduced in Congress by him and passed the House and Senate with little or no debate and virtually no change in language. It was proffered to quiet expressed fears that a bill of specifically enumerated rights[3] could not be sufficiently broad to cover all es-

---

[2] See, *e. g.*, *Chicago, B. & Q. R. Co.* v. *Chicago*, 166 U. S. 226; *Gitlow* v. *New York*, *supra*; *Cantwell* v. *Connecticut*, 310 U. S. 296; *Wolf* v. *Colorado*, 338 U. S. 25; *Robinson* v. *California*, 370 U. S. 660; *Gideon* v. *Wainwright*, 372 U. S. 335; *Malloy* v. *Hogan*, 378 U. S. 1; *Pointer* v. *Texas*, *supra*; *Griffin* v. *California*, 380 U. S. 609.

[3] Madison himself had previously pointed out the dangers of inaccuracy resulting from the fact that "no language is so copious as to supply words and phrases for every complex idea." The Federalist, No. 37 (Cooke ed. 1961), at 236.

sential rights and that the specific mention of certain rights would be interpreted as a denial that others were protected.[4]

In presenting the proposed Amendment, Madison said:

> "It has been objected also against a bill of rights, that, by enumerating particular exceptions to the grant of power, it would disparage those rights which were not placed in that enumeration; and it might follow by implication, that those rights which were not singled out, were intended to be assigned into the hands of the General Government, and were consequently insecure. This is one of the most plausible arguments I have ever heard urged against the admission of a bill of rights into this system; but, I conceive, that it may be guarded against. I have attempted it, as gentlemen may see by turning to the

[4] Alexander Hamilton was opposed to a bill of rights on the ground that it was unnecessary because the Federal Government was a government of delegated powers and it was not granted the power to intrude upon fundamental personal rights. The Federalist, No. 84 (Cooke ed. 1961), at 578–579. He also argued,

"I go further, and affirm that bills of rights, in the sense and in the extent in which they are contended for, are not only unnecessary in the proposed constitution, but would even be dangerous. They would contain various exceptions to powers which are not granted; and on this very account, would afford a colourable pretext to claim more than were granted. For why declare that things shall not be done which there is no power to do? Why for instance, should it be said, that the liberty of the press shall not be restrained, when no power is given by which restrictions may be imposed? I will not contend that such a provision would confer a regulating power; but it is evident that it would furnish, to men disposed to usurp, a plausible pretence for claiming that power." *Id.*, at 579.

The Ninth Amendment and the Tenth Amendment, which provides, "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people," were apparently also designed in part to meet the above-quoted argument of Hamilton.

last clause of the fourth resolution [the Ninth Amendment]." I Annals of Congress 439 (Gales and Seaton ed. 1834).

Mr. Justice Story wrote of this argument against a bill of rights and the meaning of the Ninth Amendment:

> "In regard to . . . [a] suggestion, that the affirmance of certain rights might disparage others, or might lead to argumentative implications in favor of other powers, it might be sufficient to say that such a course of reasoning could never be sustained upon any solid basis . . . . But a conclusive answer is, that such an attempt may be interdicted (as it has been) by a positive declaration in such a bill of rights that the enumeration of certain rights shall not be construed to deny or disparage others retained by the people." II Story, Commentaries on the Constitution of the United States 626–627 (5th ed. 1891).

He further stated, referring to the Ninth Amendment:

> "This clause was manifestly introduced to prevent any perverse or ingenious misapplication of the well-known maxim, that an affirmation in particular cases implies a negation in all others; and, *e converso*, that a negation in particular cases implies an affirmation in all others." *Id.*, at 651.

These statements of Madison and Story make clear that the Framers did not intend that the first eight amendments be construed to exhaust the basic and fundamental rights which the Constitution guaranteed to the people.[5]

While this Court has had little occasion to interpret the Ninth Amendment,[6] "[i]t cannot be presumed that any

[5] The Tenth Amendment similarly made clear that the States and the people retained all those powers not expressly delegated to the Federal Government.

[6] This Amendment has been referred to as "The Forgotten Ninth Amendment," in a book with that title by Bennett B. Patterson (1955). Other commentary on the Ninth Amendment includes Redlich, Are

clause in the constitution is intended to be without effect." *Marbury* v. *Madison*, 1 Cranch 137, 174. In interpreting the Constitution, "real effect should be given to all the words it uses." *Myers* v. *United States*, 272 U. S. 52, 151. The Ninth Amendment to the Constitution may be regarded by some as a recent discovery and may be forgotten by others, but since 1791 it has been a basic part of the Constitution which we are sworn to uphold. To hold that a right so basic and fundamental and so deep-rooted in our society as the right of privacy in marriage may be infringed because that right is not guaranteed in so many words by the first eight amendments to the Constitution is to ignore the Ninth Amendment and to give it no effect whatsoever. Moreover, a judicial construction that this fundamental right is not protected by the Constitution because it is not mentioned in explicit terms by one of the first eight amendments or elsewhere in the Constitution would violate the Ninth Amendment, which specifically states that

---

There "Certain Rights . . . Retained by the People"? 37 N. Y. U. L. Rev. 787 (1962), and Kelsey, The Ninth Amendment of the Federal Constitution, 11 Ind. L. J. 309 (1936). As far as I am aware, until today this Court has referred to the Ninth Amendment only in *United Public Workers* v. *Mitchell*, 330 U. S. 75, 94–95; *Tennessee Electric Power Co.* v. *TVA*, 306 U. S. 118, 143–144; and *Ashwander* v. *TVA*, 297 U. S. 288, 330–331. See also *Calder* v. *Bull*, 3 Dall. 386, 388; *Loan Assn.* v. *Topeka*, 20 Wall. 655, 662–663.

In *United Public Workers* v. *Mitchell*, *supra*, at 94–95, the Court stated: "We accept appellants' contention that the nature of political rights reserved to the people by the Ninth and Tenth Amendments [is] involved. The right claimed as inviolate may be stated as the right of a citizen to act as a party official or worker to further his own political views. Thus we have a measure of interference by the Hatch Act and the Rules with what otherwise would be the freedom of the civil servant under the First, Ninth and Tenth Amendments. And, if we look upon due process as a guarantee of freedom in those fields, there is a corresponding impairment of that right under the Fifth Amendment."

"[t]he enumeration in the Constitution, of certain rights, shall not be *construed* to deny or disparage others retained by the people." (Emphasis added.)

A dissenting opinion suggests that my interpretation of the Ninth Amendment somehow "broaden[s] the powers of this Court." *Post*, at 520. With all due respect, I believe that it misses the import of what I am saying. I do not take the position of my Brother BLACK in his dissent in *Adamson* v. *California*, 332 U. S. 46, 68, that the entire Bill of Rights is incorporated in the Fourteenth Amendment, and I do not mean to imply that the Ninth Amendment is applied against the States by the Fourteenth. Nor do I mean to state that the Ninth Amendment constitutes an independent source of rights protected from infringement by either the States or the Federal Government. Rather, the Ninth Amendment shows a belief of the Constitution's authors that fundamental rights exist that are not expressly enumerated in the first eight amendments and an intent that the list of rights included there not be deemed exhaustive. As any student of this Court's opinions knows, this Court has held, often unanimously, that the Fifth and Fourteenth Amendments protect certain fundamental personal liberties from abridgment by the Federal Government or the States. See, *e. g.*, *Bolling* v. *Sharpe*, 347 U. S. 497; *Aptheker* v. *Secretary of State*, 378 U. S. 500; *Kent* v. *Dulles*, 357 U. S. 116; *Cantwell* v. *Connecticut*, 310 U. S. 296; *NAACP* v. *Alabama*, 357 U. S. 449; *Gideon* v. *Wainwright*, 372 U. S. 335; *New York Times Co.* v. *Sullivan*, 376 U. S. 254. The Ninth Amendment simply shows the intent of the Constitution's authors that other fundamental personal rights should not be denied such protection or disparaged in any other way simply because they are not specifically listed in the first eight constitutional amendments. I do not see how this broadens the author-

ity of the Court; rather it serves to support what this Court has been doing in protecting fundamental rights.

Nor am I turning somersaults with history in arguing that the Ninth Amendment is relevant in a case dealing with a *State's* infringement of a fundamental right. While the Ninth Amendment—and indeed the entire Bill of Rights—originally concerned restrictions upon *federal* power, the subsequently enacted Fourteenth Amendment prohibits the States as well from abridging fundamental personal liberties. And, the Ninth Amendment, in indicating that not all such liberties are specifically mentioned in the first eight amendments, is surely relevant in showing the existence of other fundamental personal rights, now protected from state, as well as federal, infringement. In sum, the Ninth Amendment simply lends strong support to the view that the "liberty" protected by the Fifth and Fourteenth Amendments from infringement by the Federal Government or the States is not restricted to rights specifically mentioned in the first eight amendments. Cf. *United Public Workers* v. *Mitchell*, 330 U. S. 75, 94–95.

In determining which rights are fundamental, judges are not left at large to decide cases in light of their personal and private notions. Rather, they must look to the "traditions and [collective] conscience of our people" to determine whether a principle is "so rooted [there] . . . as to be ranked as fundamental." *Snyder* v. *Massachusetts*, 291 U. S. 97, 105. The inquiry is whether a right involved "is of such a character that it cannot be denied without violating those 'fundamental principles of liberty and justice which lie at the base of all our civil and political institutions' . . . ." *Powell* v. *Alabama*, 287 U. S. 45, 67. "Liberty" also "gains content from the emanations of . . . specific [constitutional] guarantees" and "from experience with the requirements of a free society." *Poe*

CONTINUED

29 OF 33

v. *Ullman*, 367 U. S. 497, 517 (dissenting opinion of MR. JUSTICE DOUGLAS).[7]

I agree fully with the Court that, applying these tests, the right of privacy is a fundamental personal right, emanating "from the totality of the constitutional scheme under which we live." *Id.*, at 521. Mr. Justice Brandeis, dissenting in *Olmstead* v. *United States*, 277 U. S. 438, 478, comprehensively summarized the principles underlying the Constitution's guarantees of privacy:

> "The protection guaranteed by the [Fourth and Fifth] Amendments is much broader in scope. The makers of our Constitution undertook to secure conditions favorable to the pursuit of happiness. They recognized the significance of man's spiritual nature, of his feelings and of his intellect. They knew that only a part of the pain, pleasure and satisfactions of life are to be found in material things. They sought to protect Americans in their beliefs, their thoughts, their emotions and their sensations. They conferred, as against the Government, the right to be let alone—the most comprehensive of rights and the right most valued by civilized men."

---

[7] In light of the tests enunciated in these cases it cannot be said that a judge's responsibility to determine whether a right is basic and fundamental in this sense vests him with unrestricted personal discretion. In fact, a hesitancy to allow too broad a discretion was a substantial reason leading me to conclude in *Pointer* v. *Texas*, *supra*, at 413–414, that those rights absorbed by the Fourteenth Amendment and applied to the States because they are fundamental apply with equal force and to the same extent against both federal and state governments. In *Pointer* I said that the contrary view would require "this Court to make the extremely subjective and excessively discretionary determination as to whether a practice, forbidden the Federal Government by a fundamental constitutional guarantee, is, as viewed in the factual circumstances surrounding each individual case, sufficiently repugnant to the notion of due process as to be forbidden the States." *Id.*, at 413.

The Connecticut statutes here involved deal with a particularly important and sensitive area of privacy—that of the marital relation and the marital home. This Court recognized in *Meyer* v. *Nebraska, supra,* that the right "to marry, establish a home and bring up children" was an essential part of the liberty guaranteed by the Fourteenth Amendment. 262 U. S., at 399. In *Pierce* v. *Society of Sisters,* 268 U. S. 510, the Court held unconstitutional an Oregon Act which forbade parents from sending their children to private schools because such an act "unreasonably interferes with the liberty of parents and guardians to direct the upbringing and education of children under their control." 268 U. S., at 534–535. As this Court said in *Prince* v. *Massachusetts,* 321 U. S. 158, at 166, the *Meyer* and *Pierce* decisions "have respected the private realm of family life which the state cannot enter."

I agree with MR. JUSTICE HARLAN'S statement in his dissenting opinion in *Poe* v. *Ullman,* 367 U. S. 497, 551–552: "Certainly the safeguarding of the home does not follow merely from the sanctity of property rights. The home derives its pre-eminence as the seat of family life. And the integrity of that life is something so fundamental that it has been found to draw to its protection the principles of more than one explicitly granted Constitutional right. . . . Of this whole 'private realm of family life' it is difficult to imagine what is more private or more intimate than a husband and wife's marital relations."

The entire fabric of the Constitution and the purposes that clearly underlie its specific guarantees demonstrate that the rights to marital privacy and to marry and raise a family are of similar order and magnitude as the fundamental rights specifically protected.

Although the Constitution does not speak in so many words of the right of privacy in marriage, I cannot believe that it offers these fundamental rights no protection. The fact that no particular provision of the Con-

stitution explicitly forbids the State from disrupting the traditional relation of the family—a relation as old and as fundamental as our entire civilization—surely does not show that the Government was meant to have the power to do so. Rather, as the Ninth Amendment expressly recognizes, there are fundamental personal rights such as this one, which are protected from abridgment by the Government though not specifically mentioned in the Constitution.

My Brother STEWART, while characterizing the Connecticut birth control law as "an uncommonly silly law," *post*, at 527, would nevertheless let it stand on the ground that it is not for the courts to " 'substitute their social and economic beliefs for the judgment of legislative bodies, who are elected to pass laws.' " *Post*, at 528. Elsewhere, I have stated that "[w]hile I quite agree with Mr. Justice Brandeis that . . . 'a . . . State may . . . serve as a laboratory; and try novel social and economic experiments,' *New State Ice Co.* v. *Liebmann*, 285 U. S. 262, 280, 311 (dissenting opinion), I do not believe that this includes the power to experiment with the fundamental liberties of citizens . . . ." [8] The vice of the dissenters' views is that it would permit such experimentation by the States in the area of the fundamental personal rights of its citizens. I cannot agree that the Constitution grants such power either to the States or to the Federal Government.

The logic of the dissents would sanction federal or state legislation that seems to me even more plainly unconstitutional than the statute before us. Surely the Government, absent a showing of a compelling subordinating state interest, could not decree that all husbands and wives must be sterilized after two children have been born

[8] *Pointer* v. *Texas*, *supra*, at 413. See also the discussion of my Brother DOUGLAS, *Poe* v. *Ullman*, *supra*, at 517–518 (dissenting opinion).

to them. Yet by their reasoning such an invasion of marital privacy would not be subject to constitutional challenge because, while it might be "silly," no provision of the Constitution specifically prevents the Government from curtailing the marital right to bear children and raise a family. While it may shock some of my Brethren that the Court today holds that the Constitution protects the right of marital privacy, in my view it is far more shocking to believe that the personal liberty guaranteed by the Constitution does not include protection against such totalitarian limitation of family size, which is at complete variance with our constitutional concepts. Yet, if upon a showing of a slender basis of rationality, a law outlawing voluntary birth control by married persons is valid, then, by the same reasoning, a law requiring compulsory birth control also would seem to be valid. In my view, however, both types of law would unjustifiably intrude upon rights of marital privacy which are constitutionally protected.

In a long series of cases this Court has held that where fundamental personal liberties are involved, they may not be abridged by the States simply on a showing that a regulatory statute has some rational relationship to the effectuation of a proper state purpose. "Where there is a significant encroachment upon personal liberty, the State may prevail only upon showing a subordinating interest which is compelling," *Bates* v. *Little Rock*, 361 U. S. 516, 524. The law must be shown "necessary, and not merely rationally related, to the accomplishment of a permissible state policy." *McLaughlin* v. *Florida*, 379 U. S. 184, 196. See *Schneider* v. *Irvington*, 308 U. S. 147, 161.

Although the Connecticut birth-control law obviously encroaches upon a fundamental personal liberty, the State does not show that the law serves any "subordinating [state] interest which is compelling" or that it is "neces-

sary . . . to the accomplishment of a permissible state policy." The State, at most, argues that there is some rational relation between this statute and what is admittedly a legitimate subject of state concern—the discouraging of extra-marital relations. It says that preventing the use of birth-control devices by married persons helps prevent the indulgence by some in such extra-marital relations. The rationality of this justification is dubious, particularly in light of the admitted widespread availability to all persons in the State of Connecticut, unmarried as well as married, of birth-control devices for the prevention of disease, as distinguished from the prevention of conception, see *Tileston* v. *Ullman*, 129 Conn. 84, 26 A. 2d 582. But, in any event, it is clear that the state interest in safeguarding marital fidelity can be served by a more discriminately tailored statute, which does not, like the present one, sweep unnecessarily broadly, reaching far beyond the evil sought to be dealt with and intruding upon the privacy of all married couples. See *Aptheker* v. *Secretary of State*, 378 U. S. 500, 514; *NAACP* v. *Alabama*, 377 U. S. 288, 307–308; *McLaughlin* v. *Florida*, *supra*, at 196. Here, as elsewhere, "[p]recision of regulation must be the touchstone in an area so closely touching our most precious freedoms." *NAACP* v. *Button*, 371 U. S. 415, 438. The State of Connecticut does have statutes, the constitutionality of which is beyond doubt, which prohibit adultery and fornication. See Conn. Gen. Stat. §§ 53–218, 53–219 *et seq.* These statutes demonstrate that means for achieving the same basic purpose of protecting marital fidelity are available to Connecticut without the need to "invade the area of protected freedoms." *NAACP* v. *Alabama*, *supra*, at 307. See *McLaughlin* v. *Florida*, *supra*, at 196.

Finally, it should be said of the Court's holding today that it in no way interferes with a State's proper regula-

tion of sexual promiscuity or misconduct. As my Brother HARLAN so well stated in his dissenting opinion in *Poe* v. *Ullman, supra,* at 553.

> "Adultery, homosexuality and the like are sexual intimacies which the State forbids . . . but the intimacy of husband and wife is necessarily an essential and accepted feature of the institution of marriage, an institution which the State not only must allow, but which always and in every age it has fostered and protected. It is one thing when the State exerts its power either to forbid extra-marital sexuality . . . or to say who may marry, but it is quite another when, having acknowledged a marriage and the intimacies inherent in it, it undertakes to regulate by means of the criminal law the details of that intimacy."

In sum, I believe that the right of privacy in the marital relation is fundamental and basic—a personal right "retained by the people" within the meaning of the Ninth Amendment. Connecticut cannot constitutionally abridge this fundamental right, which is protected by the Fourteenth Amendment from infringement by the States. I agree with the Court that petitioners' convictions must therefore be reversed.

MR. JUSTICE HARLAN, concurring in the judgment.

I fully agree with the judgment of reversal, but find myself unable to join the Court's opinion. The reason is that it seems to me to evince an approach to this case very much like that taken by my Brothers BLACK and STEWART in dissent, namely: the Due Process Clause of the Fourteenth Amendment does not touch this Connecticut statute unless the enactment is found to violate some right assured by the letter or penumbra of the Bill of Rights.

In other words, what I find implicit in the Court's opinion is that the "incorporation" doctrine may be used to *restrict* the reach of Fourteenth Amendment Due Process. For me this is just as unacceptable constitutional doctrine as is the use of the "incorporation" approach to *impose* upon the States all the requirements of the Bill of Rights as found in the provisions of the first eight amendments and in the decisions of this Court interpreting them. See, *e. g.*, my concurring opinions in *Pointer* v. *Texas*, 380 U. S. 400, 408, and *Griffin* v. *California*, 380 U. S. 609, 615, and my dissenting opinion in *Poe* v. *Ullman*, 367 U. S. 497, 522, at pp. 539–545.

In my view, the proper constitutional inquiry in this case is whether this Connecticut statute infringes the Due Process Clause of the Fourteenth Amendment because the enactment violates basic values "implicit in the concept of ordered liberty," *Palko* v. *Connecticut*, 302 U. S. 319, 325. For reasons stated at length in my dissenting opinion in *Poe* v. *Ullman*, *supra*, I believe that it does. While the relevant inquiry may be aided by resort to one or more of the provisions of the Bill of Rights, it is not dependent on them or any of their radiations. The Due Process Clause of the Fourteenth Amendment stands, in my opinion, on its own bottom.

A further observation seems in order respecting the justification of my Brothers BLACK and STEWART for their "incorporation" approach to this case. Their approach does not rest on historical reasons, which are of course wholly lacking (see Fairman, Does the Fourteenth Amendment Incorporate the Bill of Rights? The Original Understanding, 2 Stan. L. Rev. 5 (1949)), but on the thesis that by limiting the content of the Due Process Clause of the Fourteenth Amendment to the protection of rights which can be found elsewhere in the Constitution, in this instance in the Bill of Rights, judges will thus be confined to "interpretation" of specific constitutional

provisions, and will thereby be restrained from introducing their own notions of constitutional right and wrong into the "vague contours of the Due Process Clause." *Rochin* v. *California*, 342 U. S. 165, 170.

While I could not more heartily agree that judicial "self restraint" is an indispensable ingredient of sound constitutional adjudication, I do submit that the formula suggested for achieving it is more hollow than real. "Specific" provisions of the Constitution, no less than "due process," lend themselves as readily to "personal" interpretations by judges whose constitutional outlook is simply to keep the Constitution in supposed "tune with the times" (*post*, p. 522). Need one go further than to recall last Term's reapportionment cases, *Wesberry* v. *Sanders*, 376 U. S. 1, and *Reynolds* v. *Sims*, 377 U. S. 533, where a majority of the Court "interpreted" "by the People" (Art. I, § 2) and "equal protection" (Amdt. 14) to command "one person, one vote," an interpretation that was made in the face of irrefutable and still unanswered history to the contrary? See my dissenting opinions in those cases, 376 U. S., at 20; 377 U. S., at 589.

Judicial self-restraint will not, I suggest, be brought about in the "due process" area by the historically unfounded incorporation formula long advanced by my Brother BLACK, and now in part espoused by my Brother STEWART. It will be achieved in this area, as in other constitutional areas, only by continual insistence upon respect for the teachings of history, solid recognition of the basic values that underlie our society, and wise appreciation of the great roles that the doctrines of federalism and separation of powers have played in establishing and preserving American freedoms. See *Adamson* v. *California*, 332 U. S. 46, 59 (Mr. Justice Frankfurter, concurring). Adherence to these principles will not, of course, obviate all constitutional differences of opinion among judges, nor should it. Their continued recogni-

tion will, however, go farther toward keeping most judges from roaming at large in the constitutional field than will the interpolation into the Constitution of an artificial and largely illusory restriction on the content of the Due Process Clause.*

MR. JUSTICE WHITE, concurring in the judgment.

In my view this Connecticut law as applied to married couples deprives them of "liberty" without due process of law, as that concept is used in the Fourteenth Amendment. I therefore concur in the judgment of the Court reversing these convictions under Connecticut's aiding and abetting statute.

It would be unduly repetitious, and belaboring the obvious, to expound on the impact of this statute on the liberty guaranteed by the Fourteenth Amendment against arbitrary or capricious denials or on the nature of this liberty. Suffice it to say that this is not the first time this Court has had occasion to articulate that the liberty entitled to protection under the Fourteenth Amendment includes the right "to marry, establish a home and bring up children," *Meyer* v. *Nebraska*, 262 U. S. 390, 399, and "the liberty . . . to direct the upbringing and education of children," *Pierce* v. *Society of Sisters*, 268 U. S. 510, 534–535, and that these are among "the basic civil rights of man." *Skinner* v. *Oklahoma*, 316 U. S. 535, 541. These decisions affirm that there is a "realm of family life which the state cannot enter" without substantial justification. *Prince* v. *Massachusetts*, 321 U. S. 158, 166. Surely the right invoked in this case, to be free of regulation of the intimacies of

*Indeed, my Brother BLACK, in arguing his thesis, is forced to lay aside a host of cases in which the Court has recognized fundamental rights in the Fourteenth Amendment without specific reliance upon the Bill of Rights. *Post*, p. 512, n. 4.

the marriage relationship, "come[s] to this Court with a momentum for respect lacking when appeal is made to liberties which derive merely from shifting economic arrangements." *Kovacs* v. *Cooper,* 336 U. S. 77, 95 (opinion of Frankfurter, J.).

The Connecticut anti-contraceptive statute deals rather substantially with this relationship. For it forbids all married persons the right to use birth-control devices, regardless of whether their use is dictated by considerations of family planning, *Trubek* v. *Ullman,* 147 Conn. 633, 165 A. 2d 158, health, or indeed even of life itself. *Buxton* v. *Ullman,* 147 Conn. 48, 156 A. 2d 508. The anti-use statute, together with the general aiding and abetting statute, prohibits doctors from affording advice to married persons on proper and effective methods of birth control. *Tileston* v. *Ullman,* 129 Conn. 84, 26 A. 2d 582. And the clear effect of these statutes, as enforced, is to deny disadvantaged citizens of Connecticut, those without either adequate knowledge or resources to obtain private counseling, access to medical assistance and up-to-date information in respect to proper methods of birth control. *State* v. *Nelson,* 126 Conn. 412, 11 A. 2d 856; *State* v. *Griswold,* 151 Conn. 544, 200 A. 2d 479. In my view, a statute with these effects bears a substantial burden of justification when attacked under the Fourteenth Amendment. *Yick Wo* v. *Hopkins,* 118 U. S. 356; *Skinner* v. *Oklahoma,* 316 U. S. 535; *Schware* v. *Board of Bar Examiners,* 353 U. S. 232; *McLaughlin* v. *Florida,* 379 U. S. 184, 192.

An examination of the justification offered, however, cannot be avoided by saying that the Connecticut anti-use statute invades a protected area of privacy and association or that it demeans the marriage relationship. The nature of the right invaded is pertinent, to be sure, for statutes regulating sensitive areas of liberty do, under

the cases of this Court, require "strict scrutiny," *Skinner* v. *Oklahoma*, 316 U. S. 535, 541, and "must be viewed in the light of less drastic means for achieving the same basic purpose." *Shelton* v. *Tucker*, 364 U. S. 479, 488. "Where there is a significant encroachment upon personal liberty, the State may prevail only upon showing a subordinating interest which is compelling." *Bates* v. *Little Rock*, 361 U. S. 516, 524. See also *McLaughlin* v. *Florida*, 379 U. S. 184. But such statutes, if reasonably necessary for the effectuation of a legitimate and substantial state interest, and not arbitrary or capricious in application, are not invalid under the Due Process Clause. *Zemel* v. *Rusk*, 381 U. S. 1.*

* Dissenting opinions assert that the liberty guaranteed by the Due Process Clause is limited to a guarantee against unduly vague statutes and against procedural unfairness at trial. Under this view the Court is without authority to ascertain whether a challenged statute, or its application, has a permissible purpose and whether the manner of regulation bears a rational or justifying relationship to this purpose. A long line of cases makes very clear that this has not been the view of this Court. *Dent* v. *West Virginia*, 129 U. S. 114; *Jacobson* v. *Massachusetts*, 197 U. S. 11; *Douglas* v. *Noble*, 261 U. S. 165; *Meyer* v. *Nebraska*, 262 U. S. 390; *Pierce* v. *Society of Sisters*, 268 U. S. 510; *Schware* v. *Board of Bar Examiners*, 353 U. S. 232; *Aptheker* v. *Secretary of State*, 378 U. S. 500; *Zemel* v. *Rusk*, 381 U. S. 1.

The traditional due process test was well articulated, and applied, in *Schware* v. *Board of Bar Examiners*, *supra*, a case which placed no reliance on the specific guarantees of the Bill of Rights.

"A State cannot exclude a person from the practice of law or from any other occupation in a manner or for reasons that contravene the Due Process or Equal Protection Clause of the Fourteenth Amendment. *Dent* v. *West Virginia*, 129 U. S. 114. Cf. *Slochower* v. *Board of Education*, 350 U. S. 551; *Wieman* v. *Updegraff*, 344 U. S. 183. And see *Ex parte Secombe*, 19 How. 9, 13. A State can require high standards of qualification, such as good moral character or proficiency in its law, before it admits an applicant to the bar, but any qualification must have a rational connection with the applicant's fitness or capacity to practice law. *Douglas* v. *Noble*, 261 U. S. 165; *Cum-*

As I read the opinions of the Connecticut courts and the argument of Connecticut in this Court, the State claims but one justification for its anti-use statute. Cf. *Allied Stores of Ohio* v. *Bowers*, 358 U. S. 522, 530; *Martin* v. *Walton*, 368 U. S. 25, 28 (DOUGLAS, J., dissenting). There is no serious contention that Connecticut thinks the use of artificial or external methods of contraception immoral or unwise in itself, or that the anti-use statute is founded upon any policy of promoting population expansion. Rather, the statute is said to serve the State's policy against all forms of promiscuous or illicit sexual relationships, be they premarital or extramarital, concededly a permissible and legitimate legislative goal.

Without taking issue with the premise that the fear of conception operates as a deterrent to such relationships in addition to the criminal proscriptions Connecticut has against such conduct, I wholly fail to see how the ban on the use of contraceptives by married couples in any way reinforces the State's ban on illicit sexual relationships. See *Schware* v. *Board of Bar Examiners*, 353 U. S. 232, 239. Connecticut does not bar the importation or possession of contraceptive devices; they are not considered contraband material under state law, *State* v. *Certain Contraceptive Materials*, 126 Conn. 428, 11 A. 2d 863, and their availability in that State is not seriously disputed. The only way Connecticut seeks to limit or control the availability of such devices is through its general aiding and abetting statute whose operation in this context has

---

mings v. *Missouri*, 4 Wall. 277, 319–320. Cf. *Nebbia* v. *New York*, 291 U. S. 502. Obviously an applicant could not be excluded merely because he was a Republican or a Negro or a member of a particular church. Even in applying permissible standards, officers of a State cannot exclude an applicant when there is no basis for their finding that he fails to meet these standards, or when their action is invidiously discriminatory." 353 U. S., at 238–239. Cf. *Martin* v. *Walton*, 368 U. S. 25, 26 (DOUGLAS, J., dissenting).

been quite obviously ineffective and whose most serious use has been against birth-control clinics rendering advice to married, rather than unmarried, persons. Cf. *Yick Wo* v. *Hopkins*, 118 U. S. 356. Indeed, after over 80 years of the State's proscription of use, the legality of the sale of such devices to prevent disease has never been expressly passed upon, although it appears that sales have long occurred and have only infrequently been challenged. This "undeviating policy . . . throughout all the long years . . . bespeaks more than prosecutorial paralysis." *Poe* v. *Ullman*, 367 U. S. 497, 502. Moreover, it would appear that the sale of contraceptives to prevent disease is plainly legal under Connecticut law.

In these circumstances one is rather hard pressed to explain how the ban on use by married persons in any way prevents use of such devices by persons engaging in illicit sexual relations and thereby contributes to the State's policy against such relationships. Neither the state courts nor the State before the bar of this Court has tendered such an explanation. It is purely fanciful to believe that the broad proscription on use facilitates discovery of use by persons engaging in a prohibited relationship or for some other reason makes such use more unlikely and thus can be supported by any sort of administrative consideration. Perhaps the theory is that the flat ban on use prevents married people from possessing contraceptives and without the ready availability of such devices for use in the marital relationship, there will be no or less temptation to use them in extramarital ones. This reasoning rests on the premise that married people will comply with the ban in regard to their marital relationship, notwithstanding total nonenforcement in this context and apparent nonenforcibility, but will not comply with criminal statutes prohibiting extramarital affairs and the anti-use statute in respect to illicit sexual relationships, a premise whose validity has not been

demonstrated and whose intrinsic validity is not very evident. At most the broad ban is of marginal utility to the declared objective. A statute limiting its prohibition on use to persons engaging in the prohibited relationship would serve the end posited by Connecticut in the same way, and with the same effectiveness, or ineffectiveness, as the broad anti-use statute under attack in this case. I find nothing in this record justifying the sweeping scope of this statute, with its telling effect on the freedoms of married persons, and therefore conclude that it deprives such persons of liberty without due process of law.

MR. JUSTICE BLACK, with whom MR. JUSTICE STEWART joins, dissenting.

I agree with my Brother STEWART'S dissenting opinion. And like him I do not to any extent whatever base my view that this Connecticut law is constitutional on a belief that the law is wise or that its policy is a good one. In order that there may be no room at all to doubt why I vote as I do, I feel constrained to add that the law is every bit as offensive to me as it is to my Brethren of the majority and my Brothers HARLAN, WHITE and GOLDBERG who, reciting reasons why it is offensive to them, hold it unconstitutional. There is no single one of the graphic and eloquent strictures and criticisms fired at the policy of this Connecticut law either by the Court's opinion or by those of my concurring Brethren to which I cannot subscribe—except their conclusion that the evil qualities they see in the law make it unconstitutional.

Had the doctor defendant here, or even the nondoctor defendant, been convicted for doing nothing more than expressing opinions to persons coming to the clinic that certain contraceptive devices, medicines or practices would do them good and would be desirable, or for telling people how devices could be used, I can think of no reasons at this time why their expressions of views would not be

protected by the First and Fourteenth Amendments, which guarantee freedom of speech. Cf. *Brotherhood of Railroad Trainmen* v. *Virginia ex rel. Virginia State Bar*, 377 U. S. 1; *NAACP* v. *Button*, 371 U. S. 415. But speech is one thing; conduct and physical activities are quite another. See, *e. g.*, *Cox* v. *Louisiana*, 379 U. S. 536, 554–555; *Cox* v. *Louisiana*, 379 U. S. 559, 563–564; *id.*, 575–584 (concurring opinion); *Giboney* v. *Empire Storage & Ice Co.*, 336 U. S. 490; cf. *Reynolds* v. *United States*, 98 U. S. 145, 163–164. The two defendants here were active participants in an organization which gave physical examinations to women, advised them what kind of contraceptive devices or medicines would most likely be satisfactory for them, and then supplied the devices themselves, all for a graduated scale of fees, based on the family income. Thus these defendants admittedly engaged with others in a planned course of conduct to help people violate the Connecticut law. Merely because some speech was used in carrying on that conduct—just as in ordinary life some speech accompanies most kinds of conduct—we are not in my view justified in holding that the First Amendment forbids the State to punish their conduct. Strongly as I desire to protect all First Amendment freedoms, I am unable to stretch the Amendment so as to afford protection to the conduct of these defendants in violating the Connecticut law. What would be the constitutional fate of the law if hereafter applied to punish nothing but speech is, as I have said, quite another matter.

The Court talks about a constitutional "right of privacy" as though there is some constitutional provision or provisions forbidding any law ever to be passed which might abridge the "privacy" of individuals. But there is not. There are, of course, guarantees in certain specific constitutional provisions which are designed in part to protect privacy at certain times and places with respect to certain activities. Such, for example, is the Fourth

Amendment's guarantee against "unreasonable searches and seizures." But I think it belittles that Amendment to talk about it as though it protects nothing but "privacy." To treat it that way is to give it a niggardly interpretation, not the kind of liberal reading I think any Bill of Rights provision should be given. The average man would very likely not have his feelings soothed any more by having his property seized openly than by having it seized privately and by stealth. He simply wants his property left alone. And a person can be just as much, if not more, irritated, annoyed and injured by an unceremonious public arrest by a policeman as he is by a seizure in the privacy of his office or home.

One of the most effective ways of diluting or expanding a constitutionally guaranteed right is to substitute for the crucial word or words of a constitutional guarantee another word or words, more or less flexible and more or less restricted in meaning. This fact is well illustrated by the use of the term "right of privacy" as a comprehensive substitute for the Fourth Amendment's guarantee against "unreasonable searches and seizures." "Privacy" is a broad, abstract and ambiguous concept which can easily be shrunken in meaning but which can also, on the other hand, easily be interpreted as a constitutional ban against many things other than searches and seizures. I have expressed the view many times that First Amendment freedoms, for example, have suffered from a failure of the courts to stick to the simple language of the First Amendment in construing it, instead of invoking multitudes of words substituted for those the Framers used. See, *e. g.*, *New York Times Co.* v. *Sullivan*, 376 U. S. 254, 293 (concurring opinion); cases collected in *City of El Paso* v. *Simmons*, 379 U. S. 497, 517, n. 1 (dissenting opinion); Black, The Bill of Rights, 35 N. Y. U. L. Rev. 865. For these reasons I get nowhere in this case by talk about a constitutional "right of privacy" as an emanation from

773-305 O-65-37

one or more constitutional provisions.[1] I like my privacy as well as the next one, but I am nevertheless compelled to admit that government has a right to invade it unless prohibited by some specific constitutional provision. For these reasons I cannot agree with the Court's judgment and the reasons it gives for holding this Connecticut law unconstitutional.

This brings me to the arguments made by my Brothers HARLAN, WHITE and GOLDBERG for invalidating the Connecticut law. Brothers HARLAN [2] and WHITE would invalidate it by reliance on the Due Process Clause of the Fourteenth Amendment, but Brother GOLDBERG, while agreeing with Brother HARLAN, relies also on the Ninth Amendment. I have no doubt that the Connecticut law could be applied in such a way as to abridge freedom of

[1] The phrase "right to privacy" appears first to have gained currency from an article written by Messrs. Warren and (later Mr. Justice) Brandeis in 1890 which urged that States should give some form of tort relief to persons whose private affairs were exploited by others. The Right to Privacy, 4 Harv. L. Rev. 193. Largely as a result of this article, some States have passed statutes creating such a cause of action, and in others state courts have done the same thing by exercising their powers as courts of common law. See generally 41 Am. Jur. 926–927. Thus the Supreme Court of Georgia, in granting a cause of action for damages to a man whose picture had been used in a newspaper advertisement without his consent, said that "A right of privacy in matters purely private is . . . derived from natural law" and that "The conclusion reached by us seems to be . . . thoroughly in accord with natural justice, with the principles of the law of every civilized nation, and especially with the elastic principles of the common law . . . ." *Pavesich* v. *New England Life Ins. Co.*, 122 Ga. 190, 194, 218, 50 S. E. 68, 70, 80. Observing that "the right of privacy . . . presses for recognition here," today this Court, which I did not understand to have power to sit as a court of common law, now appears to be exalting a phrase which Warren and Brandeis used in discussing grounds for tort relief, to the level of a constitutional rule which prevents state legislatures from passing any law deemed by this Court to interfere with "privacy."

[2] Brother HARLAN'S views are spelled out at greater length in his dissenting opinion in *Poe* v. *Ullman*, 367 U. S. 497, 539–555.

speech and press and therefore violate the First and Fourteenth Amendments. My disagreement with the Court's opinion holding that there is such a violation here is a narrow one, relating to the application of the First Amendment to the facts and circumstances of this particular case. But my disagreement with Brothers HARLAN, WHITE and GOLDBERG is more basic. I think that if properly construed neither the Due Process Clause nor the Ninth Amendment, nor both together, could under any circumstances be a proper basis for invalidating the Connecticut law. I discuss the due process and Ninth Amendment arguments together because on analysis they turn out to be the same thing—merely using different words to claim for this Court and the federal judiciary power to invalidate any legislative act which the judges find irrational, unreasonable or offensive.

The due process argument which my Brothers HARLAN and WHITE adopt here is based, as their opinions indicate, on the premise that this Court is vested with power to invalidate all state laws that it considers to be arbitrary, capricious, unreasonable, or oppressive, or on this Court's belief that a particular state law under scrutiny has no "rational or justifying" purpose, or is offensive to a "sense of fairness and justice." [3] If these formulas based on "natural justice," or others which mean the same thing,[4] are to prevail, they require judges to determine

[3] Indeed, Brother WHITE appears to have gone beyond past pronouncements of the natural law due process theory, which at least said that the Court should exercise this unlimited power to declare state acts unconstitutional with "restraint." He now says that, instead of being presumed constitutional (see *Munn* v. *Illinois*, 94 U. S. 113, 123; compare *Adkins* v. *Children's Hospital*, 261 U. S. 525, 544), the statute here "bears a substantial burden of justification when attacked under the Fourteenth Amendment."

[4] A collection of the catchwords and catch phrases invoked by judges who would strike down under the Fourteenth Amendment laws which offend their notions of natural justice would fill many pages. Thus it has been said that this Court can forbid state action

what is or is not constitutional on the basis of their own appraisal of what laws are unwise or unnecessary. The power to make such decisions is of course that of a legislative body. Surely it has to be admitted that no provision of the Constitution specifically gives such blanket power to courts to exercise such a supervisory veto over the wisdom and value of legislative policies and to hold unconstitutional those laws which they believe unwise or dangerous. I readily admit that no legislative body, state or national, should pass laws that can justly be given any

---

which "shocks the conscience," *Rochin* v. *California*, 342 U. S. 165, 172, sufficiently to "shock itself into the protective arms of the Constitution," *Irvine* v. *California*, 347 U. S. 128, 138 (concurring opinion). It has been urged that States may not run counter to the "decencies of civilized conduct," *Rochin*, *supra*, at 173, or "some principle of justice so rooted in the traditions and conscience of our people as to be ranked as fundamental," *Snyder* v. *Massachusetts*, 291 U. S. 97, 105, or to "those canons of decency and fairness which express the notions of justice of English-speaking peoples," *Malinski* v. *New York*, 324 U. S. 401, 417 (concurring opinion), or to "the community's sense of fair play and decency," *Rochin*, *supra*, at 173. It has been said that we must decide whether a state law is "fair, reasonable and appropriate," or is rather "an unreasonable, unnecessary and arbitrary interference with the right of the individual to his personal liberty or to enter into . . . contracts," *Lochner* v. *New York*, 198 U. S. 45, 56. States, under this philosophy, cannot act in conflict with "deeply rooted feelings of the community," *Haley* v. *Ohio*, 332 U. S. 596, 604 (separate opinion), or with "fundamental notions of fairness and justice," *id.*, 607. See also, *e. g.*, *Wolf* v. *Colorado*, 338 U. S. 25, 27 ("rights . . . basic to our free society"); *Hebert* v. *Louisiana*, 272 U. S. 312, 316 ("fundamental principles of liberty and justice"); *Adkins* v. *Children's Hospital*, 261 U. S. 525, 561 ("arbitrary restraint of . . . liberties"); *Betts* v. *Brady*, 316 U. S. 455, 462 ("denial of fundamental fairness, shocking to the universal sense of justice"); *Poe* v. *Ullman*, 367 U. S. 497, 539 (dissenting opinion) ("intolerable and unjustifiable"). Perhaps the clearest, frankest and briefest explanation of how this due process approach works is the statement in another case handed down today that this Court is to invoke the Due Process Clause to strike down state procedures or laws which it can "not tolerate." *Linkletter* v. *Walker*, *post*, p. 618, at 631.

of the invidious labels invoked as constitutional excuses to strike down state laws. But perhaps it is not too much to say that no legislative body ever does pass laws without believing that they will accomplish a sane, rational, wise and justifiable purpose. While I completely subscribe to the holding of *Marbury* v. *Madison*, 1 Cranch 137, and subsequent cases, that our Court has constitutional power to strike down statutes, state or federal, that violate commands of the Federal Constitution, I do not believe that we are granted power by the Due Process Clause or any other constitutional provision or provisions to measure constitutionality by our belief that legislation is arbitrary, capricious or unreasonable, or accomplishes no justifiable purpose, or is offensive to our own notions of "civilized standards of conduct." [5] Such an appraisal of the wisdom of legislation is an attribute of the power to make laws, not of the power to interpret them. The use by federal courts of such a formula or doctrine or whatnot to veto federal or state laws simply takes away from Congress and States the power to make laws based on their own judgment of fairness and wisdom and transfers that power to this Court for ultimate determination—a power which was specifically denied to federal courts by the convention that framed the Constitution.[6]

---

[5] See Hand, The Bill of Rights (1958) 70:

"[J]udges are seldom content merely to annul the particular solution before them; they do not, indeed they may not, say that taking all things into consideration, the legislators' solution is too strong for the judicial stomach. On the contrary they wrap up their veto in a protective veil of adjectives such as 'arbitrary,' 'artificial,' 'normal,' 'reasonable,' 'inherent,' 'fundamental,' or 'essential,' whose office usually, though quite innocently, is to disguise what they are doing and impute to it a derivation far more impressive than their personal preferences, which are all that in fact lie behind the decision." See also *Rochin* v. *California*, 342 U. S. 165, 174 (concurring opinion). But see *Linkletter* v. *Walker*, *supra*, n. 4, at 631.

[6] This Court held in *Marbury* v. *Madison*, 1 Cranch 137, that this Court has power to invalidate laws on the ground that they exceed

Of the cases on which my Brothers WHITE and GOLDBERG rely so heavily, undoubtedly the reasoning of two of them supports their result here—as would that of a number of others which they do not bother to name, *e. g.*,

---

the constitutional power of Congress or violate some specific prohibition of the Constitution. See also *Fletcher* v. *Peck*, 6 Cranch 87. But the Constitutional Convention did on at least two occasions reject proposals which would have given the federal judiciary a part in recommending laws or in vetoing as bad or unwise the legislation passed by the Congress. Edmund Randolph of Virginia proposed that the President

". . . and a convenient number of the National Judiciary, ought to compose a council of revision with authority to examine every act of the National Legislature before it shall operate, & every act of a particular Legislature before a Negative thereon shall be final; and that the dissent of the said Council shall amount to a rejection, unless the Act of the National Legislature be again passed, or that of a particular Legislature be again negatived by [original wording illegible] of the members of each branch." 1 The Records of the Federal Convention of 1787 (Farrand ed. 1911) 21.

In support of a plan of this kind James Wilson of Pennsylvania argued that:

". . . It had been said that the Judges, as expositors of the Laws would have an opportunity of defending their constitutional rights. There was weight in this observation; but this power of the Judges did not go far enough. Laws may be unjust, may be unwise, may be dangerous, may be destructive; and yet not be so unconstitutional as to justify the Judges in refusing to give them effect. Let them have a share in the Revisionary power, and they will have an opportunity of taking notice of these characters of a law, and of counteracting, by the weight of their opinions the improper views of the Legislature." 2 *id.*, at 73.

Nathaniel Gorham of Massachusetts "did not see the advantage of employing the Judges in this way. As Judges they are not to be presumed to possess any peculiar knowledge of the mere policy of public measures." *Ibid.*

Elbridge Gerry of Massachusetts likewise opposed the proposal for a council of revision:

". . . He relied for his part on the Representatives of the people as the guardians of their Rights & interests. It [the proposal] was

Lochner v. *New York*, 198 U. S. 45, *Coppage* v. *Kansas*, 236 U. S. 1, *Jay Burns Baking Co.* v. *Bryan*, 264 U. S. 504, and *Adkins* v. *Children's Hospital*, 261 U. S. 525. The two they do cite and quote from, *Meyer* v. *Nebraska*, 262 U. S. 390, and *Pierce* v. *Society of Sisters*, 268 U. S. 510, were both decided in opinions by Mr. Justice McReynolds which elaborated the same natural law due process philosopy found in *Lochner* v. *New York*, *supra*, one of the cases on which he relied in *Meyer*, along with such other long-discredited decisions as, *e. g.*, *Adams* v. *Tanner*, 244 U. S. 590, and *Adkins* v. *Children's Hospital*, *supra*. *Meyer* held unconstitutional, as an "arbitrary" and unreasonable interference with the right of a teacher to carry on his occupation and of parents to hire him, a

---

making the Expositors of the Laws, the Legislators which ought never to be done." *Id.*, at 75.

And at another point:

"Mr. Gerry doubts whether the Judiciary ought to form a part of it [the proposed council of revision], as they will have a sufficient check agst. encroachments on their own department by their exposition of the laws, which involved a power of deciding on their Constitutionality. . . . It was quite foreign from the nature of ye. office to make them judges of the policy of public measures." 1 *Id.*, at 97–98.

Madison supported the proposal on the ground that "a Check [on the legislature] is necessary." *Id.*, at 108. John Dickinson of Delaware opposed it on the ground that "the Judges must interpret the Laws they ought not to be legislators." *Ibid.* The proposal for a council of revision was defeated.

The following proposal was also advanced:

"To assist the President in conducting the Public affairs there shall be a Council of State composed of the following officers—1. The Chief Justice of the Supreme Court, who shall from time to time recommend such alterations of and additions to the laws of the U. S. as may in his opinion be necessary to the due administration of Justice, and such as may promote useful learning and inculcate sound morality throughout the Union . . . ." 2 *id.*, at 342. This proposal too was rejected.

state law forbidding the teaching of modern foreign languages to young children in the schools.[7] And in *Pierce*, relying principally on *Meyer*, Mr. Justice McReynolds said that a state law requiring that all children attend public schools interfered unconstitutionally with the property rights of private school corporations because it was an "arbitrary, unreasonable and unlawful interference" which threatened "destruction of their business and property." 268 U. S., at 536. Without expressing an opinion as to whether either of those cases reached a correct result in light of our later decisions applying the First Amendment to the States through the Fourteenth,[8] I merely point out that the reasoning stated in *Meyer* and *Pierce* was the same natural law due process philosophy which many later opinions repudiated, and which I cannot accept. Brothers WHITE and GOLDBERG also cite other cases, such as *NAACP* v. *Button*, 371 U. S. 415, *Shelton* v. *Tucker*, 364 U. S. 479, and *Schneider* v. *State*, 308 U. S. 147, which held that States in regulating conduct could not, consistently with the First Amendment as applied to them by the Fourteenth, pass unnecessarily broad laws which might indirectly infringe on First Amendment freedoms.[9] See *Brotherhood of Railroad Trainmen* v. *Virginia ex rel.*

---

[7] In *Meyer*, in the very same sentence quoted in part by my Brethren in which he asserted that the Due Process Clause gave an abstract and inviolable right "to marry, establish a home and bring up children," Mr. Justice McReynolds also asserted the heretofore discredited doctrine that the Due Process Clause prevented States from interfering with "the right of the individual to contract." 262 U. S., at 399.

[8] Compare *Poe* v. *Ullman*, 367 U. S., at 543–544 (HARLAN, J., dissenting).

[9] The Court has also said that in view of the Fourteenth Amendment's major purpose of eliminating state-enforced racial discrimination, this Court will scrutinize carefully any law embodying a racial classification to make sure that it does not deny equal protection of the laws. See *McLaughlin* v. *Florida*, 379 U. S. 184.

Virginia State Bar, 377 U. S. 1, 7–8.[10] Brothers WHITE and GOLDBERG now apparently would start from this requirement that laws be narrowly drafted so as not to curtail free speech and assembly, and extend it limitlessly to require States to justify any law restricting "liberty" as my Brethren define "liberty." This would mean at the

[10] None of the other cases decided in the past 25 years which Brothers WHITE and GOLDBERG cite can justly be read as holding that judges have power to use a natural law due process formula to strike down all state laws which they think are unwise, dangerous, or irrational. *Prince* v. *Massachusetts*, 321 U. S. 158, *upheld* a state law forbidding minors from selling publications on the streets. *Kent* v. *Dulles*, 357 U. S. 116, recognized the power of Congress to restrict travel outside the country so long as it accorded persons the procedural safeguards of due process and did not violate any other specific constitutional provision. *Schware* v. *Board of Bar Examiners*, 353 U. S. 232, held simply that a State could not, consistently with due process, refuse a lawyer a license to practice law on the basis of a finding that he was morally unfit when there was no evidence in the record, 353 U. S., at 246–247, to support such a finding. Compare *Thompson* v. *City of Louisville*, 362 U. S. 199, in which the Court relied in part on *Schware*. See also *Konigsberg* v. *State Bar*, 353 U. S. 252. And *Bolling* v. *Sharpe*, 347 U. S. 497, merely recognized what had been the understanding from the beginning of the country, an understanding shared by many of the draftsmen of the Fourteenth Amendment, that the whole Bill of Rights, including the Due Process Clause of the Fifth Amendment, was a guarantee that all persons would receive equal treatment under the law. Compare *Chambers* v. *Florida*, 309 U. S. 227, 240–241. With one exception, the other modern cases relied on by my Brethren were decided either solely under the Equal Protection Clause of the Fourteenth Amendment or under the First Amendment, made applicable to the States by the Fourteenth, some of the latter group involving the right of association which this Court has held to be a part of the rights of speech, press and assembly guaranteed by the First Amendment. As for *Aptheker* v. *Secretary of State*, 378 U. S. 500, I am compelled to say that if that decision was written or intended to bring about the abrupt and drastic reversal in the course of constitutional adjudication which is now attributed to it, the change was certainly made in a very quiet and unprovocative manner, without any attempt to justify it.

very least, I suppose, that every state criminal statute—since it must inevitably curtail "liberty" to some extent—would be suspect, and would have to be justified to this Court.[11]

My Brother GOLDBERG has adopted the recent discovery[12] that the Ninth Amendment as well as the Due Process Clause can be used by this Court as authority to strike down all state legislation which this Court thinks

---

[11] Compare *Adkins* v. *Children's Hospital*, 261 U. S. 525, 568 (Holmes, J., dissenting):

"The earlier decisions upon the same words [the Due Process Clause] in the Fourteenth Amendment began within our memory and went no farther than an unpretentious assertion of the liberty to follow the ordinary callings. Later that innocuous generality was expanded into the dogma, Liberty of Contract. Contract is not specially mentioned in the text that we have to construe. It is merely an example of doing what you want to do, embodied in the word liberty. But pretty much all law consists in forbidding men to do some things that they want to do, and contract is no more exempt from law than other acts."

[12] See Patterson, The Forgotten Ninth Amendment (1955). Mr. Patterson urges that the Ninth Amendment be used to protect unspecified "natural and inalienable rights." P. 4. The Introduction by Roscoe Pound states that "there is a marked revival of natural law ideas throughout the world. Interest in the Ninth Amendment is a symptom of that revival." P. iii.

In Redlich, Are There "Certain Rights . . . Retained by the People"?, 37 N. Y. U. L. Rev. 787, Professor Redlich, in advocating reliance on the Ninth and Tenth Amendments to invalidate the Connecticut law before us, frankly states:

"But for one who feels that the marriage relationship should be beyond the reach of a state law forbidding the use of contraceptives, the birth control case poses a troublesome and challenging problem of constitutional interpretation. He may find himself saying, 'The law is unconstitutional—but why?' There are two possible paths to travel in finding the answer. One is to revert to a frankly flexible due process concept even on matters that do not involve specific constitutional prohibitions. The other is to attempt to evolve a new constitutional framework within which to meet this and similar problems which are likely to arise." *Id.*, at 798.

violates "fundamental principles of liberty and justice," or is contrary to the "traditions and [collective] conscience of our people." He also states, without proof satisfactory to me, that in making decisions on this basis judges will not consider "their personal and private notions." One may ask how they can avoid considering them. Our Court certainly has no machinery with which to take a Gallup Poll.[13] And the scientific miracles of this age have not yet produced a gadget which the Court can use to determine what traditions are rooted in the "[collective] conscience of our people." Moreover, one would certainly have to look far beyond the language of the Ninth Amendment[14] to find that the Framers vested in this Court any such awesome veto powers over lawmaking, either by the States or by the Congress. Nor does anything in the history of the Amendment offer any support for such a shocking doctrine. The whole history of the adoption of the Constitution and Bill of Rights points the other way, and the very material quoted by my Brother GOLDBERG shows that the Ninth Amendment was intended to protect against the idea that "by enumerating particular exceptions to the grant of power" to the Federal Government, "those rights which were not singled out, were intended to be assigned into the hands of the General Government [the United States], and were con-

[13] Of course one cannot be oblivious to the fact that Mr. Gallup has already published the results of a poll which he says show that 46% of the people in this country believe schools should teach about birth control. Washington Post, May 21, 1965, p. 2, col. 1. I can hardly believe, however, that Brother GOLDBERG would view 46% of the persons polled as so overwhelming a proportion that this Court may now rely on it to declare that the Connecticut law infringes "fundamental" rights, and overrule the long-standing view of the people of Connecticut expressed through their elected representatives.

[14] U. S. Const., Amend. IX, provides:

"The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people."

sequently insecure." [15] That Amendment was passed, not to broaden the powers of this Court or any other department of "the General Government," but, as every student of history knows, to assure the people that the Constitution in all its provisions was intended to limit the Federal Government to the powers granted expressly or by necessary implication. If any broad, unlimited power to hold laws unconstitutional because they offend what this Court conceives to be the "[collective] conscience of our people" is vested in this Court by the Ninth Amendment, the Fourteenth Amendment, or any other provision of the Constitution, it was not given by the Framers, but rather has been bestowed on the Court by the Court. This fact is perhaps responsible for the peculiar phenomenon that for a period of a century and a half no serious suggestion was ever made that the Ninth Amendment, enacted to protect state powers against federal invasion, could be used as a weapon of federal power to prevent state legislatures from passing laws they consider appropriate to govern local affairs. Use of any such broad, unbounded judicial authority would make of this Court's members a day-to-day constitutional convention.

I repeat so as not to be misunderstood that this Court does have power, which it should exercise, to hold laws unconstitutional where they are forbidden by the Federal Constitution. My point is that there is no provision

[15] 1 Annals of Congress 439. See also II Story, Commentaries on the Constitution of the United States (5th ed. 1891): "This clause was manifestly introduced to prevent any perverse or ingenious misapplication of the well-known maxim, that an affirmation in particular cases implies a negation in all others; and, *e converso*, that a negation in particular cases implies an affirmation in all others. The maxim, rightly understood, is perfectly sound and safe; but it has often been strangely forced from its natural meaning into the support of the most dangerous political heresies." *Id.*, at 651 (footnote omitted).

of the Constitution which either expressly or impliedly vests power in this Court to sit as a supervisory agency over acts of duly constituted legislative bodies and set aside their laws because of the Court's belief that the legislative policies adopted are unreasonable, unwise, arbitrary, capricious or irrational. The adoption of such a loose, flexible, uncontrolled standard for holding laws unconstitutional, if ever it is finally achieved, will amount to a great unconstitutional shift of power to the courts which I believe and am constrained to say will be bad for the courts and worse for the country. Subjecting federal and state laws to such an unrestrained and unrestrainable judicial control as to the wisdom of legislative enactments would, I fear, jeopardize the separation of governmental powers that the Framers set up and at the same time threaten to take away much of the power of States to govern themselves which the Constitution plainly intended them to have.[16]

---

[16] Justice Holmes in one of his last dissents, written in reply to Mr. Justice McReynolds' opinion for the Court in *Baldwin v. Missouri*, 281 U. S. 586, solemnly warned against a due process formula apparently approved by my concurring Brethren today. He said:

"I have not yet adequately expressed the more than anxiety that I feel at the ever increasing scope given to the Fourteenth Amendment in cutting down what I believe to be the constitutional rights of the States. As the decisions now stand, I see hardly any limit but the sky to the invalidating of those rights if they happen to strike a majority of this Court as for any reason undesirable. I cannot believe that the Amendment was intended to give us *carte blanche* to embody our economic or moral beliefs in its prohibitions. Yet I can think of no narrower reason that seems to me to justify the present and the earlier decisions to which I have referred. Of course the words 'due process of law,' if taken in their literal meaning, have no application to this case; and while it is too late to deny that they have been given a much more extended and artificial signification, still we ought to remember the great caution shown by the Consti-

I realize that many good and able men have eloquently spoken and written, sometimes in rhapsodical strains, about the duty of this Court to keep the Constitution in tune with the times. The idea is that the Constitution must be changed from time to time and that this Court is charged with a duty to make those changes. For myself, I must with all deference reject that philosophy. The Constitution makers knew the need for change and provided for it. Amendments suggested by the people's elected representatives can be submitted to the people or their selected agents for ratification. That method of change was good for our Fathers, and being somewhat old-fashioned I must add it is good enough for me. And so, I cannot rely on the Due Process Clause or the Ninth Amendment or any mysterious and uncertain natural law concept as a reason for striking down this state law. The Due Process Clause with an "arbitrary and capricious" or "shocking to the conscience" formula was liberally used by this Court to strike down economic legislation in the early decades of this century, threatening, many people thought, the tranquility and stability of the Nation. See, *e. g., Lochner* v. *New York*, 198 U. S. 45. That formula, based on subjective considerations of "natural justice," is no less dangerous when used to enforce this Court's views about personal rights than those about economic rights. I had thought that we had laid that formula, as a means for striking down state legislation, to rest once and for all in cases like *West Coast Hotel Co.* v. *Parrish*, 300 U. S. 379; *Olsen* v. *Nebraska ex rel. Western Reference & Bond Assn.*, 313 U. S. 236, and many other

---

tution in limiting the power of the States, and should be slow to construe the clause in the Fourteenth Amendment as committing to the Court, with no guide but the Court's own discretion, the validity of whatever laws the States may pass." 281 U. S., at 595. See 2 Holmes-Pollock Letters (Howe ed. 1941) 267–268.

opinions.[17] See also *Lochner* v. *New York*, 198 U. S. 45, 74 (Holmes, J., dissenting).

In *Ferguson* v. *Skrupa*, 372 U. S. 726, 730, this Court two years ago said in an opinion joined by all the Justices but one [18] that

> "The doctrine that prevailed in *Lochner, Coppage, Adkins, Burns*, and like cases—that due process authorizes courts to hold laws unconstitutional when they believe the legislature has acted unwisely—has long since been discarded. We have returned to the original constitutional proposition that courts do not substitute their social and economic beliefs for the judgment of legislative bodies, who are elected to pass laws."

And only six weeks ago, without even bothering to hear argument, this Court overruled *Tyson & Brother* v. *Banton*, 273 U. S. 418, which had held state laws regulating ticket brokers to be a denial of due process of law.[19] *Gold*

[17] *E. g.*, in *Day-Brite Lighting, Inc.* v. *Missouri*, 342 U. S. 421, 423, this Court held that "Our recent decisions make plain that we do not sit as a superlegislature to weigh the wisdom of legislation nor to decide whether the policy which it expresses offends the public welfare." Compare *Gardner* v. *Massachusetts*, 305 U. S. 559, which the Court today apparently overrules, which held that a challenge under the Federal Constitution to a state law forbidding the sale or furnishing of contraceptives did not raise a substantial federal question.

[18] Brother HARLAN, who has consistently stated his belief in the power of courts to strike down laws which they consider arbitrary or unreasonable, see, *e. g.*, *Poe* v. *Ullman*, 367 U. S. 497, 539–555 (dissenting opinion), did not join the Court's opinion in *Ferguson* v. *Skrupa*.

[19] Justice Holmes, dissenting in *Tyson*, said:

"I think the proper course is to recognize that a state legislature can do whatever it sees fit to do unless it is restrained by some express prohibition in the Constitution of the United States or of the State, and that Courts should be careful not to extend such prohibitions beyond their obvious meaning by reading into them conceptions of public policy that the particular Court may happen to entertain." 273 U. S., at 446.

v. *DiCarlo*, 380 U. S. 520. I find April's holding hard to square with what my concurring Brethren urge today. They would reinstate the *Lochner, Coppage, Adkins, Burns* line of cases, cases from which this Court recoiled after the 1930's, and which had been I thought totally discredited until now. Apparently my Brethren have less quarrel with state economic regulations than former Justices of their persuasion had. But any limitation upon their using the natural law due process philosophy to strike down any state law, dealing with any activity whatever, will obviously be only self-imposed.[20]

In 1798, when this Court was asked to hold another Connecticut law unconstitutional, Justice Iredell said:

> "[I]t has been the policy of all the *American* states, which have, individually, framed their state constitutions since the revolution, and of the people of the *United States*, when they framed the Federal Constitution, to define with precision the objects of the legislative power, and to restrain its exercise within marked and settled boundaries. If any act of Congress, or of the Legislature of a state, violates those constitutional provisions, it is unquestionably void; though, I admit, that as the authority to declare it void is of a delicate and awful nature, the Court will never resort to that authority, but in a clear and urgent case. If, on the other hand, the Legislature of the Union, or the Legislature of any member of the Union, shall pass a law, within the

[20] Compare *Nicchia* v. *New York*, 254 U. S. 228, 231, upholding a New York dog-licensing statute on the ground that it did not "deprive dog owners of liberty without due process of law." And as I said concurring in *Rochin* v. *California*, 342 U. S. 165, 175, "I believe that faithful adherence to the specific guarantees in the Bill of Rights insures a more permanent protection of individual liberty than that which can be afforded by the nebulous standards" urged by my concurring Brethren today.

> general scope of their constitutional power, the Court cannot pronounce it to be void, merely because it is, in their judgment, contrary to the principles of natural justice. The ideas of natural justice are regulated by no fixed standard: the ablest and the purest men have differed upon the subject; and all that the Court could properly say, in such an event, would be, that the Legislature (possessed of an equal right of opinion) had passed an act which, in the opinion of the judges, was inconsistent with the abstract principles of natural justice." *Calder* v. *Bull*, 3 Dall. 386, 399 (emphasis in original).

I would adhere to that constitutional philosophy in passing on this Connecticut law today. I am not persuaded to deviate from the view which I stated in 1947 in *Adamson* v. *California*, 332 U. S. 46, 90–92 (dissenting opinion):

> "Since *Marbury* v. *Madison*, 1 Cranch 137, was decided, the practice has been firmly established, for better or worse, that courts can strike down legislative enactments which violate the Constitution. This process, of course, involves interpretation, and since words can have many meanings, interpretation obviously may result in contraction or extension of the original purpose of a constitutional provision, thereby affecting policy. But to pass upon the constitutionality of statutes by looking to the particular standards enumerated in the Bill of Rights and other parts of the Constitution is one thing; to invalidate statutes because of application of 'natural law' deemed to be above and undefined by the Constitution is another. 'In the one instance, courts proceeding within clearly marked constitutional boundaries seek to execute policies written into the Constitution; in the other, they roam at will in the limit-

773-305 O-65-38

less area of their own beliefs as to reasonableness and actually select policies, a responsibility which the Constitution entrusts to the legislative representatives of the people.' *Federal Power Commission* v. *Pipeline Co.*, 315 U. S. 575, 599, 601, n. 4." [21] (Footnotes omitted.)

The late Judge Learned Hand, after emphasizing his view that judges should not use the due process formula suggested in the concurring opinions today or any other formula like it to invalidate legislation offensive to their "personal preferences," [22] made the statement, with which I fully agree, that:

"For myself it would be most irksome to be ruled by a bevy of Platonic Guardians, even if I

[21] *Gideon* v. *Wainwright*, 372 U. S. 335, and similar cases applying specific Bill of Rights provisions to the States do not in my view stand for the proposition that this Court can rely on its own concept of "ordered liberty" or "shocking the conscience" or natural law to decide what laws it will permit state legislatures to enact. *Gideon* in applying to state prosecutions the Sixth Amendment's guarantee of right to counsel followed *Palko* v. *Connecticut*, 302 U. S. 319, which had held that specific provisions of the Bill of Rights, rather than the Bill of Rights as a whole, would be selectively applied to the States. While expressing my own belief (not shared by MR. JUSTICE STEWART) that all the provisions of the Bill of Rights were made applicable to the States by the Fourteenth Amendment, in my dissent in *Adamson* v. *California*, 332 U. S. 46, 89, I also said:

"If the choice must be between the selective process of the *Palko* decision applying some of the Bill of Rights to the States, or the *Twining* rule applying none of them, I would choose the *Palko* selective process."

Gideon and similar cases merely followed the *Palko* rule, which in *Adamson* I agreed to follow if necessary to make Bill of Rights safeguards applicable to the States. See also *Pointer* v. *Texas*, 380 U. S. 400; *Malloy* v. *Hogan*, 378 U. S. 1.

[22] Hand, The Bill of Rights (1958) 70. See note 5, *supra*. See generally *id.*, at 35–45.

knew how to choose them, which I assuredly do not." [23]

So far as I am concerned, Connecticut's law as applied here is not forbidden by any provision of the Federal Constitution as that Constitution was written, and I would therefore affirm.

MR. JUSTICE STEWART, whom MR. JUSTICE BLACK joins, dissenting.

Since 1879 Connecticut has had on its books a law which forbids the use of contraceptives by anyone. I think this is an uncommonly silly law. As a practical matter, the law is obviously unenforceable, except in the oblique context of the present case. As a philosophical matter, I believe the use of contraceptives in the relationship of marriage should be left to personal and private choice, based upon each individual's moral, ethical, and religious beliefs. As a matter of social policy, I think professional counsel about methods of birth control should be available to all, so that each individual's choice can be meaningfully made. But we are not asked in this case to say whether we think this law is unwise, or even asinine. We are asked to hold that it violates the United States Constitution. And that I cannot do.

In the course of its opinion the Court refers to no less than six Amendments to the Constitution: the First, the Third, the Fourth, the Fifth, the Ninth, and the Four-

[23] *Id.*, at 73. While Judge Hand condemned as unjustified the invalidation of state laws under the natural law due process formula, see *id.*, at 35–45, he also expressed the view that this Court in a number of cases had gone too far in holding legislation to be in violation of specific guarantees of the Bill of Rights. Although I agree with his criticism of use of the due process formula, I do not agree with all the views he expressed about construing the specific guarantees of the Bill of Rights.

teenth. But the Court does not say which of these Amendments, if any, it thinks is infringed by this Connecticut law.

We *are* told that the Due Process Clause of the Fourteenth Amendment is not, as such, the "guide" in this case. With that much I agree. There is no claim that this law, duly enacted by the Connecticut Legislature, is unconstitutionally vague. There is no claim that the appellants were denied any of the elements of procedural due process at their trial, so as to make their convictions constitutionally invalid. And, as the Court says, the day has long passed since the Due Process Clause was regarded as a proper instrument for determining "the wisdom, need, and propriety" of state laws. Compare *Lochner* v. *New York*, 198 U. S. 45, with *Ferguson* v. *Skrupa*, 372 U. S. 726. My Brothers HARLAN and WHITE to the contrary, "[w]e have returned to the original constitutional proposition that courts do not substitute their social and economic beliefs for the judgment of legislative bodies, who are elected to pass laws." *Ferguson* v. *Skrupa*, *supra*, at 730.

As to the First, Third, Fourth, and Fifth Amendments, I can find nothing in any of them to invalidate this Connecticut law, even assuming that all those Amendments are fully applicable against the States.[1] It has

[1] The Amendments in question were, as everyone knows, originally adopted as limitations upon the power of the newly created Federal Government, not as limitations upon the powers of the individual States. But the Court has held that many of the provisions of the first eight amendments are fully embraced by the Fourteenth Amendment as limitations upon state action, and some members of the Court have held the view that the adoption of the Fourteenth Amendment made every provision of the first eight amendments fully applicable against the States. See *Adamson* v. *California*, 332 U. S. 46, 68 (dissenting opinion of MR. JUSTICE BLACK).

not even been argued that this is a law "respecting an establishment of religion, or prohibiting the free exercise thereof." [2] And surely, unless the solemn process of constitutional adjudication is to descend to the level of a play on words, there is not involved here any abridgment of "the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances." [3] No soldier has been quartered in any house.[4] There has been no search, and no seizure.[5] Nobody has been compelled to be a witness against himself.[6]

The Court also quotes the Ninth Amendment, and my Brother GOLDBERG'S concurring opinion relies heavily upon it. But to say that the Ninth Amendment has anything to do with this case is to turn somersaults with history. The Ninth Amendment, like its companion the Tenth, which this Court held "states but a truism that all is retained which has not been surrendered," *United States* v. *Darby*, 312 U. S. 100, 124, was framed by James Madison and adopted by the States simply to make clear that the adoption of the Bill of Rights did not alter the plan that

[2] U. S. Constitution, Amendment I. To be sure, the injunction contained in the Connecticut statute coincides with the doctrine of certain religious faiths. But if that were enough to invalidate a law under the provisions of the First Amendment relating to religion, then most criminal laws would be invalidated. See, *e. g.*, the Ten Commandments. The Bible, Exodus 20:2–17 (King James).

[3] U. S. Constitution, Amendment I. If all the appellants had done was to advise people that they thought the use of contraceptives was desirable, or even to counsel their use, the appellants would, of course, have a substantial First Amendment claim. But their activities went far beyond mere advocacy. They prescribed specific contraceptive devices and furnished patients with the prescribed contraceptive materials.

[4] U. S. Constitution, Amendment III.

[5] U. S. Constitution, Amendment IV.

[6] U. S. Constitution, Amendment V.

the *Federal* Government was to be a government of express and limited powers, and that all rights and powers not delegated to it were retained by the people and the individual States. Until today no member of this Court has ever suggested that the Ninth Amendment meant anything else, and the idea that a federal court could ever use the Ninth Amendment to annul a law passed by the elected representatives of the people of the State of Connecticut would have caused James Madison no little wonder.

What provision of the Constitution, then, does make this state law invalid? The Court says it is the right of privacy "created by several fundamental constitutional guarantees." With all deference, I can find no such general right of privacy in the Bill of Rights, in any other part of the Constitution, or in any case ever before decided by this Court.[1]

At the oral argument in this case we were told that the Connecticut law does not "conform to current community standards." But it is not the function of this Court to decide cases on the basis of community standards. We are here to decide cases "agreeably to the Constitution and laws of the United States." It is the essence of judicial

[1] Cases like *Shelton* v. *Tucker*, 364 U. S. 479 and *Bates* v. *Little Rock*, 361 U. S. 516, relied upon in the concurring opinions today, dealt with true First Amendment rights of association and are wholly inapposite here. See also, *e. g.*, *NAACP* v. *Alabama*, 357 U. S. 449; *Edwards* v. *South Carolina*, 372 U. S. 229. Our decision in *McLaughlin* v. *Florida*, 379 U. S. 184, is equally far afield. That case held invalid under the Equal Protection Clause, a state criminal law which discriminated against Negroes.

The Court does not say how far the new constitutional right of privacy announced today extends. See, *e. g.*, Mueller, Legal Regulation of Sexual Conduct, at 127; Ploscowe, Sex and the Law, at 189. I suppose, however, that even after today a State can constitutionally still punish at least some offenses which are not committed in public.

duty to subordinate our own personal views, our own ideas of what legislation is wise and what is not. If, as I should surely hope, the law before us does not reflect the standards of the people of Connecticut, the people of Connecticut can freely exercise their true Ninth and Tenth Amendment rights to persuade their elected representatives to repeal it. That is the constitutional way to take this law off the books.[8]

[8] See *Reynolds* v. *Sims*, 377 U. S. 533, 562. The Connecticut House of Representatives recently passed a bill (House Bill No. 2462) repealing the birth control law. The State Senate has apparently not yet acted on the measure, and today is relieved of that responsibility by the Court. New Haven Journal-Courier, Wed., May 19, 1965, p. 1, col. 4, and p. 13, col. 7.

Part 6—Medical and Scientific Consideration

[From the Washington Star, Mar. 21, 1976]

MARIHUANA EASES CANCER SUFFERING

(By Chrisine Russell)

BOSTON—The Sidney Farber Cancer Center scientists had informally heard descriptions of the medicinal magic of marihuana from patients undergoing chemotherapy for cancer. When conventional antivomiting drugs had proven unsuccessful, smoking marihuana helped control the violent nausea and stomach upset which frequently were side-effects of their anti-cancer treatments.

To find out whether these anecdotes about marihuana's therapeutic effects were folklore or fact. Drs. Stephen Sallan, Norman Zinberg, and Emil Frei III decided to conduct a controlled study of the principal chemical ingredient in marihuana—delta-9-tetrahydrocannabinol, or THC.

They took a group of 22 hospitalized cancer patients for whom nothing else worked and, in a controlled experiment, provided them with oral doses of either THC or placebo (sugar pills) when they were undergoing the cancer-countering but nausea-producing chemotherapy.

Each person was to serve as his own control, assessing nausea, vomiting and food intake on the day after treatment through the use of a self-administered questionnaire.

The results were dramatic. No person vomited while experiencing a subjective "high." Overall, significant reduction in nausea and vomiting was observed at least 70 percent of the time with THC, but occurred in none of the placebo tests.

The Boston researchers presented these findings last fall in the prestigious New England Journal of Medicine.

Since the study was published, Sallan has heard from dozens of physicians anxious to find a better way of treating their own cancer patients. He has heard from the families of cancer patients. And he has heard from the patients themselves.

In each case Sallan has necessarily given the same unsatisfactory reply. Since the drug is illegal, he cannot provide it to those who want to try its medicinal properties.

Writes Sallan: "I regret to inform you that because tetrahydrocannabinol is a Schedule I drug, it is not available by prescription . . . I appreciate your dilemma and am aware of one's suffering and helplessness in the face of the severe nausea and vomiting associated with chemotherapy. I wish I could be of more help to you at this time, but I am only licensed to use the drug within our institution under very tightly controlled circumstances. Hopefully, in the near future, this situation will change."

But Sallan is pessimistic about the prospect of extending THC to cancer patients on a widespread basis.

He's worried that the politics of policing marihuana will continue to interfere with legitimate attempts to put the drug into prescribed medical use.

For his own dealings with the federal agencies overseeing marihuana research have been discouraging, filled with distressing delays and obstructions.

Other scientists interested in investigating the drug have had similar experiences with the endless red tape, discouraging enough to lead Dr. William Regelson of the Medical College of Virginia to conclude "that the hassle just isn't worth it."

Because of what he called "overregulation," Regelson doesn't want to work with the drug any more, despite the encouraging results of his preliminary study on an advanced cancer population which indicated that THC seemed to have beneficial effects on depression, pain, nausea, and appetite.

At Southern Illinois University, Dr. Charles Whitfield conducted a pilot study similar to Sallan's and at a December scientific meeting reported similar success—it worked as an anti-vomiting agent in 75 percent of his cases.

In an interview, Whitfield seemed inclined to give up further work in this controversial area. "I have a gut feeling that the government does not want to see anything positive come out on marihuana because politically it is unpopular."

But at the Mayo Clinic in Rochester, Minn., and Mt. Sinai Hospital and Memorial Sloan-Kettering Cancer Center in New York, other researchers are intrigued enough to plan followup studies in the near future. And in Boston, Sallan and his colleagues are undeterred. In January they embarked on a second study, comparing THC with the conventional drugs that have been used with limited success in treating nausea.

The regulatory process begins with the Food and Drug Administration, which oversees the development of any new drug. Their procedures are elaborately detailed in order to protect the public from prematurely marketed drugs.

But for the marihuana researcher, much more is involved, including hospital inspections by the Justice Department's Drug Enforcement Administration and careful accounting to the National Institute on Drug Abuse (NIDA), the agency which supplies the "legal" THC for research purposes. (The THC, placed in gelatin capsules, is specially prepared by a Boston research firm or imported from an Israeli company.)

"It should be easier for doctors to obtain THC for research. We are trying to get it eased up, but the bureaucracy has millions of tentacles. It is because of the past history of our legal entanglement with this drug," admitted one NIDA official. He asked not to be named, and like numerous others contacted at the politically sensitive agency he at first avoided commenting on the details of the drug research.

"It is a very fascinating drug which has potential which is untapped as yet, but it is a Catch 22," the NIDA scientist continued. "It has to be tested to show that it is medically useful. But because of the illegality of marihuana, investigators are just plain discouraged with the mountains of red tape involved to get a little study going."

Despite the roadblocks, in the last decade marihuana "has been found to have some therapeutic potential in a number of diverse areas," concluded a recent NIDA report to Congress. In addition to the potential use as an anti-vomiting aid to cancer patients, promising applications may eventually lie in the treatment of glaucoma (it reduces eye pressure) as well as asthma (it dilates air passageways). More preliminary work in the use of cannabis as a sedative, an anticonvulsant, an antidepressant, and a pain killer has also been undertaken. And in animal experiments, THC has even been shown to slow down cancer growth.

It takes about five years—and in the case of cannabis chemicals probably more—for a drug to travel the regulatory route, sufficiently demonstrating both safety and efficacy to the federal regulators.

We're very conservative about what we call effective. There's a real danger in letting out an ineffective drug which people think is working," commented FDA's Dr. Edward C. Tocus, chief of the drug abuse staff in the Bureau of Drugs.

Sitting in his Boston office, the young doctor lamented the federal agencies' "bureaucratic obstructionist views." But he doesn't blame the middle men—the desk scientists "whose jobs depend on not making mistakes."

He feels that "within the limits of their humanity they probably fully agree with the study. They really don't want to make anybody suffer or obstruct progress. But to say yes to a highly controversial drug is a position that virtually no one other than the top man would be willing to make."

His memories of working with the marihuana drug stray back and forth between the poignant stories of the patients he has helped feel better and the frustrating days in which the promised drug shipment had been delayed once again.

His face lights up just thinking about one young boy of 18 suffering from a tumor of the shoulder muscle, who really "got into the soap operas when he was high on THC." One day Sallan entered his hospital room and the boy was holding a basin in his hand. "I was quite distressed because I was sure he was vomiting. It turned out he was just eating pretzels."

In addition to the nausea, many patients on chemotherapy lose their appetites completely. But this boy, as well as some others in the study, found interest in

food renewed soon after undergoing the monthly or biweekly treatments. The questionnaires he filled out while on the study revealed slightly unappetizing combinations of hotdogs, chocolate eclairs and milkshakes on more than one occasion.

In the first study, the patients ranged in age from 18 to 76 years, and the older ones got the same "high" responses as the younger despite their greater social reservations about the illicit drug. A young woman in her 20s described her response as a "good buzz," while a grandmother said she felt a "fluttery, floating feeling" come over her.

A rabbi with stomach cancer who suffered from severe nausea while on chemotherapy found that the THC relieved his misery, but he forgot to say his morning prayers one day while under the influence. He wasn't so upset about it, but his wife was. The rabbi finally discontinued taking the drug, recalled Sallan.

But a baptist preacher who didn't smoke or drink dropped out of the study for another reason—the THC was so effective that he didn't want to risk getting the placebo. The chemicals being used to treat his leukemia "made him about as sick as I've ever seen anybody. He was willing to try anything to get rid of the vomiting," said Sallan.

On the first day he participated in the study he felt much better. But on the second day he apparently received the placebo and was as sick as ever. The next day he admitted to Sallan that he had broken the rules of the study and gotten hold of some marihuana (from another preacher).

Of the 16 patients receiving THC, 13 experienced a "high" consisting of various mood changes. The next most common side effect was sleepiness. Two patients experienced THC toxicity, including visual distortion and hallucination.

The one with the most severe reaction was a university classics professor. "He got too high and was doing the soft shoe on the nurse's station," said Sallan. The patient later said he had no regrets, but he wouldn't want to try it again.

"It's not a wonder drug. To have to get someone high to stop their vomiting leaves a lot to be desired. But for a lot of people just being high and feeling good is something to which they look forward to," concluded the Boston doctor.

He will continue his experiments with a group of patients lucky enough to receive THC legally.

When asked for his opinion, Sallan admits he would tell them to smoke. "The study came from people who smoked marihuana. Millions of Americans seem to be able to find it when they want it. I have no qualms about telling cancer patients to smoke because it works. There's not much I can recommend to this population that works."

[From the Washington Star, Feb. 11, 1976]

LATEST U.S. MARIHUANA STUDY DEVOID OF DIRE HEALTH WARNINGS TO USERS

(By Michael Satchell)

The government's 5th annual Marihuana and Health Report to Congress may be the best news for pot smokers since Oregon became the first state to decriminalize marijuana possession two years ago.

For the first time the survey of new medical findings related to the marihuana and health issue contains no dire warnings that users of the drug face possible severe health consequences.

In fact, it reports that research conducted during 1975 had failed to support previous studies suggesting that smoking marihuana could lead to genetic damage, lower fertility rates or possible impotence.

The survey, which was released today, also reports on some promising new medical uses of the drug for cancer, asthma and glaucoma patients.

Dr. Robert L. DuPont, director of the National Institute on Drug Abuse which prepares the annual survey stresses in the report that while the new survey "does no give marihuana a clean bill of health as some would hope, it does not support the fear and irrationality that still characterize some of the public debate about marihuana."

The Government's top drug expert says continuing studies make it clear that marihuana intoxication, like getting drunk on alcohol, poses significant hazards. Just like drunks, people who are stoned on marihuana shouldn't fly airplanes, drive or operate industrial machinery, the report warns.

DuPont is known to privately favor scrapping criminal penalties for possession of small amounts of marihuana, and in the past he has ventured close to saying outright that he supports decriminalization.

What is holding him back is a fear that an endorsement of decriminalization by the government's chief drug spokesman will be misinterpreted as a message that smoking marihuana is medically safe.

DuPont has consistently stressed that the long-term effects of marihuana smoking still are not known despite recent major studies of long-term smokers that show no damage to the users.

These federally funded studies of heavily long-time smokers in Costa Rica, Jamaica and Greece found no reductions in the ability of smokers to work, nor any permanent or irreversible brain damage. They also cast serious doubt, according to U.S. researchers, on the theory that smoking lowers fertility. The NIDA report suggests that the numbers of persons studied in these recent surveys were not big enough to be conclusive.

The new report indicates that heavy smokers of marihuana can develop a physical dependency on the drug and a tolerance to its effects. New studies also confirmed the continually increasing use of the drug, mostly among young people. For the first time, a majority of the nation's 18- to 25-year-olds—some 53 percent—have now smoked marihuana, the report says.

"Unusual therapeutic promise" in the use of THC, the active ingredient in marihuana, was discovered in studies last year, the report continues.

A side effect of chemotherapy being given to cancer patients is extreme nausea and vomoting and standard anti-emetic drugs have been unsuccessful in preventing it. THC has been found to be an effective anti-emetic for virtually all of the cancer patients receiving it in tests, the reports shows, adding that most of the patients also got "high" from the drug.

THC preparations have also been valuable in reducing internal eye pressure in glaucoma patients. And use of the drug was found to be effective in dilating pulmonary air passages and decreasing airway resistance in asthma patients. Because smoking is obviously a lung irritant, THC is being developed in aerosol form for bronchial patients.

MAJOR MARIHUANA STUDY REVERSES THEORIES

(By Brian Sullivan)

NEW YORK—The pendulum seems to be swinging the other way on the safety of marihuana.

For years, there have been numerous reports of the potential dangers of marihuana to the brain, the personality, the chromosomes—reports stemming largely from laboratory studies.

Now, at what may have been a landmark meeting on the subject of marihuana, researchers made public last week major studies of heavy, long-term users of the drug; studies that turned up no significant adverse effects on body or brain functions.

The key study, completed only last month, was conducted by University of Florida researchers in San Jose, Costa Rica, where marihuana has been readily available for decades, although its use is illegal. The study said: "Marihuana use as found among working class men in San Jose functions largely as a device which they feel aids them to cope with their daily routines and problems . . . There is no . . . clear evidence of marihuana-caused interference in the normal functioning of an adult, working class male, living in Costa Rica's capital city."

Last week's meeting—sponsored by the New York Academy of Science, the Department of Psychiatry of New York Medical College, and the National Institute on Drug Abuse—is the latest chapter in the long controversy over the dangers of marihuana.

In the United States, marihuana first became a public issue in the post-prohibition era. It was considered a "killer drug" then, widely associated with dangerous, even murderous, behavior. To smoke a "reefer" was to court brain damage. In recent years, there have been a bewildering array of reports suggesting adverse effects from pot, and other studies contradicting such findings.

In 1969, the National Institute of Mental Health decided that a different approach was needed. Many of the studies being reported lacked controls and

many were in laboratory settings that could not reveal what might happen in real situations. Studies of long-term users in Jamaica, Greece and Costa Rica followed.

In all three cases, scientists found no significant damage from long use of marihuana. The results of the Greek and Costa Rican studies were reported at the meeting last week. The Costa Rican study is considered by many scientists the most thorough done so far.

"The evidence is fairly clear that chronic cannabis use is not accompanied by the things written in the medical literature of the 1930s and 1940s," said Dr. Max Fink, from the State University of New York at Stony Brook, and a co-chairman of last week's meeting, called the Conference on Chronic Cannabis Use. Cannabis is the part of the marihuana plant used as the drug.

The researchers cautioned, however, that the newest findings do not settle the marihuana controversy. Still more largescale studies are needed, they said. There is, for example, one unresolved problem in the current research—contradictory findings as to whether the use of marihuana lowers blood levels of the male sex hormone testosterone. Limited studies with young people in this country indicate a lowering, but the Costa Rican study did not detect any change.

The central findings in the major studies to date are that clearly there is no brain damage, according to Dr. Fink and the other cochairmen of the conference, Dr. Rhea L. Dornbush of New York Medical College and Dr. Alfred M. Freedman, head of the Psychiatry Department at the college and a former president of the American Psychiatric Association.

In the Costa Rican study, the men participating the research smoked a mean of 9.6 cigarettes a day, but the range was from 2.5 to 40 a day. A few of the effects of marihuana seemed to be common to each of the 41 users in the study.

"Generally, users said that marihuana smoking helps them get to sleep. Most also said that marihuana increases their appetite for food and enjoyment of sex. Approximately three-fourths reported that marihuana always helps them work better," the study said.

The researchers found that the heaviest users had stable job records and they failed to find a lack of motivation.

"From these facts one cannot conclude that marihuana, as such, seriously interferes with an individual's functioning as a normal, productive member of society. Much more important determinants would seem to be his over-all life style, as established in childhood and adolescence, and carried into adulthood," the researchers concluded.

The Costa Rican study failed to confirm any movement from marihuana to such other drugs as amphetamines, barbiturates, heroin, LSD and cocaine. "These substances are available, but users showed little interest in them," the report said.

There were suggestions that users built up a tolerance for the drug. "The heaviest user averages 40 marihuana cigarettes a day and yet manages a very successful business with eight employes."

In the physical findings, the chronic marihuana users showed more symptoms of gastrointestinal discomfort than the 41 nonsmokers included in the study, and their body weights were lower, although none was markedly underweight. There was no evidence of an increased incidence of infection that would suggest any impairment of the body's natural defense mechanisms.

"Daily marihuana use for 10 to 28 years in this sample of men under the age of 50 years did not appear to impair their ability to function normally," the team concluded.

[From the New York Times, Jan. 28, 1976]

NEW MARIHUANA STUDIES SHOW NO ADVERSE EFFECT

(By Bayard Webster)

Several recent studies of chronic marihuana users, conducted independently in half a dozen countries, indicate that the drug has no apparent significant adverse effect on the human body or brain or on their functions.

The research essentially corroborates and expands on the results of an earlier study of marihuana use in Jamaica that found no significant correlation between heavy use of the drug and impaired physical, intellectual, social and cultural activities.

The findings were reported here yesterday in research papers delivered at a New York Academy of Sciences Conference on Chronic Cannabis Use that attracted more than 100 researchers from 10 countries.

A panel of experts, summing up the three-day conference at the Roosevelt Hotel, which was at its midpoint yesterday, pointed out that the findings should not be used as a black-or-white reason for legalizing the use of marihuana, but should be noted in the context of social pressures that lead to laws making it either legal or criminal to smoke or possess marihuana.

NEED FOR FUETHER STUDY

The panel also noted that the recent studies, reported in more than 30 scientific papers, should not be regarded as the definitive word on the effects of cannabis (that part of the marihuana plant used as the drug) but should be the spur that would lead to more comprehensive studies.

One panel member, Dr. Jared Tinklen Stanford University, said that the studies disclosed evidence of dangers from chronic marihuana use had been conducted primarily among relatively young—15 to 30 years old—populations that had used marihuana before.

"The need now," he said in an interview, "is for more research that will investigate the possible harmful effects of longer-term use—30 to 40 years among older populations.

"It's hard to find the effects of cigarette smoking on people in their 30's or 40's," he said. "But you begin to find the harmful effects when they're in their 50's and 60's."

Other members of the seven-person panel agreed that the recent studies, using more sophisticated techniques than previous research, showed that the effects of cannabis were much less harmful than had been thought a decade or two ago when marihuana was often referred to as the "killer drug" and was sometimes thought to lead to insanity.

Dr. Mai Fink of the Health Sciences Center, Department of Psychiatry at the State University of New York at Stony Brook co-chairman of the conference, related that when he started his research on cannabis in 1968 he was certain the drug had the same toxicity as opium or heroin.

"But I became convinced over the years that cannabis was very different from the opium-derived drugs," he said. "You look at the reports today which show no evidence of brain damage or cause for lack of motivation or lowering of testosterone levels and you realize that, so far, the findings on cannabis are trivial."

During yesterday morning's conference session, Dr. Glen D. Mellinger of the Institute for Research in Social Behavior, Berkeley, Calif., reported on a study of lack of motivation among college students who were chonic marihuana users.

The topic, known to psychologists as the amotivational syndrome, refers to general apathy, mental confusion and lack of goals among college students that often led to the student's dropping out. It had long been thought by some observers that marihuana was a major factor in many of these drop-outs.

But in a survey of 834 college students at the University of California at Berkeley who were examined and questioned in their freshman year and again two and a half years later, Dr. Mellinger found little significant difference in dropout rates among chronic marihuana users and non-drug users.

INFLUENCES ON DROP-OUTS

He also found little disparity in clarity of occupational goals or grade point average in the two groups. But he found other factors that seemed to correlate more closely with the drop-out rate. These included individual personality differences, men with low academic motivation before they started to use marihuana, and other family history problems.

In another study comparing measurement of marihuana with alcohol involvement in criminal or assaultive behavior among young men, Dr. Tinklenberg took a survey of 248 inmates of a California prison facility. Approximately half of them had been heavy drinkers before incarceration and the other half had been heavy marihuana users.

He found that alcohol-involved assaults or violence occurred approximately 15 times more frequently than cannabis-involved incidents. His studies also showed

that, in comparison with alcohol, cannabis was far less frequently involved in fights, difficulties with the police, family or social trouble, and automobile accidents.

Other research findings presented at the conference included studies of Egyptian, Costa Rican, Greek, Jamaican, Mexican and United States marihuana users. Almost all the repos said there had been no demonstrated significant statistical evidence of impaired health, physical and mental function, and social and cultural activity.

One study conducted by the Drug Abuse Council Inc., of Washington, the nation's largest private drug research organization, determined that when Oregon eased its marihuana laws to permit possession of one ounce or less of marihuana, the number of users did not increase significantly.

The conference, which concludes today, is being held under the sponsorship of the New York Academy of Sciences, the Department of Psychiatry of New York Medical College, the National Institute on Drug Abuse, and the Drug Abuse Council.

[From the Washington Post, Jan. 28, 1976]

STUDIES SEE NO HEALTH EFFECT OF POT SMOKING, RESEARCHERS SAY

(By Stuart Auerbach)

NEW YORK, Jan. 27—Federally funded studies of long-term users of high-potency marihuana in three foreign countries showed no difference between the health, ability to work, and brain functions of users and nonusers, a number of researchers said here today.

"There are really no differences," asserted Dr. Rhea L. Dornbush of the department of psychiatry of New York Medical College, a co-chairman of a conference on long-term marihuana use sponsored by the medical school, the National Institute on Drug Abuse and the New York Academy of Science.

"As far as we can see," she continued in an interview, "with all the methods we used—with different populations, different investigators, different techniques—it's all coming out the same."

Another conference co-chairman, Dr. Max Fink of the department of psychiatry of the State University of New York at Stony Brook, called "evidence from the meeting fairly clear that chronic cannabis (marihuana) use is not accompanied by so many of the consequences which have been written in the literature in the 1930s and the 1940s."

The thrust of the 32 scientific studies being presented at the three-day meeting, which started here Monday, contradicts earlier findings of possible damage to the brain, to the body's immunological defense mechanism, to the ability to be motivated to work hard and of chromosome damage.

Fink and the third cochairman, Dr. Alfred M. Freedman, insisted all the results clearly showed that there is no brain damage from long-term marihuana smoking. Freedman, head of the department of psychiatry at New York Medical College, is former president of the American Psychiatric Association.

Dr. Sidney Cohen of the University of California at Los Angeles, former head of drug research at the National Institute of Mental Health, added that studies of marihuana users at UCLA and the University of California at Berkeley disputed the notion that smoking pot killed a student's motivation to work.

Early studies had pointed to an "anti-motivational factor" that led to dropping out of college and work as a leading bad effect of marihuana smoking.

But Dr. Glen D. Mellinger, in his studies of Berkeley students, concluded that the dropouts were poorly motivated even before they began using marihuana—and the poor motivation may have led to drug use instead of the other way around.

The studies failed, however, to settle a recent controversy over whether marihuana smoking reduces the amount of the male sex hormone testosterone, as originally reported by Dr. Robert C. Kolodny of the Reproductive Biology Research Foundation in St. Louis.

A comparison of 84 Costa Rican marihuana users with 156 nonusers by a team of doctors headed by W. J. Coggins of the University of Florida turned up no differences in testosterone levels. But Cohen's studies at UCLA backed Kolodny's findings.

Studies of long-term users concentrated on Costa Rica, Greece and Jamaica because there are no groups in the United States who have used marihuana—and no other drug—as consistently over long periods of time. Marihuana use in this country is widespread and growing; Dr. Thomas Bryant of the Drug Abuse Council estimated the number of users at 29 million and 12 million smoke it regularly.

In many foreign countries—especially Jamaica—the marihuana used is as much as 10 times more powerful than that available here. Many of the foreign users smoke as many as 25 marihuana cigarettes a day—far more than regular users in America consume.

Nonetheless, studies showed little if any harm from the marihuana smoking. Fink called the poisonous effects of marihuana, as shown in the studies, "trivial at best."

The results of the conference studies accepted were not university accepted. Dr. Gabriel G. Nahas of Columbia University's College of Physicians and Surgeons, a strong opponent of marihuana use, challenged many of the findings as inconclusive.

In Costa Rica, the University of Florida team headed by Coggins concluded after complete physical examinations of 84 users and 156 nonusers that there was no difference in the health of the two groups. Another team—Drs. Paul Satz and Jack M. Fletcher of the University of Florida and Louis W. Sutker of the University of Victoria—found after giving 17 psychological and brain function tests to 41 users that "chronic marihuana use is not associated with permanent or irreversible impairment in higher brain functions or intelligence."

Despite the exteremely high potency of the marihuana and hashish, Dornbush found that Greek users suffered some impairment when asked to perform complex tasks while smoking. But they could do simple jobs without trouble.

A team of Greek doctors, giving physicals to 60 marihuana users compared with 64 nonusers, also found no difference in the health of the two groups.

In studying the health of American users, Cohen kept 28 men who used marihuana in the UCLA hospital and studied their reactions. He found the lowered testosterone levels and Dr. Donald P. Tashkin, an associate, reported "a mild but significant" narrowing of the passages to the lung probably due to irritation from smoking marihuana.

MARIHUANA AND HEALTH

Fifth Annual Report to the U.S. Congress From the Secretary of Health, Education, and Welfare 1975

National Institute on Drug Abuse
11400 Rockville Pike
Rockville, Maryland 20852

83-317 O - 77 - 49

ACKNOWLEDGMENTS

As has been true in the past, preparation of the fifth annual Marihuana and Health Report was made easier by the generous cooperation of the many members of the scientific community who supplied useful information on their current marihuana research. Their contribution is gratefully acknowledged.

The technical chapters were written by knowledgeable members of the research community who generously gave of their time on short notice to maintain a tight production schedule. They are:

Dr. Sidney Cohen, University of California at Los Angeles, Chapter 9 Therapeutic Aspects

Dr. Douglas Ferraro, University of New Mexico, Albuquerque, Chapters 4, 5 and 6, dealing with preclinical unlearned and learned behavior and with chronic effects on both

Drs. Lissy Jarvik and Steven Matsuyama, University of California at Los Angeles, Chapter 8, Effects on the Genetic and Immune Systems

Dr. Reese Jones, Langley-Porter Neuropsychiatric Institute, San Francisco, Chapter 7, Human Effects

Dr. Ralph Karler, University of Utah, Chapters 2 and 3, dealing with Chemistry and Metabolism and with Toxicological and Pharmacological Effects

Dr. William McGlothlin, University of California at Los Angeles, Chapter 1, Epidemiology of Marihuana Use.

Scientists on the staff of the National Institute on Drug Abuse who contributed to the report in a variety of ways include: Drs. Monique Braude, Norman Krasnegor, Daniel Lettieri, William Pollin, Joan Rittenhouse, Louise Richards, Stephen Szara, Robert Willette and Ms. Eleanor Carroll.

Thanks are also due to Ms. Georgette Semick, Carol Tuckerman and Dr. Michael Rumsey for their editorial and production skills.

Dr. Robert C. Petersen wrote the summary of the Report and as senior editor had primary responsibility for its overall preparation.

INTRODUCTION

Marihuana, an issue once marked by emotionalism, is increasingly being examined thoughtfully. Much has been learned about marihuana use and its personal and social consequences. Yet, much remains to be understood. It is clear that marihuana is not a subject for simplistic analysis.

This present edition of Marihuana and Health represents the fifth in a series of annual reports from the Secretary of Health, Education, and Welfare to the Congress as required by Title V of Public Law 91-296. Last year, the fourth report in this series raised fundamental questions about the role of cannabis in altering the body's immune response, endocrine functioning and basic cell metabolism. Although more data are now available, the direct health implications of these earlier laboratory findings are still not certain.

There is little question that marihuana intoxication, like alcohol intoxication, poses significant hazards. For example, psychomotor performance is impaired by cannabis intoxication. This can have dangerous consequences in such areas as traffic safety and industrial performance. Intellectual performance and in particular, immediate memory, are also impaired while under the influence of the drug. Since marihuana is the third most widely used recreational drug -- exceeded only by alcohol and tobacco -- any adverse implications of its use are likely to be far-reaching.

It has become increasingly clear that marihuana use is inextricably bound up with the use of many other drugs. Those who use other licit and illicit drugs are far more likely to use marihuana than those who do not. Conversely, heavy marihuana users are more likely than those who are not, to use other drugs as well. While it was once thought, for example, that marihuana users were less likely to use alcohol than non-users, it is now evident that they are, in fact, more likely to do so. Frequently the two drugs are used simultaneously -- a combination that may be more hazardous than either used alone.

The increasing availability of higher potency materials makes it more likely that adverse consequences will ensue if the use of these stronger cannabis preparations becomes widespread.

This report does not give marihuana a "clean bill of health," as some would hope. Nor does it support the fear and irrationality that still characterize some of the public debate about marihuana. Instead, it is a progress report on our effort to understand a challenging health problem with immense social, political, and economic implications.

This year, in order to provide a somewhat broader perspective, the report is being issued as a general overview accompanied by a series of technical chapters which discuss the research findings in greater detail. In this manner we hope to better serve the needs of both the general reader and the research specialists.

Robert L. DuPont, M.D.
Director
National Institute on Drug Abuse

MARIHUANA AND HEALTH, 1975: SUMMARY AND OVERVIEW

EXTENT AND NATURE OF USE

Present evidence indicates that cannabis use has significantly increased among Americans during the last two years.

Throughout most of its history American marihuana use has consistently involved a minority of any national age group; however, the most recent national survey data indicate that in the 18-25 age group a majority (53%) have now tried the drug, up from 48% in 1972. Among those surveyed under 18, nearly one in four (23%) has ever tried marihuana -- an increase from the one in seven (14%) who reported in the 1972 survey ever having done so.

Current use -- defined as use within the past month preceding the survey -- has also significantly increased among those under 18. Seven percent reported such use in 1972, 12% did so in the most recent survey. There does not appear to have been a similar increase in such use among those over 18 -- among whom current use has remained the same or has slightly diminished depending on age, since 1972.

When questioned regarding their plans for future use, one third of those who have used marihuana indicate they definitely intend to do so again. Another third of this group indicate they might do so. Slightly smaller numbers of adults than of youths indicated their intention to continue use (1-1).

While there has been an increase in use by high school and junior high school age groups (attested to by both local and national survey results), future trends of marihuana use in America continue to be uncertain. Despite the other increases noted, use among adults has not increased. In part, this may be explained by research reported in the fourth Marihuana and Health report: changes such as marriage, parenthood and the assumption of other adult roles are inimical to continued marihuana use.

Support for the above interpretations is also found in data garnered from research conducted on a national sample of 20-30 year old men. This nationwide survey found that even within this restricted age group, larger proportions of the men in the younger subgroups used marihuana than did those who were older. Men pursuing more conventional life styles in that they were married and employed full time, were considerably less likely to be using marihuana than were either the unmarried or the unemployed (1-23).

Although there is good evidence of a continuing increase in marihuana use among younger people, there is little indication that such use has come to involve a significant proportion of the older population. For example, if we examine the behavior of those ages 26-34, in contrast to the 18-25 age group less than one third (29%) have ever used marihuana compared to over half (53%) of the younger group. One in four of the 18-25 group had, in fact, used in the month preceding the survey but less than one in twelve (8%) of those 26-34 had done so. In still older age groups use is even less common. Only 7% of those between 35-49 have ever used and only 2% of those over 50 have ever done so. Less than one in one hundred of the over 35 group had used during the month prior to the interview (1-1).

Despite the indications that marihuana has not become popular with older groups and the evidence that its use may be diminished as adult roles are adopted, any prediction regarding the future of cannabis in American society must be hedged with caution. A Gallup poll conducted in 1967 among college students indicated that only one in twenty had ever used the substance, but by 1974 over half (55%) reported use in the Gallup survey (1-9). In seven years, what was once clearly statistically deviant behavior has become the norm for this age group. While in previous years use was correlated with level of education, the percentage now reporting marihuana use is virtually identical for high school drop-outs, high school graduates and college graduates in similar age ranges.

National trends and use patterns mask distinctly different patterns in particular communities or geographical areas. In one Northern California county in which a survey of junior and senior high school students has been conducted each year since 1968, even the earliest findings indicated over one quarter of the ninth grade males (27%) had had some experience with marihuana during the previous year. Among male seniors nearly half (45%) reported use in the year preceding. Current (1975) comparable figures are now 49% for ninth graders and 64% for senior boys. However, the percentage reporting use on 50 or more occasions in the previous year has not markedly increased for the past five consecutive years (1971-1975) (1-4).

During the past five years since the first Marihuana and Health report, cannabis use in the United States has changed in character. Originally marihuana's popularity was concentrated among young people associated with a "counter culture." It was regarded as symbolic of their opposition to traditional values and to the prevailing political climate (Cf. the first Report, 1971).

*Numbers in parentheses refer to the several technical chapters and their lists of references. Thus, 1-1 refers to reference one in Chapter 1. This is the specific study from which the data are abstracted.

As use has spread to involve larger numbers and to more conservative segments — it has now been experienced by a majority in many groups — it has lost some of its nontraditional, antiestablishment symbolism. Early use often involved opposition to more traditional alcohol use. Now those who use marihuana are also very likely to use alcohol — frequently simultaneously. Marihuana use seems unlikely to displace more traditional alcohol use even among the young. Continuing research on patterns of multiple drug use and drug using contingencies may better enable us to predict both individual and group drug use.

Use patterns in other countries, even those in which cannabis use has been endemic for many years, provide few clues to future use in the United States. In other countries use is typically class related with the lower classes, the traditional users. While in some of these countries of traditional use there are now middle or upper class users, such users seem to have adopted marihuana as part of an international youth culture rather than by diffusion from native users. Expectations with respect to drug effects also differ in that traditional users do not share the recreational orientation that characterizes American users.

CHEMISTRY AND CHARACTERISTICS OF CANNABIS

Although a detailed discussion of developments in cannabinoid chemistry is of primary interest to the specialist, there is a range of developments of more general interest. The plant, cannabis sativa, far from being a simple substance is, in fact, chemically quite complex. The last several years of research have resulted in an increasingly sophisticated knowledge about this complex substance. There is a growing awareness of the need to much more adequately describe several major cannabis constituents if we are to adequately specify the nature of the material. The United Nations has now recommended that all research reports on cannabis describe not only the amount of delta-9-tetrahydrocannabinol (the major psychoactive ingredient) but that of cannabidiol and cannabinol as well.

The ability to synthesize various chemical components of marihuana as well as the drug's metabolites (i.e., compounds resulting from the biological transformation of the originally ingested material) is a significant advance. Availability of such pure substances provides researchers with necessary materials for careful study of the physiological role of marihuana's various components.

While primary interest has tended to center on delta-9-THC because of its role as the principal psychoactive ingredient in cannabis, the part played by several other ingredients may be important in producing other cannabis effects. These other ingredients alone or in combination, may account for possible adverse health consequences or contribute to the possible therapeutic usefulness of the drug.

The detection and analysis of marihuana in body contents such as blood, saliva, urine and breath is a problem important both to basic research and to forensic medical applications. For research, it is important to develop methods that accurately determine how much smoked or otherwise ingested marihuana actually becomes physiologically available. These amounts may be substantially different than the amount ingested because of losses that occur in consuming marihuana, delayed bodily absorption, and individual differences in ability to metabolize the drug.

In the clinical setting, appropriate treatment of the unconscious patient brought to the Emergency Room following an accident may be dependent on knowing whether he or she is marihuana intoxicated. In other medical situations being able to determine with certainty the level or fact of being intoxicated may make the diagnosis of the patient much easier.

The general increase in marihuana use has undoubtedly brought with it an increase in the numbers who drive while cannabis intoxicated. Recent evidence (Cf. Driving Effects) further confirms cannabis adversely affects driving. Thus, there is a real need for the development of one or more roadside methods that can be rapidly employed in much the same way as current tests for alcohol intoxication.

Although simple, rapid detection methods are badly needed, detecting marihuana use is inherently much more difficult than detecting alcohol use. The quantities of drug involved are much smaller and they are very rapidly transformed into metabolites which differ chemically from the originally consumed material. As with alcohol, it is important to quantify the level of use for all of the purposes outlined. During the past year considerable progress has been made in improving detection techniques.

In addition to newer, thin layer chromatography and high pressure liquid chromatography methods, two other techniques have shown unusual promise. Radioimmunoassay (RIA) is a technique in which an antibody specific to a drug or its metabolites is developed and then "tagged" by means of a radioactive molecule in its structure. When a solution of the tagged antibodies and of the body fluid in which the drug to be detected is made, the radioactive markers are displaced proportionately to the drug quantity present. The accuracy of RIA is now being compared with that of more cumbersome procedures.

A second technique under development is called the enzyme multiplied immunoassay test, or EMIT. The antibody reaction which is its basis is similar to that used in the radioimmunosassay technique. EMIT has the added advantages of involving less work, less sophisticated equipment and is more rapid thus making it more suitable for

rapid screening. Field trials on EMIT are ongoing.

A third method which also shows promise of shortly becoming available is likely to be most useful for traffic safety purposes. It utilizes breath samples in a manner roughly analogous to present roadside alcohol intoxication detection.

As has been repeatedly emphasized, marihuana and hashish vary widely in THC content and thus in their ability to intoxicate. This variability results from differences in plant genetic origin, conditions of cultivation and preparation of the material including the degree of concentration of leaves and flowering tops. A relatively recent addition to the illicit market is hashish oil, a substance having a THC concentration of 40-50% as compared to the 1-2% THC content of most marihuana ordinarily available in the United States. Increasing availability of such more potent cannabis preparations may have quite different implications from the more commonly used, weaker preparations that have been available in the past. Use of stronger material, particularly by relatively naive users unaccustomed to its effects, is considerably more likely to result in acute panic and other adverse reactions. Stronger cannabis and cannabis derivatives used under conditions in which the dose is more difficult to control, may also result in marked impairment in driving or other complex psychomotor skills. Such unexpected effects could have serious implications.

ANIMAL RESEARCH

A wide range of research on the effects of marihuana has been conducted with animals because their genetic and learning histories, unlike those of humans, can be accurately specified. Animal models also permit the use of high doses and other procedures not possible in human research. Apart from studies of various physiological effects of the drug which have been discussed primarily in relation to human findings, there are some behavioral observations in animals that are of interest.

Because there has been some question about the role of marihuana as a possible releaser of aggression, studies of animal aggression following marihuana or THC administration have been done. Generally, these drugs have been consistently found to suppress aggression when the animals are not under stress. When animals are stressed by a variety of means (e.g., food deprivation, sleep deprivation, morphine withdrawal, etc.) THC or marihuana tends to increase aggression.

The results of behavioral studies in animals suggest that the effects of cannabis on aggression may be complexly related to the degree to which the animal is subject to stress and the length of time over which it has received the drug. The degree to which these observations are relevant to human behavior is unknown although they do provide a basis for devising related human studies.

In an experiment which studied monkeys in three to six member social groups several changes of interest were found. Given oral doses equivalent to very heavy human cannabis use, the monkeys responded much like humans. They slept and rested more frequently; active social interaction such as grooming of others was reduced. Over more extended periods of administration, the monkeys gradually showed less and less of these effects. While aggression was initially reduced, after receiving THC for weeks or months during the year-long study the monkeys became irritable and aggressive (hitting, biting, chasing behavior increased). There was no evidence of the reduction in testosterone levels that has been reported in humans nor were menstrual cycles of females apparently disturbed (4-67).

More detailed discussion of the extensive research that has been done with animals is to be found in the technical chapters of this report.

HUMAN EFFECTS AND HEALTH IMPLICATIONS

Effects of marihuana can conveniently be divided into: 1) the acute effects of cannabis intoxication and 2) the longer range consequences of regular or chronic use. It is considerably easier to study acute effects and so after eight years of intensive investigations many, if not most, of these effects have been elucidated.

Human Acute Physiological Effects

An increase in heart rate and a reddening of the eyes have been the most consistently reported physiological effects of marihuana. Heart rate increases are closely dose related. Early awareness of this marihuana-induced tachycardia created concern over possible adverse cardiovascular effects of the drug especially in those with coronary disease. Several reports issued in the past year have confirmed a preliminary finding from last year. Marihuana use decreases exercise tolerance prior to the onset of chest pain (angina) in those with heart disease (7-137, 3, 4). Use by those with already existing cardiovascular deficiencies, therefore, appears to be unwise. The contrasting finding that marihuana produces minimal changes in heart function (aside from a rate increase) in young, healthy men illustrates that the drug's effects may significantly differ in persons with pre-existing medical problems from those in normals.

A number of reports have confirmed and extended initial evidence that smoked marihuana when acutely administered, results in improved pulmonary function as measured by bronchodilation (7-156, 157, 158). Optimism created by this finding has since been tempered by evidence that under conditions of more chronic use pulmonary function is impaired, rather than enhanced (7-62).

Evidence that marihuana and especially its principal psychoactive ingredient, delta-9-THC, are effective in reducing intraocular pressure in both normals and in glaucoma patients has been further confirmed. While some question exists whether this effect is due to a nonspecific drug-induced relaxation shared with other sedative drugs or to a more specific marihuana reaction, more recent evidence suggests it is THC-specific (Cf, Therapeutic Aspects).

Understanding of the metabolism and the mechanisms of action responsible for various marihuana effects has increased although many questions remain open.

More sophisticated attempts to measure various aspects of psychological and psychomotor performance have been generally consonant with subjective reports. Impaired memory, altered time sense and performance decrements on a variety of tasks have been experimentally confirmed. Generally, the more complex the task, the greater the degree of disruption produced by acute intoxication. Tasks which are relatively simple and with which the person is familiar are minimally affected. As the task becomes more demanding and novel and/or the dose of drug increases, performance decrements become larger. At lower doses, evidence confirms users' assertions that they are often able to "suppress the marihuana high" when the situations so demand.

Although users have reported enhanced auditory, visual and tactual awareness and sensitivity, experimental research has not confirmed these reports.

Driver Performance and Traffic Safety

Because of the prominent role the automobile plays in our society, the possible implications of marihuana intoxication for traffic safety have been emphasized. Early reports were more optimistic about driver performance than recent evidence. Those consuming alcohol to the level of legal intoxication were originally found to make significantly more driving errors in a driving simulator situation than those who had consumed a "social dose" of marihuana. While the marihuana-intoxicated subjects indicated that their driving performance was affected, they felt they could compensate by driving more slowly and cautiously.

Present evidence, whether derived from driver test course performance, from actual traffic conditions or from the experimental study of components of the driving task, all indicates that driving under the influence of marihuana is hazardous (7-90). The increasing simultaneous use of both alcohol and marihuana by drivers poses a threat that may well exceed that of either substance alone. While the parameters of risk connected with the use of marihuana alone or in combination with alcohol prior to driving are not yet known, discouragement of such use appears justified. A more accurate determination of the extent of risk involved in the various levels of intoxication would be desirable. Such studies are complicated by individual differences but are by no means impossible to execute.

Although there has been little systematic study of the relationship of marihuana smoking to possible pilot error, evidence related to driving is at least partially germane. Such skills as detection of peripheral stimuli and complex psychomotor coordination involved in driving are probably equally important in flying. In fact, the inherently greater complexity of flying suggests that performance is even more likely to be impaired under conditions of marihuana intoxication than is driving. Only one preliminary report of pilot performance has appeared in the research literature. This report indicates that under flight simulator test conditions experienced pilots show marked deterioration in their performance while marihuana intoxicated (7-108). More detailed studies are planned to better understand the nature of the performance deficits produced and their duration. A danger common to both driving and flying is that some perceptual or other deficits may persist for some time beyond the period of subjective intoxication. Under such circumstances an individual may attempt to fly or drive without realizing that his functioning is still impaired although he no longer feels "high."

Chronic Use-Special Problem Areas

Last year's report singled out several special problem areas involving potentially serious adverse consequences of chronic cannabis use. Subsequent research has not definitively resolved the questions raised but has expanded our knowledge base.

Some apparent inconsistencies in research findings regarding reduced plasma levels of the male hormone, testosterone, may be explained by the differing length of time users had been smoking before such levels were assessed. For example, the findings of one study that did not show a decrease during a several week period were matched by those in another study in which there were early negative findings. However, after four weeks elapsed a definite drop occurred (7-100). The decreases that have been found have still been within what are generally conceded to be normal limits. Their biological significance remains in considerable doubt. A preliminary finding that a marked reduction of sperm count (58%) occurred in five cannabis smokers following controlled conditions of smoking has been reported (7-171). While this poses the possibility of diminished fertility in chronic users, the small size of the sample and the study's preliminary nature make the work inconclusive.

With regard to hormonal aspects, two other adverse effects remain possibilities: 1) Inter-

ference with normal growth and sexual development of adolescent heavy users and, 2) Abnormal sexual differentiation of the male fetus developing in a mother who heavily uses marihuana during early pregnancy. No actual evidence for either of these speculative possibilities has yet appeared in the scientific literature.

The question of a cannabis induced impairment of the body's immune response remains important because of its potentially far reaching clinical implications. While a number of investigators have published findings that suggest that marihuana may interfere with cell-mediated immunity, other investigators have not found such evidence. Some of these differences may reflect procedural variations; nevertheless, the clinical significance of the positive findings remains in considerable doubt. At least one study of experienced marihuana smokers under well-controlled, closed experimental ward conditions found initial evidence of impaired immunity upon their admission to the study. However, by the 63rd day of controlled cannabis administration, their immune response had apparently returned to normal (8-39). This finding suggests that the impairment of immunity initially detected in these and other marihuana smokers may be related to factors other than marihuana use.

The implications of laboratory findings of inhibition of DNA, RNA and protein synthesis, all basically related to cellular reproduction and metabolism, are at present unknown. These findings based on in vitro (outside the body) study of animal and human tissue cultures are also being followed up and extended.

Similarly, no conclusive evidence exists regarding damage to human genetic functioning (i.e., chromosomal damage produced by marihuana). While the most carefully controlled studies have failed to demonstrate such damage, the research to date must be regarded as insufficient to permit definitive conclusions.

Presently, preliminary evidence of a range of potentially serious consequences of marihuana use exists. As indicated, these include: Disruption of basic cell metabolism through interference with DNA and RNA synthesis, possible interference with pituitary function, in turn, affecting testosterone production and possibly having other endocrine effects and interference with the body's disease defenses by affecting the immune response. Despite this laboratory evidence, the clinical implications remain in doubt. While no evidence has appeared indicating that marihuana users here or abroad suffer from unusually high rates of infectious disease or cancer which might result from defects in the immune response, carefully controlled large scale clinical studies have not yet been conducted. Similarly, there is no evidence — but neither have there been adequate systematic studies -- to establish whether users have significantly lower fertility rates or more serious problems with impotence than non-users.

The failure to detect gross clinical findings that might be expected does not, of course, mean that these issues have been resolved. To date systematic studies of matched samples have been modest in size. Detection of rarer consequences of use is less likely in studies of limited size and extent. As the number of chronically using Americans increases, larger scale epidemiological studies are becoming feasible. Plans for such studies are underway.

OTHER CHRONIC HUMAN EFFECTS

Tolerance and Dependence

Tolerance to cannabis -- diminished response to a given repeated drug dose — has been substantiated by research evidence. Development of tolerance to marihuana's effects was originally suspected because of the obvious ability of cannabis users overseas to ingest larger quantities of the drug without disruptive effects than was possible for less experienced American users. Systematic, controlled studies in which known doses of marihuana or THC were administered over extended periods have now confirmed this (8-53, 80, 109, 111).

The meaning of cannabis dependence is often somewhat vague. If we define it as a physical dependency manifested by physical symptoms following drug withdrawal, there is now evidence that it can occur. The symptoms that have been reported following discontinuance of high dose chronic administration of delta-9-THC include: Irritability, restlessness, decreased appetite, sleep disturbance, sweating, tremor, nausea, vomiting and diarrhea (8-80). It should be noted, however, that the after effects reported followed unusually high doses of orally administered THC under research ward conditions. Such changes have not commonly been observed in other studies nor has a "withdrawal syndrome" typically been found among users here or abroad.

Psychopathological and Neurological Aspects

The question of possible prolonged behavioral effects of chronic cannabis usage has been an area of fundamental concern throughout the American cannabis research program. As indicated in earlier reports, foreign observers have argued that a range of such effects occurs, including a specific cannabis psychosis, diminished intellectual performance and an "amotivational syndrome" (characterized by a loss of interest in work and other conventional activity). Interpretation of such reports has unfortunately been complicated by the lack of adequate control groups, poor research design, use of opium and other drugs, poor diagnostic criteria, nutritional deficiencies and other differing factors of life style.

Even when a particular consequence is correlated with marihuana use, it is often erroneously attributed to the drug use. A recent study of 38 first admissions to a psychiatric hospital illustrates the problem of interpretation involved: While there was a correlation between marihuana and subsequent psychiatric illness, it was less than with such causally unrelated variables as having danced and having drunk beer (7-2).

The acute panic anxiety reaction, previously mentioned in the discussion of acute effects, is probably the most common adverse reaction. However, a more prolonged cannabis psychosis has been reported in Eastern literature. It appears to occur under conditions of unusually heavy use or as a result of ingesting a larger amount than usual. Descriptions do not always distinguish between an acute brain syndrome or toxic delirium marked by clouded mental processes, disorientation, confusion and marked memory impairment and a more prolonged psychotic reaction precipitated by cannabis use. Often it is difficult to isolate the causative role of marihuana from that of pre-existing psychopathology or other drug use (7-64, 112).

Three NIDA-supported research studies of heavy chronic users conducted in Jamaica, Greece and Costa Rica have failed to detect evidence for a cannabis psychosis. However, given the comparative rarity of this syndrome and the small sample sizes used, it is possible that such a consequence was missed.

Studies of college student performance have generally failed to prove evidence of impaired intellectual performance related to marihuana use.

While there was no evidence of differences in grade point average or in educational achievement, marihuana users in one major study had greater difficulties than non-users in deciding career goals and were more likely to have dropped out of college to reassess their goals (7-11). Some of these studies suffer from several shortcomings, however; the samples studied may not have adequately emphasized college drop-outs thus excluding the very group that might have been most adversely affected by heavy use. A second consideration is that students typically have higher levels of ability than the general population. Particularly in more competitive academic environments, they may have above average motivation allowing them to better compensate for cannabis effects. Finally, even moderately heavy American student users use the drug less frequently, in less potent forms and in lesser quantity than more heavily using overseas populations.

Assessing the psychosocial effects of marihuana use in chronically using populations can be complicated. Changes in values and behavior attributed to marihuana use may, in fact, have preceded use rather than the use affecting the change in values. Especially in earlier years, users were much more likely to hold counterculture, antiestablishment views. For these users marihuana had symbolic value as a means of indicating their disdain for the prevailing value system. This disdain was frequently accompanied by a rejection of the traditional work ethic with its emphasis on competitive achievement. The group dynamics of marihuana use may, however, reinforce these counterculture views of more conventional motivation rather than result from any pharmacological action of the drug itself.

Similarly, attempts to create experimental models for testing the existence of such an "amotivational syndrome" have had serious limitations. Tasks chosen as tests may significantly depart from more realistic work tasks; the artificial environment of the research setting may not provide more typical motivational conditions. Two studies involving marihuana administration coupled with monetary reward for work performance did find a decline in productivity with heavier marihuana consumption. In one the task was simple and relatively undemanding, involving repetitive button pushing that could be carried on simultaneously with other activity (7-111). In the other, a more typical work task -- the making of wooden stools -- was carried on (7-13). The distinction between a direct effect on performance as a result of marihuana and on performance as a result of a decline in motivation is not easily made, however. In a third, quite limited study of agricultural performance undertaken in connection with the Jamaican study of chronic users, researchers found some decline in work performance although the decline was not dramatic (7-141).

When one turns to the neurological evidence there is little question that there are acute effects of marihuana intoxication although these are not easily distinguished from those of other psychoactive drugs as measured by conventional electroencephalograms. The EEG changes resulting from electrodes implanted deeply in the brain are dissimilar to other psychoactive drugs (7-67). The behavioral significance of the EEG changes that have been found in chronically using monkeys and in very limited human studies is not presently known.

Work in Greece has not supported previously cited evidence suggesting that brain damage marked by enlarged ventricles may result from marihuana use. The Grecian study, using non-invasive echo-encephalographic techniques for measurement of ventricle enlargement, found no evidence of such brain damage in heavily hashish using men matched with non-using controls (7-49).

Field Studies of Chronic Users

Although other portions of this and previous reports touch on one or another of the three Federally sponsored studies of chronic marihuana use in Jamaica, Greece and Costa Rica, it may be useful to summarize their findings, strengths and weaknesses here. The Jamaican study has been extensively reported in previous Marihuana and

Health reports, a recently published book and in the research literature (7-141). A report on the Greek study was delayed in order to make the data base as complete as possible. The third study in Costa Rica was just completed; its detailed findings will be released by Spring, 1976. In each of these research efforts, an attempt was made to match drug-using subjects with appropriate non-using counterparts. In the Jamaican and Costa Rican projects rather careful matching was done; in the Greek study such matching was less possible. All subjects were males because male use predominates in the cultures studied. Numbers of subjects were necessarily limited by the detailed procedures followed (Jamaica: 30 experimental, 30 control; Greece: 47 experimental, 40 control; Costa Rica: 40 experimental, 40 control, although 80 and 140 users and non-users respectively were actually examined).

The Jamaican study found few physiological or psychological differences between the matched smoker nonsmoker populations. A rather extensive battery of tests of physical and psychological functioning found no differences that could be directly attributed to marihuana use as such. While an attempt was also made to assess chromosomal abnormalities, that portion of the study must be regarded as inconclusive because of technical deficiencies in the methodology for that phase of the project.

The Greek study arose from a clinical impression by Greek observers that Greek hashish users, because of their heavy use patterns and already established researcher-subject rapport, would make a good study population for examining the effects of unusually heavy cannabis use.

A variety of neurological, psychological and physical measures found few changes attributable to cannabis use. Heavy emphasis was placed on possible brain damage as measured by electroencephalographic, echo-encephalographic (Cf. preceding section) and psychological test procedures. None of these measures showed evidence of brain damage (7-49).

The most recent Costa Rican study also examined matched samples of users and non-users especially carefully matched on such variables as age, marital status, education, tobacco smoking and alcohol use. Emphasis was placed on extensive medical examinations with special attention to pulmonary and neuropsychological functioning. Although detailed results have not yet been published, no evidence for a greater incidence of disease or of psychological deterioration has been found in the cannabis-using group (7-23).

None of the three studies found evidence of increased psychopathology or of an amotivational syndrome stemming from the use of cannabis.

While results of these studies must be regarded as somewhat reassuring of the lack of grossly adverse consequences of marihuana use, they can not, of course, be regarded as conclusive for several reasons. All three studies involve relatively small numbers of subjects. Equally limited studies of cigarette smoking, for example, which is known to have serious adverse health consequences, would not have been likely to detect those consequences. Psychological testing techniques are less apt to be satisfactory when used with subjects markedly different from the original standardization samples. To the extent that they are not culture free, performance for both experimental and control groups in cultures unlike those on which they were standardized may both show a culturally derived deficit. This deficit may mask a drug-related deficit in performance. Thus, the tests used may not be sufficiently sensitive to detect a difference that may in fact exist. Finally, it may be argued that the demands of a less technologically oriented society are less complex than those of the industrialized United States. Thus, the failure to find a drug-related decrement in social or work performance may reflect an unimpaired ability to meet the demands of a simpler situation that would not be true under more demanding circumstances.

THERAPEUTIC ASPECTS

Although cannabis has been used for over 3,000 years as a medicinal herb in native and scientific medicine, its use in Western medicine sharply declined in modern times. By the 1930s, American medicine had largely supplanted cannabis with more convenient and more stable pharmaceutical preparations. Our relatively recent concern with marihuana as a drug of abuse has led to scientific investigation into its properties by means of modern pharmacological techniques. Synthesized constituents of the natural material have been produced enabling researchers to study the properties and effects of each of the components of this complex material. This recent study has reawakened scientific interest in possible therapeutic uses for the natural material or its synthesized ingredients.

Although some of marihuana's properties -- notably its psychoactivity and its tendency to accelerate heart rate -- are undesirable for most medicinal purposes, cannabis has one highly desirable property. Compared to most pharmaceuticals it is very low in biological toxicity. Indeed, it is questionable whether any deaths can be directly attributed to an overdose of marihuana or hashish.

Whether or not cannabis or perhaps some modified constituent again becomes useful in medical practice will depend on whether some of the drug's promising therapeutic properties prove to be sufficiently persistent and its side effects controllable. Marihuana's usefulness as a medication for chronic disorders may also prove to be limited by the development of tolerance to its therapeutic effects.

The most promising therapeutic applications of the drug are in the treatment of glaucoma, as an anti-emetic for cancer patients receiving chemotherapy and possibly in the treatment of

asthmatics. Other applications as a sedative-hypnotic, an anticonvulsant, an antidepressant, an analgesic and in connection with the treatment of alcoholics have been attempted, but the results have either been inconsistent or highly preliminary.

The use of cannabis and THC in treating the elevated intraocular pressures in glaucoma patients arose from the observation in normals that internal eye pressures were reduced by the drug. Subsequent research with patients has confirmed that the effect is also produced in the diseased eye and is as great as that produced by more traditional medications. Topical preparations applied to the eyes of rabbits have successfully reduced pressure raising the possibility of using such a preparation with humans. Human experimentation is not, however, expected in the immediate future because of the formidable problems in making certain that such a preparation is safe and can meet regulatory requirements (9-12, 25, 26).

The use of THC as an anti-emetic with cancer patients receiving chemotherapy shows unusual promise. One of the undesirable side effects of chemotherapeutic agents administered to cancer patients is that they produce marked nausea and vomiting. This side effect is very difficult for patients to tolerate and is also debilitating. Standard anti-emetic drugs have not, unfortunately, been notably successful in reducing this side effect. THC, by contrast, was found in a recent double-blind study (neither patient nor physician knew whether the drug received was active or inert) to be effective in virtually all of the patients receiving it. While 13 of the 16 patients receiving the drug became "high" and one third developed drowsiness, these effects were viewed as minor compared to the therapeutic benefit achieved (9-58).

Use of THC in the treatment of asthmatics is predicated on the observation that it dilates pulmonary air passages and decreases airway resistance (9-64). Based on observations in normals, research with asthmatics has demonstrated that marihuana relieves bronchospasm and has a more persistent action than traditional medication (9-65). Since smoked marihuana has obvious lung irritant properties, more recent research has employed aerosolized THC, also with promising results (9-46).

There has been a growing awareness that constituents other than delta-9-THC may have valuable therapeutic properties if freed of some of the undesirable side effects noted with THC. It is also possible for the organic chemist to produce a very wide range of chemical compounds which are broadly based on the chemical structure of the cannabinoids, but with changes in that structure which can markedly alter their action. Such chemically more remote compounds may ultimately prove more useful therapeutically than either the natural material itself or its synthesized ingredients. Because they are not the parent compounds they must, of course, be carefully tested for toxicity and therapeutic properties like any other new compound.

CHAPTER I

EPIDEMIOLOGY OF MARIHUANA USE

Present Patterns And Changes In Use

National Household Surveys (Adult)

The National Commission on Marihuana and Drug Abuse sponsored national household surveys of marihuana and other drug use in 1971 and 1972 (2, 3). A third national survey conducted in late 1974 - early 1975 provides a comparison with the earlier periods (1). (See Table A-1)

Another national survey conducted for the Drug Abuse Council in 1974 found very similar results. The percentages of adults (18 and over) reporting ever having used and currently using were 18 and 8% respectively (24). As can be seen in Table A-1, the number of adults currently using marihuana has not changed appreciably in the past two years. Usage continues to be concentrated in the 18-25 age bracket and is about twice as frequent for males as females.

Current usage is about equal for white and non-white groups. It is positively associated with education, and is highest for those now in college (33%). Current usage continues to be highest in the West (11%) and lowest in the South (4%), and higher in large metropolitan areas (9%) than in non-metropolitan regions (3%). However, all of these differences have become less pronounced in the past three years.

Because of the relatively small numbers involved, national general population surveys do not provide very accurate estimates of changes in heavy marihuana use; nevertheless, some information is available. The 1971 Marihuana Commission survey reported daily or more frequent use among adults at 0.5%, while the comparable value for 1972 was 1.4%. The follow-on survey in 1974 did not report the rate of daily use, but noted that adult usage of nine or more days in the past month was 2.7%. The 1974 Drug Abuse Council national survey reported 1.5% of the adult sample used marihuana daily or more frequently. These limited data do not appear to indicate a change in adult daily usage in the past two years.

National Household Surveys (Youth)

The results of the Marihuana Commission surveys of youth ages 12-17 and the results of the 1974 follow-on study are found in Table-A-2.

Table A-1

MARIHUANA USE AMONG ADULTS, 1971-1974 (1, 2, 3)

	% Ever Used			% Current Use*		
	1971	1972	1974	1971	1972	1974
All adults	15	16	19	5	8	7
Age:						
18-25	39	48	53	17	28	25
26-30	19	20	29	5		
35-49	9	6	7	1	1	1
50+	6	2	2	-	-	-
Sex:						
Male	21	22	24	7	11	9
Female	10	10	14	3	5	5

*Used during last month.

Table A-2

MARIHUANA USE AMONG YOUTH, 1971-1974 (1, 2, 3)

	% Ever Used			% Current Use*		
	1971	1972	1974	1971	1972	1974
All youth	14	14	23	6	7	12
Age:						
12-13	6	4	6	2	1	2
14-15	10	10	22	7	6	12
16-17	27	29	39	10	16	20
Sex:						
Male	14	15	24	7	9	12
Female	14	13	21	5	6	11

*Used during last month

Another set of national household data collected in a Columbia University study reported quite similar results (8, 16):

	% Ever Used			
Age:	1971	1972	1973	1974-75
12-17	15	15	17	22
16-17	28	31	32	40

However, the 1974 national survey conducted for the Drug Abuse Council reported considerably lower marihuana usage for 12-17 age group, 14% in the "ever used" category and 5% as "currently using"(24). This discrepancy may have been related to the relatively small sample size of 505. This survey also utilized "rider questions" attached to a larger unrelated survey.

The Marihuana Commission surveys in 1971 and 1972 reported daily marihuana usage for the 12-17 age group at 0.6% and 1.3% respectively. The follow-on 1974 survey found 4.4% indicated usage of nine or more times in the past month. The 1974-75 national survey for the Columbia University study found 2% of youth ages 12-17 and 4% of those either 16 or 17 years of age reported using marihuana 60 or more times within the two-month period. While the percentage of daily use was not reported for the earlier years, the 1974 Drug Abuse Council survey reported daily or more frequent usage by 1% of 12-17 age group and 3% of those 16-17.

Student Surveys

A longitudinal study of high school males followed from their senior year to five years after graduation provides an indication of changes in marihuana usage over time in the same group (14, 15). The sample of over 2,000 was selected from 87 public high schools so as to be representative of American males entering high school in 1966. (Data arrayed in Table A-3.)

Another study surveyed drug usage in 22 selected high schools throughout the United States in 1971 and 1973 (16). These data are not necessarily representative of the student population, but do provide an indication of changes in marihuana use over the two-year period. (Table A-4)

A survey of 16,000 male and female high school seniors in 130 schools, selected to be representative of public and private high schools throughout the country, was conducted in 1975 (15) and is to be repeated on an annual basis. The percentage of high school seniors reporting marihuana usage in the 1975 survey were:

Table A-3

PERCENTAGE OF MARIHUANA USE
AMONG A NATIONAL SAMPLE OF HIGH SCHOOL MALES (14, 15)

	Senior Year	One Year After Graduation	Five Years After Graduation
	1969	1970	1974
Ever Used	20	35	62
Any use in prior year	20	33	52
Daily or weekly sometime in prior year	6	9	21
Daily use sometime in prior year	1	2	9

	Junior H.S.		Senior H.S.	
	1971	1973	1971	1973
Ever used	15	19	38	48
Ever used 60 or more times	2	4	11	17
Used in past two months	11	13	27	36
Used 60 or more times in past two months	1	1	2	4

83-317 O - 77 - 50

	%
Ever used	47
Used in last twelve months	41
Used in last month	29
Used 20 or more time in last month	6

The only regularly conducted national survey of marihuana use among college students is that prepared by Gallup (9). The percentages reporting having ever used this substance in surveys conducted between 1967 and 1974 were:

	%
1967	5
1969	22
1970	42
1971	51
1974	55

One other national student survey conducted in 1974-75 for the Drug Abuse Council found 48% of high school and 64% of college students reported having used marihuana (33, 34). The corresponding percentages for daily use were 6% and 8%.

One local survey of particular interest is that annually conducted among high school students in San Mateo County, California since 1968 (4). Table A-5 shows the percentage of ninth and twelfth grade male students reporting one or more, ten or more, and 50 or more uses of marihuana during the preceding year.

San Mateo County is adjacent to San Francisco, and thus had an earlier and more pronounced exposure to the counterculture movement and associated drug use than did most other areas. This is particularly evident in the figures for the late 1960's. For instance, one year after Gallup found only 5% of nationwide college students had used marihuana (1967), the comparable percentage for senior males in San Mateo county high schools was 45%. The percentage of San Mateo students using marihuana in 1975 is still substantially above the national level; however, the difference is not nearly so large. It is interesting to speculate on the meaning of this narrowing gap. One possibility is that the apparent plateau may be a ceiling and that the growth of marihuana use in San Mateo may have reached its limit. It may also be that other drugs (viz cocaine), not of great interest when the study began in '67, are now luring users away from marihuana. Many alternative explanations for the San Mateo phenomenon are possible; whether the phenomenon or its alternate interpretations have any meaning for the national level is unknown.

In summary, at the national level marihuana use appears to have significantly increased among youth during the past two years. This is indicated by the trend in national household surveys as well as surveys of various high school student populations. This conclusion is contrary to that suggested in the 1974 Marihuana and Health report, when data available at that time seemed to indicate a plateau had been reached (20). It also appears that daily marihuana use has increased among youth, although the available data on changes in daily use are fairly limited.

Table A-5

PERCENTAGE OF MARIHUANA USE AMONG MALE SAN MATEO COUNTY HIGH SCHOOL STUDENTS (4)

	One or more uses in past year		Ten or more uses in past year		Fifty or more uses in past year	
	9th Grade	12th Grade	9th Grade	12th Grade	9th Grade	12th Grade
1968	27	45	14	26	NA	NA
1969	35	50	20	34	NA	NA
1970	34	51	20	34	11	22
1971	44	59	26	43	17	32
1972	44	61	27	45	16	32
1973	51	61	32	45	20	32
1974	49	62	30	47	20	34
1975	49	64	30	45	20	31

Marihuana Use Among Males, Age 20-30

One of the most significant recent studies involved the interviewing of 2,500 selected to be representative of the 19,000,000 U.S. males in the 20-30 age group (23). This group evidences the highest rate of drug use, and the in-depth interviewing of a relatively large representative sample provided more reliable information on marihuana and other drug-using behavior than had previously been available.

The data were collected from October, 1974 to May, 1975 and showed that 55% of those interviewed had at some time used marihuana. Defining as current use any use in the year 1974-1975, the study reported 38% current users. Fifteen percent reported having used marihuana daily or almost daily at some time. Eleven percent reported using marihuana 1,000 or more times, and 11% also reported use within 24 hours of the interview. Hashish use at some time was reported by 29%, and the use of hashish oil by 11%. Surprisingly, 11% of the total sample and 41% of those described as heavy users reported growing marihuana for their own use.

When particular age categories within this group are examined, the data show that 37% of the men who were 29-30 at the time of the interview had used marihuana in comparison to 63% of the 20-24 age group. When those described as light or experimental marihuana users are excluded, the differences are even more striking; 12% of those 29-30 reported use in comparison to 37% of those 20-24. These results indicate that males now in their late twenties are less likely to have tried marihuana than men five to ten years younger, and are considerably less likely to adopt marihuana use as a frequent behavior. Similar or more pronounced differences probably exist for those over 30. For instance, the 1974 follow-on to the Marihuana Commission Survey found 7% of males and females aged 34-49 reported having used marihuana, but only 1% had done so within the past month.

The peak year of first marihuana use for the sample of males between 20 and 30 was 1969; however, the peak year for any use during the calendar year was 1974 when the rate for this group reached 37%. The authors concluded that the data were clearly consistent with an upward trend in marihuana use.

This study also revealed that the differences in marihuana use as a function of various demographic characteristics were not as pronounced in the group sampled as those reported in the general population. In the male 20-30 age group, 70% of those living in cities of over 1,000,000 population had used marihuana in comparison to 43% of those in communities of less than 2,500. In terms of education, the percentage reporting some use of marihuana was almost identical for those with less than high school education, high school graduates and college graduates. Those who had attended college without graduating showed a higher rate. For those aged 20-23 at the time of the interview, the percent having used marihuana was virtually the same for those still in school and those not. A higher percentage of blacks (65%) than whites (54%) reported some use, but the inverse relation of marihuana use to age was not as apparent in the black group. Blacks and other ethnic minorities showed a higher prevalence of marihuana use prior to the late 1960s, but minority youth were less influenced by the recent epidemic (5).

A Synthesis

The overall survey results indicate that marihuana use has not significantly penetrated the portion of the adult population over 30 years of age. Where use has occurred in this group, the frequency has been mostly of an experimental nature. However, the plateau in current marihuana use among adults found in national survey results may be deceptive in predicting future usage. As the more frequently using younger groups enter the adult age range, the overall rates are likely to increase.

Results from both household surveys and student studies indicate that marihuana use is still increasing among youth at the national level, although usage appears to have stabilized in certain areas which reached a relatively high level in the early 1970's. Most of the data on youth also indicate that daily or near-daily usage has increased in the past two to four years.

If recent marihuana usage in the United States is compared with that prior to the epidemic which began in the late 1960's or expecially with patterns of use in countries where cannabis use has been indigenous for many years, some useful perspectives emerge. It is clear that much of the recent American usage is quite minimal, both in terms of frequency of use and amount consumed (21, 27). The patterns of use often seem to be based more on the adoption of a fad or style than an attraction to the pharmacological properties of the drug. This is not to say that, once it is introduced as a fad, marihuana use will not be sustained because of its pharmacological effects.

Based on currently available survey data, it appears that around 2% of youth, aged 12-17 or about 8% of those who have tried it, are currently using marihuana daily. For those 17 years-of-age, around 4 or 5% are probably daily users and for 17-year-old males the percentage is of the order of 6 or 7%, or about 13% of those having tried it.

For adults, the overall daily use is probably only 1 or 2%, but a more meaningful percentage is that for the age groups primarily involved. As described earlier, the percentage of daily use among males 20-30 years of age is around 8 or 9% or 15% of those who have tried marihuana. For males 20-24 years of age, current daily use is around 10 or 11%, or about 17% of those having ever used the drug.

Social and Psychological Correlates

Research on the social and psychological correlates of marihuana use may be organized under three headings: 1) pre-use characteristics; 2) factors influencing transition from non-use to use, including the temporal order of drug-using behavior; and 3) correlates of marihuana use following its adoption. In most instances only statistical associations, as opposed to causal relationships, can be established.

Pre-Use Characteristics

This aspect has been thoroughly covered in earlier research and recent work has largely served to confirm prior findings. Aside from the association of marihuana with routine demographic variables such as those mentioned in the previous section, the majority of variables which predict marihuana use, ranging from a break with traditional values (7, 10, 19) to more severe behavioral and adjustment problems (11) are related to lack of conformity. Smith has found self and peer ratings of rebelliousness to be among the best predictors of high school students who subsequently become marihuana users (29).

Factors Influencing Transition from Non-Use to Use

In a longitudinal study of high school students, Jessor has shown that those individuals who will initiate marihuana use can be identified with considerable accuracy from various personality, belief and attitude measures (13). Furthermore, these measures, such as attitude towards deviance, value of achievement and friends' approval of drug use, show significant changes in the direction of the user group during the period of marihuana initiation. Jessor has found similar results with regard to the initiation of alcohol drinking and sexual behavior.

Several studies have investigated the role of child-rearing practices and parents' drug-using behavior in the initiation of adolescent drug use. One recent study found that perceived laissez-faire parent-child relationships led to high marihuana usage among the offspring; an autocratic relationship led to medium usage; and quasi-democratic or democratic relationships led to low usage (12). Another study found higher rates of marihuana use when the parents showed less disapproval of use, and also when the father used prescription drugs (25). Kandel also found a positive relationship between parents' drug-using behavior and the child's marihuana use, although her work demonstrated rather conclusively that this effect was minor in comparison to peer group influence (17). This emphasis on peer influence is in accord with the thesis of Suchman and others that student marihuana and other drug use is largely determined by the integration into a social subculture in which drug use is a part (31, 32).

One social environment, the military, has apparently proved to have less influence on marihuana and other drug use than was initially believed. O'Donnell, et. al., in their study of 20-30 year old males found that neither domestic nor overseas service had any effect on marihuana use (23). Robins has also found that Vietnam veterans' marihuana use after return was not significantly increased over that for a comparison group who did not enter the military (26).

Since marihuana use is known to generally precede other illicit drug usage, the question is often raised as to the role of marihuana in facilitating the transition or progression to more dangerous drugs. While not specifically answering this question, Kandel and associates have determined that the temporal sequence along the legal-illegal drug continuum is consistent (18, 28). By conducting longitudinal studies of two large samples of high school students, they were able to determine the order in which the various drugs were used. Only 1% of the sample began using illicit drugs without first using a legal drug. Beer and wine collectively constituted by far the most common "entry drug" (28%) with cigarettes accounting for 6% and hard liquor 3%. In addition to the fact that legal drug use virtually always

preceded illicit use, heavy use of both liquor (weekly) and cigarettes (over a pack a day) resulted in a high percentage (40%) moving from non-use to use of illicit drugs in a five month period. Only 2 to 3% of adolescent legal drug users progressed to other illicit drugs without first trying marihuana. If the individual progressed beyond marihuana, the next step was generally pills. Subsequent steps were psychedelics, cocaine and heroin, in that order; but, of course, only a small percentage progressed to the higher levels in the sequence. Heavy use of marihuana or other drugs along the sequence was more often followed by progression to the next step, and also by a higher probability of moving two or more steps during a single time period.

Correlates of Marihuana Use

Although marihuana use has become increasingly common over the past several years, it is not surprising that those who are less conventional in other respects are more likely to use the drug than are the more traditionally oriented. In their national study of males, ages 20-30, O'Donnell et. al., found that those men living in consensual unions (i.e., with a woman to whom they are not married) were more likely to be using marihuana than those living independently, or living in their parental home. Those who were married and living with their wives were least likely to be using the drug (the percentages of current use in ascending order were: married, 25%; living with parents, 38%; living independently, 56%; consensual union, 68%). A similar trend was found in the use of other drugs including alcohol and tobacco (i.e., current drug use of all types was greater by males in consensual unions than among those who were married). Those unemployed at the time of interview were more likely to have used marihuana in some time in their lives than those who were employed (72% of the unemployed had ever used compared to 52% of the employed) (23).

In this same study both self-reported criminal acts and contacts with the criminal justice system (some drug use related) were substantially higher for marihuana users than for the non-users. The authors caution, however, that "the fact that drug use sometimes occurs first and at other times criminal behavior precedes use indicated that if there is a causal connections between drug use and criminal behavior, it is not a simple one" (23). Similar results have been reported in terms of arrests by Brill and Christie (1% for non-users compared to 10% for regular marihuana users) (6).

An Air Force study of some 4500 men reporting marihuana use indicated somewhat poorer performance when compared with a control group of non-users (22). Finally, a longitudinal study of college freshmen found a strong relationship between marihuana and other drug use and the choice of unconventional careers (30). There was also a disproportionate tendency for marihuana users to change in the direction of unconventional careers during the two-and-one-half year follow-up period and the authors concluded, after multivariate analysis, that the results suggest a causal relationship. However, it should be stressed that, in general, studies relating marihuana use to other variables have not established more than a statistical association. It is clear that marihuana usage is frequently part of a larger pattern of nonconformity, but the existence of causal relationships between marihuana use and other behavior have generally not been determined.

CHAPTER 2

CHEMISTRY AND METABOLISM

Because the drug abuse problem involves marihuana, the study of the pharmacological and toxicological properties of the drug must be pursued; cannabis, however, is a complex mixture of variable amounts of numerous, potentially active substances. The chemistry of marihuana is, therefore, of paramount importance to the investigator, and the recently reported development of relatively simple analytical procedures for the separation and quantitation of the major cannabinoids in marihuana is a significant advance. The effects of marihuana can now begin to be more meaningfully compared in different laboratories, and many of the past problems of conflicting data will be avoided simply by knowing the chemical composition of the sample at hand. Indeed, the United Nations has recommended that all research reports on the properties of marihuana include a quantitative account of the major cannabinoid content of the preparation involved.

Another notable contribution in the field of cannabinoid chemistry was the introduction of a refinement in the synthesis of delta-9-THC, the major psychoactive drug in cannabis. In recent years, the synthesis of delta-9-THC, as well as of other cannabinoids, has been subjected to extensive investigation, which has resulted in a continuous simplification of the synthetic procedures. Such developments have reduced the cost of synthesis and thereby increased the availability of these important drugs for scientific investigation. The long-term significance of the recent refinement must be viewed in the perspective of a long list of many contributions to our understanding of the chemistry of cannabis and its constituents. In the past few years the chemical study of cannabis has resulted in the isolation, characterization and synthesis of numerous constituents of marihuana, thus providing biologists with the opportunity to study the pure drugs. In a classical sense, the chemical advances represent the basis for the rational investigation of the pharmacology and toxicology of marihuana.

New reports of the isolation and identification of some of the metabolites of marihuana continue to represent the most important aspect of research in the area of metabolism. In the human, for example, cannabinol has now been reported as a metabolite, and several new ones have been isolated from urine. It is essential to pursue the identification of marihuana metabolites because the question of what accounts for the pharmacological and toxicological activity of marihuana can only be answered by a study of the constituents of cannabis and their respective metabolites. The importance of metabolism was first demonstrated a few years ago when 11-hydroxy-delta-9-THC, a major metabolite of delta-9-THC, was found to be as active as, or more active than, the parent compound. In the current Marihuana and Health report, the study of the anticonvulsant activity of the cannabinoids has revealed that another metabolite, 8-alpha, 11-dihydroxy-delta-9-THC, is also a very active substance. It is not unreasonable to assume that still other marihuana metabolites will be found to produce significant pharmacological and toxicological effects.

Drug Sources

The detailed chemical analysis of cannabis has been extended to yield more components (4, 43, 44), and investigators have recently identified a new spermidine alkaloid called cannabisativine in an alcoholic extract of the root of Cannabis sativa L. (24).

The importance of the influence of smoking marihuana on the nature of its chemical constituents continues to be recognized (14, 18, 19, 20, 37). A detailed analysis of the pyrolytic products of cannabidiol (CBD) has demonstrated that one of the principal volatile products formed is olivetol, a pharmacologically active chemical precursor of the cannabinoids (19).

The cannabinoids are potentially unstable compounds and their stability in chloroform, a commonly used solvent for extraction and storage of cannabinoids, has been re-examined (51): The results of a three-month storage study support a previous assessment that either synthetic or naturally occurring cannabinoid mixtures are reasonably stable. Other investigators have determined the influence of pH on stability by describing the kinetics of the degradation of delta-9- and delta-8-tetrahydrocannabinol (delta-9-THC, delta-8-THC) at different pH values (12).

More new cannabinoids have been synthesized and examined for pharmacological activity (8, 22, 52), and the synthesis of delta-9-THC has continued to be refined with the introduction of a one-step reaction using either chrysanthenol (35) or p-mentha-2, 8-dien-1-ol and olivetol (34).

Analytical Techniques: Detection

At the present time four principal methods are used for the analysis of cannabinoids: gas-liquid chromatography (GLC), thin-layer chromatography (TLC), mass spectroscopy (MS) and radioimmunoassay (RIA). The chromatographic procedures remain the most useful because they offer either simplicity, as in the case of TLC, or the best combination of sensitivity and selectivity, as in the case of GLC. The GLC methods have been especially useful in the separation and quantitation of cannabis constituents (31). One of these methods, which involves the formation of silyl derivatives and 2 % OV-17 chromatography columns (49), has been extremely valuable for the elucidation of the major components of cannabis. This method, referred to in the 1974 Marihuana and Health report (25), demonstrated that previous GLC analyses of cannabis failed to separate CBD from cannabichromene (CBC); hence, some CBD samples used in pharmacological studies were probably significantly contaminated with CBC. The recognition of the prevalence of CBC in some cannabis samples should prompt a re-evaluation of the pharmacological effects of pure CBD and an evaluation of the pharmacological properties of CBC, alone and in combination with CBD.

The variability in cannabis composition has led the United Nations to recommend that all scholarly reports on the effects of cannabis include a quantitative analysis for CBD, cannabinol (CBN) and delta-9-THC content; the GLC method described above was recommended for this purpose. Subsequently, the same research group published another GLC method which does not require derivatization, but still provides satisfactory separation of CBD and CBC (50). The relative simplicity of this procedure suggests that it is the current method of choice for the analysis of cannabis for its principal cannabinoid constituents.

New TLC methods for the cannabinoids continue to be developed (9, 16, 17, 29, 48). A two-dimensional TLC system has been described as capable of separating 27 constituents of hashish resin, including CBD, CBN, delta-9-THC and CBC (29). This technique uses silica-gel plates and the solvents n-pentane-diethyl ether-ethyl acetate (90:8:2) and n-pentane-acetone (90:10). In another report a new procedure for extracting urine enables the cannabinoid metabolites to be separated into neutral, weak and strong acid fractions, which can be easily fractionated further by TLC (17). In addition, the use of methanol to extract delta-9-THC and its metabolites from tissues was found to yield higher recoveries than other common extraction methods (38). Finally, the factors that influence the stability and color intensity of the chromogen-cannabinoid products have been identified as chromogen basicity, residual solvent and chromogen dyestuff (9).

High pressure liquid chromatography (HPLC) represents a new and potentially useful technique for cannabinoid analyses. The great separatory capability inherent in HPLC should lend itself well to the general problem of resolving complex cannabinoid mixtures. A recent report has described the use of dansyl derivatives for the fluorometric detection of cannabinoids separated by HPLC (1). The results obtained from the analysis of cannabinoid standards illustrate that the combination of dansyl derivatives and HPLC provides a method with the sensitivity and selectivity of GLC and mass fragmentography. This method has recently been used effectively in an examination of cannabinoid metabolites in dog feces (23). Furthermore, it is interesting to note that HPLC has been used to separate quantitatively delta-9-THC from other plasma heptane extractable substances (e.g., lipids) that can interfere with the GLC analysis of such extracts (11).

Since the pioneer mass spectroscopy work with cannabinoids by Agurell, et. al. (56), which was summarized in the fourth Marihuana and Health report (25), the technique has played an important role in the identification of individual cannabinoids. The inherent sensitivity of the technique lends itself well to the potential measurement of cannabinoids in biological samples; and workers at the Research Triangle Institute have developed a method for the quantitative analysis of human plasma for concentrations of delta-9-THC as low as 0.5 ng/ml (58). Mass fragmentographic methods have also been used in a number of other studies (16, 23, 29, 43, 44, 57).

Several reports have also appeared describing the use of RIA for the detection of cannabinoids, particularly in body fluids (13, 26, 46, 47). In addition, two new immunoassay techniques are under consideration: homogeneous enzyme immunoassay (36) and free radical immunoassay (6). The most appealing feature of immunoassay is its great sensitivity, but limited selectivity continues to restrict its applicability.

Metabolism

The continuing study of the biological disposition of the cannabinoids has yielded a greater understanding of factors affecting their metabolism, the nature of their metabolites, their distribution in the body and, finally, the routes of their excretion. Research into hepatic microsomal metabolism was designed to define the optimal in vitro conditions for the metabolism of delta-9-THC (40). The influence of several cannabinoid vehicles on delta-9-THC metabolism was evaluated, and apparent Km and Vmax values were determined. The pattern of metabolite production was followed as a function of duration of incubation.

Twenty-four hours after oral administration, crude cannabis resin was found to increase both pulmonary and hepatic aryl hydrocarbon hydroxylase activity in male rats (42). The stimulus for this effect may have been the trace quantities of benzo-(alpha)-pyrene found in cannabis resin. In another experiment, the rate of delta-9-THC metabolism both in vivo and in vitro was increased by the daily pretreatment of rats with phenobarbital (39). Despite an increased rate of metabolism, neither the apparent Km nor Vmax was altered. The phenobarbital effect was compared with the response in tolerant animals: In vitro, the rate and pattern of metabolism was unchanged, and, in vivo, the amounts of cannabinoid in tissue and its disappearance from blood was also unaffected. The data suggest a functional, rather than a dispositional, basis for tolerance.

Various drugs have been examined in terms of their effects on the in vitro and in vivo metabolism of delta-9-THC (41): Pentobarbital, phenobarbital, SKF 525-A, amphetamine and meprobamate all inhibited delta-9-THC metabolism in vitro; under similar conditions morphine and mescaline had no effect. In contrast to these general findings, only SKF 525-A affected delta-9-THC metabolism in vivo. It appears, therefore, that the in vivo interactions between delta-9-THC and other centrally acting drugs cannot be explained by an alteration in delta-9-THC metabolism.

Recent examinations of the delta-9-THC biotransformation products of rabbit and dog liver microsomes have revealed the presence of 1, 2- epoxyhexahydrocannabinol (3, 55); and a comparison of metabolites from the perfused dog lung and from dog hepatic microsomes has led to the discovery of side-chain hydroxylated derivatives (55). Moreover, there is now evidence that CBN and its oxidized derivatives are normal metabolites of delta-9-THC. CBN has been identified in human plasma following marihuana smoking (27), in rat bile (54) and in rat blood (28) after intravenous injection of delta-9-THC. Oxidized metabolites of CBN have also been identified (2, 5); and a new metabolite containing two carboxyl groups has been isolated from rabbit urine (30). Both rat and rabbit liver microsomes were found to convert CBN into a number of side-chain hydroxylated compounds (53). In addition, marihuana metabolites in human urine have been extracted by a new method which separates them into neutral, weak and strong acid fractions (17).

Various aspects of the distribution of the cannabinoids in the body have been investigated: Thus, one research group has found that the properties of delta-9-THC in plasma are a function of the method of administering the drug (10). In this study, delta-9-THC was administered either intravenously in polyethylene glycol or in rat serum, or in the form of cannabis smoke. Plasma disappearance curves varied, depending upon the method of administration, and, compared with the other two means of administration, injection in serum resulted in a slower elimination from plasma, a lower proportion of metabolites relative to delta-9-THC and a different distribution of binding to plasma proteins.

Other investigators found that the plasma-protein distribution of delta-9-THC after intravenous administration differs in female and male rats (7); and at all doses tested, the response in females was more pronounced. The latter finding correlated with that of higher tissue concentrations of delta-9-THC and its metabolites in the female; therefore, the enhanced activity of delta-9-THC in the female rat may be due to the higher tissue cannabinoid concentrations in the brain.

The relationship between tissue-drug concentration and pharmacological activity was extended in a comparative study of the effects of delta-9-THC and dimethylheptopyran (DMHP) on mouse immobility (21). Like delta-9-THC, the brain concentrations of DMHP and its hydroxylated metabolite correlated with the behavioral effect (21). Despite DMHP's greater potency, the fraction of the dose in the brain was smaller than that of delta-9-THC; thus, the potency difference between delta-9-THC and DMHP appears to be a consequence of the latter's greater activity at the site of action.

Plasma concentrations of delta-9-THC, 11-hydroxy-delta-9-THC, CBN and CBD were measured by radioimmunoassay as a function of time after their intravenous administration in the rabbit (45). Delta-9-THC was unlike the other drugs, because plasma values for reacting substances rose for several minutes after injection, presumably due to the rapid formation and re-entry of the 11-hydroxy metabolite into the plasma. In humans, this metabolite leaves the plasma more rapidly than does delta-9-THC (33); an observation that has been confirmed in mice (32).

In a study of lactating ewes, both delta-9-THC and its metabolites were recovered from the milk for as long as 96 hours after administration of a single, intravenous low dose (15). Other investigations have shown that biliary excretion in rats accounts for the elimination of 60% of an intravenous dose of delta-9-THC (3mg/kg) (40), that biliary excretion remains unchanged when tolerance to THC develops (39), and, finally, that most of the metabolites in the bile are highly polar substances.

CHAPTER 3

TOXICOLOGICAL AND PHARMACOLOGICAL EFFECTS

The toxicological research reviewed in the present Marihuana and Health report is the result of the continuing need to identify and evaluate the toxicological properties of marihuana. To fill this need, a series of inhalation toxicity studies have made two major contributions. First, in the absence of detailed pathological studies in humans, marihuana has been administered to numerous species in a wide range of dosages by a variety of routes--including inhalation. The report that chronic administration of low doses by smoke inhalation results in a toxicity comparable to that elicited by other routes of administration serves to validate the conventional animal toxicity studies which are based on either the oral or parenteral route. Accordingly, the mass of animal data collected in the past few years leads to the conclusion that, to date, regardless of the route of administration, the observed toxicity of marihuana is not associated with any serious pathological changes.

Secondly, until the inhalation studies, most cannabinoid toxicity research was restricted to the principal psychoactive constituent of cannabis, delta-9-THC; now, however, cannabidiol and cannabichromene--both formerly considered pharmacologically inactive--are known to contribute significantly to the toxicity and lethality of marihuana. Clearly, future toxicological evaluations of cannabis constituents must be extended to all the major, naturally occurring cannabinoids, both alone and in various combinations.

Another important aspect of toxicological research arises from the reported effects of marihuana on such cellular components and products as lipids, proteins, nucleic acids, hormones and neurochemical transmitters. An association between some of these effects and animal behavior has now been made; most, but not all, of the changes appear to be readily reversible. These cellular effects and their implications are not easily understood, but they may reflect subtle alterations in function independent of any gross pathological changes. With chronic drug exposure, however, these subtle changes may evolve into significant toxicological factors.

The study of the pharmacological properties of marihuana is important for at least three reasons: 1) to define its effects, particularly its possible toxic effects; 2) to determine the potential interaction of its effects with various pathological states (e.g., coronary artery disease, liver disease, epilepsy); and 3) to evaluate the potential therapeutic uses of the cannabinoids. During the past year there have been significant contributions to the attainment of all these objectives. Several studies have recognized the ability of the cannabinoids to interact, not only with one another, but more importantly, with other drugs; the interaction in some instances results in the enhancement of a drug effect, in others in an antagonism. Such a complex set of effects has been described in the case of the barbiturates, the amphetamines and alcohol. The significance of this interaction potential is obviously not limited to drugs used only for illicit purposes: From the reported interaction effects, the concurrent use of marihuana with licit drugs could

conceivably result in an increased toxicity, a diminished therapeutic effectiveness or, even, an enhanced therapeutic effectiveness.

Another report of a potentially significant drug interaction centers on the delta-9-THC blockade of the morphine-abstinence syndrome. If this effect is confirmed, then the characteristics and consequences of the interaction should be defined further, particularly with reference to other drugs known to block the opiate-abstinence syndrome.

The pharmacological studies included in the present Marihuana and Health report reveal the toxic influence of marihuana on pre-existing pathological states (62): Thus, the clinical description of the adverse effect of smoking marihuana on cardiac function in patients with coronary artery disease is a significant contribution toward a more comprehensive picture of the toxicity of cannabis. There are also reports of animal data indicating that the use of marihuana may adversely affect the control of seizures. This interpretation is based on several observations of marihuana's central-nervous-system excitatory properties and on the hyperexcitability following withdrawal from repeated delta-9-THC treatment. These potentially unfavorable interactions with epilepsy may be independent of the anticonvulsant properties of marihuana, as is the case with some antiepileptic drugs, such as phenobarbital.

The Report (62) contains descriptions of two pharmacological effects that have definite clinical potential: The decrease in intraocular pressure and the anticonvulsant activity, both of which are described in sufficient detail to warrant serious consideration of their therapeutic application. Furthermore, the quantitative evaluation of the relative anticonvulsant and neurotoxic activity of several cannabinoids has demonstrated that a potentially useful therapeutic effect of cannabidiol is at least partially separable from the motor toxicity of marihuana, a finding which is further supported by the report of cannabidiol's complete lack of psychotoxicity in humans. A comparable pharmacological selectivity for other cannabinoid effects deemed potentially valuable clinically is thus a distinct possibility. Finally, the introduction of numerous synthetic cannabinoids presents an opportunity to search for the most appropriate agent for any given desired effect.

Toxicological Effects

Investigators have continued to evaluate the toxicity associated with chronic exposure to the cannabinoids using various routes of administration and several different species. Experiments have been of two basic types: those designed to study lethal effects produced by the chronic administration of massive doses, and others designed to study sublethal toxicity produced by relatively low doses, such as those commonly used by humans. The chronic low-dose work now includes rat studies of toxicity following smoke inhalation (71): The daily doses given to 1-, 5- and 23-day exposed animals were analogous to those taken by humans, and the results indicate that inhalation of delta-9-tetrahydrocannabinol (delta-9-THC) can produce the characteristic marihuana central-nervous-system (CNS) toxic effects (depression and excitation) elicited by other routes of administration. These effects, like those associated with other routes of administration, appeared in the absence of any pathological changes, and tolerance ultimately developed to most of them. In a study of the inhalation toxicity of Turkish marihuana (high in cannabidiol and cannabichromene and low in delta-9-THC content) rats were daily

exposed to smoke 5 days per week for 25 days (72). This treatment resulted in various manifestations of CNS depression and in a dose-related lethal effect--respiratory arrest; such results demonstrate that cannabidiol (CBD) and cannabichromene (CBC) can contribute to the toxicity of marihuana.

Massive oral doses of delta-9-THC or crude marihuana extract administered to rats daily for 28 to 91 days have been used to determine toxic neurochemical effects (59): After 28 days of treatment, significant decreases were observed in total brain protein, ribonucleic acid (RNA) and acetylcholinesterase activity. These neurochemical changes in rats coincided with the appearance of the CNS stimulation (fighting behavior and convulsions) characteristic of chronic marihuana treatment, and, like neurotoxicity, were partially reversed by 91 days of continued administration.

In a study similar to that described immediately above, neurochemical changes were evaluated in rats treated for as long as 180 days; in this instance, however, the doses were relatively low--2, 10 or 50 mg/kg/day orally (60). The two lower doses of delta-9-THC were again analogous to the drug content of the marihuana and hashish consumed by humans. (This work is the counterpart of a low-dose, chronic-toxicity study (74) referred to in the 1974 Marihuana and Health report (62). Neurochemical analyses of four areas of the brain (frontal cortex, parietal cortex, subcortical regions and cerebellum) were made at various times after the initiation of chronic treatment and generally showed neurochemical changes comparable to those produced in the massive-dose study described above. In the lower-dose study, however, changes required longer periods of treatment to appear and varied in the different areas of the brain. Some of the behavioral and neurochemical changes were sex-linked, and several occurred after the development of tolerance to the behavioral effects. Furthermore, a few of the neurochemical alterations were reversible, even after a 30-day recovery period.

Neurotoxicity and EEG effects of chronic oral treatment of rats and rhesus monkeys have also been described (79, 80). In rats acute treatment with 10 mg/kg delta-9-THC increased the frequency of surgically induced polyspike activity, while chronic treatment resulted in subcortical spike bursts with concomitant seizures. In the rhesus monkey chronically treated with crude marihuana extract equivalent to 12.5 mg/kg delta-9-THC or more, the neurotoxic manifestations always preceded and outlasted the effects on the EEG, and tolerance developed more rapidly to the EEG effects than to the neurotoxicity. The results suggest that the neurotoxic effects become manifest at lower doses than the characteristic EEG effects, findings similar to those previously reported in humans.

Monkeys treated intravenously (i.v.) with delta-9-THC exhibited, at the injection site, such toxic reactions as edema, necrosis, ulceration and fibrosis (83). In order to elaborate the local toxicity findings, the drug was chronically administered subcutaneously (s.c.) to rabbits in doses ranging from 15.9 to 153.4 mg/kg/day. The dermal responses, which were generally dose-related, included erythema, edema, ulceration and nodule formation. These results illustrate that the use of marihuana i.v. may be accompanied by local toxic reactions. The chronically treated animals displayed dose-related decreases in body and liver weights, in glycogen content of the liver, and in blood sugar and alkaline phosphatase activity; serum potassium concentration was elevated. As in other chronic toxicity studies from this group, no pathological tissue effects--other than those at the injection site--were discernible.

A study of the influence of different routes of administration and vehicles on the lethal dose 50 (LD50) values of delta-9-THC has also been made (73). The oral LD50 for delta-9-THC in an aqueous emulsion of sesame oil and polysorbate 80 was similar to that obtained with a pure sesame-oil vehicle, indicating that the composition of the emulsion did not affect the LD50. Furthermore, the i.v. LD50 for the same aqueous formulation was essentially identical to the inhalation LD50. In general, the results established the validity of the i.v. route of administration in the investigation of the pharmacology and toxicology of marihuana-like substances.

The continuing interest in the carcinogenic potential of marihuana smoke has brought forth a report that marihuana tar painted on mouse skin produced a variety of effects on squamous cells, including metaplasia of sebaceous glands (20). This good correlation with the established carcinogenicity of tobacco smoke led the investigators to conclude that cannabis smoke will also be carcinogenic, a conclusion which is supported by bioassays of marihuana tar on mouse skin. Both tumorgenicity and tumor-promoting activity were revealed although at levels significantly lower than those resulting from tobacco smoke (41). This contrasts with in vitro observations on human lung explants which suggest that cannabis smoke may be more carcinogenic than tobacco smoke (91).

In another investigation, marihuana smoke produced a dose-dependent depression of the bactericidal activity of pulmonary alveolar macrophages; the effect was related to a water-soluble constituent in the smoke rather than to delta-9-THC (23). It is possible that the toxicity of marihuana smoke to the alveolar macrophage may impair the ability of this cell to function in the host-defense mechanism of the lung.

Numerous reports have appeared describing the effects of delta-9-THC on the endocrines. The main thrust of research in this area has aimed at pituitary and gonadal hormones. (See Appendix G "Human Effects" for a detailed review of the latter.) One of the previously reported effects of heavy marihuana use in humans was gynecomastia (37). This effect has now been produced in rats given 1 mg/kg delta-9-THC s.c. for two to three weeks (38). In a related study, delta-9-THC in male rats increased pituitary weight, total pituitary prolactin and the concentration of prolactin in serum (24), but in a similar study, delta-9-THC decreased, rather than increased, serum prolactin concentrations (57). The discrepancy in these results may be due in part to differences in dosage: The effect in the former study was obtained at 16 mg/kg, whereas in the latter study the highest dosage employed was 10 mg /kg. In humans, marihuana use has had no apparent effect on serum prolactin. The gynecomastia described above was associated with normal serum hormone values, while another group of chronic marihuana users was also normal (56).

Research into the effect of delta-9-THC on other pituitary hormones has indicated that in rats delta-9-THC in doses of 5 to 20 mg/kg inhibited growth hormone and stimulated adrenocorticotropic hormone secretion; daily administration of 20 mg/kg for 20 days did not produce tolerance to these effects (55). The findings suggest that delta-9-THC acts as a stress stimulus of the hypothalamic-pituitary axis. A similar response to delta-9-THC in the mouse was evidenced by an increase in corticosterone concentration in plasma (69), although tolerance to the effect on steroid secretion rapidly developed in this species. The work of one group of investigators has shown an inverse relationship between plasma corticosterone and the amount of 5-hydroxytryptamine in whole brain. A positive

correlation between the steroid value and aggressive behavior in ovariectomized rats following chronic cannabis treatment was found (66). Aggressiveness was abolished by estrogen treatment, suggesting that previously described sex differences in response to cannabis may, in part, have been due to female variability during different phases of the estrus cycle.

The inhibitory effect of delta-9-THC on the secretion of growth hormone also manifested itself in prepuberal male rats (17), but in adult female rats high doses of the drug (50 mg/kg) elevated serum growth hormone values (28). In a study of male mice chronically treated with delta-9-THC, growth was depressed in a way similar to that seen in estradiol treated animals, suggesting that delta-9-THC can exert an estrogen-like effect (78).

Pharmacological Effects

The similarities in psychological actions between the liqueur absinthe and cannabis have led to a molecular structural comparison of their active principles, thujone and tetrahydrocannabinol (26). Because the substances have a similar molecular geometry and similar functional groups, they may exert their psychic effects by interacting with a common receptor in the CNS. The receptor should have a binding site for oxygen, a planar region for the allyl group and pockets, or cavities, for fitting with alkyl and hydrogen groups that are common to both drugs. The importance of the phenolic hydroxyl group in tetrahydrocannabinols in eliciting delta-9-THC-like activity in animals has also been established (86).

Studies of the effects of delta-9-THC on sleep-wakefulness patterns referred to in the 1974 Marihuana and Health report (62) have been expanded to include the male squirrel monkey whose patterns are similar to those of the human (1). Chronic treatment reduced slow-wave sleep time, which failed to return to normal, even after a 30-day recovery period. In addition to this change in sleep pattern, the time spent in Stage 1, or drowsy sleep was increased in treated animals and this change also persisted throughout the recovery period.

The analgesic activity of delta-9-THC has now been described in the dog, as well as in the rat, mouse and rabbit (54). Tolerance, which has been found to develop to such other effects in the dog as ataxia and sedation, also developed to the analgesic effect. Two cannabinoid-free extracts (an aqueous extract and a volatile oil) of marihuana also were found to elicit analgesia in mice. The analgesic potency of the extracts was much lower than that of delta-9-THC, but the nature of the analgesic material and its interaction with delta-9-THC are still unknown.

Many cannabinoids, in addition to delta-9- and delta-8-THC, are known to be anticonvulsants: These include cannabinol (CBN), dimethylheptylpyran (DMHP) and some of its isomers; 11-hydroxy-delta-9-THC (46); 8-alpha, 11-dihydroxy-delta-9-THC (45); and some new benzopyrans (70). Moreover, the activity of CBD has been confirmed and the compound subjected to a variety of seizure tests which have demonstrated that in its anticonvulsant properties the drug more closely resembles diphenylhydantoin (DPH) than does delta-9-THC (44, 49, 85). The interaction of CBD with other anticonvulsant drugs has also been described in studies that generally show that, in a maximal electroshock test in mice, CBD clearly enhances the potency of delta-9-THC, DPH and phenobarbital (PB). The determination of the protective indices (toxic dose/anticonvulsant dose) of several cannabinoids in mice indicates that motor toxicity is a separable effect from anticonvulsant activity

(46); for example, compared with delta-9-THC, DMHP is relatively more toxic and CBD significantly less toxic. Furthermore, the separation of toxicity from anticonvulsant activity is dramatically illustrated by the report that massive i.v. doses of CBD in humans do not produce either the marihuana-like psychotoxicity or tachycardia (68).

In rats and mice subjected to a maximal electroshock test, tolerance to the protective effect of delta-9-THC and CBD rapidly developed (46, 47), but a similar response to repeated treatment was associated with DPH and PB (47); in addition, tolerance to delta-9-THC or CBD involved cross-tolerance to DPH and PB (47). Tolerance has also been described for the antiseizure activity of delta-9-THC in the gerbil, but in this case it did not develop to the neurotoxic effects (82). It should be noted, however, that a study of the influence of repeated daily drug treatment on the results of several anticonvulsant tests indicates that tolerance does not develop to all the anticonvulsant properties of the cannabinoids (48). In fact, in some tests anticonvulsant activity increased, rather than decreased, with repeated treatment. Similar results were obtained with DPH but not with PB. The evidence suggests that the tolerance observed is not a dispositional but a functional adaptation. For example, in one study tolerance to protection against a maximal electroshock developed concurrent with an accumulation of cannabinoids in the CNS and increased sensitivity to cannabinoids in certain anticonvulsant tests, while no change occurred in plasma delta-9-THC concentration or in barbiturate sleep time (48).

Previous reports mentioned descriptions of some excitatory properties of delta-9-THC, especially in conjunction with toxicity produced by chronic, high-dose treatment. Withdrawal from repeated treatment with anticonvulsant doses of delta-9-THC also resulted in CNS hyperexcitability, as measured by a decrease in the 6-Hz-electroshock threshold test for minimal seizures (49, 50); no such withdrawal increase manifested itself in the case of CBD or DPH. On the other hand, withdrawal hyperexcitability to delta-9-THC could not be demonstrated when pentylenetetrazol (PTZ) was used to elicit minimal seizures (11). Following low-dose, i.v. administration, convulsant effects of delta-9-THC have been observed in a special strain of rabbits (19). Furthermore, delta-9-THC administered i.v. to the photosensitive baboon Papio papio resulted in an epileptiform EEG response, 3/sec rhythmic spikes and waves (63); no doses were anticonvulsant against the photically elicited myoclonic activity, but high doses (1-5 mg/kg) enhanced seizure responses in some cases.

In the area of cannabinoid hypothermic activity, one recent study compared several cannabinoid preparations with chlorpromazine in mice (58) and ranked them in order of decreasing potency as follows: chlorpromazine, marihuana extract, distillate, DMHP, delta-8- and delta-9-THC. Tolerance to the effects of both delta-9-THC and chlorpromazine rapidly developed, although more rapidly to the former drug. Antipyretic activity for delta-9-THC, suggested by previous reports, has now been confirmed in mice (16). Additionally, with respect to the mechanism which lowers body temperature, the results from direct and indirect calorimetry measurements suggest that delta-9-THC-induced hypothermia is associated with both a decrease in heat production and an increase in heat loss (4, 88). In brain, some investigators have found a decreased tissue metabolic rate following in vivo drug administration and a subsequent tolerance (64). Such an effect on metabolic rate could be mediated by either a direct or indirect action of the cannabinoids: A direct effect of several cannabinoids on tissue oxygen consumption in vitro has

been described by another research group (14) who reported that the cannabinoids depress the oxygen consumption of homogenates of liver, heart, brain and skeletal muscle. Moreover, mitochondrial preparations from the latter two tissues were studied further and their metabolic rates were also depressed. The dose-response data from the oxygen consumption research indicate that hypothermic doses of delta-9-THC yield tissue-drug concentrations sufficient to depress metabolic rate directly.

Recent research into the cardiovascular effects of marihuana has yielded a number of studies on various facets of this subject (cf. 15). For example, it has been found that in rats tolerance does not develop to the bradycardia commonly associated with chronic marihuana treatment (53). In addition, the effect of delta-9-THC on cardiac function has been described in pentobarbital-anesthetized dogs with an electrically maintained constant heart rate (9). In this study, the drug decreased aortic blood pressure, cardiac output, left ventricular peak pressure and left ventricular end-diastolic pressure, but the contractility index was not affected. The decrease in cardiac output could be restored to normal by elevating left ventricular end-diastolic pressure with an expansion of plasma volume. In dogs with a maintained constant cardiac output, delta-9-THC decreased blood pressure and total peripheral resistance, but increased intravascular blood volume. These results indicate that the delta-9-THC-induced decrease in cardiac output in the presence of constant cardiac rate is due to a decreased venous return, rather than to a decrease in myocardial function.

In a study using spinal preparations, delta-9-THC exerted no cardiovascular effects; hence, the role of the CNS in mediating delta-9-THC's effects on heart rate and blood pressure was investigated in cats anesthetized with chloralose (87). Spinal transection (C1-C2) abolished the drug-induced bradycardia and hypotension. The delta-9-THC-caused bradycardia was also blocked by the surgical removal of tone to the heart, but neither heart-rate nor blood-pressure effects were modified by bilateral vagotomy. Sympathetic outflow in the inferior cardiac nerve decreased after delta-9-THC administration although peripheral sympathetic functions were unaffected; thus, the cardiovascular effects of delta-9-THC appear to be due to a CNS action which results in a decrease in sympathetic tone.

Other investigators have examined the relationship between the sympathetic nervous system and delta-9-THC's cardiac effects in terms of changes in the uptake of noradrenaline by the heart and have found that delta-9-THC, like cocaine, can decrease in a dose-related manner the uptake of noradrenaline by the isolated, perfused rat heart, although cocaine appears to be about ten times more potent than delta-9-THC (32). The significance of such effects is not yet clear, but of great interest is the report that smoking marihuana can adversely affect cardiac function in patients with angina pectoris (3). In these patients, smoking one marihuana cigarette containing 19.8 mg delta-9-THC decreased exercise performance significantly more than smoking one placebo cigarette.

The cannabinoids' ability to decrease intraocular pressure is still inciting investigation and several congeners of delta-9-THC, administered either systemically or topically, have now been tested. These are listed in order of decreasing efficacy: 11-hydroxy-delta-9-THC; delta-9-THC; 8 alpha, 11-dihydroxy-delta-9-THC; SP111A; other derivatives (33). Delta-9-THC can decrease the pressure in the rabbit eye by 25% and increase outflow capacity by 70% and the role of the

sympathetic nervous system in mediating these effects has been established (34, 35, 36). The alpha-response is an enhanced total outflow facility and the beta-response is a vasodilatation of the efferent vessels from the anterior uvea, thereby causing a decrease in the formation of aqueous humor. Part of delta-9-THC's effect on intraocular pressure appears to be mediated through these actions on sympathetic receptors; but most arises from a central effect.

The influence of cannabinoids on biogenic amines continues to be a focal point for studies of their mechanism of action. In a rat study of repeated delta-9-THC treatment on brain metabolism of 5-hydroxytryptamine (5-HT) and norepinephrine (NE), the products of metabolism were isolated from whole brain following the intracisternal administration of radiolabelled 5-HT or NE (40). Chronic treatment yielded a decrease in the metabolism of 5-HT but an increase in that of NE. In another study in the rat, the effect of hypothermic doses of delta-9-THC on the metabolism of 5-HT and NE in the hypothalamus and brainstem was reported (89), and these results show that there are no changes in either the amount or the turnover of these amines in the two parts of the brain investigated. Several cannabinoids have been examined for their effect on the uptake of NE, 5-HT, dopamine (DA) and gamma-aminobutyric acid (GABA) by synaptosomes derived from various regions of the rat brain (6). The findings indicate that cannabinoids can inhibit the uptake of NE, 5-HT and GABA by hypothalamic synaptosomes; in addition, a discussion of the structural requirement for these effects is included. Delta-9-THC can also augment the release of NE from the isolated rat vas deferens (32), an observation which has led to the suggestion that the release of transmitter from peripheral stores may, in part, account for the hypotensive activity of delta-9-THC. Delta-9-THC can decrease the uptake of DA by crude striatal synaptosomal preparations (42); however, amphetamine is more potent in this regard. Delta-9-THC also appears to alter the intraneuronal disposition of DA without any effect on its metabolism (65). It is possible that these effects are related to delta-9-THC's known interaction with amphetamine.

Studies of the mechanism of action of delta-9-THC have been expanded to include its effect on cyclic adenosine, 3', 5' -monophosphate (cyclic AMP), and investigators have found that low doses of delta-9-THC (0.1-1.0 mg/kg intraperitoneally) cause a 50-160% increase in brain cyclic AMP, whereas higher doses (2.0-10 mg/kg) depress cyclic AMP 30-60% (27). This biphasic response apparently correlates with other previously reported biphasic responses in biogenic amines, temperature regulation and behavior.

The influence of tetrahydrocannabinols on brain acetylcholine content has also been investigated (5). The intravenous administration of 5 mg/kg delta-9- or delta-8-THC was found to decrease brain acetylcholine content, while 11-hydroxy-delta-9-THC, a metabolite, was ineffective. Delta-8-THC did not appreciably alter either acetylcholinesterase or choline acetyltransferase. The decrease in acetylcholine was not observed in rats treated with 6 mg/kg intraperitoneally (90). In contrast to the results described above for acute experiments, chronic oral cannabinoid treatment produced a decrease in brain acetylcholinesterase activity, as well as a decrease in total protein and RNA (59); however, no changes were observed in brain lipid, glycolipid or cholesterol concentration. In the chronic study, the neurochemical changes coincided with the onset of neurotoxicity; furthermore, both were partially reversed during continued drug treatment. The mechanism of some of the anticholinergic effects of the cannabinoids remains to be elucidated.

The relationships between cannabis and prostaglandins have been studied further and it has been confirmed that cannabinoids inhibit the formation of prostaglandins PGE1 and PGE2 but they also stimulate PGF production (22). In another study, eugenol, a minor volatile constituent of cannabis, was found to be a more active inhibitor of PGE1 synthesis than was delta-9-THC. This observation, combined with a demonstration of pharmacological activity in the essential oil fraction (76), indicates a need to consider the role of these substances in the pharmacology of cannabis. The release of PG-like substances by delta-9-THC from both rabbit kidney and guinea-pig lung has been reported (52): These substances produced renal vasodilation and pulmonary vasoconstriction, responses which were blocked by aspirin. The former effect may account for the diuretic property ascribed to delta-9-THC, while the delta-9-THC-caused release of PG-like material may be related to the increase in PG synthesis referred to above (22).

An examination of the influence of acute and chronic delta-9-THC treatment on the lipids of rat brain subcellular fractions has revealed the following effects: Acutely, the lipid content of the mitochondrial, synaptosomal and myelin fractions decreased, but in the microsomal fraction all major lipid components increased; chronically, these changes tended to return to normal (75). Other reports have noted a lysis of rat liver lysosomes in vitro by high concentrations of delta-9-THC (8), and the uptake of delta-9-THC in vivo by the lysosomes (43).

Numerous interaction studies of marihuana constituents have been undertaken since the last report and the interaction between cannabinoids, particularly between delta-9-THC and CBD, has received a great deal of attention. CBD's ability to antagonize some of the behavioral effects of delta-9-THC has been established and studies have been extended to the investigation of other effects. In one such study, prior treatment with CBD blocked the delta-9-THC induced catatonia, corneal areflexia and aggresiveness in REM sleep-deprived rats (51). In addition, CBD potentiated the delta-9-THC analgesic effect and impairment of rope climbing. In another study, pretreatment with apparently inactive doses of CBD reduced the depressant effects of delta-9-THC on body temperature, on heart rate and on respiration (7). CBD also reduced the depressant effects of delta-9-THC on variable-interval and fixed-interval schedules of food reinforced operant behavior (25). In these tests, high doses of CBD did affect these behavioral parameters, suggesting that CBD can function as a partial agonist. A comparison of the interaction of CBD and CBN with delta-9-THC showed that CBD intensified delta-9-THC's effects on animal motility, on food and water intake, on body temperature, on catalepsy, and on hexobarbital sleep time (30). CBN, in general, did not alter the activity of delta-9-THC, except in the barbiturate sleep-time test. In this case, CBN, in contrast to CBD, blocked the delta-9-THC prolongation of hexobarbital sleep time, thus corroborating an earlier report of CBN antagonism. The evidence presented suggests that CBD heightens the effects of delta-9-THC by a metabolic interaction at the level of the hepatic drug-metabolizing enzymes; on the other hand, the observed antagonism between CBN and delta-9-THC on sleep time appears to be a central interaction (29). The ability of CBD to potentiate the anticonvulsant activity of delta-9-THC was described above (85). An in vitro potentiation has also been reported (2). Both delta-9-THC and CBD were found to depress intestinal motility, but delta-9-THC was more potent. Inactive doses of CBD increased the depressant effect of delta-9-THC, demonstrating that potentiation was not necessarily mediated by a CBD blockade of delta-9-THC's metabolism.

The interaction of CBN with depressant, excitatory and peripheral effects of delta-9-THC has also been described (81): Inactive doses of CBN appeared to enhance the depressant effects and slightly inhibit excitatory effects, while having no effect on a peripheral response to delta-9-THC.

Additional studies have focused primarily on the interaction of cannabinoids with other drugs. Acutely, delta-8-THC, in a dose-related manner, prolonged alcohol sleep time, but tolerance developed to this interaction with repeated cannabinoid exposure (31). The enhanced sleep time produced acutely cannot be attributed to an altered rate of alcohol metabolism (31). The possibility that some of the effects of delta-9-THC are mediated by an action on chemical transmitters has been pursued by measuring the cannabinoid's influence on the LD50s of certain drugs. It was found to intensify the toxicity of some cholinergic drugs but to attenuate the toxicity of others; the toxicity of adrenergic drugs was significantly reduced by the pretreatment with delta-9-THC and, finally, delta-9-THC increased the toxicity of a 5-HT-blocking drug (77).

The interaction studies of cannabinoids and barbiturates have been expanded to include ether anesthesia (13, 61). Cannabis extract prolonged the duration of both barbiturate and ether anesthesia. However, after repeated treatment, tolerance developed to the interaction with ether but not to that with pentobarbital. CBN also prolonged the duration of ether anesthesia, but CBD tended to antagonize ether. The investigators suggested that the failure of others to observe any such effect on ether anesthesia may have been the consequence of the variable cannabinoid composition of cannabis extracts.

A study of the interaction of delta-9-THC pretreatment with d-amphetamine in aggregated mice, indicated that cannabinoid pretreatment can potentiate motor activity and lethality without affecting hyperthermia (21); these effects were associated with a decrease in the amount of amphetamine in the brain. The influence of a combined treatment of delta-9-THC and methamphetamine on the EEG and on behavior has been described by other investigators who reported methamphetamine reversed the delta-9-THC effects on the EEG, but the combination of drugs produced some striking behavioral disturbances, which appeared to be a potentiation of methamphetamine toxicity (18). An interaction between delta-9-THC and a naloxone-precipitated abstinence in morphine-dependent rats appears to exist for a single delta-9-THC pretreatment can block in a dose-related manner the naloxone-induced abstinence signs. Pretreatment with 10 mg/kg CBD failed to produce any such effect (39).

It should be noted that two comprehensive reviews (67, 84) on the general subject of the pharmacology of marihuana have appeared since the 1974 Marihuana and Health report (62).

CHAPTER 4

PRECLINICAL EFFECTS: UNLEARNED BEHAVIOR

As the studies reviewed in the four previous Marihuana and Health reports (44, 45, 46, 47) have shown, the cannabinoids produce a variety of effects on unlearned behavior in different animal species. The literature pertaining to cannabis and unlearned behavior is now quite voluminous. Consequently, this appendix focuses primarily on the relevant literature which has appeared since the last report, although some attempt is made to consider this literature in light of previous findings. Furthermore, for the sake of exposition the appendix is organized around four categories of unlearned behavior: gross behavior; activity and exploration; consummatory behavior; and aggressive behavior.

Gross Behavior

Much of the early preclinical research with cannabinoids investigated the effects of these drugs on the gross behavior of a wide range of animal species. As has been discussed in previous Marihuana and Health reports and recent reviews of the animal literature (e.g., 53) a variety of gross behavioral changes are induced in animals by the cannabinoids. Included among these effects are: catalepsy, ataxia, abnormal body postures, hypersensitivity, and hyperactivity. Subsequent to this earlier work on gross behavioral changes, much of the preclinical work with cannabinoids pertained to learned rather than unlearned behavior. Most recently, however, there has been a renewal of interest in the gross behavioral changes induced in animals by cannabinoids. The primary reason for this has been the recognition that complex pharmacological interactions may occur among the cannabinoids.

The majority of cannabinoid research on unlearned behavior has used delta-9-THC or delta-8-THC since these particular cannabinoids have been established as the major active components of cannabis samples (49). However, several researchers reported that the pharmacological activity of cannabis samples was not always entirely explained by the tetrahydrocannabinol content of the samples (7, 36, 55). This led to the suggestion that interactions between THC and other cannabinoid constituents of cannabis, namely cannabidiol (CBD) and cannabinol (CBN), may be important. This suggestion was supported by findings that CBD inhibits the metabolism of delta-9-THC (25, 35, 42).

Experiments dealing with interactions of cannabinoids on gross unlearned behavior are still few in number. However, those interactions which have been observed appear, at this time, to be complex and are not always consistent among experiments. For example, in testing the effects of cannabinoids on catalepsy in rodents, investigators have found CBD and CBN administered alone to be either active (37, 61) or inactive (24). Moreover, when administered in combination with delta-9-THC, CBN has been reported either to have no effect on catalepsy (24) or to potentiate delta-9-THC induced catalepsy (61). Finally, CBD in combination with delta-9-THC has been reported to prolong (24) or to enhance (37) catalepsy induced by delta-9-THC.

The interactions between the cannabinoids on drug-induced loss of the righting reflex (anesthesia, sleeping-time) seem to be particularly complex (14, 15, 25, 37, 41, 43, 61). For example, CBN antagonizes delta-9-THC effects on pentobarbitone- (41) and hexobarbitone- (25) induced loss of the righting reflex but potentiates delta-9-THC-ether effects on the same unlearned response system in the same animal species (43). The complexity of these and other interactions (14) will most likely be better understood with additional research--especially research which can distinguish between drug interactions involving CNS activity and those involving cannabinoid-induced changes in tetrahydrocannabinol metabolism.

As would be expected, THC interacts with drugs other than the cannabinoids to affect unlearned gross behavior. Recent experiments have shown that delta-8-THC potentiates the loss of righting reflex induced in rats by alcohol (27) while delta-9-THC potentiates some, and antagonizes other, amphetamine-induced postural and activity behaviors in rats (30) and rabbits (16).

Activity and Exploration

Based on the research available at the time, the 1974 Marihuana and Health report (47) concluded that "cannabinoids generally suppress the spontaneous motor activity and exploration of animals, although findings regarding these effects are limited, as always, by drug route, time-effect, and drug-response considerations" (20, 26). The suppression effect of delta-9-THC on spontaneous motor activity has been confirmed by two recent studies (6, 56). In one of these (6), oral doses of delta-9-THC ranging from 1.25 mg/kg to 40.0 mg/kg were administered acutely to mice. The lowest drug dose produced a significant increase in activity while the remaining drug doses produced a dose-dependent suppression of activity. Other mice were used to investigate tolerance to the suppressive effects of 40.0 mg/kg of delta-9-THC (p.o.) on spontaneous activity. Complete tolerance developed after one dose and had a duration of less than four days.

Another aspect of this latter study (6) deserves mention. Specifically, the activity of mice that had been previously habituated to the experimental apparatus was not suppressed by a 40.0 mg/kg dose of delta-9-THC. This finding is in accord with other research (17, 19) which shows that prior habituation to an experimental situation can alter the effects of THC on motor activity in animals.

Delta-9-THC doses of 30.0, 60.0 and 120.0 mg/kg were administered subcutaneously to pregnant rats on the fourth day of gestation (66). It was found that delta-9-THC produced an increase in abnormal pregnancies but that it had no significant effect on the locomotor activity of the offspring. This latter finding is at odds with a previous experiment (7) in which effects were observed on the unlearned behavior of offspring from pregnant rats that had been administered delta-9-THC subcutaneously during the tenth to twelfth days of gestation. Additional research is needed to determine whether delta-9-THC has a direct action on the developing fetus which becomes manifest in the unlearned behavior of offspring.

The spontaneous activity of rats was additionally used to study the drug interaction between delta-9-THC and phencyclidine (56). It was found that an increase in activity produced by 5.0 mg/kg intraperitoneal injections of phencyclidine was antagonized by oral doses of delta-9-THC, ranging from 2.5 to 10.0 mg/kg, in a dose-related manner.

Exploratory behavior and performance on simple unlearned motor tasks have also been used recently to study the interactions of delta-9-THC with other cannabinoids. First of all, it has now been reported that CBD and cannabichromene (CBC), in inhaled doses from 1.0 to 2.0 mg/kg decreases exploratory behavior of rats in a dose-related manner (57) while CBN (10.0 mg/kg; i.p. injection) significantly increased exploration-ambulation in rats (61). However, CBD did not affect the motor coordination of mice over a wide range of i.p. doses (62). In combination with delta-9-THC, both CBD (37) and CBN (61) produce a pharmacological interaction on exploratory behavior in rats, although delta-9-THC and CBD do not seem to interact to affect motor coordination in mice (62).

Consummatory Behavior

Prior to 1973 delta-8-THC, delta-9-THC, hashish resin, and pyrahexyl were all shown to produce reductions in food and water intake, with a consequent weight loss, in animals. Research appearing since that time, much of which was reviewed in the fourth Marihuana and Health (47) report, has generally confirmed and extended these findings for delta-8-THC and delta-9-THC (3, 28, 32, 33, 39, 59, 60). In addition, inhaled doses of CBD and CBC have been recently shown to reduce the rate of growth in rats and to decrease their food and water consumption in a dose-related manner (57). On the other hand, neither CBN nor CBD were found to affect food and water consumption over a range of i.p. doses up to 80.0 mg/kg (24). However, in this latter study, CBD, but not CBN, was found to enhance the suppressive effects on consummatory behavior produced by delta-9-THC.

The general finding of cannabinoid-induced suppression of consummatory behavior stands in stark contrast to the findings that marihuana or hashish will increase the human appetite for food (1, 31). Several possible explanations have been offered to account for this discrepancy. Sofia and Barry (60) have suggested that since pure delta-9-THC has not been used with humans, the appetite-stimulant effect of marihuana might be due to a constituent other than THC. The recent findings regarding CBN, CBD and CBC reported above (24, 57) seem to make this suggestion less likely. It has also been suggested that, since most animal studies have not taken continuous measurements of consummatory behavior, increases in consumption may have been overlooked. However, in recent experiments with rats where such continuous measures have been taken (32, 60), dose-related delta-9-THC decreases in food and water intake have been confirmed. There is some evidence (28) to support the contention (22) that the discrepancy between animal and human consummatory behavior is due to the higher cannabinoid doses, relative to body weight, used in animals than in humans. Furthermore, the possibility that the discrepancy is related to humans' adaptation to a long-term deprivation regimen whereas most animals used are either nondeprived or acutely deprived has also received empirical support (29). Nevertheless, the discrepancy between animal and human experiments is inadequately explained. There is, of course, the possibility that the differences are due solely to between-species differences. If so, consummatory behavior will stand as a rare instance in which animal research with cannabinoids has not served reliably as a predictor of cannabinoid effects in humans.

Aggressive Behavior

If aggression is taken as a uniform behavior of threatening or attacking another animal, then conflicting findings regarding the effects of cannabinoids on aggressive behavior exist in the literature. However, a variety of procedures has been used to study the aggressive interactions between animals under the influence of cannabinoids, each of which tends to involve a different kind of aggressive behavior. In fact, when separated by aggression paradigms, the literature regarding cannabinoid effects on aggressive behavior is quite consistent. In general, the conclusion from both the last Marihuana and Health report (47) and a recent extensive review of the cannabis and aggression literature in animals (2) is that cannabinoids suppress aggressiveness in nonstressed animals but increase stress-induced aggression. While one recent study (51) has demonstrated an increase in aggression following long-term administration of THC to rats which were not apparently stressed, the above conclusion applies to the acute cannabinoid experiments on animal aggressiveness which have appeared since the last report. For the sake of discussion, the new experiments will be divided into categories of stress-induced and nonstress-induced aggression, with the latter category being subdivided into isolation-induced aggression, competitive aggression and predatory aggression.

Stress-induced Aggression

As indicated, when stressed animals are put under the influence of cannabinoids the usual outcome is an increase in aggressiveness. This outcome seems to be independent of the nature of the stressor used. Increased aggression under cannabinoids has been reported for such stressors as: starvation (13), low temperature (12), REM sleep deprivation (5, 11), withdrawal from morphine (10), septal lesions (21), electric shock (9) and most recently, ovariectomy (54).

Takahashi and Karniol (61) have investigated the interaction between CBN and delta-9-THC with respect to stress-induced aggression. Generally, this experiment produced results comparable to a similar previous investigation of the interactive effects of CBD and delta-9-THC on aggression induced by REM sleep deprivation (37). Intraperitoneal injections of 20.0 mg/kg delta-9-THC and 80.0 mg/kg CBN induced aggressiveness in the stressed rats. Interestingly, however, when the same doses of CBN and delta-9-THC were administered together, the amount of aggressiveness was less than that produced by delta-9-THC alone (61).

Isolation-Induced Aggression

Several experiments have shown that delta-9-THC and cannabis extract will suppress isolation-induced aggression in rats which have not also been subjected to stress (e.g., 21, 58). Other studies have shown that this cannabinoid-induced suppression of aggression is not a result of motor impairment (38) nor does it exhibit tolerance (63).

The interaction between delta-9-THC and CBD on isolation-induced aggression was investigated this year in mice (62). Intraperitoneal doses of 2.5 mg/kg delta-9-THC and 40.0 mg/kg CBD individually suppressed aggressiveness although the interaction between these two cannabinoids was not significant.

Competitive Aggression

Recent findings are in accord with previous results (34, 52, 64, 65) showing that delta-9-THC reduced dominance and social competition in animals. For example, Cutler et. al. (18) administered cannabis resin to mice in i.p. doses ranging from 4.0 to 100.0 mg/kg, then placed the mice with unfamiliar partners. These researchers found that the drug did not affect nonsocial behavior, social investigation or sexual behavior. However, dose-related increases in immobility and flight relative to aggression were obtained.

Ely et. al. (23) demonstrated the importance of the existing social structure in their examinations of cannabinoid effects on animal aggression. Doses of 0.5, 2.0 and 20.0 mg/kg of delta-9-THC were intravenously injected into mice whose dominant or subordinate status in their colonies was either relatively stable or whose dominance was threatened either by a rival or an intruder. In the stable colonies the only behavioral change noted was a limited period of reduced activity by the dominant males. Dominant mice confronted with a rival exhibited a reduction of activity and a consequent loss of their dominant status. Dominant mice confronted with an intruder made fewer attacks on the intruder than non-drugged dominant mice, but their aggressiveness returned to the pre-drug baseline level after 24 hours.

Dose effects of delta-9-THC on aggressive behaviors of resident and intruder rats were examined by Miczek (50). This investigator varied i.p. dose level from 0.125 to 4.0 mg/kg and found that as the dose was increased, attack and threat behaviors of the dominant resident rat decreased. Only at the highest dose level of 4.0 mg/kg did delta-9-THC interfere with the defensive and submissive behaviors of the intruder.

Predatory Aggression

Research appearing before the last report (47) supported the conclusion that cannabinoids reduce predatory aggression in nonstressed animals (2, 21, 48). Although one study (4) indicated that THC could produce muricidal behavior in rats which did not previously display such behavior, it was not possible to conclusively determine whether stress induced by food deprivation or the administration of the cannabinoid over a 40-day period was responsible for this result. However, a recent study by Miczek (51) indicates that the long-term administration period may have been the crucial factor. This investigator found that during an administration period of 60 days, previously nonmuricidal rats given sufficient food and water so as not to lose weight and an intraperitoneal delta-9-THC dose of 10 or 20 mg/kg/day developed mouse-killing behavior.

CHAPTER 5

PRECLINICAL EFFECTS: LEARNED BEHAVIOR

A review of the previous four Marihuana and Health reports (40, 41, 42, 43) reveals that an extensive array of procedures and contexts have been used experimentally to study the effects of cannabinoids on the performance of learned behavior in animals. These preclinical behavioral experiments have provided a framework for, and guided the design of, subsequent human experimentation. Compared to previous years, only a few experiments pertaining to cannabinoids and learned behavior have appeared this year. By and large these more recent experiments confirm previous findings; no particularly novel procedures have been employed nor have there been dramatically unpredictable results. In part, the decrease in activity in cannabinoid preclinical animal research on learned behavior is one sign of an increase in human cannabinoid-learning investigations.

Several detailed taxonomies of learned behavior are possible. However, for the purposes of the present report, learned behaviors will be categorized into those involving: avoidance learning and aversive control; reinforcement schedules and maze learning; and discrimination learning.

Avoidance Learning and Aversive Control

Whether or not cannabinoids enhance, depress or fail to affect the acquisition of avoidance behavior depends importantly on the cannabinoid time-course of action (45) and dose (22), as well as on the particular cannabinoid (28) and type of avoidance task used (52). However, when the behavior investigated is performance, rather than acquisition, of a learned avoidance task, cannabinoids have been reliably found to have disruptive effects (e.g., 9, 27, 28, 47).

Additional reports of cannabinoid-induced impairment of established avoidance behavior have come from Tayal et. al. (53) and Pryor and Braude (51). In the latter study (51), it was further reported that delta-9-THC had a more than additive interaction with phencyclidine, over a wide range of doses for both drugs, in impairing conditioned avoidance behavior. The Tayal et. al. (53) experiment also found that tolerance develops to the disruption in avoidance performance induced by an alcoholic extract of cannabis. This finding of tolerance confirms and extends previous reports of cannabinoid tolerance development unde learned avoidance tasks (e.g., 27, 39). However, no new research has appeared to add to the finding (47) that delta-9-THC is cross tolerant with ethyl alcohol but not with morphine or chlorpromazine in a shuttle box avoidance task.

With respect to aversive control situations other than avoidance learning, there have been several reports that cannabinoids reduce the conditioned emotional response of animals to a stimulus previously associated with an unavoidable electric shock, regardless of whether an appetitive or aversive situation is used to maintain baseline responding (e.g., 23, 27). The usual interpretation given to this finding is that cannabinoids act to reduce fear or anxiety. However, a fear-reduction interpretation does not always gain support from research with humans (50).

83-317 O - 77 - 53

Moreover, Ferraro and Bruce (16) have argued that previous conditional emotional response experiments have been, in part, confounded by drug-state changes which occurred between the training and testing phases of these experiments. Indeed, when they compared the conditioned emotional responses of rats who had received all of their training and testing under 2.0 mg/kg delta-9-THC (intraperitoneal injection) with nondrug control rats, delta-9-THC was found to increase the conditioned emotional response (14).

Another factor which may be considered to temper the interpretation that cannabinoids reduce fear in aversive control situations is that delta-9-THC has been found to have an analgesic effect in animals (35) and humans (48, 49). This was demonstrated by Dykstra and McMillan (12) who used a titration procedure to determine the intensity at which monkeys would maintain a continuously applied electric shock. It was found that an injection of 15.0 mg/kg delta-8-THC caused the monkeys to adjust the shock to a higher intensity than they had in the absence of the drug.

In still another aversive control context, Corcoran et. al. (8) have extend previous findings that delta-9-THC (14) and hashish extract (7) produce "bait shyness" in rats when paired with novel tastes. In the Corcoran et. al. (8) study, delta-8-THC, CBD, and cannabigerol (CBG) all produced bait shyness. However, cannabichromene (CBC) did not produce a conditioned taste aversion in this aversive control situation.

Reinforcement Schedules and Maze Learning

Both operant and instrumental conditioning paradigms have been used to study the effects of cannabinoids on appetitively reinforced learned behavior in animals. In the operant conditioning context, schedules of reinforcement have received the most study. In the instrumental conditioning context, maze or alley learning has been the usual baseline for determining cannabinoid effects.

Following the outline established in the fourth Marihuana and Health report (43), experiments dealing with cannabinoid-reinforcement schedule interactions will be categorized into two major types: Type I experiments which focus on changes in schedule controlled responses, and Type II experiments in which such responses merely provide a baseline for the study of drug-related parameters.

The bulk of the earlier cannabinoid research with reinforcement schedules was of the first type (cf., 40, 41, 42, 43). What little research of this type there has been in the past two years (e.g., 9, 20, 55) has mainly tended to replicate and confirm the findings from the earlier research even where more complicated reinforcement schedules have been used (2). Taken all together, the research demonstrates that behavior under reinforcement schedule control is reactive to delta-9-THC and delta-8-THC as well as to other constituents of cannabis (10, 21). In general, such behavior is depressed in a dose-related manner by cannabinoids, although under schedules which tend to generate low response rates, a bi-phasic dose-response function or an alternation between periods of no responding and increased rates of responding are sometimes observed.

Although only limited attention has been given to the effects of cannabinoids on the acquisition and extinction of operant behaviors (18), the now very extensive literature on the relationship between cannabinoids and performance of schedule controlled responses has stimulated the use of such responses as baselines in Type II studies of drug-related parameters.

Among other things, reinforcement schedule baselines have been used in the past two years to study: between-cannabinoid comparisons (36); cross-tolerance between cannabinoids and other drugs (47); and differences between drug vehicles and routes of cannabinoid administration (1, 15, 17). An operant paradigm has also been used to investigate the interaction between delta-9-THC and cannabidiol. Davis and Borgen (10) found that intraperitoneal injections of 3.0 mg/kg delta-9-THC suppressed schedule controlled responding in rats while 25.0 mg/kg CBD did not. Similarly, intramuscular injections of 1.0 mg/kg delta-9-THC suppressed responding in pigeons while 50.0 mg/kg CBD did not. However, when animals were pretreated with their respective CBD doses, the THC induced suppression of responding was reduced.

An instance of the Type II reinforcement schedule experiment was recently performed by Dykstra et. al. (13). These researchers injected pigeons responding under variable interval, fixed ratio, and fixed interval schedules with a range of delta-9-THC and SP-111 doses (.3 to 18.0 mg/kg intramuscular injection administered either one or two hours before the start of the experimental session). SP-111 is a water soluble ester of delta-9-THC which bears a basic amino function (56). Both drugs produced a dose-related suppression of reinforcement schedule responding although delta-9-THC was three to six times more potent than SP-111 and had a faster time of onset.

A large number of both types of reinforcement schedule experiments have investigated the development of tolerance under the cannabinoids (e.g., 1, 2, 20, 36, 38, 47). These experiments have uniformly shown that tolerance readily develops in animals to cannabinoid-induced suppressant effects on operant responding. However, two studies have shown that, in this situation, tolerance development to delta-9-THC is due to the animals responding under the influence of the drug rather than to the mere exposure of the animals to delta-9-THC (5, 38). Moreover, Frankenheim (20) observed that repeated i.p. injections of delta-8-THC (10.0 and 17.8 mg/kg) tended to increase the sensitivity of rats to a response rate-increasing effect of the drug under a differential reinforcement of low rate schedule of reinforcement. This increased sensitivity was likened by Frankenheim (20) to the reverse tolerance sometimes reported for marihuana effects in humans.

Compared to operant reinforcement schedule research, the effects of cannabinoids on the acquisition and performance of instrumental maze or alley-way responding have not received extensive study. A Canadian study, not yet published, has found that permanent impairment of maze learning ability in rats occurred following six months of treatment with oral doses of either ethanol or cannabis extract. While the doses of THC and alcohol were both relatively high (20 mg THC/kg) the authors point out the animals were visibly intoxicated for "only about four hours after each dose, gained weight normally and were in good general health throughout the experiment." Based on the degree of intoxication, they argue that

the research may be relevant to possible learning impairment under conditions of unusually heavy human use (57). Based on previously published literature, it may be concluded that the cannabinoids impair reinforced and latent learning in a variety of instrumental conditioning situations including the Y maze, T maze, Lashley III maze and straight alley (11, 29, 44, 46, 54).

Discrimination Learning

The effects of cannabinoids on discrimination learning were reviewed for the first time in the previous Marihuana and Health report (43) under two subtopics: 1) the effects of cannabinoids on the performance of discriminations based on exteroceptive stimuli, and 2) the acquisition of stimulus control of behavior based on the presence or absence of cannabinoids.

As there have been few experiments published since the last report which describe the effects of cannabinoids on discrimination learning with exteroceptive stimuli, only a brief summarization of the existing literature will be made herein.

In general, the effects of cannabinoids on established stimulus discriminations are influenced by the same variables as determine the effects of other psychotropic drugs on discrimination performance (cf., 43). More specifically, disruption of discrimination performance by cannabinoids is more likely if the discrimination is complex rather than simple and if the discrimination is successive rather than simultaneous. The typical cannabinoid-induced disruption of discrimination performance is the result of dose-related decreases in responses to the stimulus associated with reinforcement and corresponding increases in responses to the stimulus associated with nonreinforcement. Finally, and in accord with the effects of most other psychotropic drugs, during generalization testing delta-9-THC reduces total response output but does not typically alter the slope of the generalization gradient.

It is now well established that animals can learn to discriminate between the presence of cannabinoids and a vehicle-control solution (3, 4, 19, 25, 31, 32, 33, 37). Jarbe et. al. (33) used an experimental procedure which is prototypic of research on this topic. Gerbils trained in a T maze were required to make discriminative choices based on whether delta-9-THC or drug vehicle alone had been injected prior to the training session. As is the usual outcome in cannabinoid stimulus studies of this sort, Jarbe et. al. (33) found that the delta-9-THC discrimination was acquired in a dose-related manner (from 0.5 to 16.0 mg/kg, i.p.). Furthermore, decreasing the dose or increasing the injection-test interval from that used in training led to a decrease in delta-9-THC associated choices. One final aspect of this study which is unique is that pentobarbital (20.0 mg/kg) interacted in a more than additive fashion with delta-9-THC to determine drug versus control solution choice responses.

The delta-9-THC discrimination paradigm has also been used recently to compare the potency of different routes of drug administration (3, 32). As compared to intraperitoneal administration, delta-9-THC administered orally or by inhalation had stronger stimulus properties while lesser stimulus properties were manifest after intravenous administration of delta-9-THC.

Although some quantitative differences exist, it now appears that the stimulus properties of delta-9-THC are interchangeable with delta-8-THC, 11-OH-delta-8-THC, cannabis extract, and hashish smoke (3, 32). However, neither CBD or CBN seemingly produce THC-like stimulus properties (32). Furthermore, a wide range of drugs from several pharmacological classes have been shown not to be interchangeable, in terms of stimulus properties, with delta-9-THC. Thus, there is support for a hypothesis that the active cannabinoids may have a unique mode of pharmacological action.

One final aspect of the cannabinoid-stimulus discrimination paradigm merits further study. Of concern is whether or not tolerance develops to the drug-stimulus properties of delta-9-THC. There have been three studies which address this concern. One study supports the development of tolerance (26), one provides indirect evidence supporting tolerance development (30), and finally, one provides data indirectly supporting a lack of tolerance development (6). Until additional experiments are performed it seems appropriate to conclude tentatively that a slow, and perhaps partial, tolerance develops to the stimulus properties of delta-9-THC.

State-dependent learning refers to the phenomenon that animals perform better if trained and tested under the influence of a drug than if a drug-state change occurs between the training and testing phases of an experiment. State-dependent learning has been shown for delta-8-THC and delta-9-THC (cf., 45). However, it is not clear from the THC literature whether or not symmetric disruptive effects are obtained between a change from a drugged to a nondrugged state (D-ND) and a change from a nondrugged to a drugged state (ND-D). Both symmetric and asymmetric state-dependent effects have been reported for THC (24). In the case of asymmetric effects, a change from the D to ND state produces greater impairment of responding than does a change from the ND to D state (22). Johansson et. al. (34) have shown that delta-8-THC will reliably induce asymmetric state dependency of this latter type if animals are first made tolerant to the acute disruptive effects of the drug.

CHAPTER 6

PRECLINICAL CHRONIC EFFECTS: UNLEARNED AND LEARNED BEHAVIOR

There is no unequivocal answer to the question of whether or not tolerance develops to cannabinoid-induced effects on unlearned and learned behavior. In certain response systems, tolerance clearly develops and is characterized by its rapid development and large magnitude. Indeed, in the past two years tolerance has been demonstrated for both unlearned and learned responses in a range of animal species under a variety of drug conditions in studies examining: unlearned motor responses in rats (4); spontaneous activity in mice (3); conditioned avoidance performance in rodents and monkeys (30, 39, 46); analgesia in dogs (31); and reinforcement schedule performance in pigeons, monkeys and rats (2, 5, 21, 32).

In addition to demonstrations that tolerance to the cannabinoids can develop in unlearned and learned behavioral situations, there have been several experiments which serve to elucidate some of the determinants, both pharmacological and extrapharmacological, of tolerance development to the cannabinoids. These latter experiments encompass a wide variety of situations and parameters and, in some instances, suggest constraints on the generality or pervasiveness of tolerance to the cannabinoids. The studies described below are representative of these experiments.

Abel et. al. (1) have shown that tolerance to the effects of delta-9-THC on reinforcement schedule responding develops in pigeons at about the same rate after intramuscular, intravenous, or peroral administration. Tolerance also follows a similar course for delta-9-THC and its metabolite 11-OH-delta-9-THC (32). However, Fernandes et. al. (13) have suggested that CBD interacts with THC to enhance the tolerance development to THC.

Barnes and Fried (4) have shown that the age of the subject at the time of first exposure to delta-9-THC interacts with later tolerance development. Rats who first received delta-9-THC when immature developed tolerance more rapidly as adults than did rats who were adults when first drugged.

Rate of tolerance appears to depend as well on: the amount of prior training on a learning task (40); and the type (39), parameter values (19, 24, 30), and complexity of the learned task (16, 43). In general, as the amount of prior training is decreased and the difficulty of the learned task is increased, tolerance develops more slowly or does not develop at all. Another behavioral variable that seems to determine the rate of tolerance development is the behavioral consequences produced by delta-9-THC (14, 36). For example, in one experiment (36) tolerance developed to delta-9-THC much more rapidly if delta-9-THC acted to increase the number of shocks received by rats working under a conditioned avoidance task. In this same learning context, it appears that the development of delta-9-THC tolerance in appetitive reinforcement situations is facilitiated if animals are given the opportunity to respond under the influence of the drug rather than being given mere exposure to the drug. This latter finding has been reported for rats (7), pigeons (5), monkeys (35), and chimpanzees (18).

On the basis of findings such as the above, Ferraro (15) has followed the lead of others (12, 25) in proposing a behavioral model of marihuana tolerance. The essence of this position is that learning or drug-behavior interactions account, in part, for some of the characteristics of tolerance development to delta-9-THC. The pharmacological mechanism underlying tolerance development to the cannabinoids is not definitively known (cf., 37). However, there is evidence which suggests that the development of tolerance to delta-9-THC may proceed by more than one pharmacodynamic mechanism of action. For example, Anderson et. al. (3) found that both the time of onset and the duration of tolerance to delta-9-THC differed in mice with respect to drug effects on intestinal motility, temperature, and locomotor activity. As these researchers concluded, it seems unlikely that any one mechanism, such as metabolic tolerance, could account for the obtained differences in tolerance development over so wide a range of response systems. Other experimenters have provided data which suggest that delta-9-THC tolerance is not solely metabolic or drug distributional (10, 38). Obviously, additional research will be necessary in order to specify just what pharmacodynamic and learning factors are important in determining the development of tolerance to marihuana.

Admittedly, it is not possible to make direct comparisons between different cannabinoid tolerance experiments since they often differ in nonsystematic ways with respect to such variables as number, level and distribution of drug doses, behavioral task and species of subject. Nevertheless, it must be noted that the literature contains a fair number of experiments where a lack of tolerance development to the cannabinoids has been reported. This result has been found for rodents in such situations as: open-field behavior (42); isolation-induced aggression (11); food and water intake (23, 44); and discrimination learning based on exteroceptive (20) or drug-produced stimuli (6). By contrast, Frankenheim (22) has recently reported that repeated injections of delta-8-THC produce an increased sensitivity to some of the effects produced by this drug on reinforcement schedule-controlled responding in rats. This increased sensitivity was likened by Frankenheim (22) to a reverse tolerance effect.

With respect to other chronic effects of the cannabinoids, two experiments have failed to find any residual effects on learned behavior following discontinuance of delta-9-THC previously administered for 150 consecutive days (18) or aperiodically for seven months (17). And, with the exception of one experiment (41), animals have not been observed to self-administer cannabinoids. More specifically, monkeys do not self-administer delta-9-THC after receiving the drug for a month or when offered it as a substitute for cocaine (26). Rats forced to drink cannabis extract or hashish suspensions for long periods of time (up to 126 days) reject the drug in favor of a control solution (9, 33). Finally, mice are reluctant to consume food pellets containing delta-9-THC even after subsisting on the pellets for over two months. (34).

It is noteworthy that no behavioral symptoms of abstinence or withdrawal were reported in the above experiments at the termination of the forced drug regimens used (cf., 26, 33). One further experiment by Chesher and Jackson (8) reported the absence of an abstinence syndrome after withdrawal of cannabis extract administered in oral doses equivalent to up to 80.0 mg/kg delta-9-THC for 11, 13, and 28 days. In this study, mice were tested for their convulsive thresholds to pentylenetetrazol between six hours and six days following termination of the cannabis drug regimen. No differences were obtained between drug and control animals.

Despite the above evidence to the contrary, there were two reports last year that were suggestive with respect to delta-9-THC-produced dependence and abstinence symptoms (29, 45). In the better controlled of these experiments (45), rats were administered naloxone hydrochloride after a five-week pretreatment period with delta-9-THC (8.0 to 32.0 mg/kg, intraperitoneal injection). The rats exhibited narcotic-like withdrawal symptoms including diarrhea, teeth chattering and "wet dog" shakes. Two additional experiments published this year (27, 28) demonstrated that delta-8-THC and delta-9-THC, but not CBD, reduce the abstinence symptoms precipitated by naloxone hydrochloride in morphine-dependent rats. In the first of these (27), delta-9-THC doses of 5.0 and 10.0 mg/kg administered by the intraperitoneal route one hour before naloxone administration significantly reduced the frequency of wet shakes and diarrhea in the morphine treated rats. On the basis of their data, Hine et. al. (27, 28) concluded that the tetrahydrocannabinols may have some therapeutic utility in clinical narcotic detoxification programs.

CHAPTER 7

HUMAN EFFECTS

Acute Effects

A person ingesting or smoking cannabis experiences a fairly predictable sequence of physiologic and psychologic changes which last a few hours and then gradually disappear. Although dose administered and individual differences in personality, expectations, setting and past drug experience all contribute to varied consequences from a given dose of cannabis, the variability in acute effects from cannabis seems no greater than with any other psychoactive drug. A number of reviews and collections of papers have appeared during the past year which attempt to cover the vast amount of information accumulating about the acute and chronic effects of cannabis (7, 27, 43, 70, 82, 114). Some authors have attempted to consider the research findings in the context of political-social decisions (43, 135) and point out the lacunae in the data as well as the well established facts (43). The continuing research efforts this past year have attempted to fill some of the gaps. Emphasis has been placed on the chemistry of cannabis constituents, less obvious effects such as hormonal changes and the initial studies of acute drug effects in populations other than those made up of self-selected marihuana users.

Activity of Natural and Synthetic Cannabinoids

Detailed pharmacokinetic studies of delta-8-THC in man using mass fragmentographic techniques indicate a similar time course and clearance pattern to that seen with delta-9-THC (103). A very rapid alpha phase was followed by a slower phase. While blood levels did not always predict physiological and psychological effects, they paralleled heart rate changes well.

DMHP, a synthetic cannabinoid, differs from delta-9-THC by having a double bond in the 6a, 10a positions. Intravenous administration in man produced profound cardiovascular effects but only minimal psychological effects (102). As is the case with natural cannabinoids, hydroxylation seemed to be the major metabolic pathway.

Metabolism of Cannabinoids and Biochemistry

Metabolites. Although studies of a major metabolite of delta-9-THC, 11-hydroxy-THC, indicate it is pharmacologically active, some question remains whether it is the only metabolite or whether delta-9-THC needs to be hydroxylated to 11-hydroxy-THC before the THC is active (72). In an attempt to clarify these issues, Hollister sorted people into fast and slow hydroxylators on the basis of antipyrine and phenylbutazone plasma disappearance rates. THC and these drugs are metabolized by the same liver microsomal enzyme system (169). There was no difference in speed of onset, intensity or duration of effects after intravenous injection of delta-9-THC when the two groups were compared (72). Such results suggest 11-hydroxy-THC may not be the sole source of delta-9-THC effects. Another group of investigators found 11-hydroxy-THC to leave the plasma more rapidly than THC, suggesting THC may, in fact, be more potent (133).

A number of additional marihuana metabolites have been reported in a series of studies (83, 84, 85) and for the first time, unchanged delta-9-THC was identified in the urine using conventional thin layer chromotographic techniques in amounts estimated at .01-.005% of the dose (74). New extraction procedures revealed a previously ignored fraction containing abundant metabolites (83) including many polar metabolites (84). The exact identity and activity has yet to be determined. In a review of structure activity relationships of cannabinoids in man, Hollister concluded that the potency of the THC molecule is altered by changing length of side chains, or by metabolic hydroxylations. No material has yet been formed in nature in cannabis itself or in THC metabolites which differ qualitatively from THC (71). There is now evidence indicating the human small intestinal mucosa, as well as the liver, can hydroxylate THC (59).

Cannabinoid Interactions. Studies of the possible interaction between delta-9-THC and the other two major cannabinoids of marihuana -- cannabinol (CBN) and cannabidiol (CBD) -- are not completely consistent in their conclusions. Hollister found only slight interaction between THC and CBD. After CBD, there was a delayed onset and prolonged effects of THC that were slightly more intense (73). The magnitude of the interactions was so small as to be clinically insignificant. However, other experiments in man with different samples of marihuana plant material containing varied amounts of CBN and CBD found differences in effects, possibly due to differing proportions of CBN, CBD and THC (18). A subsequent study by the same group found large doses of CBD to block many of the effects of THC (86). A possible complicating factor in cannabinoid interaction studies is the issue of instability of various synthetic and naturally occurring cannabinoids (165).

Interactions with Other Drugs. Besides CBD and CBN, other drug interactions with THC have been investigated in man. Secobarbital and smoked marihuana had additive effects on subjective responses and psychomotor impairment (32). Subjects had difficulty distinguishing 150 mg of secobarbital from 25 micrograms of THC/kg. When amphetamine and smoked marihuana were combined, additive effects of heart rate and blood pressure and subjective symptoms were observed, but no interaction effect on psychomotor performance was found (47). Based on the assumption that THC interferes with cholinergic brain mechanisms, physostigmine decreased the tachycardia and conjunctival injection, but had little effect on psychological changes (54). Little potentiation of narcotic drug effects was noted in a study evaluating THC as a pre-anesthetic agent (77). Animal studies indicate that whatever the drug combination the depressant effects of THC tend to predominate (138).

Assay Techniques. A great deal of effort has gone into the development of practical assays of cannabinoid levels in man. Such measures are needed not only for research purposes, but would be useful clinically and in law enforcement, (particularly in cases where intoxication while driving an automobile is an issue). A number of techniques using saliva and TLC with mass spectrometry (81), radioimmunoassay of blood and urine (105, 160), and gas chromatography of blood (106) have been reported but still are not sufficiently sensitive, specific and reliable for widespread practical application. The tight binding of THC to plasma protein (170) is only one of the many problems in the development of sensitive reliable tissue level assays (cf. Analytical Techniques, Detection).

Cardiovascular Effects

Cannabis has long been known to have marked cardiovascular effects (21, 143). Last year's report reviewed some preliminary data which resulted in some expressed concern about electrocardiographic changes during acute intoxication. The subsequent publication of a number of studies where cardiovascular dynamics were studied some time after administration of large doses of THC indicates that cannabis produces only minimal EKG changes in young healthy subjects (77, 8, 22, 104). Nonspecific P or T wave changes are most commonly noted. Occasional premature beats also occur. Tachycardia continues to be the most common and prominent physiological response to acute doses (145). In a study of prolonged administration of oral doses of 30 mg delta-9-THC given every four hours, heart rate slowing and blood pressure drops developed (8). Blunting of peripheral vascular reflexes developed along with plasma volume expansion. Although tolerance developed to the orthostatic hypotension, the supine hypotensive effects persisted throughout the period of drug administration. These changes commonly seen in laboratory animals but not previously noted in man suggest a biphasic action of THC in humans with an increase in sympathetic activity involving the heart and peripheral blood vessels at low doses and a centrally mediated sympathetic inhibition at higher doses (65). The slightly increased supine blood pressure would be consistent with this mechanism (22, 77, 104). Forearm blood flow increases and total peripheral resistance decreases slightly with acute doses (104, 77) consistent with beta-adrenergic stimulation. The great individual variability in response to large intravenous doses has, however, led one group to suggest an indirect episodic activation of the sympathetic system secondary to psychological arousal in addition to the beta-adrenergic stimulation (104). Cardiovascular and psychological mechanisms of action may be independent as is suggested by the observation that DMHP, a synthetic cannabinoid, produces profound cardiovascular but few psychological effects. (102).

A series of reports on the cardiovascular effects of cannabis smoking in persons with coronary disease are consistent with the preliminary report cited last year (137, 4, 3). Smoking either marihuana or high nicotine cigarettes decreased exercise performance prior to the onset of angina by increasing myocardial oxygen demand and decreasing myocardial oxygen delivery (4). Cardiovascular hemodynamics were evaluated by echocardiography (137). After marihuana, stroke index decreased and ejection fraction was greater. Carboxyhemoglobin made for some changes after both marihuana and placebo. These studies demonstrate that marihuana effects may differ in individuals with pre-existing disease than in normals. Most research studies thus far have, of course, been done on youthful selected, normal volunteers.

Pulmonary Effects

Because smoking is the most common means of cannabis consumption in this country, the effects of cannabinoids and marihuana smoke on pulmonary function has been of continuing interest. The fourth Marihuana and Health report described bronchodilating effects with possible therapeutic implications after marihuana smoking. Previous reports have described mainly adverse findings in frequent chronic cannabis smokers including bronchitis, obstructive pulmonary defects, and chronic cough (62).

Two groups publishing the promising reports described last year have continued and extended their studies (149, 156, 157, 168). Acute administration of either smoked marihuana or oral doses of THC produced statistically significant increases in bronchodilation and reversed experimentally induced bronchospasm in young adults with bronchial asthma (156, 157, 168). Indications are that the mechanism is independent of beta adrenergic or antimuscarinic effects (149). In contrast to these promising reports, a British group (34, 58) found that measures of forced vital capacity, peak expiratory flow rate and other clinically useful measures of pulmonary function did not improve in a group of patients with reversible airway obstruction given 10 mg doses of oral THC. One possible reason for these discrepant findings may be that the groups (149, 156) reporting cannabis-induced bronchodilation are using whole body plethysmography, an exceedingly sensitive measure that will detect very small changes in pulmonary function, whereas the less optimistic reports come from a group using less sensitive, although clinically relevant measurement techniques.

Chronic smoking may produce different and less useful effects than acute administration as indicated by pulmonary function changes during periods of chronic administration (109). Mendelson found significant impairments in pulmonary function tests (vital capacity, or FEV 1.0) in a group of chronic marihuana smokers (109). Further reduction in pulmonary function test performance developed during this study in which the volunteers smoked three to ten marihuana cigarettes daily for 21 days. An outpatient study of young adults with varying tobacco cigarette habits found more improvement in pulmonary function during an eight week period of no smoking in the cannabis smoker subgroup (5). An in vitro study suggests that the water soluble components of marihuana smoke may contain substances toxic to the defense network of the lung other than delta-9-THC or other cannabinoids (31). Studies using high doses of THC given intravenously noted only modest changes in minute ventilation and the ventilatory response to CO2 equivalent to that produced by 5 mg doses of morphine (77, 104).

A study of the respiratory effects of smoked marihuana and orally ingested delta-9-THC has examined the effects of the drugs on the respiratory response curve. Both the synthetic and natural material produced a respiratory depression in a group of previously chronic users. Although the effect was found to be slight, the authors recommend further study because of the possible relevance of this effect to patients with chronic lung disease or central nervous system impairment of respiratory regulation (172).

Endocrine and Metabolic Effects

The report of depressed plasma testosterone levels in chronic marihuana smokers (98) and the report of a failure to find such a change in marihuana smokers receiving the drug daily over a 21-day period (110) have led to further studies and discussion (55, 93, 96, 97, 99, 100, 101). Kolodny has reviewed the numerous problems confounding the study of the hypothalamic-pituitary-testicular axis in man (96) and discusses possible biologic implications of lowered testosterone levels. He presents data (97, 100) showing significant drops in plasma testosterone levels and luteinizing hormone levels two and three hours after smoking a single marihuana cigarette. In a chronic administration study, subjects showed no significant drop in levels after four weeks of daily marihuana smoking; but, then, with continued smoking they had significant drops in luteinizing hormone, followed

by falling testosterone levels and follicle stimulating hormone levels. Thus, the data from research finding no marihuana-related hormone changes (93, 110, 144) are quite consistent with studies that do (97, 98, 100) if the different time periods of marihuana use are taken into account. The biological significance of these changes is unclear and Kolodny is appropriately cautious in his interpretation of their importance (96). In most cases the plasma hormone levels remain within the usually accepted normal limits. Such alterations might be expected to be more important for prepubertal or pubertal males or males with already impaired sexual functioning. There might also be adverse effects on sexual differentiation of the fetus of mothers using cannabis. In the absence of clinical evidence for these consequences, such concern is at present speculative.

One surgeon has attempted to link such hormonal changes to the development of gynecomastia in male marihuana users (66, 69). He was able to stimulate the development of rat breast tissue by delta-9-THC administration (66). Other investigators (101) have not found changes in serum prolactin levels in men given THC experimentally. The absence of prolactin changes is surprising since many centrally acting drugs alter prolactin levels. The reported gynecomastia was postulated to result from a prolactin dependent mechanism.

In last year's report a study described glucose intolerance in a small group of subjects given intravenous doses of delta-9-THC (75). A lower dose of THC given as smoked hashish had no effect on blood glucose though blood lactic acid decreased (129). Glucose efflux from human erythrocytes was inhibited by THC and cannabidiol, suggesting some drug effects on glucose transport mechanisms (146). It would, however, be quite speculative to try to relate these changes to the craving for sweets often reported by cannabis users.

Sexual Functioning

Reports discussed in the section on "Endocrine Effects" describe sex hormone changes related to cannabis use. Although anecdotal accounts describe cases of sexual dysfunction possibly associated with such changes, properly controlled studies are needed to confirm them (96, 100). A number of accounts report enhanced sexual activity associated with cannabis use (11, 20, 51, 63, 93). However, the psychological, social and pharmacologic factors associated with sexual activity probably interact in complicated ways as is true with most other drug effects on sexual behavior (20, 93). For example, with cannabis, as with alcohol, dose is important. Small to moderate doses appear to be most effective as releasers of inhibitions (93). Larger doses and/or chronic use of marihuana may actually diminish sexual interest and potency in males. Adequate data elucidating the effect of marihuana use on sexual functioning are not yet available.

Neurological Effects

Perceptual, cognitive and mood changes are presumably reflected in changes in nervous system activity. As with any psychoactive drug, however, simple one-to-one correlations between behavioral changes and brain activity are rare (78). The most important questions have to do with how long the effects persist: for hours, days, weeks or are they permanent?

Most of the new studies are extensions of or attempts to replicate findings reported last year. Smoked cannabis produces acute, reversible, dose-related changes in brain waves as measured by computer-analyzed EEG (49, 91). Following ordinarily used doses, the changes are modest, consisting mostly of alpha wave slowing and are not indicative of any particular pathology. Cannabis does not appear to have unique qualities among CNS active drugs as measured by scalp EEGs. Changes in EEG recorded from deep brain structures, consisting of slow wave and spiking activity, have not, however, been seen with any other drug (67). These changes have been well-described in monkeys. Similar changes have been reported in a small number of humans (67). The behavioral significance of these neurological changes is yet to be determined (78). A recent review of possible neural mechanisms of cannabis suggests the hippocampus and other deep structures may be important sites of action (41), at least in animals.

Scalp EEG and evoked potentials showed marked changes in subjects given very large smoked doses of THC or marihuana (158, 159). Alpha abundance increased with posterior slow wave activity becoming prominent. Ataxia, hypersomnia, increased deep tendon reflexes, tremor, tonic muscle contractions and myoclonus followed these 1 mg/kg doses of THC.

Loss of REM sleep appears to be a predictable effect of cannabis (158, 159). Total sleep time increases. Stage 4 or slow wave sleep is relatively unaffected. In this respect cannabis is unlike any sedative-hypnotic drug studied thus far (48). When the drug is stopped after a period of prolonged administration, REM sleep stage and eye movements show a marked rebound above baseline levels. In contrast to the relatively small changes in waking EEGs after the drug is given, sleep EEG changes are very dramatic and large--both when the drug is acutely and chronically administered (48).

Changes in the slow cortical potentials recorded from the scalp (contingent negative variation or CNV) after cannabis are of particular interest since this measure is said to be sensitive to changes in motivation and attention deployment, among other factors. A recent study of the CNV obtained somewhat different results from those reported last year (10). Like many neurophysiologic measures, it appears the CNV is far more complicated than was originally assumed. It appears the CNV may get larger or smaller after cannabis, depending on the level of intoxication, the task demands, the motivation of the subject and changes in attention. To view the cannabis-induced CNV changes as any direct measure of attention deployment or motivation is probably an oversimplification (10).

Effects on Cell-Mediated Immune Response

Conflicting opinions as to the possible effects of cannabis on the cell-mediated immune response continue to appear (148). In the fourth report, the observation that chronic marihuana users had decreased in vitro lymphocyte response to allogeneic cells and to a mitogen was described (118). This original observation has led to extensive in vitro and animal studies described elsewhere in this report. Related studies in humans published this past year provide partial support for the notion of an immune system or thymus-derived cell alteration in people who smoke marihuana (30, 118, 134). However, other investigators using an in vivo skin testing procedure found no evidence of impairment of cell-mediated

immunity in chronic marihuana users (151). Marihuana smokers had less T cell response to phytohemagglutin stimulation and decreased PMN phagocytic capacity (134). The authors of the latter study caution that the clinical significance of these findings is uncertain. In possibly related in vivo studies, the white blood cells from both cannabis users and non-users showed similar dose-related inhibition of migration when exposed to THC and extracts of cannabis (147). Substances other than THC in the crude extract may have effects on this test system.

Administration of THC or cannabis to controlled populations, with before and after testing, is underway and may provide useful information in clarifying the etiology of the cell-mediated immune effects (125).

Other Physiologic Effects

Previous reports associated cannabis intoxication with decreases in intraocular pressure. The possible therapeutic implication of this unexpected effect is discussed in the section on therapeutic applications. More extensive studies in normal volunteer subjects indicate a non-dose-related pressure drop lasting from four to five hours (68). The magnitude of the eye pressure decrease (about 30%) was the same whether the person smoked one or 22 marihuana cigarettes. Effects on other aspects of eye physiology (acuity, refractive error, biomicroscopy, fundus changes, visual fields, ophthalmodynamometry, electroretinography and orthoptic evaluation) were minimal or absent. Other investigators concluded that the observed eye pressure decreases were more likely a consequence of drug-induced relaxation and sedation rather than specific cannabis effects on the eye, since other sedative drugs produced similar changes in eye pressure (52). Results of studies of the effects of smoked marihuana on galvanic skin response are consistent with drug-induced reduction in level of autonomic nervous system arousal (25).However, recent findings seem to contradict this interpretation (cf. Therapeutic Aspects).

Intravenous administration of a water infusion of cannabis resulted in gastroenteritis, hypoalbuminemia, hepatitis, and many cardiovascular changes secondary in part to hypovolemia (131). It is not entirely clear what symptoms were cannabinoid effects or, more likely, the non-specific effects of injected foreign plant material.

Acute Effects on Mental and Psychomotor Performance

As in previous years a host of studies have reported impaired functioning on a variety of cognitive and performance tasks while marihuana intoxicated. For the most part, impairments were dose-related. The investigators who gave the smallest doses generally reported the fewest effects. Impaired memory (9, 33, 38, 39, 167), altered time sense (9, 167) and decrements on performance on a number of tasks--such as those involving reaction time, concept formation, learning, perceptual motor coordination, attention and signal detection--are commonly described (9, 24, 25, 32, 35, 37, 115, 116, 119, 120, 121, 150, 162). A number of discussions of the locus of the memory impairment have appeared (33, 39, 164). There is a growing consensus that the memory defect is due to a storage problem rather than acquisition or retrieval. There has been concern that cannabis may increase the suggestibility of those using it. However, in laboratory studies marihuana smoking had no effect on hypnotic susceptibility (6).

Effects on Sensory Function

One of the more commonly reported effects of cannabis is a subjective change in sensation. A number of groups investigated drug effects on various aspects of sensory functioning. Although subjective impressions of changes in skin sensitivity are commonly associated with cannabis intoxication, no objective or measurable change in cutaneous sensitivity using a number of measures was noted (115). The decrease in auditory signal detection while intoxicated appeared to be due to a decrease in sensitivity rather than a change in criteria (120). This finding contrasts with the usual subjective reports of enhanced auditory sensitivity. THC given to patients suffering from pain demonstrated mild analgesic effects but 20 mg doses orally produced many unpleasant side effects --somnolence, dizziness, ataxia, blurred vision, etc. (126, 127). The experience of experimentally induced pain in normal subjects was also diminished by smoked marihuana (130). Pain secondary to spinal cord injury was decreased by cannabis use (42). The characteristics of preferred tone frequency were shifted while intoxicated (35).

Automobile Driving Performance

More evidence has accumulated indicating that driving ability and related skills are impaired by cannabis at doses likely to be commonly used in the United States (90, 89, 119, 44). Despite their commonly expressed belief that their driving ability is impaired when intoxicated (90, 163, 32), more cannabis users appear to drive today while intoxicated than was the case a few years ago. In limited surveys 60% to 80% of the users questioned reported driving soon after marihuana use (90, 154). The use of alcohol in combination with marihuana before driving was reported by 64% of one sample and during driving by 20% of the sample (90). As the risks of arrest for possession decrease, one might expect more users will take the chance of being caught while intoxicated and driving (154).

A more detailed report of a Canadian driving study discussed last year (89) has appeared (90). The data clearly demonstrate that marihuana in relatively low doses (cigarettes containing approximately 5 and 8 mg of THC) typically had a detrimental effect on driving skills and performance not only on a test course but also under more usual city driving conditions. However, as is true with alcohol, effects were not uniform with all drivers. Some, particularly at the lower dose, actually improved their performance. Thus, the problem of individual differences that has complicated developing and enforcing "drunk driving" laws will probably recur when discussions of the minimal allowable dose or blood level of cannabinoids come up.

Compared to most of the behavioral tasks studied in the laboratory, automobile driving is more complex. The relative importance of the various perceptual, cognitive and psychomotor functions in determining driving ability is not completely understood. For example, in some situations the cognitive impairment produced by cannabis may have only limited impact on actual driving performance due to concomitant drug-induced changes in risk acceptance or feelings of aggression. In a laboratory simulation of driving, cannabis-intoxicated subjects took longer to decide whether to pass another car seemed less likely to accept the risks of passing and seemed less aggressive than alcohol-intoxicated subjects (40, 45). Other laboratory simulator studies have found that, while some driving skills are relatively unaffected by marihuana, there is a dose-related impairment in the ability to attend to peripheral stimuli while driving (119). Such

an impairment might interfere with a driver's response to a car suddenly emerging from a side street.

Because of the many inherent inadequacies of laboratory driving simulator studies (90), cannabis-related driving risks will ultimately have to be assessed on the basis of studies of actual accident rates for users compared to non-users. This has been difficult in the study of alcohol. It promises to be still more difficult with cannabis because of the difficulties of measuring tissue levels of the cannabinoids, the longer excretion times, the more complicated metabolism and the often combined use of cannabis and alcohol while driving, making the relative contribution of either drug uncertain (90, 154).

Flying an airplane demands still more complex skills than does driving. There is little information concerning possible pilot error or impairment in performance as a result of having used marihuana. A preliminary study has shown that under flight simulator test conditions experienced pilots showed marked deterioration in performance following smoking marihuana containing 6 mg. of THC (108). More detailed studies are planned to follow up these initial observations.

Nonpharmacologic Determinants of Subjective Response

Sociocultural factors (128) appear to interact with such pharmacologic aspects as dose and route of administration so as to modify marihuana's subjective effects. Some of these factors were explored in studies published this past year. Laboratory studies are often criticized because a sterile, scientific laboratory setting may alter the response to the drug so that findings have little relevance to more typical conditions of use. A group of subjects were randomly assigned to smoke marihuana (16 mg THC) and were tested either in a typical medical research laboratory or a private living room designed to facilitate a pleasurable drug experience (76). Although there were great differences between subjects in their subjective responses to the smoked marihuana, the effect of the very different settings was negligible. A similar study using only a subjective level of intoxication as an index of drug effects found a psychedelic environment was associated with greater intoxication at intermediate dose levels, but not at the highest (16 mg THC) dose employed (14). Another attribute of the setting in which cannabis is often used is the possible effect of other intoxicated friends on a person's "high." However, in a study testing the effects of modeling, subjects smoking marihuana for the first time were relatively unaffected by the presence of an actor modeling a marihuana high (17). The results of this study suggest that previous experience with cannabis is a complicated socialization process in which individuals learn from friends and others to discriminate and label various aspects of the drug state (17). The mood one is in before smoking is sometimes thought to interact with the drug effects to produce varied outcomes. A laboratory study found no difference in subjective response to low doses of smoked marihuana and no difference in level of anxiety in groups of subjects made anxious by exposure to laboratory stresses (136). Finally, in a study mentioned in last year's report, but which had not yet been published, it was found that the dose of cannabis consumed in an experimental laboratory setting was determined by many factors (size of cigarettes, past drug experience) other than pharmacologic potency of the drug (15). A similar study by the same group (14) found that controlling the amount of drug consumed in accord with its varying strength was difficult for subjects, again suggesting that nonpharmacologic considerations are important in affecting the amounts consumed.

Cannabis and Psychopathology

The association of cannabis use with psychiatric illness raises complex questions for which no completely satisfactory answers are yet available. Two reviews of past research point out the many methodological and theoretical shortcomings of existing work (64, 112). A variety of psychiatric disorders are clearly associated with the use of cannabis—however, whether the psychopathology is an antecedent to use, a consequence or a mere coincidence is still very much open to question. A best guess is that cannabis use like that of many other psychoactive drugs will sometimes be an antecedent, a consequence or coincidental to psychopathology, depending on the person and many other variables (112).

As is often true in medicine, the ambiguity in diagnostic classification and definitions adds to the confusion concerning adverse psychological reactions associated with cannabis use. The following classification has been adopted in imposing some order on the literature (64, 112).

Acute Panic Anxiety Reactions

The acute panic anxiety reaction has been noted by many reviewers to be the most common adverse reaction to cannabis use (64, 112). The symptoms and signs are usually exaggerations of normal cannabis effects more generally described by users. Anxiety is often focused on fears of "going crazy." This reaction appears most likely to occur in novices and after consuming more potent materials. Personality variables that make for poorer coping skills play a role. The symptoms diminish with authoritative reassurance or in a few hours when the immediate drug effects have worn off. A number of reports in the past year illustrate these considerations (1, 87, 117, 124, 127, 164, 166).

Patients with chronic pain (127) and depression (1, 139) given low doses of THC in therapeutic trials had far more dysphoric and acute panic episodes than would be expected if the same doses were given to typically youthful cannabis users. These older people presumably found it difficult to accept the drug-induced mental changes as desirable. Younger but equally inexperienced "cannabis experimenters" often react similarly (164, 117).

Cannabis-induced mild paranoid feelings in student and "counter culture" users of marihuana are common and usually not a source of undue concern to them (87). About two-thirds of a student group and 95% of a counter culture group studied described suspicion of being subjected to a police raid or having friends tricking them while intoxicated. Inability to reality test concerning these suspicions was reported by over half of the subjects. Another field survey found that individuals with a tendency to use paranoid defense mechanisms experienced fewer acute anxiety reactions after cannabis (124). The authors thought that the more sophisticated defenses represented in paranoid functioning may be effective in preventing acute adverse reactions. The same study found that persons with high scores on the schizophrenia subscale of the MMPI tended to have more problems with adverse psychological reactions indicating (as have a host of previous studies) that pre-existing psychopathology is an important factor in such reactions.

Cannabis Induced Acute-Brain Syndrome or Toxic Delirium

The clinical features of the acute brain syndrome associated with cannabis intoxication--such as clouding of mental processes, disorientation, confusion and marked memory impairment--are similar to those produced by other exogenous toxins (64, 112). The syndrome is most likely to occur at high doses and to be dose-related, whereas the panic reactions may occur at any dose unfamiliar to the user (64, 112, 79). The toxic delirium is likely to follow the time course of other drug effects. This syndrome appears to be relatively rare in the United States.

Prolonged Reactions

Possible prolonged psychological effects of cannabis use are an area of serious concern and controversy. These include not only psychotic reactions but also personality change, change in life style, a possible "amotivational syndrome," "flashbacks" and a possible causal relationship between marihuana use and use of other drugs. Here it is even more difficult to establish precise cause and effect because the close relationship between ingestion of the drug and acute effects is lacking.

Descriptions of a specific long lasting cannabis psychosis appear largely in the Eastern literature, and thus are largely drawn from a culture where use is generally more frequent, and at higher dose levels, than normally is typical for the United States. This acute "cannabis psychosis" is generally associated with very frequent use and reportedly lasts one to six weeks or longer (64, 112). Recent studies abroad in Jamaica (141), Greece (155) or Costa Rica (23) where frequent users of high potency cannabis were examined failed to document the existence of a specific cannabis psychosis. However, small sample sizes were involved and such a relatively rare occurrence could well have been missed.

A few years ago a clinical report by Kolansky and Moore (95) described eight psychotic reactions in a group of 39 marihuana smokers in this country and attempted to demonstrate a cause-and-effect relationship to their marihuana use. A more recent clinical study demonstrates how correlations between various behaviors and subsequent psychiatric disorders can be misleading (2). Consecutive first admissions to a psychiatric hopital were evaluated. Thirty-eight patients who had used marihuana prior to the onset of psychiatric problems were studied. Indeed, apathy, poor judgment, confusion and depression followed marihuana smoking, but the correlations between marihuana use and subsequent illness was less than with such causally unrelated variables as having masturbated, having experienced sex education, and having drunk beer. In this clinical study marihuana use could not be singled out as a prime factor leading to psychiatric illness.

Marihuana flashbacks--spontaneous recurrences of feelings and perceptions similar to those produced by the drug--continue to be reported (12). The etiology of such flashbacks remains obscure, but those who experience them seem to require minimal treatment, if any.

Nonpsychotic Prolonged Adverse Reactions

Surveys of user and non-user populations provide some information as to neuropsychological changes, changes in life style and the so-called amotivational syndrome associated by some with cannabis use. In an all too rare prospective

study, Culver and King (28) compared groups of LSD-mescaline users with marihuana, hashish users and non-drug using controls. The investigators used a sophisticated psychological test battery including the Halsted-Reitan tests, the Wechsler Adult Intelligence Scale and tests of spatial perceptual abilities. When tested a year later the LSD-mescaline group scored least well on the trail making test but the performance of all three groups fell within normal limits. No evidence could be found for the existence of a neuropsychological deficit with either light or frequent cannabis use. Another study of heavy drug users using a similar test battery arrived at similar conclusions (13). However, the authors of the study remind their readers that one should not conclude that no organic changes occurred since psychological test data is inferential and definitive statements as to organic changes can only be based on radiological or pathological evidence. One study of multiple drug users in the Navy found a large number of psychiatric symptoms reported by them on the Cornell Medical Index but because of the variety of drugs habitually used it was impossible to single out marihuana use as an important factor (61).

The possible effects of cannabis on student performance has been a major concern because of the extensive use by that group. A longitudinal study of a sample of 1,970 college students examined the relationship between cannabis use and psychosocial adaptation and academic performance (11). Users and non-users did not differ in grade point average or in educational achievement, but the marihuana users seemed to have more difficulty in deciding on career goals and dropped out of college more often to reassess goals. A smaller percentage of regular users planned to seek advanced or professional degrees. There was, in the opinion of the users themselves, a poorer academic adjustment among the most frequent users than among infrequent or non-users. Only 6% of non-users reported a worsening of their emotional state since beginning college but 20% of the long duration users reported negative changes in emotional state. A problem with the study was that a significant percentage of the initial sample was lost over the three year period. If the loss was from the group who failed out or dropped out, those most likely to show loss of motivation or intellectual functions may have been automatically excluded from the study. Also, the study merely reported the students' own assessment of their adaptation since no interviews were attempted. Other questionnaire surveys reported differences between users and non-users but the question of causation remains and the mental health significance of some of the findings are unclear. Non-users scored higher on needs for achievement and order and not surprisingly had higher grades (152). Other surveys found marihuana users to be more dissatisfied, disillusioned and alienated (29), more oriented towards the past (88), but to be more creative and adventuresome (60). They also had lower levels of achievement (16).

The ability of cannabis users to work in other contexts has been examined in attempts to see if a measurable "amotivational syndrome" exists (113, 111). In a study of frequent and infrequent users smoking cannabis while living on a research ward, work output decreased as marihuana consumption increased (111). However, the investigators noted that "motivation" is a function of situational variables as well as drug factors. To term the decrement in work output "amotivational" would imply that the users in the experiment had lost interest in working for money. However, if the work decrement resulted from a drug-induced impairment of performance, it would not be proper to term it a motivation effect. In a similar

Canadian study (113) a fall in productivity (making stools) followed the smoking of cannabis. The decreased productivity appeared to be due to less time spent working rather than to decreased efficiency. The authors interpret this as indicative of an "amotivational syndrome." To the extent that these types of studies involve artificial work conditions and tasks dissimilar to more usual employment, it is hazardous to draw more general conclusions regarding the role of cannabis in a more generalized amotivational picture. Moreover, these studies involved intensive daily use. Their relationship to episodic or less frequent use in altering motivation is unknown.

An assumed relationship between cannabis use and the use of other drugs (mainly opiates) has been a source of concern. The progression hypothesis is a good example of a theoretical construct repeated so many times that it has become verified by repetition rather than by facts (161). The patterns of the shifts from one drug to another seem to be changing with more of a "progression" to "polydrugs" other than heroin (57). In a military population the pattern of drug use and selection of drugs was determined more by availability, peer pressure and drug use fads than by pharmacologic or personality variables (123). Cannabis users are, however, very likely to use other licit and illicit drugs with a positive correlation between level of cannabis use and the variety of drugs used (122).

Criminal and Aggressive Behavior

The often discussed possible link between cannabis use and crime or aggressive behavior was the topic of reviews (56, 92) and experimental studies (26, 107, 142). Both reviews (56, 92) concluded that evidence showing marihuana to cause crime is virtually nonexistent. Young prisoners who varied in their degree of marihuana use were compared using a number of personality measures (e.g., MMPI, CPI) (107). Non-users and occasional users had typical criminal profiles. Regular users of only marihuana were better socialized and adjusted, though more deviant, than collegiate marihuana users. Prisoners who used marihuana plus other drugs were the most deviant.

In addition to concern about marihuana use and criminality, the association between marihuana intoxication and hostile human behavior has been a topic of great interest and discussion. The results of observations and self-reports of hostile, aggressive feelings from research subjects intoxicated acutely or chronically with cannabis suggest the usual effects are to decrease expressed and experienced hostility (80, 109, 142).

Chronic Effects

Tolerance

Marked tolerance to the effects of cannabis doses commonly consumed in this country is not usually evident, presumably because of relatively infrequent use and the generally low doses of active material. However, as data accumulate from

countries where more frequent use of high doses is common (23, 49, 141, 155), it is apparent that tolerance must develop to many of the psychological and physiological effects. In controlled experimental situations where prolonged administration of THC or marihuana to volunteer subjects has been undertaken, what appears to be dose-related tolerance develops rapidly (8, 53, 80, 109, 111) as judged by behavioral, psychologic and physiologic measures.

In outpatient studies where frequent and infrequent users or other populations with differing drug histories are compared in their response to a given dose of cannabis, the results are less consistent. Marked tolerance to measured effects is rarely obvious, if evident at all (94, 132, 140, 155). However, when sensitive and reliable measures are used, even infrequent use may produce evidence of some degree of tolerance on outpatient laboratory tests (9, 24). Tolerance in man is apparently a dose-related effect as it is in animals (36).

Dependence

When volunteers were given 30 mg doses of THC orally for 10-20 days, sudden cessation of the drug was associated with the appearance of irritability, restlessness, decreased appetite, marked sleep disturbance (including sleep EEG alterations), sweating, salivation, tremor, weight loss, nausea and vomiting, diarrhea and, in general, a clinical picture similar to that following chronic administration at moderate doses of many sedative-hypnotic drugs (8, 48, 80). Such psychologic and physiologic changes have not been commonly observed in other chronic administration studies in this country. Restlessness and weight loss was reported by Mendelson in an inpatient volunteer study at the end of a 21-day smoking period (109). Drug-seeking behavior has not been associated with the withdrawal syndrome, but the presence or absence of such behavior is difficult to assess in the laboratory. A withdrawal syndrome has not been described in recent investigations of chronic users abroad (23, 49, 141).

Field Studies of Chronic Users

Several field studies of populations of frequent long-term users have searched for possible adverse or other effects associated with chronic use (23, 49, 94, 141). These all were concerned with users in countries where high potency cannabis is more readily available than in the United States.

The results of a chronic user study discussed in two previous reports were recently published in book form (141). The 30 experimental subjects had been smoking high potency cannabis almost daily for ten years or more. Few psychological or physiological differences between the cannabis smokers and nonsmokers were evident. There was no evidence for liver, kidney or cardiovascular malfunction. While no differences in chromosomal abnormalities were found, the results must be regarded as inconclusive because of various technical dificiencies of the study. Modest decreases in pulmonary function and altered hemoglobin levels were the only physiologic differences evident. The impact on these findings of tobacco use by the subjects is uncertain. After smoking cannabis, a small group of workers produced less work (weeding, hoeing, digging) with more movements, but otherwise showed no evidence of "amotivation." The importance

of cultural differences in the interpretation of drug effects is evident in that people in Jamaica did not find their appetite increased by cannabis, nor their hearing enhanced nor their time sense altered, and in fact said they used cannabis so as to work better. Although reassuring, the findings should also be judged in perspective. They were derived from a small group of selected users, so that rare consequences (if they did occur) such as brain atrophy or psychosis might not have been detected. The subjects were laborers and farmers in a very different culture, so that intellectual impairment may have been relatively difficult to detect.

A similar although larger and more complex study is underway in Costa Rica. Coggins presented a preliminary report (23). Eighty daily marihuana users and matched noncannabis-using controls were evaluated with extensive medical examinations, laboratory studies, X-rays, EEG, EKG and neuropsychological testing. Although the study is still in progress, no evidence for a greater incidence of disease or deterioration has yet to be found.

In studies of Greek and chronic hashish users approximately 47 chronic users were compared with 40 control nonusers on a variety of EEG, echoencephalographic, neuropsychologic and experimental laboratory tests (49, 94, 155). Conventional clinical measures of brain damage (EEG, echo-EEG) showed no evidence of abnormality in the chronic users. Tolerance to administered doses rapidly developed on the EEG indices. No evidence of withdrawal symptoms after three days of chronic administration was evident. When given high doses of THC, some of these very experienced subjects developed unpleasant psychological symptoms when their tolerance level was exceeded. These were all outpatients so no precise control over drug use outside of the laboratory was possible. A slightly higher incidence of personality disorders in the hashish-using group was better explained by psychosocial variables than by marihuana use.

Thus, these three field studies of users abroad do not report brain damage, psychosis or an "amotivational syndrome." However, the cultures are different, and the sample populations are relatively small so such drug effects can not be ruled out. They may be simply uncommon or difficult to measure.

Chronic Effects - Laboratory Studies

A number of groups have studied the effects of daily cannabis use in paid volunteer subjects consuming cannabis for up to 72-day periods while hospitalized (8, 48, 53, 80, 109, 111, 113). Although even 72 days is not really chronic use, such studies complement the more commonly performed acute outpatient studies. In general, in all these chronic or subchronic studies, subjects have tolerated the drug treatment phase well and very few dropouts, psychoses, or other blatant manifestations of distress were revealed. Except for the pulmonary function changes noted in one study (109), drug effects on mental, behavioral and physiologic functions appear to disappear rapidly on cessation of drug administration and have been, in general, similar to those seen in acute studies. Tolerance is evident at lower doses (53, 109) and obvious at high doses (80).

Adverse Physiologic Effects Associated with Chronic Use

Mention has already been made of the endocrine and immunologic changes reported in some populations of users. Mutagenesis and teratogenesis is discussed elsewhere in this report. A discussion of the report of brain ventricle changes was presented in a previous report. A paper describing the same group of subjects appeared this past year (46), but no similar reports have yet appeared. The difficulty of performing pneumoencephalograms in neurologically normal volunteers makes survey studies impossible. A number of groups are testing cannabis users with noninvasive techniques for measuring brain ventricle size (computerized tomography) and preliminary results should be available soon. An investigator who reported the electrical changes in the deep brain structures of a human smoking marihuana has now completed chronic studies in monkeys, finding similar electrical changes. The slow wave activity persists for months after the cessation of a chronic period of smoking. The behavioral and biological significance of the changes in man is uncertain.

CHAPTER 8

EFFECTS OF MARIHUANA ON THE GENETIC AND IMMUNE SYSTEMS

The effects of marihuana and other cannabis preparations on the genetic and immune systems have recently been areas of intensive research. Since the fourth Marihuana and Health report, a wealth of new information has become available.

Animal Studies

In the area of preclinical investigations, chromosome studies in rats and hamsters have been negative (23, 35). However, cytological and cytochemical studies of hamster lung cultures (18) exposed to smoke from marihuana and tobacco cigarettes found an inhibition of DNA synthesis and cell division, abnormalities in mitosis, and variable DNA content in chromosomes. Recently, THC was found to reduce the number of lymphocytes and leukocytes and inhibit the hemolytic plaque forming cell response (a measure of antibody producing cells) in mouse spleens (16). In another study (13), an increase in lymphocytes in rat bone marrow accompanied inhibition of myelopoiesis following administration of delta-9-THC. There is also the report by Harris et. al. (11) that delta-9-THC administered orally to mice retarded tumor growth and increased survival 36%. Harris and associates also observed in another set of experiments that the acute administration of delta-9-THC inhibited 3H-thymidine uptake into the DNA of tumor cells but not into the DNA of bone marrow, spleen, testes, and brain. If the acute administration of delta-9-THC preferentially inhibits DNA synthesis in tumor cells in humans as well, then the potential usefulness of marihuana as an antineoplastic agent will have to be evaluated. Marihuana may also have potential therapeutic use as an immunosuppressant in transplantation surgery if the findings that it depresses cell-mediated immunity in rodents (20, 32) are substantiated in human studies.

Studies of Teratogenicity

Early studies of marihuana indicated teratogenic activity in rats, rabbits, mice and hamsters (7, 8, 36, 37). Recently, Fournier et. al. (6) have confirmed the findings in rabbits. Mantilla-Plata and Harbison (21) observed that the teratogenicity of delta-9-THC in mice could be modified by pretreatment with phenobarbital and SKF525A. Phenobarbital partially antagonized THC-induced reduction of fetal body weight, while SKF525A either antagonized or potentiated reduction of fetal body weight depending on the gestational age at which it was administered. In addition, SKF525A significantly increased the incidence of THC induced fetal resorptions. By contrast, the studies conducted on rats and rabbits by the National Institute of Drug Abuse (22) did not show deleterious effects of marihuana on either the pregnant mother or the fetus. This is reinforced by the negative finding by Banerjee et. al. (1), that delta-9-THC administered to rats produced no malformations among the fetuses, except for a dose related increase in the incidence of spongy spinal cords. Finally, there is the negative report by Legator et. al. (17); a

battery of tests (including the host-mediated assay, microsomal activation, blood and urine studies, dominant lethal and cytogenetic--micronucleus--examination) failed to detect any effect of delta-9-THC administered orally in the one mouse strain used in all of these studies. Uyeno (44) reported increasing complications associated with delta-9-THC administration to pregnant rats. Results of a later study (45) unfortunately are not interpretable for lack of controls.

The conflicting reports on teratogenic effects may be due to a number of variables including the specific strain used, route and time of administration and dosage. Well designed research projects utilizing animals are needed to determine under what circumstances marihuana acts as a teratogen in animals and how these findings may be applied to humans. To date, aside from occasional case reports, no systematic human studies on the teratogenic effects of marihuana have been carried out.

Human Studies

Chromosome Analyses

The assessment of genetic effects in man has been exclusively based on cytogenetic analysis; specifically, the examination of human chromosomes. In vitro cytogenetic studies did not show an increase in the frequency of chromosome breaks following the addition of delta-8-THC (33), delta-9-THC (41) and cannabis resin (24) to lymphocyte cultures, but did show dose dependent mitotic inhibition. Cytogenetic analyses of lymphocyte cultures from chronic marihuana smokers have been contradictory. The majority of these studies have been retrospective with comparisons made between marihuana smokers and controls. Seven studies of this type have been published. Negative findings were reported by Martin et. al. (24) on a Jamaican population and by Dorrance et. al. (5) on light marihuana users. Gilmour et. al. (9) also reported that light marihuana users did not show an increased frequency of cells with aberrations but that polydrug users, all of whom used marihuana heavily, did show a significant increase in abnormal cells. However, the use of other drugs makes it impossible to interpret this increase as due specifically to marihuana. Nahas et. al. (31) mentioned increased chromosome damage in chronic marihuana smokers but did not provide further information. According to Morishima (27), this increase was not statistically significant.

The three positive studies of marihuana effects on chromosomes should be interpreted with caution. Stenchever et. al. (42) reported a significant increase in the number of cells with breaks in marihuana users as compared to controls (3.4% vs. 1.2%). However, as stated in the fourth Marihuana and Health report, "the biological significance of the findings remained unclear because of several methodological and sampling questions raised by the authors themselves" (22). Herha and Obe (12) reported increased exchange-type aberrations (dicentrics and translocations) in chronic cannabis users. Close inspection of their data shows that five of the nine aberrations they observed occurred in only one of the eleven subjects. Further, chromatid and chromosome breaks, the most commonly reported type of aberrations, were not included in their analysis; when this is done, there is

no longer any difference between users and controls. In the third study (14)--the only one to examine chromosomes from direct bone marrow preparations--the authors reported a statistically significant increase in the frequency of breaks. Again, the increase was accounted for by two of the seven heavy cannabis users; the others showed no breaks. In addition, the total number of cells examined was small, 157 cells for all of the seven subjects. (In drug studies, 50-100 cells per subject are customarily considered minimal.) Since information on the number of cells analyzed for each subject was not provided, it cannot be determined whether the number was evenly distributed among all subjects.

Retrospective studies such as those cited above, with their many uncontrolled variables, make definitive interpretations and conclusions difficult, if not impossible. To resolve the controversy, prospective studies are needed.

So far, the results of only two prospective studies (with subjects serving as their own controls) have become available and both have been negative. Nichols et. al. (34) did not detect an increase in the percent of cells with breaks following the oral administration of hashish extract (containing THC, CBN and CBD), marihuana extract (delta-9-THC alone) and synthetic delta-9-THC to 30 subjects following a variety of schedules. The second study (a 94-day study with 72 days of unlimited smoking of marihuana cigarettes containing approximately 2.2% delta-9-THC) found no increase in the break frequency when baseline and post-exposure values were compared (25). However, subjects in both studies were all marihuana users and their baseline values may already have been elevated above those of non-drug using controls. Thus, even these prospective findings are not definitive.

Effects on chromosome complements have also been published. Leuchtenberger et. al. (18, 19), using an in vitro exposure of human lung cells, reported a relative increase in aneuploid cells. Even more strikingly, Morishima (26) reported that in marihuana smokers, a high proportion of cells (30.6%) contained from 5-30 chromosomes instead of the normal 46. In a subsequent study (28), the in vitro addition of delta-9-THC to leukocyte cultures was found to increase the frequency of cells with abnormally low chromosome numbers. The possibility that these types of cells have been overlooked by other investigators as technical artifacts, or that these cells may indeed be technical artifacts, is not settled. Since it markedly reduces the potential for technical artifacts, use of the flow microfluorometry technique to measure DNA content in intact lymphocytes from marihuana smokers and to compare it with DNA content of nonusers may resolve this question.

At this time, there is no conclusive evidence that the consumption of marihuana causes chromosome damage. Indeed, the two prospective studies carried out as part of large biobehavioral investigations on the effects of marihuana did not show increased break frequencies when baseline and post-exposure values were compared. There are no data available, however, on the long-term consequences of marihuana use.

Immune Responses

The immune system of man is compartmentalized into two parts: cell-mediated immunity and humoral- or antibody-mediated immunity. Each is dependent upon a major subpopulation of lymphocytes, the T- or thymus dependent cells and the B- or thymus independent cells, respectively. The initial publication

83-317 O - 77 - 56

was that of Nahas and associates (31) reporting that in vitro cell-mediated immunity, as assessed by mitogenic (phytohemagglutinin) and allogeneic cell stimulation, was significantly depressed in 51 chronic marihuana users compared to 81 controls. Indeed, it was depressed to a level similar to that seen in patients with known T- cell immunity impairment (uremia, cancer and transplant patients).

Investigations attempting to replicate this finding have led to contradictory reports. Gupta et. al. (10) compared by rosette formation the circulating populations of T- and B-cells in 23 healthy chronic marihuana smokers and 23 normal controls. They found that the mean percentage of T-cells forming rosettes was significantly lower in the marihuana smokers while the percentage of B-cell forming rosettes was similar in both populations. One might conclude, therefore, that smoking impaired T-cell function. Intradermal testing, however, on a limited subsample of marihuana smokers (including those with low or normal percentages of rosette forming T-cells) revealed no correlation with the presence or absence of a positive reaction to one or more antigens tested. Therefore, the results of this study concerning T-cell function are equivocal: When measured by rosette-formation, T-cell function was impaired; when measured by intradermal challenge, it was not. Petersen et. al. (38) also reported significantly lower percentages of rosette-forming T-cells in marihuana smokers, while B-cells remained normal. Although the responsiveness to phytohemagglutinin was not significantly different from that of controls, in that same study the cells from smokers did tend to be less responsive suggesting possible impairment of T-cell function. Serum levels of immunoglobulins G, A and M (a measure of B-cell function) were similar in marihuana smokers and non-smokers. Further, the capability of polymorphonuclear leukocytes to phagocytize killed yeast cells was reduced in smokers (phagocytic activity of polymorphonuclear leukocytes is a necessary prerequisite for the transformation of lymphocytes into macrophages which process antigens in the immune system).

The effects of macromolecular synthesis (i.e., DNA, RNA and protein synthesis) in lymphocyte cultures from normal controls exposed in vitro to many of the natural cannabinoids have been investigated. Cushman and Khurana (3) reported that in vitro incubation of control lymphocytes with delta-9-THC, cannabinol, and cannabidiol for one hour gave a dose-related reduction in rosettes. DeSoize et. al. (4) reported that in vitro addition of the natural cannabinoids (delta-9-THC, delta-8-THC, cannabinol, cannabidiol, cannabichromene, and cannabicyclol) to human lymphocyte cultures all affected DNA, RNA and protein synthesis as measured by uptake of 3H-thymidine, 3H-uridine, and 3H-leucine, respectively. These two laboratories also reported positive findings on cell-mediated immunity. Results obtained by Blevins and Regan (2) confirmed inhibition of DNA, RNA and protein synthesis following the in vitro addition of delta-9-THC to human diploid fibroblast, neuroblastoma cells and mouse neuroblastoma cells in culture. Further analysis detected no effect on either DNA repair synthesis or uptake of radioactively labelled precursors into the cell, but did demonstrate that the intracellular pool sizes of these precursors were depressed 50%. This last finding could account for the reduced synthesis reported by others.

All of the studies discussed so far point to impairment of cell-mediated immunity in marihuana users. There are others, however, which failed to confirm such impairment. Silverstein and Lessin (40) in an in vivo study evaluated the immunocompetence of 22 chronic marihuana smokers compared to 60 controls by

the gross criterion of ability to be sensitized to DNCB (2, 4-dinitrochlorobenzene) and found no differences. White et. al. (43) using both PHA and pokeweed mitogens in an in vitro study, also reported no impairment of mitogen-induced blastogenic response in twelve chronic marihuana users as compared to twelve matched controls. Lau et. al. (15) in a prospective study could detect no differences in either peak level of response to PHA or concentration of PHA at which the maximal blastogenic response occurred. However, they did find that in cultures without PHA, the level of 3H-thymidine incorporation was higher in marihuana smokers than controls. These investigators carried out assessments before and after fourteen days of oral doses of 210 mg/day delta-9-THC and at a one-week follow-up. Rachelefsky et. al. (39) in a prospective study evaluated the immune system of twelve chronic marihuana smokers before and after 64 consecutive days of smoking unlimited quantities of marihuana cigarettes containing approximately 2.2% delta-9-THC. They found that baseline total T-cells and B-cells were significantly lower than controls but increased to normal by the 63rd day, suggesting that factors other than marihuana smoking may have caused the depression seen at baseline. Response to PHA and allogeneic cells was normal and did not change over time; serum levels of immunoglobulins G, A and M were also within normal limits in their study.

Some progress toward reconciling these contradictory findings will be possible when the impact of certain subtle procedural variations becomes known. For example, Nahas et. al. (30), found that the cytotoxic effect of delta-9-THC added to 72-hour lymphocyte cultures for the initial 24 hours could be reversed by prolonged washing of the cells with the nutrient medium RPMI. That is, the level of incorporation of tritiated thymidine at 72 hours was the same in treated and non-treated cultures. They surmised that the negative findings by White et. al. (43) may have been the result of the washing procedure used in the isolation of lymphocytes; the cell-bound THC may have been washed away. Nahas et. al. also found that THC induced inhibition of thymidine incorporation increased as the serum concentration of the culture medium decreased. This, they suggested, could help resolve an apparent inconsistency between two earlier findings: the Nahas et. al. results summarized above (31), which showed marked inhibition of DNA synthesis in a medium with a serum concentration of 10%, and a later study (29) which examined the effect of THC on healthy blood in vitro and found the inhibition to be considerably less with a serum concentration of 20%. However, even this may not be an adequate explanation since in the first study fetal calf serum was used and in the second, pooled human serum.

There is general agreement among investigators that marihuana smokers taken off the street and tested have a reduced number of T-cells as measured by rosette formation. In light of the report by Rachelefsky et. al. (39) that the initially low level of T-cells returned to normal while subjects were confined on a ward smoking quality controlled marihuana cigarettes, it may be concluded that some as yet unidentified variable, and not marihuana, may be the cause of the reduced number of T-cells seen in chronic drug users. The relationship between reduced T-cell rosette formation and immunologic function, as assessed by mitogen and/or allogeneic cell stimulation, is not clear since Petersen et. al. (38) reported a significantly lower mean percentage of T-cells in marihuana smokers than controls, but no statistically significant differences in PHA responsiveness. There is as yet no evidence that marihuana smokers are more susceptible to diseases known to be associated with lower percentages of T-cells (e.g., cancer, viral infections) and/or

reduced responsivity to mitogens. Also, skin testing of chronic marihuana smokers indicates intact and normal T-cell functions. B-cell function, too, appears to be normal regardless of how assessed.

Summary and Conclusion

The retrospective design and other methodological imperfections of most human studies, whether chromosomal or immune, leave much to be desired and preclude definitive conclusions. For example, information on nutrition, health care, recent radiation exposure and drug use pattern--all of which are variables known to affect both the genetic and immune systems--is generally obtained retrospectively from the participating subjects and is, therefore, of dubious validity. The potential inaccuracy of such information may doom any attempt to identify a deleterious effect of a specific drug, like marihuana, even were the composition of illicitly obtained marihuana known. Many of the other methodological questions now plaguing researchers could be settled by the collaboration of several laboratories, particularly those reporting contradictory findings, in a single prospective double-blind research design with appropriate control groups.

There is no information on the teratogenic effects in humans and it may take several generations to detect them. The reports on teratogenic effects in animals are contradictory and further rigidly designed experimental studies are needed to supplement the few done so far.

Bearing in mind the limitations of the studies discussed in this report, there is at this time no conclusive evidence that the consumption of marihuana causes chromosome damage. The studies which have been most carefully controlled have failed to show such damage, but insufficient research has been conducted to allow any definitive conclusions.

A number of investigators have reported results indicating that marihuana may interfere with cell-mediated immunity, but until the inconsistencies between these findings and the negative results which have also been reported are resolved, and until the implications of particular procedural variations are more clearly understood, the question of whether or not THC impairs cell-mediated immunity in humans remains a moot one. There is preliminary evidence, however, that in certain rodents delta-9-THC depresses cell-mediated immunity and preferentially inhibits DNA synthesis in tumor cells as compared to cells of normal tissue. It is important, therefore, to verify the anti-immune and anti-tumor activity of delta-9-THC in animals since, if these findings are confirmed and found to hold true for humans, delta-9-THC may have potential as an immunosuppressing and antineoplastic agent.

CHAPTER 9

THERAPEUTIC ASPECTS

Cannabis is one of the most ancient of healing drugs. It was and is an important folk medicine in many cultures. This fact alone is no reason to expect that it will qualify in today's stringent tests of medical efficacy and pharmacologic toxicity. One should not, however, summarily dismiss the possibility of therapeutic usefulness simply because the plant is the subject of current sociopolitical controversy. The controversy makes its impartial evaluation more difficult, but just because a substance has a potential for harm does not mean that it may not also have potential benefits. Furthermore, unaltered marihuana will not be the ideal preparation if some significant area of usefulness is found. Even its active cannabinoids can be improved upon by synthetic chemists. The benzopyran structure is a unique one which can be modified at many positions on the molecule. If the psychological changes of cannabis are not desired, they can be eliminated. If water solubility is preferred, it can be achieved. Although a good deal of further testing will be needed, there is a promise that certain of the pharmacologic effects of cannabis can be helpful.

When one surveys the specific therapeutic indications, some seem more promising than others. It is possible that cannabinoids may have a contribution to make in the treatment of glaucoma and asthma. Despite the recent finding that in certain animals, delta-9-THC is a convulsant in addition to being an anticonvulsant, some of the synthetic compounds may, one day, be helpful in managing certain forms of epilepsy. Inasmuch as only a single preclinical study (24) has examined the usefulness of cannabinoids in the treatment of tumors, it is much too early to say whether cannabis might have an anti-tumor action in man.

Some role may be found for a cannabinoid as a tranquilizer or a sedative-hypnotic. However, it will have to compete with a number of quite effective drugs already marketed for this purpose. Because of recent contradictory findings, a definite statement concerning the value of cannabis as an analgesic or antidepressant cannot be made at this time, but its antiemetic and euphoriant activity could provide needed relief for cancer patients undergoing chemotherapy. There is no evidence at present that the usefulness of cannabis exceeds that of currently available preanesthetic agents or those now in use for detoxification of patients in various drug and alcohol dependency states.

In addition to the possibility that specific benefits may some day, accrue, another reason for therapeutic interest in the cannabinoids is the possibility that their mechanisms of action may be different from the standard preparations. The elucidation of these mechanisms would be even more important than the finding of another therapeutic agent.

The Ancient Lore

The therapeutic use of cannabis predates recorded history. The earliest written reference is to be found in the fifteenth century B.C., Chinese

Pharmacopeia, the Rh-Ya (16). From the Chinese plateau its use as a folk medicine, ritual potion, fabric and intoxicating agent spread to India, the Middle East and far beyond.

An examination of the diverse claims made for cannabis as a medicament during past epochs reveals that many cannot be justified by the current knowledge of its pharmacologic activity. For instance, it had wide use as a lotion and poultice for a variety of skin afflictions. It had purported effectiveness in cases of leprosy, gonorrhea and arsenic poisoning. The smoke was tried in enema form for strangulated hernia and an application of the juice of the leaves was recommended for dandruff and vermin infestation.

On the other hand, a rationale can be found for certain of the early medicinal practices. Cannabis was widely used in painful conditions like neuralgia, dysmenorrhea and toothache and its relaxant and euphoriant properties may well have been utilized in the treatment of melancholia and hysteria. Because of its purported analgesic effect, supported by some recent findings, cannabis also found service in minor operations like circumcision and boil lancing.

Cannabis was one of the most important drugs in the Indian Materia Medica at the turn of this century (54). It was, and is, widely used in rural areas of the Indian subcontinent for asthma and bronchitis. A bronchodilator action has recently been quite well established, but cannabis is more likely to be a cause of, rather than a cure for, bronchitis. It was known to be an appetite stimulator; and this usage is confirmed in numerous subjective reports, although no precise mechanism for assessing the appetite-enhancing effect is available.

One interesting effect of bhang and ganja as reported by the Indian Hemp Drugs Commission, and more recently from Jamaican (57) and Costa Rican studies is the assertion that it is a "creator of energy"--that it increases staying power, relieves fatigue and is a stimulant. The Jamaican report told of its use as an energizer and motivator to work. Ganja breaks in back country Jamaica seem to be the equivalent of the North American coffee breaks. Employers have been known to supply their workers with ganja to "get more work out of them." This reason for use among laborers and farmers stands in sharp contrast with our concerns about a marihuana-induced "amotivational syndrome."

The scattered but persisting reports about an aphrodisiac property are not easy to evaluate. Much seems to depend upon the mental set of the consumer. If it is taken for that purpose, sexual interest, activity and enjoyment are likely to be enhanced. On the other hand sexually abstinent Indian monks used cannabis to diminish sexual drives and as an aid to meditation. While it may enhance sensory perception, prolong the subjective experience of time and reduce inhibitions, and thus intensify sexual experience, cannabis appears to have no direct effect upon sexual drive states (7). In fact, in view of the reports of lowered plasma testosterone levels after heavy usage, potency may, in some instances, be reduced (35).

Many therapeutic references can be found regarding the seeds of Cannabis sativa (23). For example, the seventh century Sythians inhaled and bathed in the vapors of hemp seeds thrown onto a fire, and "they howled with joy." The seeds contain essentially no active tetrahydrocannabinols, so that whatever joy there was

must have been due to the effects of the sauna. A persistent theme that runs from ancient times up to the present is the healing effect of external applications of cannabis. The potential efficacy of cannabis as a topical antibiotic has been most extensively researched in Czechoslovakia (30).

The Middle Period

During the latter half of the nineteenth century a resurgent interest in the medical usefulness of the hemp plant developed. Well over a hundred papers appeared in the medical journals of the day. Some of these reports are worth citing, however briefly. In Calcutta, O'Shaugnessey (47) tried cannabis on patients with a variety of ailments, including tetanus, rabies, epilepsy and rheumatism. He reported favorably on its anticonvulsant, analgesic and muscle-relaxing properties. This sparked a flurry of clinical investigations including those of M'Meens (42) who considered it a sedative-hypnotic, useful in such diverse disorders as neuralgia, dysmenorrhea, asthma and sciatica. Many favorable reports appeared, including those of Birch (3) and of Mattison (37) who recommended cannabis enthusiastically for the treatment of morphine, alcohol and other addictions. In 1890 Reynolds (55) wrote of its value in senile insomnia and tic douloureux (trigeminal neuralgia).

During this period Moreau de Tours (43) successfully treated obsessive compulsives, melancholics and patients with many other chronic psychiatric syndromes. His positive findings were confirmed by some, but not by other studies.

Despite the encouraging testimonials about cannabis, the drug began to fall into disuse at the beginning of the twentieth century. In retrospect, it would appear that the following reasons combined to account for its neglect:

1) Different batches of the plant had widely varying potencies, with some essentially ineffective and others stronger than the prescriber expected;

2) The drug had a poor shelf life. Many of the extracts of cannabis were practically inert by the time they were dispensed. Delta-9-tetrahydrocannabinol gradually breaks down into cannabinol at room temperature or when exposed to daylight and air. Cannabis sativa was, therefore, unreliable, and some of the contradictory clinical opinions might be explained on this basis.

3) Delta-9-THC is extremely insoluble in water and crosses the gastrointestinal wall with difficulty. It is for this reason that the oral route is two or three times less effective by weight than the pulmonary.

4) Synthetic, water soluble analgesics and hypnotics which had a much more predictable, stable pharmacological action were beginning to appear.

5) The final blow was the Marihuana Tax Act of 1937 which classified the drug as a narcotic. By that year, however, it was hardly employed in medical practice in the United States.

Even when the first synthetic tetrahydrocannabinol, pyrahexyl (Synhexyl), became available for clinical trials, it was not widely employed. Some work was done by Thompson and Parker (67), who treated various drug withdrawal syndromes with some success. In what may have been the first double blind study with a cannabinoid, Parker and Wrigley (48) administered it to 57 depressed patients.

They were unable to demonstrate a significant difference between pyrahexyl and the placebo. This study has been criticized by Grinspoon (23) for having used an inadequate dosage level. At any rate, both favorable and unfavorable reports with pyrahexyl can be found in the literature. It was tried in depressions, epilepsy and in addictive states. The value of many of the earlier reports is indeterminate. They were uncontrolled, poorly designed and impressionistic. Still, they did provide certain clues which have been exploited in present day pharmacologic investigations.

The Current Period

The systematic study of the clinical pharmacology of cannabis is less than ten years old. It required a number of scientific advances and administrative decisions before it could begin. These included:

1) The total synthesis of delta-9-THC by Mechoulam (38) permitting the manufacture of sufficient material for investigators.

2) The clarification of the relationship between delta-9-THC and the plant material (39).

3) The development of a source of uniform, assayed marihuana by the University of Mississippi group (52) under a NIDA contract.

4) The availability of a reliable assay procedure for delta-9-THC in marihuana.

5) The funding of animal and human studies designed to clarify the physiologic, pharmacologic and psychologic effects of cannabis.

6) The availability of various cannabinoids for research purposes from the National Institute on Drug Abuse.

7) The recent development of assay methods which can qualitatively identify cannabinoids in biological fluids (1).

Cannabis has been found to have some therapeutic potential in a number of diverse areas. They can be divided into two general groups, those that utilize the psychologic changes that the drug induces and those that do not. In the latter instance, the subjective symptoms often become undesired side effects of the drug.

The non-psychologic research directions include: intraocular pressure reduction, bronchodilator, anticonvulsant and tumor growth retardation.

The therapeutic efforts which rely on changes in the psychic state are: sedative-hypnotic, analgesic, antidepressant and tranquilizer, preanesthetic, antinauseant and antiemetic, and drug and alcohol dependence therapy.

Intraocular Pressure (IOP) Reduction

Hepler and associates (25, 26) undertook a study of the various ocular alterations produced by smoking cannabis in 1970. Among their early findings were a consistent, dose-related, clinically significant fall in IOP in subjects with normal

ocular tension. The IOP was also reduced with oral delta-9-THC and, to a lesser degree, with cannabinol and cannabidiol. Seven of eleven patients with ocular hypertension demonstrated a drop in IOP averaging 30% which lasted four to five hours. Topically instilled delta-9-THC in sesame oil produced a 40% reduction in IOP when compared to a treatment of sesame oil eye drops administered to a group of twelve rabbits.

Green et. al. (20, 21) demonstrated a fall in the IOP of rabbits given intravenous delta-9-THC. They postulated that delta-9-THC interacted with the adrenergic innervation system of the eye, namely that alpha-adrenergic blocking agents partly inhibited the THC effect. Apparently, beta-adrenergic blockade also dampens the delta-9-THC effect. The result of these adrenergic activities is a dilation of the efferent blood vessels. These effects were found to be modulated via an inhibition of prostaglandin synthetase.

Cooler and Gregg (12) compared intravenous (i.v.) doses of 1.5 and 3 mg of delta-9-THC, 10 mg diazepam (Valium) and a placebo in ten volunteers. IOP was diminished 29% with the low and 37% with the high delta-9-THC dosages. Diazepam lowered the pressures 10% and placebo 2%. These investigators also measured analgesia and noted no cutaneous or periosteal analgesic effects. Their subjects manifested an increased anxiety level on both doses of delta-9-THC. This study and others indicate that the IOP reduction is not due to any relaxing or euphoriant effects of cannabis as suggested by Flom et. al. (18).

Bronchodilation

During 1973 two articles referring to a bronchodilator effect appeared. Vachon et. al. (68) studied the effects of a single administration of smoked marihuana on normal subjects and asthmatic patients. Airway resistance decreased significantly permitting an increase in specific airway conductance and mean expiratory flow rates. The bronchoconstriction of the asthmatic patients was reversed for hours.

Tashkin et. al. (64) did a double blind study of 32 non-naive, male subjects randomly assigned to a placebo group, a 1% delta-9-THC and a 2%-delta-9-THC group. The investigators found that both dosages decreased airway resistance with a peak at fifteen minutes and with activity still present after an hour. Subsequently, they examined dose response curves with a placebo and 10, 15 and 20 mg of oral delta-9-THC and found that peak effects for the THC dosages were obtained at three hours. Persistent effects were evident for six hours.

Tashkin and associates also induced bronchospasm in asthmatics with methacholine or exercise (65). In a single blind fashion 10 mg of smoked delta-9-THC was compared to 1.25 mg of inhaled isoproterenol (Isuprel), both placebo controlled. Bronchospasm was relieved promptly by both drugs, not by their placebos. The isoproterenol had a higher peak effect, but the marihuana had a longer lasting activity.

The irritant quality of smoked cannabis, with its terpenes and coal tars, makes it a poor delivery vehicle for asthmatics. At present, an aerosolized delta-9-THC is being tried (46). The results of a pilot study are encouraging, showing that the aerosol produced a mean peak increase above baseline of 89%--much

greater than the increase observed when the same amount (10 mg) of delta-9-THC was smoked. Also, systemic effects such as the tachycardia and the "high" were not as pronounced with the aerosolized preparation.

This group also attempted to clarify the mechanism of bronchodilator action (59). In one set of experiments, six young males either smoked a cigarette containing 10 mg delta-9-THC or were injected with atropine before being challenged with methacholine. In contrast to atropine the cannabis-induced increase in specific airway conductance was not blocked by a methacholine challenge. In succeeding sets of experiments, the effects of combinations of propranolol and marihuana and isoproterenol and marihuana on young males were examined. Unlike isoproterenol, propranolol did not block the cannabis-induced increase in specific airway conductance. Apparently, cannabis is a bronchodilator independent of beta-adrenergic or antimuscarinic effects.

Anticonvulsant

Much of the work investigating the anticonvulsant properties of cannabis has been preclinical. The effects of cannabinoids on animal seizures resembling epileptic attacks, whether induced by pentylentetrazol (Metrazol) or by audiogenic or electrical means, have been recently examined. Consroe et. al. (8, 9, 10) found that delta-8-and delta-9-THC blocked all three types of seizures in a dose-related manner, and that these cannabinoids were qualitively comparable to diphenylhydantoin (Dilantin). Boggan (4) confirmed the effect of delta-9-THC in audiogenic seizure susceptible mice.

Rat hippocampal seizures precipitated by afferent electrical stimulation were used in another study of anticonvulsant activity (17). Cannabinoids were effective--more effective than diphenylhydantoin--in diminishing these seizure discharges. Cannabidiol was most potent, followed by cannabinol, delta-9-THC and delta-8-THC in order of effectiveness. Interestingly, the psychologically non-active cannabinoids outperformed the active ones.

Karler et. al. (31, 32, 33) showed that tolerance developed to the anti-seizure activity in the maximal electroshock test in rats treated with delta-9-THC and in mice treated with delta-9-THC, cannabidiol, diphenylhydantoin and phenobarbital. In other electrical seizure models tolerance was variable and specific for each model. It is possible that cannabidiol, which has no psychotoxicity or cardiotoxicy, has the further advantage of being a better anticonvulsant than delta-9-THC. Mechoulam (40) reported that 6-oxo-cannabidiol diacetate is a promising anticonvulsant.

The Davis and Ramsey pilot study in 1949 (13) examined the effect of tetrahydrocannabinols on five epileptic hospitalized children who had been receiving diphenylhydantoin or mephenytoin (Mesantoin) as medication. Two cases showed improvement after receiving one cannabidiol, while transfer to a second cannabinoid produced mixed results. Very little human investigation of the anti-epileptic properties of the cannabinoids has been done since.

Convulsant as well as anticonvulsant action has been demonstrated for cannabis. This is usually manifest when toxic or high chronic doses are used.

However, Consroe et. al. (11) have bred a strain of New Zealand rabbit which is quite susceptible to delta-9-THC seizures. Doses of 0.1-0.8 mg/kg i.v. produced behavioral seizures regularly. Spontaneously epileptic beagles were given delta-9-THC, cannabidiol or a placebo for twenty consecutive days. Myoclonic jerks and generalized seizures were observed only in those dogs receiving 3-5 mg/kg orally. A single case report suggests that cannanbidiol may activate spiking in epileptic patients (69).

In view of the problems involved with delta-9-THC (insolubility, variable oral absorption, psychotoxicity, tachycardia, convulsant potential), three new benzopyrans have been synthesized (51). These are dimethylheptylpyran (DMHP) analogues which are more active than diphenylhydantoin in rats given the supramaximal electroshock test. These new compounds have varied anticonvulsant profiles, do not produce tolerance and have minimal toxicity.

Retardation of Tumor Growth

Harris et. al. (24) have reported that mice inoculated with Lewis lung adenocarcinoma materials showed reductions of tumor size from 25 to 82%, depending upon the dose and duration of treatment, with subsequent administrations of oral delta-9-THC, delta-8-THC and cannabinol, but these investigators did not find such an effect with cannabidiol. Cannabinoids increased survival time by a quarter to a third compared to an increase of about 50% for cyclophosphamide. Friend leukemia virus growth was also inhibited by delta-9-THC, but L1210 murine leukemia was not. In vitro experiments confirmed the animal inhibition of growth, leading the authors to conclude that certain cannabinoids possess antineoplastic properties by virtue of their interference with RNA and DNA synthesis.

The therapeutic studies which rely upon the psychologic effects of marihuana follow.

Sedative Hypnotic

Freemon et. al. (19) confirmed the observation of others that delta-9-THC, like most hypnotics, reduces REM time during sleep. However, in contrast to findings with other hypnotics like the barbiturates, the abrupt withdrawal of THC after six consecutive nights of usage failed to produce a REM rebound, although mild insomnia was observed. Sofia and others (61) have demonstrated that pretreatment of laboratory animals with delta-9-THC reduces the dose of barbiturates needed for hypnosis and increases sleep time.

Studies attempting to exploit the well-known relaxing, sedating properties of cannabis have been performed. Two studies conducted by Neu and his colleagues (44) exploring the use of delta-9-THC as a bedtime sedative are difficult to reconcile with one another. In the first study nine subjects with sleep difficulties were given 10, 20 or 30 mg of delta-9-THC or a placebo at weekly intervals, double blind. The drug, as compared to the placebo, significantly reduced the time needed to reach a state of sleep. Furthermore, sleep was less interrupted during the drug nights. Side effects were mild, but they grew in number with increasing dosage. The main complaint was of feeling hungover or "stoned" the next day.

In the second study the delta-9-THC doses were reduced to 5, 10 and 15 mg to reduce hangover. These were compared to a placebo and to 500 mg of chloral

hydrate, a well-established hypnotic. Surprisingly, neither the chloral nor the delta-9-THC facilitated sleep induction or extended the duration of sleep as compared to the placebo. At the 15 mg dose level, some complaints of hangover were recorded. The authors suggested that difficulties in controlling the room temperature during the winter may have interfered with sleep sufficiently to negate any possible hypnotic effects of the active substances.

Tassinari et. al. (66) reported increases in total sleep time in eight volunteers. Stage II sleep was increased and REM sleep was reduced. The doses used were rather large (0.7 to 1 mg/kg of delta-9-THC).

Analgesic and Pre-anesthetic

One of the earliest folk uses for cannabis was its pain-relieving quality. A series of preclinical investigations by Kaymakalan et. al. (34) tended to confirm the analgesic effect. After having received intravenous administration of 1 mg/kg delta-9-THC, dogs received electric stimulation through an implanted dental electrode. The cannabinoid produced a definite analgesic effect, as shown by a fourfold increase in pain thresholds. Tolerance to analgesia, sedation and ataxia occurred in eight days. In another study delta-9-THC produced pain reduction in mice and rats as measured by the tail flick and writhing tests, and in rabbits receiving sciatic nerve stimulation. The analgesia produced with the doses used was equivalent to morphine analgesia--in fact, in rats a cross tolerance between delta-9-THC and morphine was found. An earlier study (49) measured the effect of delta-9-THC on rats with electrodes implanted in aversive brain sites. A non-dose related elevation of the pain threshold and an attenuation of the escape response were recorded.

A double blind Canadian study by Milstein (41) revealed a significant increase in pain tolerance among those who had smoked marihuana. Using a pressure algometer, the experimenter found that experienced subjects obtained greater analgesia than non-experienced subjects, although the increased pain tolerance was found only in the preferred hand. No effects on sensitivity to pain sensation were noted.

In another human study Hill et. al. (27) recorded opposite results. Here, 26 subjects received blind either marihuana smoke containing 12 mg of delta-9-THC from a spirometer or a marihuana placebo, then were given electrical skin stimulation. The THC was found to decrease tolerance and heighten sensitivity to pain.

In an impressionistic report Dunn and Davis (15) questioned ten paraplegics hospitalized in a V.A. Hospital, all of whom had admitted using marihuana in the past. Four reported that it produced a decrease in phantom pain sensations, five mentioned a decrease in spasticity, and five noted a decrease in headache pain and an increase in pleasant sensations.

Cancer patients in pain were studied by Noyes et. al. (45). Patients were given either delta-9-THC in 5, 10, 15 or 20 mg doses or a placebo. Pain reduction was greater at all delta-9-THC levels than in the placebo condition and significantly so at the 15 and 20 mg THC levels. These researchers felt that the pain relief was not due to the sedative or euphoriant effects.

Antidepressant

Since marihuana tends to elevate mood, it follows that an evaluation of its antidepressant potential would be sought. Kotin et. al. (36) administered 0.3 mg/kg of delta-9-THC or a matching placebo twice daily to eight patients who required hospitalization for their affective disorder. The patients were all considered moderately or severely depressed. Treatment lasted a week, with placebos substituted for the active drug thereafter. No evidence of a significant affectual change could be demonstrated. In chronic depressive states a longer duration of drug administration is sometimes needed.

A group at the Medical College of Virginia (53) performed a double blind study with cancer patients receiving chemotherapy. An initial starting dose of 0.1 mg/kg t.i.d. was used which was raised if previous doses were well tolerated. On a battery of personality tests and mood scales the delta-9-THC acted as a mood elevator and tranquilizer producing significant improvement on two of three Zung depression scales. Cognitive functioning was unimpaired and appetite enhancement and retardation of weight loss were noted from the clinical records. The need for narcotics was decreased, and patients had the impression that some pain relief resulted. Relief of nausea and vomiting was problematic.

Pre-anesthetic

A number of studies have examined the role that delta-9-THC can play as a preanesthetic agent, with mixed results. When it was given prior to inhalation anesthesia, the requirement for cyclopropane and halothane was decreased (50, 62). Smith (60) found that normal volunteers given 200 mcg/kg THC intravenously experienced marked sedation with minimal respiratory depression. Also, salivation was diminished, bronchodilation occurred, and cardiac output increased on the basis of the expected tachycardia. Although the author cautioned that some of the observed effects may have been due to the alcohol in which the delta-9-THC was dissolved, that amount of the drug given intravenously could easily have provided the manifestations recorded. Whether delta-9-THC has a potential usefulness in anesthesiology will depend on findings from additional studies.

Gregg and Small (22) found two dosage levels of intravenous delta-9-THC ineffective in controlling anxiety in oral surgery patients. In fact, in low doses it elevated anxiety, sometimes to a marked degree. Intravenous diazepam (Valium) outperformed the drug under investigation.

Smith (60), having searched for suitable pre-anesthetic combinations, reported that 5 mg of delta-9-THC intravenously produced fear in a number of patients. In combination with an opioid it provided useful sedation but with a marked decrease in carbon dioxide sensitivity. When combined with a barbiturate, the CNS depression was unpleasant and associated with some restlessness, but the response to carbon dioxide was unchanged. With diazepam definite drowsiness and other depressive effects were notable, and the ventilatory response to carbon dioxide was decreased. The investigator suggested that the combination of marihuana with pre-anesthetic or anesthetic medications could lead to undesirable potentiation.

Johnstone et. al. (29) also examined delta-9-THC in combination with other drugs. THC was administered intravenously after subjects had been pretreated

83-317 O - 77 - 57

with oxymorphone (OXM) or pentobarbital (PBL). The sedative effects of OXM were increased by THC, but the cannabinoid also increased respiratory depression. The combination of PBL and THC did not cause respiratory depression but produced such intense anxiety and psychotomimetic reactions that four of the seven subjects receiving this combination were not given the full course of five THC doses. The investigators concluded that neither combination was a desirable anesthetic premedication and also expressed reservations about the value of THC alone for such a purpose.

Antinauseant and Antiemetic

Sallan (58) gave two oral courses of delta-9-THC or a placebo to a small number of cancer patients in chemotherapy who were not responding well to the conventional antiemetics. Nausea and vomiting were brought under control with the drug significantly more often than with the placebo. Sedation, which could be considered desirable in this group of patients, was a frequent side effect.

Alcoholism and Drug Abuse

Rosenberg (56) has studied the response of a group of alcoholics and normal volunteers to marihuana cigarettes (0.4 gm/50lb body weight) and to alcohol (2 ml vodka/kg). This investigator found that alcoholics tended to be less responsive to stress (mental arithmetic and talking to a videocamera) and were more likely to withdraw from a stress situation than the normals. Alcoholics became more angry and depressed after alcohol ingestion as measured by mood scales. Marihuana produced a more positive mood state and did not interfere with the arousal reaction, although it greatly increased heart rate and produced an acute paranoid or confusional state in 3 of the 27 subjects. This investigator also found that disulfiram (Antabuse) and marihuana could be given safely together in the treatment of alcoholism. The study is continuing, but the early findings indicate that marihuana may be a suitable therapeutic adjunct for some alcoholics.

Hine and colleagues (28) have implanted morphine pellets in rats. Delta-9-THC in 1, 2, 5 and 10 mg/kg doses was injected 71 hours later. After one additional hour, 4 mg/kg of naloxone (Narcan) was delivered. The two higher doses blocked the appearance of wet shakes, escapes, diarrhea and increased defecations, although neither delta-9-THC nor cannabidiol precipitated abstinence in these rats. The results indicate that delta-9-THC may be worth studying in narcotic detoxification situations.

Mechanism of Action

The precise mechanism by which cannabis exerts its various pharmacologic effects is not known. Burstein (5, 6) found that delta-9-THC reduced prostaglandin formation by inhibiting prostaglandin synthetase. Other cannabinoids also have this effect, as does olivetol, from which delta-9-THC is synthesized. Many prostaglandins exist, and it will be necessary to determine what effect the cannabinoids have on the various fractions. Prostaglandin inhibition would explain a number of the physiologic actions attributed to cannabis such as the intraocular pressure reducing and bronchodilating effects.

The influence of cannabinoids on neurotransmitters has been examined, but the results are inconsistent. Banerjee et. al (2) have shown that the psychologically active cannabinoids and cannabidiol are potent inhibitors of norepinephrine, dopamine, serotonin and GABA in vitro, while the cannabinoid-biogenic amines relationship is undoubtedly much more complex. Drew and Miller (14) believe that cholinergic dominance best explains the mental effects. Monoamine oxidase inhibition of the various cannabinoids is also beginning to be studied.

Summary

The further study of the cannabinoids for various therapeutic applications seems worthwhile. Numerous synthetic cannabinoids have begun to appear; these do not have the disadvantages (insolubility, undesired psychic effects, instability) intrinsic in the naturally-occurring ones. Therapeutic efficacy may also be enhanced by molecular manipulations. Thus, it is likely that if any cannabinoid achieves clinical acceptance, it will be a synthetic.

Findings of importance are: 1) the wide safety margin between effective and lethal doses, of cannabinoids; and 2) that in many instances the mechanism of action appears to differ from the medication commonly employed. The hemp plant and its derivative chemicals turn out to be neither the best nor the worst of substances. Like everything else it should be used for its beneficial effects and avoided for its noxious aspects.

SUBJECT INDEX

abstinence syndrome, 72, 73, 91 (see also withdrawal syndrome)
academic performance, 7, 89
acetylcholine, 40
activity and exploration, 52-53
acute brain syndrome (toxic delirium), 88
acute effects, 4, 78-90
acute panic anxiety reaction, 6-7, 87
adolescent use, 2, 3, 10-16
adult use, 2, 3, 10, 16, 17, 18, 19
aerosolized delta-9-tetrahydrocannabinol (THC), 121-122
aggressive behavior, 4, 37, 54-55, 90 (see also competitive aggression, human aggression, isolation-induced aggression, predatory aggression and stress-induced aggression)
alcoholism, treatment of, 8, 117, 119, 126
amotivational syndrome, 6, 7, 88-90, 92, 118
analgesic effect, 8, 37, 41, 71, 85, 117, 118, 119, 120, 124-125
angina, 4, 39, 80
anticonvulsant effects, 8, 23, 34, 37, 38, 41, 117, 119, 122-123
antidepressant effects, 8, 117, 120, 125
antiemetic effect, 8, 9, 117, 120, 126
antimuscarinic effects, 80, 122
antinauseant effect, 120, 126
antitumor agent, 112, 117, 123
assay techniques, 24, 25, 27, 78, 120 (see also chromatography, free radical immunoassay, gas chromatography, gas-liquid chromatography, high pressure liquid chromatography and thin-layer chromatography)
asthma, treatment of, 8, 9, 80, 117, 119, 121 (see also bronchodilation)
auditory effects, 5, 85
aversive control, 61-62
avoidance learning, 61

bait shyness, 62
benzopyrans, 37, 117, 120
beta-adrenergic, 80, 81
blacks, use of marihuana, 16
bradycardia, 39
bronchodilation, 4, 118, 120, 121-122

cannabichromene (CBC or CBCH), 25, 33 34, 35, 53, 62, 110
cannabicyclol, 110
cannabidiol (CBD), 3, 24, 25, 27, 33, 34, 35, 37, 38, 41, 51, 53, 54, 62, 63, 64, 71, 73, 79, 109, 110, 122, 127
cannabigerol (CBG), 62
cannabinoid interactions with non-cannabinoids, 33, 42, 79
cannabinoid interactions with other cannabinoids, 33, 41-42, 51-52, 79
cannabinol (CBN), 3, 23, 24, 25, 26, 27, 37, 51, 52, 53, 54, 64, 79, 109, 119
cannabis resin, 26
Cannabis sativa L., 24, 118, 119
cannabisativine, 24
carcinogenicity, 36
cardiovascular effects, 4, 34, 35, 39, 77, 79, 83
cell-mediated immune response, 83, 109-112
central nervous system, accumulation of cannabinoids in, 34
central nervous system, effect on, 34, 35, 37, 38, 39, 82-83
chemistry of marihuana, 23-24, 78
chromatography, 24, 25, 79 (see also assay techniques, gas chromatography, gas-liquid chromatography, high pressure liquid chromatography, thin-layer chromatography)
chromosomes, effects on, 8, 8, 107-109
chronic animal effects, 71-73
chronic human effects, 90-93
college student use, 2, 3, 14
Columbia University, 12
competitive aggression, 55
consummatory behavior, 53
contingent negative variation (CNV), 83

SUMMARY *

Extent and Nature of Cannabis Use in the United States

The best current data indicate that approximately one in seven Americans twelve years of age or older has made some use of marihuana. Although more definitive data on a nationwide sample of the general population will not be available until Spring, 1975, present indications are that use has not changed appreciably in the general population since it was last reported in the third Marihuana and Health Report.

Overall estimates of national use mask the widely varying trends and levels of use by various subgroups and by regions of the United States. For example, there is some evidence that use among high school and junior high school students continues to increase though perhaps at a slower rate than in previous years. There are also wide geographical differences in the number who have tried the drug. Almost one in four living on the West Coast has used marihuana while in the South less than one in fourteen has done so. Studies of use in the various states also reflect wide regional variations.

A recent follow-up study of a nationwide sample of high school senior boys whose drug use was first explored in 1969 reveals a marked increased in the nonusers who have used since then. In 1969 only 20 percent had experimented with the drug; by 1974, over 60 percent had done so.

Adolescent drug use, like that of adults, differs markedly by geographical area. Over three times as many teenagers have used marihuana in the West as have used in the South (23.5 percent vs. 7.0 percent).

One West Coast county high school population has been of particular interest because it is an area of extensive drug use for which unusually complete trend data are available for the past six years (1968-1974). Use has continued to increase over the six year period. While only a little over a quarter of the male high school freshmen in the 1968 survey had used marihuana during the previous year, almost half had done so by the time of the Spring, 1974 survey. Although this represents nearly a two-fold increase of users in this relatively young group, it is also noteworthy that this was the first

* "MARIHUANA AND HEALTH" Fourth Report to the U.S.Congress from the Secretary of Health, Education, and Welfare, 1974.

year since the survey was begun in which a slight (2.6 percent) decline was noted in the freshman age group. At the time of the first survey (1968) use by senior girls lagged significantly behind that of boys (32 percent vs. 45 percent) but by 1974 the two sexes reported having used almost equally (62 percent for boys vs. 58 percent for girls). Generally, the rate of increase in use appears to have slowed since 1971 although total use continues to increase in this high use county.

Three state surveys of general population use illustrate the marked regional differences in use patterns. In Pennsylvania 22 percent of those fifteen or over had ever tried marihuana while in Minnesota and South Carolina the proportions of a similarly aged sample were 12.5 percent and 7.8 percent respectively. As in other nationwide surveys, regular users made up half of those reporting having ever used.

Cannabis use by college and university students continues to be extensive although there are marked regional variations in this age group similar to those found among high school students.

Serious doubt has been cast on the general belief that college students use marihuana to a greater extent than their noncollege attending peers. One major follow-up study of young men first studied while high school students has found that use, at least during the first year following high school graduation, was virtually identical in both groups.

In the general population about half of those who have ever tried the drug are not currently using it. However, among those who have continued to use marihuana, over half do so once a week or oftener and about one in five does so on a daily basis.

New light has been shed on some of the influences involved in continuing or discontinuing marihuana use. Attitudes approving social deviance, social support for drug use, friends' approval of such use and lack of church attendance are some of the factors predictive to some degree of marihuana use among high school students. "Openness to experience" was an important predictor of use in those not yet users. In one study, most heavy marihuana users on the college level have reported that they do not use in situations where control of behavior or concentration is required.

The most significant factors related to the cessation of marihuana use by former college users have been found to be the development of commitment to nonstudent roles, family and job constraints and increasing social isolation from other users. Age per se was not a significant factor.

Previous editions have discussed in detail marihuana and its relationship to the use of other drugs. Prior use of alcohol and tobacco in youthful groups is closely associated with later cannabis use. Contrary to popular opinion, there is little evidence to support the contention that marihuana use displaces the use of alcohol and other drugs. Those who use marihuana are also likely to use alcohol -- often simultaneously. Moreover, marihuana users as compared to nonusers are more likely to use or have used other, both licit and illicit, psychoactive drugs. The more heavily a user smokes marihuana, the greater the probability he has used or will use other drugs. It has been suggested that such use is related to "drug use proneness" and involvement in drug using subcultures rather than to the characteristics of cannabis, per se.

Preclinical Research

The preclinical findings of greatest interest and potential significance during the past two years have been a series of studies indicating that delta-9-THC (and possibly other marihuana constituents) have an effect upon certain basic cellular mechanisms which involve the uptake of amino acids and the nucleotides into primary nuclear components such as DNA. Since this may interfere with basic biological processes, the preliminary data raise the possibility that the effects of marihuana, under some circumstances, may be more widespread in the organism than has been previously thought. While many other substances from aspirin to antitumor agents show some of these effects, few are as fat soluble and, therefore, are retained as long in the body.

Initial studies, which will require considerable replication and follow-up before their significance is clear, have described possible adverse immunologic and genetic implications as well as potential therapeutic applications. While such possibilities exist, there is as yet no direct clinical evidence confirming them. No human research has been reported which demonstrates that disease

resistance is significantly impaired by marihuana use; studies of possible genetic damage have thus far shown contradictory results.

Understanding of the chemistry of marihuana and of its constituents has continued to advance. While much of this knowledge is primarily of interest to the specialist, it is worth noting that many other ingredients, in addition to the principal psychoactive ingredient, delta-9-THC, may play a role in the drug's effects and its duration of action. Constituents, such as the other primary cannabinoids and metabolites, may serve to modify various aspects of the drug's action and may also have other biological roles. By better understanding the complex chemistry of marihuana's constituents we can better understand the implications of its use and the mechanisms of its effects.

Forms of liquid hashish called hashish oil have come into illicit use since the last report. Their potency, reportedly ranging from 22 to 70 percent delta-9-THC, is significantly greater than that of the usual hashish previously available (usually not greater than 10 percent delta-9-THC). Since hashish oil has not yet come into widespread use, the implications of its use have not yet been investigated. However, availability of a much stronger cannabis preparation might be expected to make adverse effects more likely.

New and improved methods for detection and quantification of marihuana and its constituents in body tissue and fluids have been an important aspect of recent developments. While many of these are quite sensitive, unfortunately they are not yet simple enough for routine medical use or inexpensive wide scale screening. Development of simpler procedures remains an important goal which has significant research, clinical and forensic implications.

Animal experimentation with marihuana and synthetic delta-9-THC continues to be a valuable tool in understanding possible toxic and other effects in man, the drug's interactions with other drugs and the mechanisms of action of cannabis.

New data on the effects of marihuana on human lung explants (lung tissue grown in artificial tissue culture) continue to indicate a variety of changes in DNA synthesis, cell division and growth. Whether such changes have implications for humans similar to those produced by tobacco smoke remains in some question. Animal

studies of chronic marihuana smoke inhalation are in progress and should yield better answers to this important question.

Two aspects of delta-9-THC which have recently been investigated may prove to be of importance in future therapeutic application of the drug. There is a preliminary evidence that delta-9-THC delays rejection of skin grafts in rats suggesting a possible usefulness in organ transplant surgery. A second aspect, the inhibition of solid tumor growth in mice, may also eventually prove therapeutically useful in the treatment of human tumors. It should be reemphasized that this preclinical work is highly preliminary and the treatment possibilities are only speculative at this time.

Previously reported anticonvulsant effects of marihuana in animals have now been corroborated by several investigators. However, this antiepileptic property of cannabinoids is nonpersistent because of tolerance development. This, coupled with the psychoactive properties of the drug, casts into doubt the potential therapeutic use of cannabis or its synthesized constituents as effective human anticonvulsant agents.

Preclinical Behavioral Effects

One interesting finding in animal behavioral studies is that marihuana (at least in short term administration), in a variety of animal species has been found to reduce expressions of aggression. This observation is consistent with the widespread clinical impression that marihuana in humans, unlike alcohol, tends to reduce aggressive behavior rather than to potentiate it.

Animal studies to date also suggest that in order to develop behavioral tolerance to the effects of marihuana (i.e., the ability to compensate for the disruptive effects of intoxication), it is necessary for the behavior to be practiced while the animal is intoxicated. Thus, contradictory experimental findings reported in man may be partially attributable to behavioral mechanisms -- learned compensatory responses while under the drug's influence -- rather than pharmacological ones.

Although tolerance to many of the effects of marihuana has been convincingly demonstrated in animals and there is evidence of it

in humans, dependence has not typically been found in animal experimentation. Most research has found animals reluctant to self administer natural or synthetic material or to consume it in food or water when alternatives are available. Two groups of investigators did, however, find some evidence of physical dependence following prolonged drug administration. Since there is now some preliminary evidence of possible withdrawal symptoms following heavy use, the possibility of physical dependence will continue to be carefully investigated in further animal research.

Human Research

Acute Effects

Studies on the acute effects of marihuana and its major ingredients have continued. Such research is useful in learning the role various marihuana constituents play in producing psychological and biological effects or in modifying the effects of marihuana's more active components. Two of the most abundant cannabinoids are cannabidiol and cannabinol. Neither was found to have effects in itself although a possible interactional role with delta-9-THC, the major psychoactive ingredient in natural marihuana, has not been ruled out. Delta-8-THC, another constituent of cannabis, has been found in human trials to have effects qualitatively similar to, though quantitatively less than, delta-9-THC. 11-hydroxy-delta-9-THC, believed to be the major metabolite of delta-9-THC, has been found to be active by three groups of investigators. The question of whether delta-9-THC acts primarily through its conversion to this metabolite has not yet been resolved. Research on the metabolic aspects of marihuana and its various constituents has helped elucidate some of the possible mechanisms of action of the drug. These data will also be useful in anticipating and explicating possible interactive effects of cannabis with other commonly ingested drugs.

One report on the effect of marihuana ingestion on the electrocardiograms of a small sample of young men expressed concern about possible effects on heart action, both acutely and on a cumulative basis. However, the observed effects were not replicated in a second study and may represent a benign, temporary stimulating effect of the drug rather than any seriously adverse effect on cardiac function; further clarification is required. Previous Marihuana and Health

Reports have expressed concern that the effects of marihuana -- thus far explored principally in relatively young adults -- might be of greater consequence in older, less healthy groups. At least one study of patients with clearly established coronary artery disease has found that chest pain (angina pectoris) was experienced sooner after exercise and after less work while smoking marihuana than while smoking an inactive placebo. Thus use of marihuana by those with coronary difficulties may be especially unwise.

Another study testing whether marihuana can alter physiological response to stress found that with moderately high doses response to experimentally induced stress was not reduced.

Several investigations of the acute effects of marihuana on brain electrical activity have been conducted. These electroencephalographic studies tend to provide objective support to users' assertions that, when intoxicated, they tend to selectively attend to particular aspects of the outside world. Alcohol, by contrast, was interpreted as having a generalized suppressive effect on brain arousal.

A variety of studies further confirms the fact that marihuana impairs short-term memory processes while the user is intoxicated. This impairment appears to involve the transfer of information from short-term memory to longer term memory storage.

Because of domestic restrictions on research involving the experimental administration of cannabis to women, there has not been systematic comparison of effects on males and females in the United States. However, Canadian investigators -- employing a wide range of intellectual and psychomotor tasks -- have found few differences between the sexes in their performance under conditions of acute intoxication.

Cannabis and Driving

Evidence that marihuana has a detrimental effect on driving performance, especially as the dose increases, continues to mount. It has been found to increase both braking and starting times, to adversely affect attention and concentration abilities and to detract from performance on a divided attention task, all of which are presumably involved in driving. A recent Canadian study of driving ability while marihuana intoxicated examined drivers' performance under both driving course and actual traffic conditions. A significant

decline in performance as measured by several criteria was found in most drivers tested. Based on the accumulated evidence, it seems clear that driving while under the influence of marihuana is ill-advised.

Genetic and Reproductive Aspects

The third report on Marihuana and Health indicated that "there continues to be little evidence from human case reports and research studies that cannabis preparations have either a significant teratogenic effect or have any significant effect on chromosome breakage." In one more recent study of marihuana users an increase in chromosomal abnormalities was found while in another study utilizing known dosages of pure cannabis preparations no drug-related increase was found. These contradictory data may reflect methodological and sampling differences and considerable uncertainty exists regarding the possible significance of these chromosome breaks. Hopefully, the present uncertainty will be clarified by ongoing or newly designed studies such as those looking at chromosomal number and DNA metabolism.

Chronic Effects

While tolerance to the effects of marihuana has not been generally observed among American users, there is increasingly convincing evidence that tolerance (i.e., larger dosages required to produce the same effects originally found with lower dosages) does develop under conditions of heavy, regular use. Given the relatively low doses and infrequent use typical of present patterns of use in the United States it is not surprising that tolerance has not usually been observed. One report based on a study of subjects in a hospital setting (receiving relatively large amounts of THC) describes an abstinence syndrome occurring following abrupt withdrawal of the drug. This withdrawal syndrome is reportedly characterized by sleep loss and disturbance, irritability, restlessness, hyperactivity, decreased appetite, sweating, sudden weight loss, increased salivation and increased intraocular pressure. While the amounts involved were usually large and quite atypical of current use patterns, the possibility of a withdrawal syndrome in at least some American heavy users must be considered.

Preliminary evidence in one study of chronic American marihuana smokers indicates that levels of the male hormone testosterone

may be lowered in chronic users. This study reported that six of the twenty young men studied had reduced evidence of fertility (lowered sperm counts) and two were impotent. Testosterone levels in this group were significantly lowered though they remained within what are generally regarded as normal limits, and promptly increased upon discontinuing marihuana use. Preliminary findings from two other studies of young male subjects were inconsistent; one found a depression in serum testosterone levels, another did not. The significance and implications of these findings will require further study. It has been speculated that depressed testosterone levels in young boys may affect adolescent development, or that marihuana consumed regularly during early pregnancy -- while sexual differentiation is occurring in the male fetus -- may adversely affect its development. There is, however, no empirical evidence to this effect at present.

The possibility that regular, heavy doses of marihuana may result in a diabetic-like response has been suggested by preliminary research, but is quite tentative and requires further investigation. There is no clinical evidence as yet of marihuana-precipitated diabetes.

While chronic users in the United States have used for appreciably shorter periods of time than users overseas, studies of American chronic users are potentially of great importance in assessing possible implications of marihuana use for the American population. In one large scale study of undergraduate student use comparisons were made between nonusers (including those who had done a limited amount of experimentation), occasional users and chronic users (those who had used three or more times a week for three years or more or for two years if use was almost daily). No statistical differences in academic performance were found nor was there any evidence of reduced motivation. It should, of course, be noted that some chronic users who dropped out may have been excluded. As yet, however, there is no evidence that in a college population use is typically accompanied by impaired performance or motivation. Another study of moderately using medical students who had used regularly for three or more years and who were matched with non-using medical students for intelligence, found no difference on an extensive battery of neuropsychological tests.

It should be kept firmly in mind that most research on American users involves samples of motivated groups using only modest

amounts of cannabis (by overseas standards) for limited periods of time. Overseas studies of longer term, heavier using groups have been limited to small samples. Rarer consequences of use or more subtle impairment which may be significant in a highly urbanized, industrial society may have escaped detection in these agrarian cultures.

Cannabis and Psychopathology

To date, well controlled studies demonstrate few differences in psychopathology in carefully matched samples of users and non-users. However, a series of clinical and case reports associating marihuana use with a wide range of psychiatric symptomatology has appeared. The question of a causal role of cannabis still remains largely unresolved. Most such studies have reported on small self-selected samples many of whom were consuming other drugs in addition to marihuana. Previously reported (Cf. earlier editions of Marihuana and Health), larger scale studies in countries where cannabis use is endemic which have described intellectual deficit or psychopathology associated with cannabis use have been poorly controlled, confounded by multiple drug use and used dubious diagnostic methods. Observations made in the last Report continue to appear sound. Serious psychiatric complications of use seem to be most common in those with a previous history of psychopathology who consume large doses of cannabis or inadvertently overdose. More recent findings tend to confirm the observation that American marihuana users who use heavily are somewhat more likely to come from populations with a higher pre-existing risk for psychiatric problems than has the general population.

Therapeutic Aspects

Cannabis has had a long history of use in native medicine to the present day, and in Western scientifically based medicine until supplanted by other more uniform and/or convenient drugs. More recently, with its investigation as a drug of abuse, has come a renewed interest in it and its synthesized constituents for use in modern medicine. It is too early to know which of the several applications that are being made of the drug will prove to be ultimately useful. While cannabis is a drug of very low toxicity it has, at the same time, limitations due to the psychological effects and possible tolerance to its effects developing over time.

A preliminary study of the possible therapeutic use of marihuana has explored several possible facets of the action of THC with a group of cancer patients. This preliminary work suggests that THC may be valuable in reducing the need for other pain reducing drugs in acting as an anti-emetic, in retarding weight loss and for its tranquilizing and mild mood elevating properties. Whether these initially observed effects will prove useful over more extended periods of use with larger numbers of patients is not known at this time. It is, however, reported that the side effect of intoxication sought by street users was not troublesome -- it was not experienced by the patient sample studied. The researchers interpret this as an indication of the importance of personal expectation (the "set" of the user) in determining one's subjective response. It is noteworthy that Jamaicans who use the drug primarily as a work adjunct and to relieve the discomfort of arduous conditions also do not characteristically report the "high" sought by American recreational users.

Other investigations have studied the use of cannabis or its constituents for such diverse purposes as the treatment of glaucoma and asthma, as a sedative, as a possible analgesic, as an anticonvulsant and as an antidepressant. While preliminary findings in the treatment of glaucoma and asthma have been encouraging, further clinical trials are needed and the drug's usefulness may be limited by several factors including the development of tolerance to its effects. Some investigators report that breathing efficiency assessed by measures other than bronchodilation is actually impaired. This finding also casts doubt on the clinical usefulness of marihuana in treating asthmatics. The drug's sedative potential is questionable because of its interference with normal sleep patterns, some "hangover" effects and mild insomnia following its discontinuance. Recent animal research, while confirming the antiepileptic property of the drug in short term use, suggests that the effect is nonpersistent unless the dosage is increased over time. Results to date have shown no indication of effectiveness in the treatment of more seriously depressed patients. Finally, recent animal research discussed elsewhere (Cf. Preclinical Research) raises the possibility that marihuana may have some usefulness in facilitating organ transplants and in the treatment of some types of tumors.

[From the Hospital Physician, December 1975]

DEBUNKING THE MARIJUANA RESEARCHERS

(By Edward M. Brecher[1])

Many housestaff physicians no doubt assume that making a significant contribution to the medical sciences is a long and arduous process, requiring years of preparation. This may be true of other fields; but *marijuana* research is different. You don't even have to follow the simple rules of evidence you learned as a first-year medical student to turn out a paper publishable in *The Lancet* or the *New England Journal of Medicine*—if the paper purports to show that marijuana is a dangerous drug. Here, in four easy lessons, is a guide to instant success.

LESSON NO. ONE—POST TOKE ERGO PROPTER TOKE

Pick almost any pathological condition or syndrome and ask patients who exhibit the condition whether they smoke marijuana. If you can find 10 marijuana smokers in your sample, you have a publishable contribution to the world's scientific literature.

One pioneer example of this approach appeared in *The Lancet* back in 1971. It was a study by Dr. A. M. G. Campbell, an eminent English neurologist, on 10 cases of cerebral atrophy among marijuana smokers.

The evidence that all 10 in fact suffered from cerebral atrophy was unchallengeable; indeed, *The Lancet* reproduced air encephalograms establishing the diagnosis beyond doubt. But the etiological role of marijuana in the atrophy was less rigorously established.

Four of the 10 patients, for example, had suffered significant head injuries. One had had convulsions *before* he smoked his first joint. All 10 had taken LSD, and varying numbers had taken other drugs, barbiturates, amphetamines, morphine, heroin—as well as marijuana. Alcohol is known to produce cerebral atrophy; the alcoholic intake of the ten patients was not stated. Just why the cerebral atrophy should be attributed to marijuana rather than to these or other possible antecedents was nowhere made clear.

In other research fields, of course, the Campbell paper would be cited as a superb example of the *post hoc ergo propter hoc* fallacy—the fallacy of assuming that because B follows A, A must be the cause of B. But in marijuana research, *post toke ergo propter toke* is not a fallacy; it is a standard operating procedure.

Finding 10 cases of cerebral atrophy among Librium or Valium takers, or among margarine eaters or cider drinkers, will not earn you an instant reputation as a promising young scientist. Only marijuana and a few other illicit drugs offers this opportunity. Don't expect scientific kudos or publicity in the lay press, moreover, if your study concludes that marijuana does *not* produce damage. Surely *The Lancet* would have rejected the Campbell paper out of hand if it had been based on ten air encephalograms showing long-term heavy-dose hard-core potheads with *undamaged* brains.

---

[1] Edward M. Brecher is a well-known author and lecturer whose major areas of expertise include licit and illicit drugs, sex research, and health care delivery systems.

Together with his late wife, Ruth, Brecher has authored more than 250 articles, in both lay and professional journals. He is a regular lecturer at several medical schools.

Brecher has been the recipient of the Albert Lasker Memorial Award for medical writing, the "Ellie" award of the American Society of Magazine Editors, and the George Polk Award for Outstanding Magazine Writing. He is the senior author of Licit and Illicit Drugs: The Consumers Union Report on Narcotics, Stimulants, Depressants, Hallucinogens, Inhalants, and Marijuana—including Caffeine, Nicotine, and Alcohol. Other books to his credit are An Analysis of Human Sexual Response (with Ruth Brecher), The Sex Researchers, and Methadone Treatment Manual. His most recent efforts, due to be published shortly by the U.S. Government Printing Office, is Health Care in Correctional Institutions.

83-317 O - 77 - 59

LESSON NO. TWO—ESCALATE THE DOSAGE

Undergraduate medical students learn early in their studies the importance of the *dose-response curve.* You can kill even a healthy patient, after all, with sufficiently massive doses of H_2O, sodium chloride, or other common substances. Sound procedure requires that you administer a drug at several different dosage levels and report how the response varies with the dose. In marijuana research however, no dose-response curves are demanded. You need only select a dose of marijuana enormous enough to produce damage, and then report that damage has indeed occurred.

Exhibit A for this lesson in dosage escalation is a study by Dr. Robert C. Heath at the Tulane University School of Medicine in which electrodes were implanted deep in the brains of six rhesus monkeys so that their electroencephalograms could be recorded before, during, and after exposure to marijuana smoke. EEG changes were in fact noted, following both acute and chronic exposure.

Impressive evidence? Perhaps. But the dose Dr. Heath used to demonstrate acute effects was roughly equivalent to the smoking of 100 marijuana cigerettes at a single session. To demonstrate chronic effects, Dr. Heath gave his monkeys the equivalent of 30 joints per session, three sessions a day, five days a week, for six months.

Don't be afraid, moreover, to use this dose escalation approach with *human* subjects. Here is an advertisement which appeared in an underground San Francisco newspaper, the *Bay Guardian*, in April 1974:

Subjects Needed

> To participate in a government-sponsored research project to study the effects of marijuana. To participate you must be male, between the ages of 21–35 years, and have used marijuana on a regular basis. The study involves living on a closed psychiatric ward and receiving dosages under close supervision.

This study was under the supervision of Dr. Reese T. Jones of the Langley-Porter Neuropsychiatric Institute in Berkeley. The research was financed by a $350,000 federal grant. Volunteers accepted for the experiment were paid $25 per day and were given oral doses of delta-9-THC, believed to be one of the major active ingredients in marijuana, in capsule form six times a day for three weeks. Dosage totalled 210 milligrams of THC per day.

How much marijuana would a pothead have to smoke to get the equivalent of 210 mg. of oral THC daily? Opinions differ. It is commonly thought that a typical "street" joint weighs about half a gram and contains about one percent THC; such a joint contains 5 milligrams of THC—not all of which, of course, reaches the blood stream. Dr. Sanford Feinglass estimates that the dosage used in the Langley-Porter experiment equalled the smoking of 168 joints per day. Dr. Jones himself has been quoted as saying it was equal to "only" eight to ten "good San Francisco joints" per day. Another authority believes that a head would have to "smoke one joint every seven minutes throughout a 24-hour period to equal the 210-mg. THC dose." All hands agree that 210 mg. is *not* the usual daily dose even for inveterate pot smokers who stay stoned all day long.

The report on the Langley-Porter experiment has not yet been released. When it is, expect another rash of "marijuana is dangerous" headlines.

LESSON NO. THREE—DON'T WORRY ABOUT SAMPLE SIZE

In May 1974, Dr. Akira Morishima of Columbia University's College of Physicians and Surgeons reported to the Internal Security Subcommittee of the United States Senate that the chromosomes of marijuana smokers differ markedly from the chromosomes of controls. "It seems logical to anticipate," he added, "potential danger in (the) immune defense system, development of cancer . . . genetic mutation and birth defects" as a result of chromosome defects among marijuana smokers.

Dr. Morishima's May 1974 report was based on a comparison of the chromosomes of three marijuana smokers with those of three controls. This lesson that sample size is irrelevant in marijuana research is one that should save future researchers many arduous hours of travail.

LESSON NO. FOUR—STUDY TESTOSTERONE

There are few human parameters which show greater lability than the serum testosterone level. Enormous variations occur from month to month, from day

to day, and even from hour to hour—with no known cause and no visible effect.

In one classic experiment undertaken as part of his M.D. thesis, Dr. C. A. Fox checked testosterone levels of one subject (perhaps himself) each morning at 10 a.m. over a 43-day period. One fine morning, the level was above 450 ng. per 100 ml; the next morning it was barely 200 ng.; two mornings later it was down to 120 ng.—and the next morning it was back to 450 ng. again, with no apparent explanation and no effects noted for either the fall or the rise. On another occasion, the serum testosterone level inexplicably soared from less than 200 ng. one morning to more than 500 ng. the next morning. With such inherent lability, the odds are good that you can prove almost anything about serum testosterone levels.

Nor does *averaging* the levels eliminate the apparently causeless and effectless variations. During the initial Fox study, the 10 a.m. serum testosterone levels varied from 145 to 565 ng. with a mean of 321.5 ng. over a 43-day period. When the study was repeated on the same subject over another 43-day period six months later, the range was from 269 to 717 ng. with a mean of 440 ng. No explanation was available for the 37 percent rise in mean testosterone levels.

Hour-to-hour levels are similarly capricious. Thus in a study which checked levels at 15-minute intervals, one subject sitting quietly in a room suffered a fall in serum testosterone from 628 to 410 ng. per 100 ml. in three hours for no apparent reason; another showed a similarly inexplicable rise from 286 to 438 ng. in two hours while similarly sitting quietly in the same room.

The above fluctuations occurred in individual subjects. When different subjects are compared, even more startling variations are found. Thus in one study of 16 apparently normal, healthy, young males, levels varied from 246 to 785 ng.; in another study of 23 normal, healthy, young males, levels varied from 260 to 770 ng. Why? Nobody really knows. Such lability makes it possible to prove—or disprove—almost any hypothesis with a little luck and very little effort.

In 1971, for example, Dr. Robert C. Kolodny and his associates at the Reproductive Biology Research Foundation in St. Louis (the Masters-Johnson research center) reported that 20 homosexual males had significantly lower serum testosterone levels than 20 heterosexual controls. A subsequent research team reported no difference in serum testosterone levels between homosexual and heterosexual males. A third team reported that homosexual males have *higher* serum testosterone levels than heterosexual controls. The next step, inevitably, was to study the testosterone levels of marijuana smokers.

Dr. Kolodny and his St. Louis associates were also first in the field with a report on 40 heterosexual males, for each of whom they made two serum testosterone determinations. Twenty had never smoked marijuana; they showed a mean serum testosterone level of 742 ng. per 100 ml. The 20 marijuana smokers in the study showed a mean of 416 ng. Those who reported smoking five to nine joints per week showed a mean of 503 ng. compared with 309 ng. for those who smoked 10 or more joints per week. The Kolodny report was published in the *New England Journal of Medicine.*

As might be expected, the Kolodny findings were soon challenged. Dr. Jack H. Mendelson of Harvard and his associates recruited 27 healthy males—12 "casual" marijuana smokers and 15 "heavy" smokers. The average serum testosterone levels, based on six successive daily determinations, were 988 ng. per 100 ml. for the casual smokers and 1115 ng. for the heavy smokers. "These values are in the upper range of normal adult levels and are not significantly different from each other," the Mendelson group noted.

The 27 volunteers in this Mendelson study were then locked up in a hospital ward, and for three weeks were given all the marijuana they wanted. The casual smokers averaged from one to four or five joints per day; the heavy smokers averaged from one to seven or eight joints per day. Testosterone levels did not fall. "Under controlled conditions," the Mendelson group announced, "high-dosage marijuana intake was not associated with suppression of testosterone levels when multiple plasma samples were obtained before, during, and after the 21-day smoking period." The Mendelson findings, like the Kolodny findings, were reported in the *New England Journal of Medicine.*

Thereafter, Dr. Kolodny and his St. Louis associates returned to the problem, recruiting an additional 20 marijuana smokers for further testosterone studies. Did these fresh recruits, like the first group of 20, show low testosterone levels? Here was Dr. Kolodny's chance to buttress his earlier findings. Since his second study has not yet beeen published, I wrote to ask him about it.

During the first two weeks following recruitment, Dr. Kolodny replied, the volunteers in his second study were instructed to refrain from smoking mari-

juana; and during the next 10 days, they were locked up in a hospital ward without access to marijuana. Then marijuana was supplied them. Serum testosterone testing was not begun until these first 24 days had elapsed. Thus no one will ever know whether this second group of marijuana smokers resembled Dr. Kolodny's first group with low testosterone levels or Dr. Mendelson's group with remarkably high testosterone levels. What a pity!

In the second Kolodny study, the 20 volunteers were locked up for three months in a hospital ward, and given five marijuana cigarettes of known potency daily after the first ten days. Serum testosterone levels began to fall after the fourth week, and continued to fall thereafter.

Here let me digress for a moment. While serum testosterone levels fluctuate capriciously from month to month, from day to day, and even from hour to hour in the same subject, and while they vary widely from one young, apparently healthy subject to another, a few factors are known to influence the levels. For example, sexual stimulation—such as viewing pornographic films—produces a significant rise in serum testosterone. So does sexual intercourse. In animal experiments, locking males up on close confinement together lowers testosterone levels, and the same may be true of human males. But the effects of sexual stimulation and sexual intercourse in humans have been documented only over periods measured in hours; nobody knows the effects of locking up heterosexual males together in a hospital ward, without sexual access to females, for periods as long as three months. Thus the Kolodny group had a golden opportunity to kill two birds with one stone. They could simultaneously have determined the effects of incarceration and the effects of marijuana on healthy young males.

To accomplish this, they need only have followed the elementary rule taught in high school science courses: *don't forget to include controls in a research protocol.* If they had divided their 20 volunteers into two groups of 10, and had provided only one of the two groups with marijuana, two outcomes would have been possible. Perhaps the serum testosterone levels of the marijuana smokers would have fallen while the levels in the controls remained stable. In that event, the fall could have been traced to marijuana with reasonable assurance. *But the second Kolodny study lacked controls;* hence there is no way of knowing whether the fall was due to incarceration or to marijuana.

If there had been controls, and if the serum testosterone levels in both the marijuana smokers and the controls had fallen, marijuana would of course have been exonerated. With only a slight further refinement, moreover, the study would have established the effect of incarceration on testosterone levels. The refinement would have been the taking of baseline levels when the volunteers were first recruited, so that each volunteer could serve as his own control in a comparison between levels before, during, and after incarceration. In the absence of both baseline levels and controls, the experiment proves nothing about either marijuana or incarceration. Even so, it made front-page headlines in the *New York Times* in September, under a headline reading "Male Sex Debility Traced to Marijuana." It was also featured in the Medicine Section of *Time.*

I could go on and on, but these four lessons are more than enough to prove my point. Research indicating that marijuana is a dangerous drug is the shortest route to scientific and lay recognition. Federal funding is available; and you don't have to worry about bothersome obstacles to research on other topics such as avoiding the *post hoc ergo propter hoc* fallacy, or preparing dose-response curves, or securing an adequate sample, or even dividing your research population into subjects and controls.

Year-Old U.S. Army Pot Study Surfaces

(By Milan Korcok)

A major study of the chronic use of marihuana, funded by the U.S. Army and conducted by Dr. Jack H. Mendelson of Harvard University, has been extracted from the military bureaucracy by the National Organization for Reform of Marihuana Laws (NORML).

The report, which cost the army $382,000, finds marihuana virtually benign in respect to any behavioral or biological risks of long-term use.

The abstract of the report lists these conclusions:

No impairment in motivation to work for money even when users smoked a large number of marihuana cigarettes.

Some decrease in work performance the day following heavy smoking, though "not biologically significant."

Some impairment of lung functions "closely related to the smoking process per se rather than to any pharmacological action of marihuana."

No change in testosterone level .(Suppression of testosterone might impair sexual or procreative function.)

Significant weight gain related to smoking marihuana.

No evidence that chronic marihuana use impaired cognitive or neurological function.

Some change in social and psychological factors associated with interpersonal responses, but not to the point of interfering with group behavior.

The report, which clearly substantiates many of the conclusions drawn in the Jamaica-Ganja study was discovered almost by accident when NORML filed requests with nine federal agencies for reports on any research being done on marihuana.

The request was filed under the Freedom of Information Act, designed to allow greater public access to data compiled with the aid of public funds.

The fact this report had been completed more than a year ago (September 1974) and had not been publicly released, or even referred to during that period of time, prompted NORML's executive director Keith Stroup to charge the army with a "cover up" because it "didn't like what was found."

"This is very important information and should have been disseminated. The work was paid for with tax dollars and the public should be told these findings immediately," said Stroup.

In fact, some of the results have been emerging via the scientific journal process. Dr. Mendelson's work on testosterone, funded by the army, has been reported. So has information involving comparative pharmacology of alcohol and marihuana, and relationships between marihuana use and motivation.

In response to NORML's charges, Col. France F. Jordan, executive officer of the Army Medical Research and Development Center which commissioned the study, said these studies do get into the medical journals but "everybody's too damned lazy to pick them up".

Stroup contends release of this data under one cover, in comprehensive form, might have made considerable public impact at a time when the marihuana debate was quite fervent.

Stroup, however, admits the army was "fairly responsive" to the NORML request, much more so than any other federal agencies, one of which reportedly requested a $300 fee to make a computer search of what was available.

In response to NORML's request, the army first sent summary sheets describing four different research projects being done.

"All we got back were one-page summaries," Stroup told The Journal. "But when we saw this one, a bell rang."

NORML subsequently filed a request to get the full report, but Stroup, who admits he was impatient with what he felt was a "runaround", released copies of the summary to The New York Times and the Washington Star

"We needed help so let a couple of journalists have the summary."

Within one week after news of the summaries appeared in the press (Oct. 4 and 5, full copies of the report were given to NORML.

The Journal's request for the report was filled immediately.

WHY WAIT?

The Army marihuana study (page 16) is an important contribution to our knowledge of cannabis.

Like the Ganja in Jamaica study it addresses a critical set of questions. But why was its release delayed?

NORML has charged the study was deliberately suppressed because the data did not support the position of the hawks.

Others might indulge in a bit of cynicism about the fact that as the anti-marihuana forces gathering about the Eastland committee in the summer and fall of 1974 were being given full media exposure, a report of this magnitude was sitting, gathering dust. Well, maybe.

The army is to be commended for sponsoring this research, and also for being the first government agency off the mark in responding to NORML's request for information.

But it does itself a disservice by failing to follow through so as to make information as widely accessible as possible.

[From the Journal of the Addiction Research Foundation, Toronto, Nov. 1, 1975]

U.S. Army Study Unveiled—Supports "Ganja Study" Findings

(By Milan Korcok)

The report on long-term ganja smoking in Jamaica has hardly had time to gather dust and now another massive study on chronic marihuana use has emerged.

Sponsored by the US Army at a cost of $382,000, and conducted by Dr. Jack H. Mendelson at the McLean Hospital Alcohol and Drug Abuse Research Center in Massachusetts, the report on behavioral and biological concomitants of chronic marihuana use strengthens many of the conclusions made in the Ganja report. (The Journal, September) and sheds light on areas not covered in the Jamaican studies.

In effect, chronic marihuana use among heavy and casual smokers monitored in a research setting showed none of the "amotivational syndrome" so long claimed to be an effect of smoking pot.

Furthermore, no significant changes were observed in physical and laboratory assessments following smoking, there was no evidence of any significant adverse effects on cognitive or neurological function, and there were no adverse changes in testosterone lvels as a result of chronic marihuana use.

The researchers noted some decreased capacity in work performance the day following smoking, but not to the point of being biologically significant. There aiso appeared to be some psychological changes that affected the way individuals interacted with each other, but not to the detriment of group behavior.

The researchers noted some impairment to lung function that prompted them to argue against use of this drug to persons with underlying pulmonary disease, though the changes could have been attributed to the smoking process per se. They also found significant weight gain among the smokers.

Several findings drawn from this body of research have already been reported.

THE DESIGN

The experimental design involved constant monitoring, in a research ward of McLean Hospital, of 27, tightly-screened heavy and casual users, who were given free access to marihuana in return for work performed.

The heavy users had been smoking marihuana for an average of 5.6 years, had started smoking while in their 17th year, and reported using the drug an average of 42 times a month.

The casual users had been smoking 5.3 years, had begun at 18 years of age, and had averaged almost 12 smoking occasions a month.

The subjects, four at a time, were put through a 31-day period—an initial five-day block during which they had no marihuana a 21-day block during which they could buy and smoke all the marihuana they wished, and a subsequent five-day non-marihuana period. They served as their own controls, with baseline tests being run on them during the non-marihuana periods.

The research ward was fitted out with individual bedrooms for the subjects, a common activity room, and examination facilities.

Work program involved a simple button pressing device. To earn points, subjects would press the device—each response spaced one second or more apart. Each press would signal a point, and every 1,800 points could be exchanged for 50 cents at the end of the study, or for a marihuana cigarette during the free-smoking period. Purchase of one cigarette required one half hour of sustained work.

Each marihuana cigarette, .09 grams, contained 2% THC. All smoking was done under supervision.

MARIHUANA USE, WORK, AND MOTIVATION

Though the marihuana literature is stocked with claims about the drug's depressant effects and its "amotivational" influence on behavior, such claims were not substantiated by the army studies.

Marihuana, in fact, interfered very little with work output. Both casual and heavy users often worked at very high rates both during and immediately after smoking. The peak smoking period (from 8 p.m. to midnight) was also the period of greatest work output.

Casual users averaged 2½ marihuana cigarettes per day, heavy smokers close to six.

The amount of smoking increased as the experiment went on, to the point that on the last smoking day, the heavy smokers actually consumed an average of 14 "joints" each. The subjects all knew ahead of time, it was to be their last smoking day.

Work outputs of both groups decreased the day following marihuana use. Heavy users showed less inclination to work the day after heavy marihuana use, and among casual smokers, the more they smoked the less they worked the following day.

The researchers, however, caution against too free a generalization of these findings, largely because of the potential influence on motivation exerted by the research setting itself.

As the experiment went on, sleep time increased, time devoted to work decreased, and there were some suggestions about boredom setting in.

"Under natural but uncontrolled settings, work output may not be significantly influenced," says the report. This clearly supports the major finding of the Jamaican study which showed that not only does marihuana NOT produce indolence, but also it is used with success to fuel the work ethic, and to encourage hard, tedious, repetitive work tasks.

TOLERANCE

Development of tolerance to the various effects of marihuana use has been a contentions area among researchers. Many studies have noted a tendency for consumption to increase after continued long-term use. This tendency has often been attributed to development of tolerance.

Tolerance to the subjective effect of smoking—the "high"—would induce the smoker to consume more and more to get a set level of intoxication. This rate of progression becomes important if it is ever conclusively proven that chronic marihuana use can be related to such physical damage as respiratory dysfunction, or to psychological dependence.

Using measurements of pulse rate as well as the subjects' own ratings of their "high", the researchers found the casual users (consuming between 15 and 30 mg of marihuana per day) showed no signs of tolerance developing. In effect, the "high" they were getting at the end of the smoking series was of the same intensity and duration as with their first smoke.

Among heavy users (consuming between 30 and 60 mg daily) the situation was different.

Pulse readings, and ratings of intoxication showed that as they progressed further into the smoking period, the intensity of high remained constant but the effect of each cigarette did not last as long. This was indicated by the fact that pulse readings immediately after a smoking period remained constant throughout the series, but 25 minutes after smoking readings tended to diminish as the studies went on.

What this essentially means, according to the researchers, is that "tolerance does not develop . . . to marihuana intoxication . . . unless rather heavy doses of delta 9 THC are administered repeatedly."

Taking it one step further, the researchers suggest the tendency of users to increase consumption over time, appeared not necessarily to be due to the development of any tolerance, but possibly to other psychosocial and environmental factors that would influence them to smoke.

Why did the subjects smoke more and more as the studies went on?

In their own words, because they were bored, because the drug was available, and because "being stoned helped me better tolerate the ward routine".

PHYSIOLOGICAL EFFECTS

Perhaps the most dramatic finding in respect to physiological consequences of smoking was that subjects gained an average of six pounds during the 21-day free-smoking period. (In the Jamaican study, smokers were an average seven pounds lighter than the non-smokers).

Of obvious concern to the researchers was the effect of smoking on lung function. Measurements of peak air flow showed significant increases in flow rate in 12 of 15 subjects—suggesting an acute, bronchodialtor effect of marihuana.

Another concern was that in presmoking baseline studies, six subjects showed decreased vital capacity. Since they had all been smoking marijuana for at least

five years, this finding suggested "perhaps there may be chronic, irritative, inflammatory or other pulmonary disruptive process related to long-standing smoking of marihuana."

TESTOSTERONE

The research study's findings that high dose marihuana did not suppress testosterone levels in either casual or heavy users is bound to add to an already exuberant debate between Mendelson and several other researchers, primarily Dr. Robert Kolodny of the Reproductive Biology Research Foundation in St. Louis.

Dr. Kolodny has reported marked reductions in plasma testosterone levels among marihuana users.

Other reports linking reduced testosterone and marihuana have suggested chronic marihuana use can lead to enlarged breasts in males, as well as loss of or impairment of sexual and procreative function.

But the Mendelson studies refute many of these conclusions, largely on the basis of methodological peculiarities.

The Army report says in the Kolodny studies samples were obtained on only two different days, usually a month apart. Yet, testosterone levels vary widely in males, says the report. Consequently, time and frequency of sampling are of major importance.

The Mendelson samples were done daily, throughout the course of the studies.

Mendelson is also critical of Kolodny's reliance on the subject's verbal recollection of drug use, and the failure to carry out urine screening to detect the possible presence of any other drugs.

"It is at least possible that suppression of plasma testosterone levels observed by Kolodny et al may be related to ingestion of substances other than marihuana."

COGNITIVE AND MOTOR TASKS

Use of marihuana among the casual and heavy users in the army studies has been shown to cause little impairment of cognitive and psychomotor activities.

Results of various assessments showed no cumulative marihuana-related changes and no acute marihuana effects on simple reaction time, perceptual flexibility, or psychomotor performance.

In respect to effects of use on short term memory and vigiliance, results were not so clear cut.

Although smoking did not have any residual effects on short term memory, the acute effects of marihuana did interfere with the casual users' performance. It did not affect heavy users in respect to short term memory.

According to the researchers, the findings suggest the effect of marihuana on the acquisition and storage phases of short term memory (which require attention), may be the crucial factor in its effects on short term memory performance.

THE GROUP

The only significant changes marihuana use exerted on the group process was that it induced the casual users to talk less and to retreat into their own thoughts more.

When intoxicated, the casual user showed he was more interested in his own thoughts than in those of others, but not to the point of abandoning the group.

Says the army report: "Although the absolute amount of interaction was reduced, intoxicated subjects generally did take part in the discussion, and their participation did not indicate they were incapable of communicating coherently and intelligently. Few anomalies in speech or expression were observed that could be related to marihuana intoxication."

Heavy users, on the other hand, showed no changes in respect to group behavior, except they seemed to laugh more.

It was said a little differently, certainly more lyrically, in the Jamaica-Ganja report which noted that those who prefer to smoke in a group usually go to the bush where they can enjoy "good and loving thoughts."

"I feel more merry, not lonesome."

Another big study finds no harm in 'grass'

Cannabis consumption investigated in Jamaica

Beginning with the Indian Hemp Drugs Commission Report in 1894, studies of the effects of marijuana smoking have produced controversy after controversy. Yet no large-scale study has ever actually found any serious harm in the practice.

The latest, an investigation commissioned by the National Institute of Mental Health, is no exception. The results of this study, done for the NIMH's Center for Studies of Narcotic Addiction and Drug Abuse and directed by Drs. Vera Rubin and Lambros Comitas of New York's Research Institute for the Study of Man, are only just now available in the U.S.

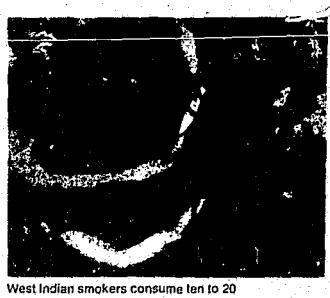
Conducted from 1970 to 1972 in Jamaica, West Indies, where marijuana smokers consume ten to 20 times more grass, called *ganja* in that country, than their American counterparts, the study was a collective effort involving researchers in fields as diverse as anthropology, pathology, sociology, medicine, psychiatry, and psychology. A preliminary report entitled "Effects of Chronic Smoking of Cannabis in Jamaica," was presented to the NIMH in March 1972, and a book on the findings, *Ganja in Jamaica*, was prepared by Drs. Rubin and Comitas. Because the text was published by a Dutch company, copies of *Ganja in Jamaica* have only recently arrived in this country.

The pattern of cannabis consumption in Jamaica is different from that of the U.S. Compared with typical American users who smoke only one or two "joints" a week, Jamaicans smoke a prodigious quantity of marijuana. One part of the report claims that the average Jamaican user smokes seven or eight marijuana cigarettes a day, and the potency of Jamaican ganja averages at least ten times more THC (Δ^9-tetrahydrocannabinol, the drug's chief active ingredient) than the typical Mexican marijuana smoked in the U.S. The widespread use and socially acceptable status of ganja creates another major difference between Jamaican and American use. Smokers are not considered deviant in Jamaica. Among the rural population, to smoke is to conform, whereas those who refrain from smoking are considered eccentric.

The clinical studies on the effects of chronic smoking were made by the faculty of the University of the West Indies and by the staff of the university hospital. Sixty adult working-class men—30 ganja smokers and 30 nonsmokers—were selected and admitted to the hospital for six consecutive days. Detailed medical histories were taken, and the examination included heart and lung radiology, ECGs, hematologic studies, treponemal serology, respiratory function tests, and chromosome studies. Urine and blood samples were forwarded to the U.S. for analysis of peripheral thyroid hormone levels and steroid excretion. Samples of ganja submitted by smokers were also sent to U.S. laboratories for THC analysis.

No significant physical abnormalities were found except in two smokers. One of these had a long history of bronchial asthma, and in the other the findings indicated a form of neuropathy. There was no evidence, however, to suggest that these disabilities were caused by ganja. In both groups blood pressures were normal, and x-rays showed normal hearts and lungs.

Minor ECG abnormalities were found in both smokers and controls. No significant variations were found in cortisol secretion or in peripheral thyroid hormone levels between smokers and controls, and the incidence of mild chromosome breakage was no higher than that found in other random chromosome studies at the University of the West Indies.



West Indian smokers consume ten to 20 times more marijuana than do Americans.

The major statistical differences between the two groups were in hemoglobin and monocyte count values and in post-exercise bicarbonate levels. Chronic heavy smokers of both tobacco and ganja were at greater risk of functional hypoxia, but it is suspected that this may result from the tobacco that is customarily mixed with ganja by Jamaicans.

The Jamaican study has been hailed by Raymond Philip Shafer, who headed President Nixon's National Commission on Marijuana and Drug Abuse, as the "first intensive, multidisciplinary study of marijuana use to be published." Dr. Sidney Cohen, former director of the Division of Narcotic Addiction and Drug Abuse at NIMH, feels that the Jamaican study is a valid one, but doesn't think that it has proved that chronic marijuana use is harmless. "Just as we didn't realize the relationship between tobacco smoking and lung cancer 100 years ago, we may someday find a correlation between marijuana and cancer. However, I find the study provocative—the medical profession should pay attention to it," he said.

Dr. Lester Grinspoon, associate professor of psychiatry at Harvard Medical School and author of *Marihuana Reconsidered*, regards the Jamaican study as significant because of its field nature. "But there are some cultural differences, and what is shown for rural Jamaicans isn't necessarily true for people in this country," he stressed. ■

[From Rational Drug Therapy, Vol. 9(7), July 1975]

What a Physician Should Know About Marihuanna

(By Jared R. Tinklenberg*)

Marihuana is a crude preparation of various parts of the Indian hemp plant, *Cannabis sativa*, which grows in most parts of the world. In the last two decades there have been marked increase in the non-medical use of this psychoactive plant and also greater understanding of its effects in man. This discussion summarizes our current knowledge of marihuana and emphasizes what a physician should know about its pharmocology.

Tetrahydrocannabinols (THC) and their metabolites are the principal active ingredients in marihuana and are responsible for most of the potency of cannabis preparations. Plant concentrations of THC vary widely depending on the geographical area where the plant was grown and methods of cultivation, harvesting, and curing. Plants grown in the United States have a low THC content and therefore produce relatively weak cannabis preparations.

Hashish is a potent cannabis preparation derived primarily from the thick resinous materials of the flowering tops and upper leaves that yield high concentrations of THC. Although THC can be synthesized, the cost of the procedure limits its production by this method. In different countries and even within a given country, the colloquial expressions for various cannabis preparations differ. In this article the generic term cannabis will be used to refer to all natural and synthetic preparations which contain THC and other cannabinoids. However the reader should remember that there is a great deal of difference in potency among preparations and thus in their clinical effects.

CLASSIFICATION

One of the difficulties in understanding cannabis is that it does not precisely fit into any of the usual pharmacological categories; its action varies considerably depending on the dose and time course of drug effects. In small doses, cannabis initially causes exhilaration, euphoria, heightened perceptions, and other effects similar to those induced by stimulants of the central nervous system, whereas later in the time action course, sedation usually becomes predominant. With larger doses, such as might be obtained with potent hashish, the effects of cannabis more closely resemble those of psychedelic drugs rather than of drugs of any other category. Although cannabis preparations are often legally and popularly classified as narcotics, their effects differ from those of heroin, opium, morphine, and other narcotic analgesics.

METABOLISM

In the United States cannabis preparations are most commonly smoked, but they are also ingested in the form of confections. With inhalation, about 50 percent or less of the smoked THC is absorbed and enters the pulmonary circulation; the rest is lost by inappropriate inhalation technique or is accumulated in pulmonary tissue. The onset of action of cannabis when inhaled is usually within minutes, peaks in 20 to 30 minutes, and ceases within an hour or two after cessation of smoking. After ingestion up to 95 per cent of THC is absorbed and the onset of effects occurs in about one hour, reaching a maximum in two or three hours and largely dissipating after four to five hours.

The THC molecules are rapidly metabolized into a variety of products that are quickly distributed to almost all parts of the body. The extremely low water solubility of the cannabinoids suggests that cannabis solubility in plasma may be easily exceeded so that there is accumulation in certain body tissues, such as fat, that are compatible with the extremely lipophilic cannabis molecules. Because these lipophilic characteristics are much stronger than with most other drugs in common use, even a single dose of cannabis is sequestered and eliminated slowly over the course of a week or more. During this prolonged retention, it is unclear whether the cannabinoids continue to exert biological effects. As with

*Dr. Tinklenberg is assistant professor of Psychiatry, Stanford University School of Medicine and the Palo Alto Veteran's Administration Hospital. During 1975, he was a fellow with the Drug Abuse Council, Washington, D.C.

many other drugs, the repetitive use of cannabis tends to accelerate metabolism and excretion.

In addition to its major psychoactive component, delta-9-THC, natural cannabis contains dozens of other cannabinoids which may have effects of their own or may modify the effects of delta-9-THC. Although these constituents are only beginning to be investigated, it appears that most of the clinically important effects of cannabis are the results of THC.

CELLULAR AND BIOCHEMICAL EFFECTS

A large dose of cannabis has a deleterious effect on certain basic cellular mechanisms that involve the uptake of amino acids and nucleotides into primary nuclear components such as DNA. This results in a variety of changes in DNA synthesis, cell division, and cell growth. Although other substances exert these effects, cannabis is virtually unique in being highly fat soluble and thus is retained within the body for long periods of time. However, as mentioned previously, it is unclear how long cannabis is biologically active; it may persist in the body primarily in an inert form. In addition, the clinical significance of these effects on basic cellular processes is unknown.

At dosages comparable to what is commonly used in the United States, no consistent effects of cannabis at a genetic or cytogenetic level have been demonstrated. The use of cannabis does not exert significant changes in the hemogram, electrolytes, blood glucose, free fatty acids, or other commonly obtained measures of body chemistry. Although glucose tolerance may be lowered by cannabis, clinical consequences are rare. Under certain experimental conditions, cannabis impairs the functioning of our component of the immune system, the T-lymphocytes, that are responsible for cell-mediated immunity. Consequences of this impairment in terms of altered susceptibility to disease have yet to be established. Since, according to skin patch testing, chronic smoking of cannabis does not cause gross immune deficit and since the few available studies do not indicate an increased incidence of disease (including infections or tumors) in chronic users of cannabis, the clinical significance of cannabis-impaired, cell-mediated immunity remains an important but unresolved issue.

Physiological effects. One consistent effect of cannabis is an increase in heart rate that is dose-related. This tachycardia, which seems to be mediated both by increased and sympathetic nervous system activity and by inhibition of the parasympathetic system, varies from 80 beats per minute to 150 or more. Any alterations in the electrocardiogram are usually minor nonspecific ST and T segment changes that may merely reflect the sympathomimetic action of cannabis and the increased heart rate. Cannabis usually has no significant effect on blood pressure, although orthostatic hypotension may occur.

Dilatation of the conjunctival vessels, which occurs regardless of the route of administration and creates the characteristic blood-shot eyes, is another invariable effect of cannabis. Other ocular changes include slight pupillary constriction, reduction in tear secretion, and increase in glare recovery time. A recent finding is that in some individuals cannabis decreases intraocular pressure, presumably by affecting both the inflow and outflow of aqueous humor. The clinical utility of this effect for the treatment for glaucoma is unclear, as is indicated below.

Bronchodilation in the absence of changes in respiratory rate is another acute effect of cannabis. Increased conductance with the use of cannabis, which stems from an increase in airway caliber, is diametric to the bronchoconstricting effects of tobacco smoke. However, as is often the case in clinical pharmacology, the effects of chronic smoking of cannabis are often not so salutary; rhinopharyngitis, sinusitis, asthma, and bronchitis have been reported in heavy cannabis smokers.

Most of the other physiological effects of cannabis are minor or inconsistent. Muscular weakness, increased deep tendon reflexes, fine tremors, and decrements in hand steadiness and body equilibrium are notable in some users. Certain users experience a marked increase in appetite, especially for sweets. Cannabis induces only minor changes in thresholds for pain but, as with many psychoactive drugs that alter attention, may under certain conditions decrease subjective complaints of pain. The effects of cannabis as reflected in electroencephalograms are inconsistent.

EFFECTS ON HORMONES

The short-term administration of cannabis has been reported to lower human plasma testosterone levels, but does not consistently affect plasma luteinizing hormone, follicle stimulating hormone, cortisol, or prolactin. Decreaes in growth hormone response to insulin challenges and decreased estradiol levels suggest that the lower testosterone concentration reflects altered central regulatory processes rather than impaired testicular capacity, although the precise mechanisms are undefined. Also unknown is the clinical significance of these findings. In most studies the total reduction in testosterone is not large, and thus the effects on potency, sterility, adolescent sexual development, sexual differentiation during early gestation, and other androgen-sensitive processes may not be appreciable. Further investigation is needed before conclusions can be drawn.

Possibly related to the cannabis-induced decrease in circulating androgens is the recent finding of gynecomastia in some adolescent users. Again, the importance of these findings is unclear since gynecomastia in adolescents may stem from various etiologies and direct links with cannabis consumption have not been firmly established.

PSYCHOLOGICAL AND BEHAVIORAL EFFECTS

As with most psychoactive drugs, there is wide individual variability in the psychological effects of cannabis and marked differences among individuals in awareness and interpretation of these alterations. The user's expectations of how cannabis will affect him and his prior experiences with the drug, if any, are important influences on drug effects. Initial effects of cannabis at low doses usually include euphoria, heightening of subjective sensory experiences, alteration in the perception of time, and induction of a relaxed laissez-faire passivity. With moderate doses, these effects are intensified by impaired immediate memory function, disturbed thought patterns, lapses of attention, and a subjective feeling of unfamiliarity. With higher doses of cannabis (as with most psychoactive drugs), behavioral effects are determined largely by the drug properties themselves and less by the psychosocial factors of setting. Very high doses induce changes in body image, depersonalization, and marked sensory distortion. Some individuals, especially those with limited experience in the use of cannabis, interpret these alterations as incipient psychosis and fear that they will become permanently "crazy." The user's mood may change from the usual pleasant lassitude to various degrees of anxiety, including rate incidents of panic and aggressiveness. These adverse reactions are similar in many respects to "bad trips" that may accompany use of lysergic acid diethylamide (LSD) and other potent psychedetic drugs. Bad trips occur much less frequently, are less severe, and are usually less prolonged with the use of cannabis than with the use of LSD. The treatment of these reactions is discussed below.

The effects of cannabis on behavior are usually related to dose and task complexity. The effects of low doses of cannabis on simple tasks such as uncomplicated reaction time are often minimal; however, performance of more complex tasks that require fine discrimination and difficult decisions is usually impaired. Contrary to prevailing myths, cannabis does impair the ability to operate a motor vehicle, especially in conditions of heavy traffic where the individual is bombarded by many stimuli simultaneously and decisions have to be made rapidly. Recent studies have also shown that cannabis disrupts the ability to pilot an airplane that necessarily involves sophisticated integration of perceptions of time and space.

SLEEP

Initial use of cannabis is characterized by pronounced soporific effects, especially during the latter part of the time course of action. However with the repeated use of cannabis, tolerance to these sedating effects develops rapidly. Most other effects of cannabis on sleep are comparable to those with depressants of the central nervous system such as alcohol and barbiturates; rapid eye movement (REM) sleep is suppressed by these drugs and there is a rebound of REM when use is discontinued. Consistent with the slow metabolism of certain cannabis metabolites, most effects of cannabis on sleep are sustained; even single doses of cannabis can alter the REM deprivation compensation response for five days or more. Some heavy users of cannabis report disturbances in sleep with

frequent awakenings and nightmares that continuue as long as four to six months after the cessation of use of cannabis. The effect of cannabis on sleep differs from that of alcohol in that cannabis induces either no change or a slight increase in slow wave sleep, whereas alcohol decreases this component of sleep. The significance of this difference is not clear.

CHRONIC EFFECTS

There have been no adequate, large scale, epidemiological studies of the consequences of intensive, long-term consumption of cannabis and therefore knowledge of the chronic effects of the drug is incomplete and lacks reliability. Clinical reports indicate that smoking cannabis is associated with a variety of respiratory disorders including bronchitis, asthma, and pharyngitis. Cannabis may impair the T-cell mediated component of the human immune response, but it is unclear what significance this alteration has in the total immune response and hence for the susceptibility to disease. There is no definite evidence that the use of cannabis causes serious mental illness or induces persistent generalized decrements in motivation in the form of a motivational syndrome. Similarly, in the few studies done well there has been no evidence of cannabis-induced brain damage. While as yet there is no definite evidence that cannabis represents a danger to human genetic and reproductive processes, the fact that cannabis may alter DNA synthesis suggests the possibility of changes along these lines with chronic use.

As further investigations of chronic users of cannabis are completed, other adverse consequences of the drug may be identified. One should be aware of the inevitable time lag between the widespread use of a drug and the recognition of long-term adverse effects. Tobacco, with its long history of extensive use as a "harmless" drug, is only one of many examples.

TOLERANCE AND DEPENDENCE

Although marked tolerance to cannabis seldom develops with current patterns of consumption in the United States that entail the use of low potency preparations, experimental and cross cultural studies clearly indicate that tolerance can rapidly develop when potent preparations of cannabis are used. With the sudden cessation of heavy consumption, a withdrawal syndrome occurs characterized by sleep disturbance, irritability, restlessness, decreased appetite, sweating, and sudden weight loss because of the elimination of retained body fluids. These discomforts are usually mild in comparison with the extreme distress experienced during opiate, barbiturate, or alcohol withdrawal. Shortly after withdrawal from cannabis all tolerance to the drug is rapidly lost. Cannabis users, unlike opiate users, do not usually manifest a psychological compulsion to return to the use of cannabis.

Drug dependence is determined not only by tolerance and withdrawal reactions, but also by positive psychosocial effects. As with virtually all drugs exerting positive effects, a certain percentage of chronic users will increasingly center their lives around cannabis, gradually excluding other daily activities. In addition, one should not assume that the chronic user will confine his drug intake to cannabis. Drug dependencies are interrelated; people who extensively use one type of psychoactive agent are prone to use other drugs excessively as well. Contrary to what is believed, there is little evidence that the use of cannabis displaces the use of alcohol or other drugs. Chronic users of cannabis are at greater risk for heavy consumption of cigarettes, alcohol, and other nonmedical drugs than those who use cannabis in moderation or not at all.

CONTRAINDICATIONS

As one would expect with the cannabis-induced tachycardia, the use of the drug by patients who have heart disease is definitely contraindicated. In patients who have coronary artery insufficiency, angina pectoris and exercise intolerance often occur more rapidly when cannabis is used. Knowledge of drug interactions is limited, but some evidence indicates that cannabis interacts adversely with the centrally active acetylcholinesterase inhibitor, physostigmine, to produce profound depression. The use of cannabis with any potent drug is probably unwise. Since cannabis rapidly crosses the placental barrier, use during pregnancy, especially during the first trimester, should be avoided. Adverse reactions and toxic psychosis are more common in older users; people over thirty are at greater risk for unpleasant effects.

ADVERSE REACTIONS AND OVERDOSE

In managing an adverse reaction to or an overdose of cannabis, one should remember that cannabis has an extremely high lethal dosage range and that the untreated course of toxicity from cannabis is invariably benign. The main treatment in such situations is supportive and symptomatic, although it must be established that other drugs were not used simultaneously. The use of emetics, gastric lavage, and stimulants to the vital or respiratory centers is not indicated when cannabis alone has been taken. High doses of cannabis may induce transient bradycardia and decrease the blood pressure, but these conditions usually improve by placing the patient in a supine position with legs elevated.

Transient panic reactions and toxic psychosis are infrequent reactions to cannabis. These conditions are best treated with verbal support, reassuring the patient that although he is suffering from the adverse effects of a drug, the distress will gradually subside. The patient's surroundings should be arranged to reduce unnecessary stimulation and yet avoid sensory deprivation and reduction of orienting cues. Thus patients should be treated in quiet rooms with moderate lighting; talking should be subdued but understandable; and rapid or sudden movement should be avoided.

In many cases, supportive treatment is all that is required; however, if the patient remains distressed or becomes increasingly agitated, a sedating drug should be administered, preferably by the oral route. My preference is diazepam (Valium), in an initial dose of 20 to 30 mg. orally. However, the physician is well advised to use moderate doses of the short-acting sedative with which he is most familiar.

POSSIBLE THERAPEUTIC USES

Recent clinical trials suggests that cannabis may have some therapeutic effects. As described previously, cannabis is a potent bronchodilator. Airway resistance is significantly decreased; specific airway conductance and expiratory flow rates are increased. Although the mechanisms involved have not been clearly identified, the fact that cannabis increases the diameter of bronchi in a matter unlike that of standard antiasthmatic agents is of interest.

Investigations are underway to determine the clinical utility of cannabis in treating glaucoma, especially in those patients who do not respond to conventional treatment. However, the reduction of intraocular pressure is quite variable and many patients complain of cannabis-inducted dizziness, somnolence, perceptual changes, and cognitive impairment.

Preliminary investigations using cannabis in patients with carcinoma in advanced stages suggest that the drug is an appetite stimulant which helps retard weight loss and reduce cachexia. In addition, cannabis exerts some tranquilizing, mood elevating, analgesic, and antiemetic effects. Some cannabinoids also retard the growth of certain tumors. Although the tumors are not curbed to the extent that would be required for therapeutic purposes, cannabis is of theoretical interest because it does not appear to act in the same manner as conventional anticancer drugs.

Initial clinical trials using cannabis for treating anxiety, insomnia, endogenous depression, epilepsy, and other conditions have not been especially promising. Further investigations for therapeutic efficacy is clearly warranted because the drug has unique pharmacological properties that are just beginning to be understood.

Committee on Drugs

Effects of Marihuana on Man

The Committee on Drugs has reviewed the pharmacology of marihuana with special emphasis on effects in man because of the enormous impact of this drug on society. Much of modern day society's reaction to and attitudes about this psychoactive agent does not reflect its pharmacology, and it is only recently that pertinent biologic facts about marihuana have become known. The Committee reports these facts here, in part, to inform the Academy membership of these facts and, in part, to provide a perspective with which to consider the various societal controls (*i.e.*, laws) on the use of marihuana.

COMPOSITION

Marihuana is a mixture of leaves and flowering tops of the plant *Cannabis sativa L.* It contains approximately 1% Δ-9-tetrahydrocannabinol (THC), the principal psychoactive substance in marihuana. Street preparations tend to vary in Δ-9-THC content; the range is 0% to 5%. An average marihuana cigarette contains 500 mg of marihuana and, therefore, about 5 mg of Δ-9-THC. Hashish, usually used in Eastern (Asiatic) countries and in North Africa, is the resinous substance of the flowers and leaves of *Cannabis sativa L* in which Δ-9-THC is found. Hashish contains 5% to 15% Δ-9-THC and is usually smoked as a mixture of the resin and tobacco. Generally, marihuana cigarettes do not contain tobacco, although some street preparations do.

USERS

In considering adverse effects of marihuana, it is important to appreciate some pertinent epidemiologic facts. It is estimated that 24,000,000 Americans have tried marihuana at least once and that there are 8,300,000 current users in this country.[1] Approximately 70% of adults and youth (12 through 17 years) who were found by the National Commission on Marihuana and Drug Abuse[1] to use marihuana used it so infrequently as to be considered experimental users. Individuals in this category have used marihuana at least once (most of them) but no more than once a month. Almost 20% of adult and youthful users take marihuana more than once per month, but no more than ten times a month (intermittent users). About 7% of the adults and youths surveyed indicated that they use marihuana more than ten times per month but less often than once daily (moderate users). Finally, about 4% of adults and youths who ever used marihuana use it more than once per day and are considered heavy users. A small fraction of these are extremely heavy users, and are almost continually intoxicated from smoking marihuana with a relatively high Δ-9-THC content many times a day.

BASIC PHARMACOLOGICAL CONSIDERATIONS

The main psychoactive ingredient of marihuana is Δ-9-THC. The isolation and recognition of this substance, the ability to assay for it quantitatively in natural materials, and its synthesis have allowed more precise psychopharmacologic studies of marihuana. Delta-9-THC is rarely available for use outside of a research setting. Delta-8-THC is another psychoactive substance in cannabis but usually occurs in negligible concentrations. Other neutral and acidic cannabinoids are found in cannabis, but they probably exert little biologic effect. However, they may

modify the effects of Δ-9-THC and thus confound the comparison of the actions of purified preparations of this compound with those of cannabis.

Smoking marihuana is a most effective route of administration, although the amount of Δ-9-THC absorbed into the bloodstream from the lungs varies considerably among smokers. Psychoactive and physiologic effects appear in two to three minutes, sometimes less, after smoking. The peak effect occurs in 10 to 20 minutes, and the duration is about 90 to 120 minutes after smoking a single cigarette (approximately 5 mg of Δ-9-THC). The pharmacologic effects of Δ-9-THC are delayed when administration is oral. Onset is usually 30 to 60 minutes after ingestion; peak effects occur in two to three hours, and the effects last for three to five hours. It requires approximately three times more marihuana or Δ-9-THC when administration is oral to obtain effects equivalent to those from smoking.

Studies with Δ-9-THC tagged with carbon 14 have provided information on its pharmacokinetics and metabolism in man. For instance, it has been found that THC is almost completely metabolized[2]; less than 1% is recovered unchanged in urine or feces, regardless of the route of administration. Animal and *in vitro* studies indicate that nonspecific hepatic microsomal oxidases rapidly transform Δ-9-THC into 11-hydroxy-THC (11-OH-THC).[3] This metabolite is psychoactive, being as potent as Δ-9-THC. 11-OH-THC is further rapidly metabolized to the inactive 8, 11-dihydroxy-THC. A good correlation exists between the time course of pharmacologic effects and plasma levels of Δ-9-THC and its immediate metabolites. Peak effects and blood levels were noted 10 to 30 minutes after smoking and about three hours after oral administration. It is not clear whether the parent compound or psychoactive metabolities were most psychoactively effective because the blood levels were determined by measuring radioactivity (reflecting unchanged Δ-9-THC and metabolities), administered initially as carbon 14 tagged Δ-9-THC.

Once Δ-9-THC is absorbed, there is an initial rapid decline of plasma Δ-9-THC concentration in about two hours.[4] Delta-9-THC is transported in the lipoprotein fraction of plasma while the more polar 11-OH-THC is bound to albumin. After the initial two hours, Δ-9-THC disappears from the plasma at a slower rate for several days. The different rates of disappearance of Δ-9-THC from the plasma suggest rapid uptake and slow release by certain tissues. In the rat, Δ-9-THC is accumulated in fat much more than in any other tissue and persists for two weeks.

The initial distribution of Δ-9-THC is probably a function of vascularity and lipid content of the various organs. Thus, in rats, lung, salivary glands, jejunum, kidney, adrenals, muscle, liver, and testis (in decreasing order of concentrations of Δ-9-THC and metabolites) are the most prominent tissues for the early distribution.[5] Brain levels of Δ-9-THC (and metabolites) persist for as long as seven days, and at that time concentrations are as high or higher than for other organs. Studies on the distribution in monkey brain indicate that there is an early concentration of radioactivity in gray matter, especially of the visual and frontal cortex.[6] This radioactivity may reflect the more polar metabolites of THC. A later phase of organ distribution probably reflects excretion of the cannabinoids; some 60 minutes after administration of Δ-9-THC, relatively high concentrations (of radioactivity) are found in liver, bile, the gastrointestinal tract, kidneys, and bladder.[3] Of interest is the fact that there is enterohepatic cycling of the metabolic products of Δ-9-THC. Delta-9-THC crosses the placental barrier in pregnant animals, and sizeable concentrations are found in the fetus.[7] Effects on viability of the fetus are under investigation.

Delta-9-THC metabolites are principally excreted in the urine and feces. Radioactive metabolites persist in urine and feces for days after administration of a single large dose. The use of cannabis appears to be detectable for a longer period than that of alcohol.

The physiologic responses to the administration of Δ-9-THC or marihuana include a dose-dependent increase in heart rate.[8] Pretreatment with propranolol (a β-adrenergic blocking agent) has been reported to inhibit the effect of Δ-9-THC on heart rate.[9] Another response to Δ-9-THC is conjunctival reddening, irrespective of route of administration (smoking or ingestion). It has been noted that Δ-9-THC may effect a decrease in intraocular pressure. There are no evident changes in body temperature, respiratory rate, or deep tendon reflexes after administration of marihuana or Δ-9-THC. Pupillary size is affected almost imperceptibly; a *decrease* can be recorded by careful measurement.[10] Delta-9-THC does not usually affect fasting blood sugar levels or plasma levels of free fatty acids.

Physiological and biochemical measurements are being used to document the neurologic effects of cannabis in man and animals. Electroencephalographic changes, detected by computer rather than visual analysis, have been reported in volunteers who smoked marihuana in high or low doses and placebo cigarettes. The principal

changes noted were an increase in the percent of alpha time with decreased theta and beta bands.[11] Young chronic users of marihuana, when acutely intoxicated, showed a decreased auditory-evoked EEC response.[12] Studies on biogenic amines and neurotransmitter substances in the brain of experimental animals administered Δ-9-THC seem most promising in understanding the mechanism of action of cannabis. Effects on serotonin and catecholamine concentration in localized brain areas are being studied. The technique of autoradiography has been used to detect accumulations of radioactive Δ-9-THC or metabolites in specific brain areas at the time of maximal behavioral activity in the monkey.[6] The lateral geniculate nuclei, the amygdala, the hippocampus, and the inferior and superior colliculi accumulated the labeled compounds at the peak of behavioral activity. Relatively large concentrations were also found in the cerebellum.

PSYCHOLOGICAL EFFECTS

The subjective effects of marihuana have been reported by many sources. Common and characteristic subjective effects in nonlaboratory settings have repeatedly indicated that the perception of the external environment is changed in all sensory modalities. Visual imagery is more vivid than usual; the subject sees forms and meaningful patterns in ambiguous visual material. There is an awareness of subtle qualities of sound rhythms, purity, and distinctness. Touch, taste, and smell are subjectively enhanced. Time perception seems changed; subjects report slowing down or stopping of time. Marihuana seems to potentiate social interaction; however, high doses tend to remove the user from the group, perhaps because of the enhanced psychoactive effects. Other typical components of the marihuana high are a feeling of lightness of the limbs, uncontrollable laughter without provocation, and difficulties in remembering from moment to moment the thread of what is being said in a conversation.

Almost invariably users report a pleasant, positive, emotional state. The temporarily overwhelming negative emotional state, known as "freakout," occurs infrequently in about 20% of experienced marihuana users.[13] Almost always this state can be handled by reassurance and support. "Freakouts" may occur more frequently in new users, especially with potent preparations.

The attitude and expectations of the subject determine the subjective response of using marihuana. Even with experienced users,[14] a placebo effect is common, especially in double-blind studies. Apparently, this reflects a learned set of expectations in the user. The interpersonal situation also is a determinant of the subjective response to marihuana. There is a greater variety of subjective symptoms when marihuana is smoked in a group setting. Sedative effects seem to predominate when the same subject smokes alone.

Marihuana and Δ-9-THC affect motor and mental performance in a dose-dependent manner, especially when dosage is carefully controlled. Motor performance (on various standardized tests) deteriorates with the dose of marihuana administered by smoking. Testing of mental performance has shown dose-related impairment of verbal output, counting, and color discrimination.[15] Short-term memory seems to be the mental faculty most significantly affected by marihuana. Moderate amounts of marihuana seem not to interfere with the information retrieval component of this mental faculty but more likely with initial learning, thus affecting the acquisition process involved in the storage of information.[16]

Comparative studies of the effects of marihuana, alcohol, and other drugs on mental and motor performance are especially interesting. Delta-9-THC in doses of 2.5 to 5 mg (the content of one half to one marihuana cigarette) provided the same performance decrements as three bottles of beer or 3 oz of 100-proof whiskey taken one half hour before testing (equivalent to a blood alcohol level of 0.05%). When alcohol (first) and marihuana (second) were consumed together, an additive decrement on mental and motor performance was noted.[17]

There is a significant effect of smoking experience on mental and motor test performance. In general, individuals with more experience seem to score better than those with little or no smoking experience after administration of standardized doses of marihuana.[18]

Of particular importance is the effect of marihuana on driver performance. A significant dose-related increase in brake time has been found after ingestion of marihuana.[19] An increased amount of time is required for recovery from glare when driving at night.[20] This effect lasted for several hours after smoking marihuana. It was not related to pupillary size. Sedation and effects of marihuana which increase complex visual reaction time and variability in performance because of occasional lapses of attention would be expected to impair driving performance.

TOLERANCE

It is now generally agreed that physical dependence on cannabis comparable to that for the opiates, alcohol, and barbiturates does not exist (*i.e.*, withdrawal from the drug is not followed by

83-317 O - 77 - 60

a characteristic abstinence syndrome). On the other hand, tolerance to cannabis has been conclusively demonstrated in several species of animals and probably develops in man with prolonged use of potent preparations. When increasing drug doses are required to obtain the same degree of effect in an individual, tolerance has developed. The concept of tolerance should be restricted to a specific action of a drug rather than to all the effects of the drug. Dispositional tolerance refers to changes in absorption, distribution, metabolism, and excretion which result in a decreased intensity and duration of contact between the drug and its target tissue. Any change in the target tissue which makes it less sensitive to the same dose of the drug results in functional tolerance.

Tolerance, probably dispositional tolerance, to various pharmacologic and behavioral actions of marihuana and Δ-9-THC occurs in a number of animal species (pigeons, rats, dogs, mice, monkeys, and chimpanzees).[21] This tolerance develops rapidly and is long-lasting. Hundredfold increases over the initially effective dose produce little effect in tolerant animals of some species. Cross tolerance for various effects has been demonstrated between Δ-9-THC and Δ-8-THC, but not LSD, morphine, and mescaline. Tolerance to the behavioral actions of THC may result from the animal learning to adapt to effects of the drug (a type of functional tolerance). However, there is clear evidence for metabolic tolerance as shown by an increase in the lethal dose during the course of tolerance development. SKF-525-A, an inhibitor of hepatic microsomal enzymes which interferes with THC metabolism, has been shown to possess a blocking action on tolerance in laboratory animals.[21] Animals develop tolerance to some effects of THC but not others. Thus, differential tolerance is an important consideration for interpreting the results of various studies dealing with the development of tolerance.

A number of reports from Asian and Middle Eastern populations describe the daily use of enormous amounts of cannabis by chronic users.[22] That tolerance has developed for psychoactive effects is suggested by the fact that the quantities consumed produce dysphoria in less experienced users but do not interfere with the usual daily activities of some chronic, heavy users. Smokers in these Eastern groups have increased the initial daily consumption some five to six times over a 20- to 30-year period to achieve the same degree of psychologic effect.

The development of tolerance has been studied and compared in long-term, intermittent, and moderate marihuana users given free access to the drug over a 21-day period.[21] The investigators concluded that tolerance developed for the depressant and some physiological (pulse rate) and psychological effects (impaired recent memory, time estimation, and psychomotor coordination) of cannabis and that the duration of the desired high shortened with continuing exposure to the drug. Other more recent studies have tended to confirm one or more of these observations.

Of special interest have been reports suggesting "reverse tolerance" for marihuana. The basic observation has been that of a novice smoker requiring more marihuana initially to achieve psychological effects than after his first few trials with the drug. It is as if an individual has to acquire the ability to perceive the desired effects of the intoxicated state. Supporting this phenomenon are observations of experienced users becoming high after receiving the same amount of Δ-9-THC or marihuana which was psychologically ineffective for naive subjects. Behavioral factors seem to account for such increased sensitivity.

ADVERSE PHYSICAL EFFECTS

Interest in and debate over the adverse effects of marihuana have stemmed from legal prohibitions and have raised questions concerning the appropriate stance of society and, in turn, the law with regard to this drug. Any consideration of the pharmacology of cannabis should include information concerning acute and chronic physical toxicity and psychiatric illness. In general, manifestations of acute physical toxicity are minimal, even with administration of large doses. Death from overdose has rarely been reported, and critical analysis of reports of fatality make it possible to conclude that definite incrimination of marihuana is lacking in most instances. For instance, although a cannabis metabolite was found in the urine of one victim recently reported to have succumbed from an overdose of marihuana, no cannabis was found in body tissues.[24] Large amounts of cannabis were found in the room of the victim, and no other cause of death was apparent. Acute toxicity studies in animals and human case reports all indicate a high ratio of lethal to effective dose for marihuana; this ratio is more favorable than for alcohol and barbiturates.

Uneventful recovery from coma following overdose with hashish (nine to ten large pipefuls were smoked) has been reported.[25] The most commonly reported physical reactions to marihuana are nausea, vomiting, and dizziness. These manifestations tend to occur most often in inexperienced smokers or with oral administration.

The intravenous administration of street preparations of marihuana has resulted in severe toxicity.[26] Hypotension, chills, fever, leukocytosis, hepatosplenomegaly, and anuria have been reported following intravenous administration, which results in injection of insoluble particles and perhaps bacteria into the bloodstream.

Reports of chronic, physical effects of marihuana must be judged from the perspective of the population group under scrutiny. Heavy, long-term patterns of marihuana use in Eastern (Asiatic) populations have not yet been matched in Western groups where only small numbers of chronic users have been observed. Populations associated with heavy, chronic use of cannabis differ from Western groups in such important variables as nutritional status, patterns of disease, and perhaps in the potency of the cannabis preparation (e.g., hashish in the East, marihuana in the West).

In view of the usual route of administration of cannabis preparations, it is not surprising to encounter a relatively large number of reports dealing with the respiratory tracts of chronic users. High frequencies of chronic bronchitis have been encountered in heavy, long-term users from Eastern populations.[27] Because mixtures of cannabis and tobacco are smoked in these populations, disentangling the respiratory effects of each of these agents poses a difficult problem. A group of 22 American soldiers in West Germany who smoked huge quantities of hashish (100 gm or more monthly) for 6 to 15 months exhibited a high frequency of upper and lower respiratory complaints: bronchitis, sinusitis, asthma, and nasopharyngitis. Twenty-one of the 22 soldiers also smoked tobacco.[28] Five of nine patients with bronchitis were studied for pulmonary function and showed mild obstructive changes which improved on diminished hashish exposure, irrespective of tobacco smoking. It is difficult to relate these findings to the usual chronic user of marihuana in the United States because enormous amounts of a preparation containing about five times as much THC as in marihuana were smoked by soldiers. The clinical observations seemed to implicate hashish; but, it is not clear what level, if any, of marihuana exposure can affect pulmonary physiology. An attempt to define a pathologic effect on the lungs of marihuana smokers was undertaken by Mann *et al.*[29] who studied structure and function of alveolar macrophages obtained by pulmonary lavage from heavy users (3 to 20 cigarettes per day for at least one year). These investigators demonstrated no differences in phagocytic capacity (for *Candida albicans*) of macrophages from marihuana or tobacco smokers and nonsmokers. Twenty-five percent fewer macrophages were recovered from the lungs of marihuana smokers as compared to recovery from nonsmokers (other studies have shown recovery of increased numbers of pulmonary macrophages from tobacco smokers than from nonsmokers). The investigators concluded that macrophages, a primary pulmonary defense against inhaled organisms and particles, were apparently replaced by other cell types. Thus, this finding may be reflected in the clinical respiratory picture described here for chronic and heavy exposure to cannabis preparations. Although there is little information on the respiratory status of intermittent and moderate users, the respiratory tract may be a potential target for adverse effects of long-term cannabis use. The information on pulmonary effects must be weighed, and tar from marihuana cigarette smoke has a carcinogenic effect on mouse skin similar to cigarette tobacco tar.[30]

A high frequency of obliterative arteritis involving the lower extremities has been reported for young Morrocan males who are heavy cannabis users. Unfortunately, this is a clinical report and there are no control data.[31] There is no definite evidence that long-term use of cannabis causes liver dysfunction.

Of note is the claim by British physicians that regular use of cannabis produces cerebral atrophy in young adults.[32] These physicians reported evidence of ventricular dilatation by air encephalography in ten young adult males who used marihuana consistently for 3 to 11 years; other drugs (amphetamines, LSD) were also used, but reportedly less frequently. Normal values for ventricular measurements were obtained from age-matched patients with normal air encephalographic examinations and follow-up confirmation of a neurologically normal state. There was no attempt to control for exposure to marihuana and other psychoactive agents. This clinical observation is not enough to prove that long-term use of marihuana predisposes to or results in cerebral atrophy. There are variables other than marihuana which also must be controlled (e.g., the role of the other psychoactive drugs). The reliability of the histories of drug abuse given by the subjects of this study is questionable. Carefully controlled studies are needed to substantiate this clinical report.

The effects of long-term use have been studied in a small sample of cannabis users in Jamaica.[33] Thirty long-term smokers of ganja (3% THC, on average, usually smoked with tobacco) and 30

matched nonusers were selected for intensive hospital investigation. The ganja smokers in this study had used the drug for a mean duration of 17.5 years. No significant differences were found between users and controls for neurologic and EEG abnormalities, liver function tests, abnormal chest x-rays, and chromosomal aberrations. Ganja smokers, 90% of whom also smoked tobacco, showed significantly higher hemoglobin concentrations and hematocrits than did nonusers (19 of 30 nonusers smoked tobacco). These differences may reflect the effects of chronic ganja and/or tobacco smoking on the lungs of users; the hematological changes may be related to functional hypoxia. However, the results of pulmonary function tests did not differ between ganja smokers and nonusers.

New findings concerning the possible adverse effects of chronic intensive marihuana use (at least four days a week for a minimum of six months) on the endocrine system have recently been reported.[34] Plasma testosterone levels were found to be significantly depressed in 20 marihuana smokers. More significantly, a suggestion of a dose-related response was noted in that there was an inverse relationship between amount of marihuana used and plasma testosterone concentration. The depressed plasma hormone levels were raised to normal concentrations on cessation of marihuana smoking or by administration of human chorionic gonadotropin; these observations suggest central suppression of testicular secretion of androgen. Oligospermia was noted in approximately one third of the marihuana users. The authors concluded that their findings raise an area of serious concern, but still do not answer specifically the question of safety in the use of marihuana.

MUTAGENESIS AND TERATOGENESIS

Results of studies seeking evidence of chromosomal abnormalities in peripheral blood lymphocytes of marihuana smokers are inconclusive. Two studies have suggested that abnormalities do not occur, at least for "light" marihuana users (one to two cigarettes per month or less)[35] and a small group of smokers including both light and heavy users.[36] Neither study would detect a low frequency of chromosomal abnormalities in heavy marihuana users. A more recent study has shown increased chromosome breakage in marihuana users.[45]

Another aspect of this recent study, dealing with the effect of chronic marihuana smoking on cell-mediated immunity, exemplifies the application of newer knowledge and techniques to learning about the effects of this drug in man.[37] Mixed lymphocyte culture (MLC) and phytohemagglutinin (PHA) responsiveness of the lymphocytes of 51 individuals who smoked marihuana at least once a week for at least one year was investigated; no other drugs were used by these subjects. MLC and PHA responsiveness reflects the status of cell-mediated immunity in man. Eighty-one healthy volunteers were used as controls, and the results of these tests were also compared to data from groups of patients with impaired cellular immunity (e.g., patients with uremia or malignancy and those receiving immunosuppressive therapy). The results of this study indicated that the mean response of the lymphocytes of marihuana smokers to allogenic cells (MLC) or PHA was significantly less than that of the control group and about the same as for the patients exhibiting impaired cellular immunity.

The basis for the depressed MLC and PHA responses of the marihuana smokers' lymphocytes is unknown. The investigators suggest that DNA synthesis is impaired, but their own summarized evidence for this hypothesis—chromosome breaks, micronuclei, and a decreased number of cells synthesizing DNA in studies on four marihuana smokers—was not presented in a form permitting analysis. The data on chromosome breaks are controversial because, as indicated here, other groups have failed to find an increased frequency of chromosome damage among marihuana users. Unless this finding is consistent among different laboratories, extrapolation to mutagenesis and teratogenesis is extremely tenuous.

The design of this investigation suffers from flaws common to many other studies on adverse effects of marihuana. The assumption that marihuana is the only variable differentiating the control and study groups cannot be accepted. Variables correlated with marihuana smoking are unexamined in this (and other) studies, even though one or more of these may be depressing the MLC and PHA responses. Evidence of a "dose-response" relationship which demonstrates increasing frequency of chromosomal aberrations and increasing impaired MLC and PHA responses with increasing marihuana exposure should be sought. Although this type of evidence would not completely rule out the etiologic significance of other correlated variables, it would tend to suggest a causal role of marihuana.

The evidence is minimal for incriminating marihuana as a teratogen in man. The three clinical case reports of children born with birth defects to mothers who used marihuana[38-40] can hardly be used as such evidence; multiple drugs

were used by the mothers and there is relatively high frequency of birth defects in the general population. If marihuana were a human teratogen, we might expect more than three clinical case reports of association because of the large number of users in this country. However, it is extremely difficult to demonstrate cause-and-effect relationships for mutagens and teratogens in man so animal studies can provide useful information. Indeed, reports of cogenital malformations in offspring and decreased litter size in various experimental animals exposed to (usually extremely large doses of) cannabis, certainly indicate that avoidance of exposure to marihuana during pregnancy would be wise.

ADVERSE PSYCHOLOGICAL EFFECTS

Perhaps one of society's greatest concerns with marihuana has been its possible relationship to mental illness. Clinical observations provide most of the information on this relationship; unfortunately, critically devised and analytic epidemiologic studies utilizing control groups and well-founded frequency data are lacking. In addition to the pharmacologic properties and dose received of a psychoactive drug, the psychologic state of the individual and the setting in which the drug is taken are two important variables which determine effect. Adverse psychologic effects may be dependent on these two variables and make it difficult to isolate the role of the psychoactive agent. Much of the information on cannabis-related mental illness originates in developing nations where the relatively low standards of medical care have resulted in low priorities for dealing with mental illness, few well-trained psychiatrists, and poor facilities for dealing with psychiatric disorders. Careful diagnosis and evaluation of the mentally ill patient is probably lacking. Chronic illness in these countries, especially infectious diseases and malnutrition, may affect mental function. Data from these countries on the frequency of mental illness among users and nonusers of marihuana are unavailable. Thus, there are reasons for using caution in relating much of the seemingly relevant information to Western populations.

If lack of critical information hampers delineation of a cause-and-effect relationship between marihuana and mental illness, the nonspecificity of the adverse psychologic reaction(s) attributed to cannabis does not improve the chances for critical analysis. For instance, there are no specific manifestations which distinguish between cannabis psychosis, an acute toxic state which occurs after heavy use, and other types of toxic psychoses. There is an acute onset of confusion, visual and/or auditory hallucinations, paranoid ideas and excitation or aggressive behavior; this state is self-limited (days to a few weeks). The diagnosis has given important weighting to a history of heavy cannabis intake, a situation which could lead to a biased inflation of the frequency of cannabis-induced psychosis. The similarity among cases reported from Eastern populations as cannabis psychosis may suggest that this is a diagnostic entity; however, this says nothing about the role of the psychoactive agent.

Administration of relatively large doses of Δ-9-THC isolated from cannabis can produce acute toxic psychosis and hallucinations in a controlled setting.[41] Thus, it is not surprising to find various reports of toxic psychologic reactions following use of marihuana in Western populations. Smith and Mehl of the Haight-Ashbury Clinic (San Francisco)[42] believe that the ingestion of large amounts of drugs, inexperience of the user, and personality factors predispose to such reactions which are manifested by panic, fear, depersonalization, confusion, disorientation, depression, and paranoid ideas.[43] Among case reports associating panic reactions and psychotic states with use of marihuana, other factors (possibly) predisposing to the mental disturbance can often be found—a severe degree of stress, schizophrenia in the patient or his family, and preexisting psychopathology.[44] Again, the host and the setting in which cannabis is taken are significant in understanding the etiology of these adverse reactions. The use of marihuana, especially heavy use, apparently can precipitate adverse psychologic effects, from mild reactions to psychotic episodes. Host and situational factors appear to contribute to many of these adverse effects. Fortunately, the psychotic episodes tend to be self-limited and of short duration if marihuana use is terminated.

A consideration of the frequency of toxic psychologic reactions associated with marihuana use soon indicates the poor quality of the data on which such estimates are based, even in Western populations. The reports of widespread cannabis use in American soldiers in Viet Nam suggested that a useful source of data was available.[45] This source provided an estimate of five cases per 45,000 troops per month of (acute onset) psychosis associated with a history of marihuana use. (The authors reporting this estimate indicated the presence of predisposing personality factors.) Of course, such an estimate provides no indication of the risk to a marihuana user of developing a psychosis because the actual number of such users among American troops in Viet Nam was

not reported; the estimate was based on the total American military population. Other similar estimates, from the student health service at Yale (11 cases per 8,500 students for the 1968-1969 academic year)[13] and from Los Angeles County Hospital (nine admissions resulting from the use of marihuana out of 700,000 admissions during the period from 1961 to 1969—most of these patients were admitted after intravenous injection of marihuana),[14] are again uninformative.

The recurrence of psychoactive effects when not under the influence of marihuana has been described by the term "flashback."[15] Euphoria, anxiety, or hallucinations may be features of the flashback, often depending on the psychologic manifestations of previous (especially recent) intoxications. These recurrences are intermittent, usually occur within days to a few weeks after using marihuana, and tend to disappear with time. Although flashbacks have been reported in individuals who have used only marihuana, these phenomena seem to occur more frequently in individuals who have used hallucinogenic drugs previously. The repetition during marihuana intoxication of hallucinations previously experienced with our psychoactive drugs is another phenomenon, perhaps related psychopharmacologically to flashbacks, which has been reported. The basis for these types of recurrent phenomena are poorly understood.

The amotivational syndrome refers to the loss of conventional motivation and to preoccupation with drug-taking and its subculture. The regular long-term use of marihuana may produce this syndrome (the marihuana hypothesis).[17] Individuals who are constantly and chronically intoxicated cannot be expected to show conventional levels of motivation, although their desire to remain in the intoxicated state will motivate them to obtain sufficient amounts of the drug. Such individuals have been the subjects of reports from countries where the most potent preparations of cannabis are used. A less severe form of this syndrome may be manifest in this country in youths who are dropping out of school and refusing to prepare themselves for traditional adult roles and in young adults who, after a number of years of regular marihuana use, show subtle personality changes as indicated by diminished drive, lessened ambition, loss of effectiveness, apathy, and introversion.[18] An important issue appears to be the role of marihuana in the etiology of the amotivational syndrome.

There is no objective evidence for or against the hypothesis that the amotivational syndrome results from organic brain changes brought about by chronic use of large amounts of cannabis. Preexisting personality traits of heavy marihuana users which attract them to the drug must be considered in the etiology and pathogenesis of the behavior complex known as the amotivational syndrome. The emphasis in our present day society on reexamining traditional values and roles, which correlates with youthful rebellion and interest in "dropping-out," indicates that interaction of the drug and social variables must also be considered in any examination of the amotivational syndrome. In the absence of data which provide insight into this possible adverse effect, an hypothesis equally suitable to the marihuana hypothesis is that psychosocial variables bring individuals into the counterculture, one of whose characteristics is use of cannabis.

CONCLUSIONS

Various adverse effects have been attributed to marihuana and other cannabis preparations. Most of these claims cannot be well substantiated because they are based on uncontrolled observations, improperly controlled studies, studies with small sample sizes, and retrospective analyses. Comparative studies of users and nonusers purporting to demonstrate physiologic or psychological adverse reactions usually fail to differentiate between a marihuana effect and effects of other variables correlated with the use of this drug. Demonstration of a specific adverse effect of marihuana (by studying users before and after abstaining from the drug) and of a dose-response relationship may tend to overcome this flaw in comparative studies.

Repeated clinical observations, properly executed investigations, and controlled animal studies are now documenting certain adverse effects of marihuana. Present knowledge indicates that, except for the effects of long-term smoking of potent cannabis preparations on the upper and lower respiratory tract, acute and chronic physical toxicity is rather low in man. The clinical significance of altered MLC and PHA responses and depressed plasma testosterone levels of marihuana users remains to be demonstrated. Animal studies indicating a teratogenic potential for cannabis are sufficient to recommend avoidance of exposure to marihuana by women who are or may become pregnant.

Observations on psychologic and physiologic effects of marihuana indicated that, as with alcohol and other psychoactive drugs, individuals who are "high" should not drive. Use of marihuana, especially heavy use, can precipitate adverse psychologic reactions. Host and situational

factors appear to contribute to many of these adverse effects.

Tolerance to cannabis develops with prolonged use of potent preparations. A relationship between marihuana tolerance and adverse effects is not evident.

The biomedical aspects of the use of marihuana are being monitored, and we can expect more information on its adverse effects. As more information becomes available, the Committee on Drugs will bring it to the attention of the Academy membership.

The Committee on Drugs continues to adhere to its conclusion stated in 1971.[10] Namely, that there should be no criminal penalties for simple possession and use of marihuana. When adequate methods for detecting concentrations of cannabis in the body (blood, urine, etc.) become available, the Committee would favor appropriate legal penalties for driving while intoxicated by marihuana.

Marihuana
Can It Hurt You?

"MARIHUANA! Can it hurt you?" was a question asked with some urgency by a boy in a group of ninth-grade students visiting the US Capitol Building. The youngsters, curious about a group of men walking by, were told that they were scientists who just completed a day of testimony on the toxicity of marihuana to a subcommittee of the Committee on the Judiciary in the US Senate.

This boy's compelling question highlights an important issue in medicine today. We possess accumulated scientific knowledge of marihuana's toxic effects on humans, yet we are without adequate and effective means to deliver this information to the public. The consequence is that the known toxic effects from marihuana use are not adequately prevented.

Wynder and Peacock[1] said recently that modern medicine has been highly successful in the prevention of devastating infectious diseases, through the coordinated efforts of researchers and clinicians. They indicate that in certain clinical conditions, such as cardiovascular diseases, cerebrovascular accidents, and malignant neoplasms, similar preventive results have not occurred, although much time has elapsed since discovering certain factors known to reduce death risks. The authors said the reason these discoveries have been inadequately used preventively is that

> apathy exists among most human beings when it comes to anything for which the results are long delayed. . . . This public attitude is matched by a similar disinterest among most physicians for preventive measures.

Extensive Clinical and Laboratory Evidence of Toxicity

A comparable situation prevails regarding the large accumulation of clinical and laboratory work that demonstrates cannabis toxicity. If adequately publicized, this work might have far-reaching preventive effects.

In the past decade, we have seen hundreds of patients suffering from psychiatric and neurological symptoms that resulted from cannabis use, and have described our findings in several publications.[2-3]

In our reports, we detailed the toxic psychological effects of cannabis use in 51 of our patients, all of whom demonstrated symptoms that simultaneously began with cannabis use and disappeared within 3 to 24 months after cessation of drug use. *Moreover, a correlation of the symptoms to the duration and frequency of smoking was established.* When these observations were coupled with the stereotyped nature of the symptoms seen, regardless of psychological predisposition, we presumed that with intensive cannabis use, biochemical and structural changes occurred in the central nervous system.

All subjects clearly demonstrated *an early diminution in self-awareness and judgment along with slowed thinking and shorter spans in concentration and attention.* We also reported a gradual development of *"goallessness," blunted emotions, a counterfeit impression of calm and well-being, and a prevailing illusion of recently developed insight and emotional maturity.* Many demonstrated *difficulty in depth perception and an alteration in the sense of timing,* both of which are particularly hazardous during automobile driving. These clinical findings, along with other more severe mental symptoms, have been similarly reported by other investigators.[illegible]

Consequences of Legalized Status

Some may ask, "But aren't these symptoms found only in people who use marihuana heavily? What about occasional or moderate use?" In an editorial "Marihuana: Buyer Beware," THE JOURNAL warned that

> Spokesmen who espouse tolerance toward "occasional" or "moderate" use of marihuana should be mindful of the possibility that, for whatever reasons, occasional may become "frequent" and moderate may become "intensive," with forbidding consequences.

The editorial continued, "If marihuana ever were given the same legal status as alcoholic beverages, nothing could be said except, 'buyer beware'."[7]

Despite this and similar warnings, marihuana use has continued to escalate, as have the toxic effects. This has led to a large increase in communications by laboratory and clinical investigators who report toxic effects on many body systems and physiological mechanisms.

Campbell[6] showed enlarged lateral ventricles indicative of cerebral atrophy in young, steady cannabis users, while Heath[8] eliminated many human variables in his laboratory work with rhesus monkeys. In his work, electrodes were deeply planted in the brain, and the results consistently demonstrated abnormal electroencephalograms. Anatomical structural alterations found during some postmortems suggested irreversible brain changes.

Retention in Tissues

Lemberger et al[9] have shown the retention of cannabis Δ^9-tetrahydrocannabinol in tissues for as long as eight days. This retention is particularly noteworthy in fatty tissues such as brain and testicles.

Kolodny et al[10] recently reported lowered sperm counts and testosterone levels to the point of temporary infertility in the marihuana smoker, likely related to the retention of the drug in the testes.

Still other investigators indicate that marihuana has effects on body cellular processes that include reduction in number of T-lymphocytes and resultant interference in the immune process,[2,3,4] reduction of DNA and RNA synthesis,[2,3,4,5] and an increased number of cells with broken chromosomes.[4,5] Emphysema, pharyngitis, and bronchitis have been reported,[2,3,4] and premalignant lesions in lung tissues[2,3,4] have also been noted.

To date, most of the public remains uninformed about medical findings that clearly indicate substantial health hazards as a result of marihuana smoking. A systematic campaign to disseminate medical information is long overdue, particularly by governmental agencies and the news media.

The physician should not be apathetic about the current marihuana epidemic. By familiarizing himself with the results and potentials of marihuana toxicity, he is in a uniquely effective position to act as the spearhead in a coordinated community effort to prevent the cannabis epidemic from becoming endemic.

Marihuana

Gabriel G. Nahas, MD, PhD

"MARIHUANA is no more dangerous than alcohol or cigarettes and should be legalized for anyone over the age of sixteen." So declared Margaret Mead in 1968. Ever since, similar statements have been made with increasing regularity by others who wish to see the use of marihuana legalized, or at the very least "decriminalized."

And yet, in that same year, 1968, a joint statement was issued by the Committee on Drug Dependence of the National Research Council, National Academy of Sciences, and the American Medical Association, stressing the following points:

1. Cannabis is a dangerous drug and a public health concern. In virtually all societies where it has been extensively used, sanctions against both users and distributors have been necessary.

2. Legalization of marihuana would create a serious abuse problem in the United States.

3. Penalties for violations of marihuana laws are too harsh. They should therefore be modified to penalize distributors and to deal with users in a flexible manner.

4. Additional research on marihuana should be encouraged. All presently available knowledge warrants an effort to reduce the use of this drug.

This joint statement was in keeping with those issued by all the international conventions of scientific and legal experts assembled since 1924 under the aegis first of the League of Nations and then of the United Nations. All of these conventions have recommended that cannabis derivatives, as well as opium and coca-leaf derivatives, be classified as "stupefying drugs."

Such drugs were considered to be profoundly destructive to man and society, and their use was to be limited to medical purposes only. These conventions also recommended that private possession for nonmedical use be considered an offense to be penalized. As marihuana has no therapeutic value, the Single Convention of the United Nations on Stupefying Drugs (1961), of which the United States is a party, recommended that cultivation of the drug-type plant be eliminated over the next 25 years. These recommendations were taken at the initiative of the representatives from Asia and Africa, who claimed that the widespread usage of marihuana was associated with physical and mental morbidity of a large number of their people as well as with social stagnation. And yet, at the same time that President Johnson signed the Single Convention in 1967, millions of young Americans were beginning to smoke and enjoy marihuana.

As the use of marihuana spread throughout America and Canada, a growing number of psychologists, sociologists, lawyers, and physicians have urged that marihuana be treated as a soft, recreational drug that should be made freely available, discounting the empirical historical reports about cannabis from Asia and Africa. These intellectuals, despite the absence of any hard scientific evidence, have claimed that cannabis use produces little physical damage, is less harmful than alcohol or tobacco, and may have redeeming social value.

Marihuana Not Harmless

In contrast, recent scientific evidence has shown that marihuana is not at all harmless. It contains unique substances, the "cannabinoids," which are soluble only in fat and are stored in body tissues, including the brain, for weeks and months, in the same manner as DDT. Anyone using marihuana more than once a week (the time required for its elimination) cannot be drug-free, in contrast to the use of tobacco and alcohol. Two review articles published in *Science* (185:683-685, 775-776, 1974) have summarized this scientific evidence:

1. Chronic marihuana smoking impairs cellular-mediated immunity as measured by the tests of lymphocyte transformation or a T-lymphocyte rosette formation. T-lymphocytes sampled from heavy marihuana smokers show a decreased ability to undergo proper cell division due to a general antimitotic property of the cannabinoids. Our own studies indicate that besides Δ^9-tetrahydrocannabinol (THC, the psychoactive substance), all other natural cannabinoids and their metabolites contained in marihuana inhibit in lymphocyte cultures the synthesis of DNA, RNA, and protein by impairing the precursor uptake of these molecules so essential for proper cell division. This antimitotic effect of marihuana products, which is due to olivetol, the small molecule which they all have in common, has been observed by others. Zimmerman from Toronto has observed the effect in tetrahymena. Blevin and Regan from Oak Ridge, using normal and malignant human cell cul-

The Author: Gabriel G. Nahas, MD, PhD, is a physiologist and a pharmacologist. He is research professor of anesthesiology at the College of Physicians and Surgeons of Columbia University, New York. In the past five years, he has studied the pharmacology of marihuana products and has made surveys in the countries where marihuana has been used and abused over centuries. He is the author of more than 400 scientific papers and the controversial book, *Marihuana, Deceptive Weed.*

tures, have observed a 40% to 50% decrease of DNA, RNA, and protein synthesis by THC 10 ⁻⁵ M. Harris and colleagues from Richmond, Va, have used the cell impairment ability of THC to inhibit malignant tumor growth in mice. They have observed immune depression in rodents in related experiments. No impairment of human clinical immunity, however, has been reported in chronic marihuana smokers (who, like 98% of the population, present a positive dinitrochlorobenzene test). Nevertheless, one may well ask what will happen to them in a decade or two, when the aging process has further decreased their immune mechanisms.

2. Cannabis may cause chromosome abnormalities that could lead to genetic damage. Further studies at Columbia by A. Morishima show that many of the cultured lymphocytes sampled from marihuana smokers are also structurally abnormal: 30% of these cells in metaphase contained only 5 to 20 chromosomes, whereas in nonsmokers the percentage is only 7%. Very similar findings were reported by Cecile and Rudolf Leuchtenberger on lung cultures exposed to marihuana smoke.

These studies lead to the speculation that marihuana products that accumulate in ovaries and testes might also interfere with DNA metabolism of the germ cells. Such alterations of the gonads raises the possibility that marihuana might have mutagenic effects. Both THC and crude marihuana extract cross the placental barrier. (In this regard, it must be remembered that in countries where long-term cannabis use has prevailed, only the male population has indulged.)

3. Cannabis may act on hormone regulators and produce impotence and temporary sterility. Confirming animal studies, Robert Kolodny and associates from St. Louis have observed in heavy marihuana smokers a lowered sperm count and impotence (impotence has also been reported by John Hall of Jamaica, as well as by Indian and Moroccan physicians). Hormones such as luteinizing hormone, antidiuretic hormone, growth hormone, and prolactin are also affected by marihuana.

4. Heavy use of cannabis is severely debilitating to the bronchial tract and lungs. Reports from areas where potent cannabis preparations are used, such as India, Egypt, and Morocco, indicate that excessive smoking produces bronchial irritation, chronic catarrh, laryngitis, and "asthma." Studies in Boston in 1971 for the National Commission on Marihuana showed impairment of lung function. Similar upper respiratory and bronchial tract symptoms have been observed in studies on young American soldiers. Lung biopsy specimens showed that squamous cell metaplasia and atypical cells occurred in all, with basal cell hyperplasia and subepithelial gland changes in most, lesions that are statistically and anatomically related to carcinoma of the lung. Tar yield from marihuana smoke condensate has been shown to be as carcinogenic to the skin of a mouse, as is smoke from the tobacco of commercial cigarettes.

5. Marihuana causes sharp personality changes that lead to marked deterioration in what is normally considered good mental health. Cannabis products are psychoactive and induce temporary effects, such as impairment of short-term memory storage and alterations in electroencephalographic patterns, especially when measured with deep electrodes. The storage of THC and of the other natural cannabinoids and their metabolites in the brain has not been related to permanent brain damage; however, this is difficult to show histologically for any psychotropic drug. Robert Heath of Tulane has conducted experiments with rhesus monkeys that have shown alterations of brain wave patterns that persisted when smoking was discontinued.

Impairment of psychomotor performance, symptoms of physical and mental deterioration, and lack of motivation have been associated with long-term use of marihuana ever since Moreau made such observations of hashish users in Egypt 150 years ago. When such symptoms were reported in the United States, sociologists and psychologists coined the term "amotivational syndrome" and argued whether it was due to impairment of the brain or only reflected the "subculture" with which marihuana users associate!

It is now well established that in all animal species, including man, a considerable degree of tolerance to the physiological and psychological effects of marihuana develops rapidly. American volunteers in Boston or Los Angeles, after a few weeks are able to increase 10 to 20 times the number of joints they smoke daily! Such observations, which are in keeping with older ones, put to rest the so-called reverse tolerance discovered by some students at Harvard, who claimed that marihuana was the only psychoactive drug that required a smaller dose to obtain the initial effect!

Need for Studies

Because of these scientific findings, even those who claimed that marihuana was harmless are now heeding the danger signals. They are calling for longitudinal, epidemiological studies of marihuana similar to those that took 40 years to ascertain the damaging effects of tobacco. Such longitudinal studies, which should concentrate on investigating cellular damage, will take at least a decade to complete in America. As a result, some are now being undertaken abroad in areas of chronic marihuana consumption. In the meantime, preventive medicine would dictate that a moratorium be called on any further attempts to make marihuana socially acceptable and more readily available to the youth of America. This attitude would be welcomed by all the national and international organizations that are trying to maintain a measure of control over the growing use of dangerous drugs in the Western world.

And the time for unlimited experimentation is rapidly running out. Throughout history, social acceptance of marihuana in a society sets citizens on a one-way downward course; in the past, there has been no way to turn back. In any event, the idea that marihuana is harmless must be reviewed. For too long, with a near-total lack of scientific evidence, this notion has enjoyed a high degree of acceptance, with a complete disregard for both history and preventive medicine.

MARIJUANA: THE HEALTH QUESTIONS

Is marijuana as damaging as recent reports make it appear?

By Edward M. Brecher and the Editors of Consumer Reports

Over the past year the news media have carried many stories warning that smoking marijuana produces severely damaging effects on the human body. CU has followed these news accounts with great interest. In our special publication, "Licit and Illicit Drugs," published in 1972, we presented an exhaustive study of the scientific, social, and legal evidence through the end of 1971. Based on the evidence then available, we recommended that marijuana should be regulated rather than prohibited, that all persons currently imprisoned for marijuana possession or for sharing marijuana with friends should be released, and that past offenses of these kinds should be erased from the legal records. The time has come to take a fresh look at the alleged dangers of marijuana.

THE SCIENTIFIC CASE AGAINST MARIJUANA

Many of the recent allegations concerning the effects of marijuana on health have appeared in reputable scientific journals. Here, in summary, is the case against marijuana recently presented to the public.

Edward M. Brecher, an award-winning science writer and investigative reporter, has been a frequent contributor to CONSUMER REPORTS since 1938. He was a principal collaborator on "The Consumers Union Report on Smoking and the Public Interest" (1963), which foreshadowed the U.S. Surgeon General's report of 1964; and he was the senior author of "Licit and Illicit Drugs," the CU report cited by the American Library Association as one of 43 books "of outstanding merit" in 1972.

1. Smoking marijuana damages the brain irreversibly and ages it prematurely.

In December 1971, the late Dr. A. M. G. Campbell and his associates reported in a leading British medical journal, The Lancet, on X-ray studies of the brains of 10 chronic marijuana smokers. Compared to a group of nonsmokers of the same age, the marijuana group reportedly showed "evidence of cerebral atrophy"—that is, a wasting away of brain tissue.

Such X-ray studies, called air encephalograms, can be painful and hazardous, and no other research group has yet ventured to repeat the Campbell study. Several studies involving other techniques, however, are often cited in support of Dr. Campbell's findings. At the Tulane University School of Medicine, for example, Dr. Robert G. Heath implanted electrodes deep in the brains of six rhesus monkeys and recorded the monkeys' brain waves before, during, and after heavy exposure to marijuana smoke. In monkeys, as in humans, temporary changes in brain-wave patterns are normal with almost any change in the body or its environment. But persistent changes are cause for concern. Dr. Heath reported that after his monkeys were subjected to marijuana smoke in large doses daily for months, the changes became persistent; they could be observed as long as five days after marijuana exposure was discontinued. Further, an autopsy report on two of Dr. Heath's monkeys indicated "structural alteration of cells in the septal region of the brain." The alterations

were said to be "minimal," visible only under a microscope. "Our previous experience with similar conditions," Dr. Heath stated, "would lead us to assume that this chronic smoking of marijuana has probably produced irreversible changes in brain function."

Dr. Campbell's 10 patients and Dr. Heath's two monkeys provide the only direct evidence of possible brain damage to date. Indirect evidence, however, comes from Drs. Harold Kolansky and William Moore, psychiatrists at the University of Pennsylvania School of Medicine and the Institute of the Philadelphia Association for Psychoanalysis. Drs. Kolansky and Moore are convinced, on the basis of their observations of marijuana-smoking patients, that chronic smoking produces "a specific and separate clinical syndrome," or pattern of behavior, which has been called "the amotivational syndrome." The hallmarks of this syndrome are said to be "disturbed awareness of the self, apathy, confusion, and poor reality testing." Other signs are sleep disturbances, memory defects, and impairment of the time sense.

"Many of those we examined," Dr. Kolansky said, "were physically thin and often appeared so tired that they simulated the weariness and resignation of some of the aged. All appeared older than their chronological age. . . ." These observations, the Philadelphia psychiatrists concluded, "seemed to imply some form of organic change" in the brains of chronic marijuana smokers.

2. Smoking marijuana lowers the body's resistance to infectious diseases and cancer.

The human body has several defenses against infectious diseases, foreign protein substances, and possibly even against some types of cancer. One of these immunological defenses is provided by the "T-lymphocytes"—certain white blood cells derived from the thymus gland. When viruses or some other foreign substances invade the body, the T-lymphocytes multiply very rapidly and attack the invaders. This is an important aspect of the "immune response."

Dr. Gabriel G. Nahas and his associates at Columbia University's College of Physicians and Surgeons reported in Science in February 1974 that the immune response of marijuana smokers is impaired. The Nahas group based its conclusion on a complex series of laboratory procedures. They removed some T-lymphocytes from the blood of 34 marijuana smokers, allowed the cells to multiply in laboratory cultures for 72 hours, and then exposed them to pooled donor lymphocytes or to a specific chemical—either of which normally evokes the immune response in those cells.

Under these circumstances, the T-lymphocytes of the marijuana smokers assimilated less thymidine (an important cell building block) from the culture solution than did those of the nonsmokers. This result suggested that the cells from the smokers were not multiplying normally.

Dr. Nahas interprets this finding to mean that the immune response of the T-lymphocytes of marijuana smokers is impaired. In this respect, he states, they resemble the T-lymphocytes of some patients with cancer or kidney disease. He concludes that marijuana smokers lack an essential means of defense against infectious diseases and cancer.

In October 1974, Dr. Sudhir Gupta and his associates at Roosevelt and St. Luke's Hospitals in New York City reported related findings in The New England Journal of Medicine. Using a procedure that tests the response of T-lymphocytes to sheep red blood cells, they observed that the reaction of T-lymphocytes from marijuana smokers was weaker than the reaction of T-lymphocytes from nonsmokers. They concluded that marijuana might induce a reduction of T-lymphocyte function in man.

3. Smoking marijuana increases the likelihood of birth defects and of hereditary diseases.

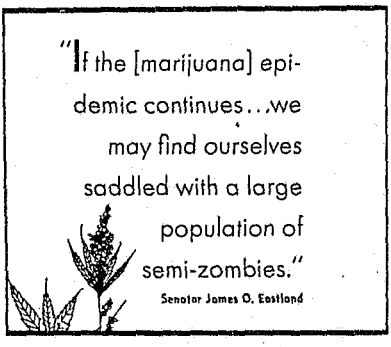
Most normal human cells have 46 chromosomes. Each chromosome carries numerous genes, or units of DNA (deoxyribonucleic acid), which govern the manufacture of proteins within the cell and regulate many of the cell's other functions. Sperm cells and ova each contain only 23 chromosomes; these are of particular importance, for they carry the DNA "genetic code" from parents to offspring.

Back in 1967, reports began to appear alleging that the drug LSD damages chromosomes. Subsequent careful studies failed to confirm this allegation, and the earlier reports are now generally discredited.

Among those who reported that LSD does not damage chromosomes was Dr. Morton Stenchever of the University of Utah College of Medicine. In January 1974, however, Dr. Stenchever and his associates reported in the American Journal of Obstetrics and Gynecology that they had found a somewhat elevated proportion of damaged chromosomes in the lymphocytes of 49 marijuana smokers, including some who smoked marijuana only twice a week or less.

Another chromosome study, not published at this writing, was described at hearings of the U.S. Senate Subcommittee on Internal Security last May. Dr. Akira Morishima, an associate of Dr. Nahas, told the subcommittee that he had compared 956 lymphocytes from marijuana smokers with 954 from nonsmokers. More than 30 per cent of the lymphocytes from smokers contained fewer than 31 chromosomes instead of the usual 46. Among lymphocytes from nonsmokers, only about 10 per cent contained so few chromosomes.

"Since lymphocytes constitute an essential component of



cellular immunity and chromosomes are basic units of inheritance at the cellular level," Dr. Morishima told the Senate subcommittee, "it seems logical to anticipate potential danger in [the] immune defense system, development of cancer . . . , genetic mutation and birth defects."

In the Nahas experiment, it will be recalled, T-lymphocytes failed to multiply rapidly when challenged with foreign substances. The *reason* they failed to multiply, Dr. Nahas declares, was that they could not manufacture enough DNA. Dr. Morishima similarly attributes his finding of too few chromosomes to a defect in DNA manufacture.

4. Smoking marijuana causes precancerous changes in the lung cells and other lung damage.

Damage to lung cells from marijuana smoke has been reported by Drs. Cecile and Rudolph Leuchtenberger of Switzerland and also by Dr. Forest S. Tennant, whose studies were performed while he was a medical officer stationed with the U.S. Armed Forces in Europe. In addition, some clinical studies suggest that those who smoke large amounts of marijuana for long periods may be more likely to develop chronic bronchitis or other conditions indicating lung-cell damage than those who do not.

Dr. Cecile Leuchtenberger's work, however, goes far beyond lung-cell damage. She grew lung cells of human origin in her laboratory and subjected them to repeated whiffs of marijuana smoke. Under these conditions, she found damage to chromosomes, changes in the number of chromosomes, and changes in DNA manufacture—which she interpreted as suggesting precancerous changes. She also reported abnormal sperm cells in mice exposed to marijuana. Thus, Dr. Leuchtenberger alleges five different kinds of marijuana damage—more than any other scientist to date.

5. Smoking marijuana may lead to sterility, impotence, or both, among men.

Testosterone is the most potent male sex hormone. The concentration of testosterone in the blood of a human male can be readily measured. In April 1974, Dr. Robert C. Kolodny and his associates at the Reproductive Biology Research Foundation in St. Louis (the Masters-Johnson sex research center) reported in The New England Journal of Medicine that they had studied testosterone blood levels of 20 frequent marijuana smokers and 20 nonsmokers. The levels in the marijuana smokers, though within normal limits, were lower than the levels in the nonsmokers. And the levels in subjects who smoked 10 or more marijuana cigarettes per week were lower than the levels of those who smoked only five to nine per week.

Six marijuana smokers had relatively low sperm counts and two complained of impotence; such effects might (or might not) be related to low testosterone levels. When one of the men who complained of impotence stopped smoking marijuana, he reported his potency had been restored.

SENATOR EASTLAND'S CONCLUSIONS

Many of the findings reviewed above were nationally publicized last spring at hearings of the Senate Internal Security Subcommittee, chaired by Senator James O. Eastland of Mississippi. Senator Eastland drew these personal conclusions from the testimony:

"(1) If the cannabis [marijuana] epidemic continues to spread . . . we may find ourselves saddled with a large population of semi-zombies—of young people acutely afflicted by the amotivational syndrome. . . .

"(2) We may also find ourselves saddled with a partial generation of young people—people in their teens and early twenties—suffering from irreversible brain damage. . . .

"(3) The millions of junior high school and grade school children who are today using marijuana may produce another partial generation of teen-agers who have never matured, either intellectually or physically, because of hormonal deficiency and a deficiency in cell-production during the critical period of puberty. . . . We may witness the phenomenon of a generation of young people who have begun to grow old before they have even matured.

"(4) . . . There is the possibility . . . that we may develop a large population of youthful respiratory cripples. And there is the possibility—which can only be confirmed by epidemiological studies—that marijuana smokers are producing far more than their quota of malformed and genetically damaged children. . . ."

If the scientific reports of adverse marijuana effects are well-founded, there can of course be no possible objection to their then being widely publicized through Congressional hearings, news accounts, or other means. The truth about marijuana should be known. But if the reports are poorly founded, that fact needs to be reported, too. For such misinformation serves only to frighten the public unnecessarily, especially the millions of marijuana smokers, former smokers, and their families—many of whom may now be waiting in dread for brain damage, cancer, and other predicted disasters to strike themselves or their loved ones. Accordingly, it may prove useful for CU to review recent medical evidence overlooked—or ignored—by the Eastland subcommittee and by the press that covered the hearings.

THE JAMAICA STUDY

Back in 1970, when CU's "Licit and Illicit Drugs" was still in the research stage, a different but almost equally horrifying collection of marijuana hazards was being publicized. Yet many marijuana smokers appeared to remain in good health and in good spirits, just as they do today. Perhaps, we reasoned, it is too early to gauge the true effects of marijuana smoking in the United States or Canada.

But what of other countries where marijuana has been a daily custom for generations? If dire adverse effects existed, they would surely be readily visible there, observable without air encephalograms, implanted electrodes, or other sophisticated laboratory procedures. Scientists dispatched to such countries would not have to *predict* the long-term consequences of marijuana use; they could readily see and measure those effects.

The same idea, of course, occurred to others, including administrators at the National Institute of Mental Health. They commissioned the Research Institute for the Study of Man to study marijuana effects on the island of Jamaica. For decades, Jamaicans have smoked marijuana much stronger than that smoked in the United States.

Although the Jamaica report was completed nearly three years ago, it has still not been published in the United

States. Indeed, CU was unable to obtain a copy from the Government agencies concerned. An edition in English was finally scheduled to be published last month (February) by Mouton, a Dutch firm in The Hague. The report, titled "Ganja in Jamaica," is by Drs. Vera Rubin and Lambros Comitas, director and associate director, respectively, of the Research Institute for the Study of Man.

In Jamaica, the report explains, marijuana is called "ganja" and is used in many ways. It is smoked, brewed as a tea, chewed, and used in cooking. In rural areas especially, it is an important element of folk medicine and superstition. "Children are introduced to ganja quite early," the Jamaica report notes, "first as a medicament in 'bush tea' or in a crude method of vaporizing, where adults blow smoke at an infant with respiratory congestion." Increasing doses of marijuana tea throughout infancy are recommended as a prophylaxis against disease. Schoolboys are urged to smoke marijuana to "help them study," to "improve memory," and to "help pass examinations." This widespread use of marijuana is found both among farmers and villagers and among residents of the slums of Kingston, Jamaica's capital.

The Jamaica study was launched in June 1970, when six anthropologists were sent into the field—five into rural districts and the sixth into an urban slum neighborhood. They found heavy ganja smoking common among the poor, despite severe legal penalties (not less than 18 months' imprisonment with hard labor for a first offense).

One of the anthropologists, Dr. Joseph H. Schaeffer, studied the effects of marijuana on ability and willingness to work. He recorded in detail how much work both smokers and nonsmokers did in a sample week and how much metabolic energy they expended while at work. In general, Dr. Schaeffer found that field laborers actually performed more motions and expended more energy after smoking marijuana than before. But they appeared to accomplish less when on marijuana—weeding a smaller patch of crops in an hour, for example. Dr. Schaeffer also reported, however, that marijuana use in group labor situations tended to increase the social cohesiveness of the workers. While it may have decreased overall efficiency, it appeared to make the prospect of long hours in the field more palatable and increase the laborers' willingness to work.

The Jamaica report calls this the "motivational syndrome"—as distinguished from the "amotivational syndrome" described by other psychiatrists.

Following this and other field studies, the Jamaica research team brought 30 male marijuana smokers and 30 nonsmokers to University Hospital at the University of the West Indies for six days of intensive medical examinations. The 60 subjects ranged in age from 23 to 53; the average age was 34. All but one of the marijuana smokers had first smoked before the age of 20; they had been smoking marijuana for 17.5 years, on the average (the range was from 7 to 37 years). They did not smoke marijuana while in the hospital.

But it was the frequency with which they smoked that will startle American readers. To qualify as a "heavy" smoker in the Jamaica study, one had to smoke at least eight "spliffs" (ganja cigarettes) a day. In the U.S., a "heavy" smoker is often defined as one who smokes more than seven marijuana cigarettes a *week*. And the typical Jamaican spliff is more potent than the typical North American marijuana "joint." Thus, Jamaicans smoke considerably heavier doses than their American counterparts, even though the latter tend to inhale more deeply than Jamaicans.

The 30 control subjects were matched with the ganja smokers for age and socio-economic status. It was, however, impossible to enlist enough working class males in the right age bracket who had never once used marijuana. Accordingly, the control group was composed of 12 men who had never smoked ganja plus 18 confirmed nonsmokers who had smoked only occasionally in the past. All but three of the ganja smokers and all but 11 of the controls also smoked tobacco cigarettes. (Tobacco is also sometimes mixed with ganja in spliffs to make a "better smoke.")

Summarizing the examination findings, the Jamaica report notes "no significant physical abnormality" in any of the controls or in 28 of the 30 ganja smokers. One ganja smoker had a long history of asthma; another had a little-understood nervous condition known as "Jamaican neuropathy," suspected of being an atypical form of neurosyphilis. "There is nothing to suggest that these disabilities were in any way related to the use of cannabis," the report states.

The marijuana smokers and controls were well matched in height as well as age, but the smokers weighed seven pounds less on the average—a difference, the report noted, that "might indicate that the chronic use of cannabis causes some suppression of appetite."

X-rays of the lungs were normal in both groups except for some scarring of the lungs in one of the subjects who did *not* smoke marijuana. Since smoking tobacco cigarettes impairs lung function, it was also necessary to discount that effect when gauging the effects of marijuana. At worst, the Jamaica findings suggest, impaired lung function is produced by inhaling smoke, whether tobacco or marijuana.

Since the marijuana smokers in the Jamaica study were also in many cases the children and grandchildren of persons who smoked marijuana, and since many of them were probably exposed to marijuana before birth as well as during infancy, childhood, adolescence, and adult life, the study of their chromosomes by Dr. Marigold J. Thorburn of the University of the West Indies is of no small interest. Briefly, the chromosomes of the marijuana smokers were in good condition. In fact, they showed slightly fewer abnormalities than were found in the control group, though the difference was not statistically significant.

In addition to these and other studies of physical health, both ganja smokers and controls were given thorough psychiatric examinations by Drs. Michael H. Beaubrun and Frank Knight, both psychiatrists. Only one ganja smoker and one control reported a history of past mental illness. Four ganja smokers and three controls had had alcohol problems sufficiently acute to interfere with work or social functioning. Two ganja smokers, however, "reported that they had been able to reduce their alcohol intake, and seemed to relate this to ganja use."

On the Eysenck personality test, the "extroversion

scores" were identical for ganja smokers and controls. The only man suffering from depression, as gauged by the Hamilton Ratings Scale for Depression, was not a marijuana smoker. Not a single smoker or control appeared to be schizophrenic on either of two rating scales.

The brain-wave recordings of both ganja smokers and controls were also compared. Significant differences were not found.

A battery of 19 psychological tests, designed to compare ganja smokers and nonsmokers on 47 measures, including 11 measures of intelligence, was administered in the Jamaica study. Smokers had not smoked marijuana for two days before the tests and did not smoke on the test day. The marijuana smokers scored better on 29 of the 47 measures—a statistically insignificant finding.

Drs. Beaubrun and Knight summed up as follows: "The data clearly indicate that the long-term marijuana use by these men did not produce demonstrable intellectual or ability deficits when they were without the drug for three days. There is no evidence in the results to suggest brain damage."

The psychiatrists also asked about regularity and continuity of employment and frequency and nature of job changes. No significant differences were found between marijuana smokers and controls. Thus, careful psychiatric examination showed no evidence that these Jamaicans were "semi-zombies" after having smoked very large quantities of very strong marijuana for an average of 17.5 years.

CONFLICT OF EVIDENCE

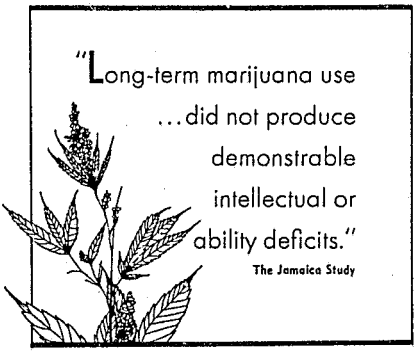
By far the greatest conflict of evidence on marijuana exists between the Jamaica study and the studies cited earlier. But there are also notable conflicts among the latter studies themselves. Here are some examples.

1. Brain damage. The Campbell report, it will be recalled, found evidence of brain damage in a group of marijuana smokers. But was the damage present before the patients started to smoke marijuana? If not, was it caused by marijuana, by some other drug, or by some nondrug factor, such as a blow on the head? Here is what Dr. Kolodny—the scientist who believes marijuana smoking lowers testosterone levels—has to say about the Campbell report:

> Research in cannabis effects on humans has not always been performed or presented with objectivity. Many studies have been severely limited by indiscriminately including multiple drug users, thus frequently raising more questions than providing useful information. As an example of such research, I would like to comment briefly on the [Campbell] study entitled "Cerebral Atrophy in Young Cannabis Smokers. . . ." In the 10 cases reported, all 10 men had used LSD—many of them over 20 times—as well as cannabis, and 8 of the 10 had used amphetamines. One subject had a previous history of convulsions, four had significant head injuries, and a number had used sedatives, barbiturates, heroin, or morphine. On the basis of these facts, speculative connection between cannabis use and brain damage is highly suspect. Unfortunately, this type of report is typical of much of the research done in this field.

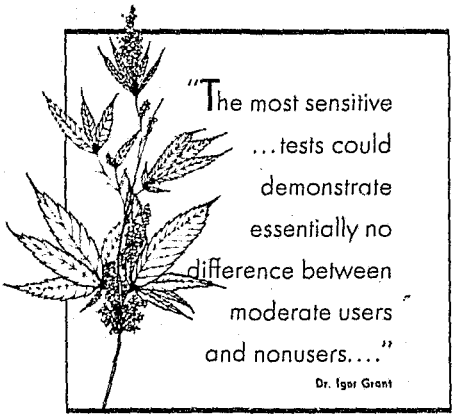
Next, consider this comment on the work of Dr. Heath, who reported brain-wave changes in rhesus monkeys exposed to marijuana smoke, by Dr. Julius Axelrod, who won a 1970 Nobel Prize for two studies, one of them concerned with the effects of drugs on the brain. Dr. Axelrod appeared as a witness before the Eastland subcommittee to warn against marijuana. Asked at the subcommittee hearings about Dr. Heath's experiments, Dr. Axelrod replied:

> . . . One of the fundamental principles in pharmacology is the amount of a compound or drug that enters the body. You could take the most poisonous compound, and if you take too little, there is no effect. One may take a very supposedly safe compound, and if you give enough of it, it will cause toxic effects. This, I think, all pharmacologists recognize. I respect Dr. Heath; he is a fine neurologist; but the doses he has given for the acute effect, for example, would be equivalent to smoking 100 marijuana cigarettes, a very heavy dose of marijuana. And the amount he has given for the chronic effect represents smoking 30 marijuana cigarettes three times a day for a period of six months. [Even the heavy ganja smokers in the Jamaica study smoked only a fraction of this.] The results indicate that marijuana causes an irreversible damage to the brain. But the amounts used are so large that one wonders whether it's due to the large toxic amounts Dr. Heath has given. I think it would be a better experiment if he had done what is done in pharmacology, a dose-response [curve]: smaller amounts equivalent to that used by an occasional marijuana smoker and larger amounts used by a chronic smoker [would be given] to see what levels would produce these irreversible effects. I hope that this will be done.



Dr. Lester Grinspoon of the Harvard Medical School similarly points out that the monkeys in the Heath study did not smoke marijuana voluntarily but had the heavy doses forced into their lungs. Since the monkey lung is about 1/15th the size of a human lung, the concentration of marijuana in the monkey lung may have been 15 times as high as that of a comparable dose in the human lung. Allowing for this and other dosage disparities, Dr. Grinspoon notes, it is possible that Dr. Heath's monkeys were exposed to marijuana concentrations vastly greater than those experienced by the usual human smoker.

Nor have the brain-damage allegations of Drs. Kolansky and Moore gone unchallenged. At the University of Pennsylvania (with which Drs. Kolansky and Moore are associated), another team of researchers headed by Dr. Igor Grant



administered a neurolo[illegible]examination to 29 marijuana smokers and 29 nonsmo[illegible]ntrols, all of them medical students. In addition to the neurological functions usually tested, six measures specifically designed to reveal brain damage were used. The examiners did not know which examinees were marijuana smokers and which were nonsmokers. No difference was found between the two groups.

In addition, the Grant team administered a battery of neuropsychological tests designed to reveal brain damage. "We found no difference between marijuana smokers and nonsmokers on seven out of eight measures," Dr. Grant and his associates reported. "Marijuana smokers did not perform quite as well as nonsmokers . . . on one of the three subtests of the Tactual Performance Test." The team added, however, that "the absence of confirmatory findings in the other tests has led us to conclude that this one finding did not indicate a neuropsychological deficit among marijuana smokers." They summed up their findings in these terms:

> A battery of the most sensitive neuropsychological tests now available could demonstrate essentially no difference between moderate users and nonusers of marijuana. These results agree with those of Mendelson and Meyer who employed similar tests with 10 casual and 10 heavy users.

Finally, the allegations of an "amotivational syndrome" and of brain damage are challenged by the findings of Dr. Norman Q. Brill and his associates at the University of California at Los Angeles School of Medicine. This group checked the college grades of 1380 UCLA undergraduates in 1970, then followed up on the same sample in 1971 (1133 students) and 1972 (901 students). Many of those who left college as well as those who stayed on were followed up.

Six groups of students could be discriminated during this study: those who had never smoked marijuana; those who began smoking during the study; those who increased use during the study; those whose usage remained stable throughout the study; those who decreased use; and those who quit marijuana altogether.

All six groups showed a steady improvement in college grades from year to year. The nonsmokers had the highest grades as freshmen but the lowest grades as seniors and graduate students; the differences were not statistically significant. Neither college grades nor other factors checked by the UCLA scientists supplied any evidence of brain damage or of an amotivational syndrome. "So far as we have been able to determine by this longitudinal study," the Brill group concluded, "the dire consequences that were predicted have not materialized."

2. Lowered resistance to disease. Dr. Nahas, it will be recalled, grew T-lymphocytes from marijuana smokers in laboratory cultures and then challenged them with foreign substances. He interpreted his results as indicating an impairment of the immune response among marijuana smokers—an impairment similar to that found in some cancer patients.

Among those alarmed by the Nahas findings were Dr. Melvin J. Silverstein and his associate, Ms. Phyllis J. Lessin, at the University of California at Los Angeles. Patients with this kind of defect in immunity, they noted in a recent issue of Science, "develop cancer at rates at least 80 times that of the general population." But was Dr. Nahas right in interpreting his results to mean a loss of immune response?

To check on the Nahas claim, Dr. Silverstein and Ms. Lessin took an approach that determines the immune response in the human body itself instead of in a test tube. They challenged chronic marijuana smokers with a foreign substance called DNCB (2,4-dinitrochlorobenzene). A small amount of DNCB was first rubbed on the skin to sensitize it; two weeks later, small doses of DNCB were injected into the skin. Under these circumstances, 96 per cent of all adults develop an immune reaction—a reddening of the skin around the test area and sometimes more severe skin changes. These changes can be graded from 1-plus (a minimum reaction) to 4-plus (a very severe reaction, including blistering).

When this test was run on 22 marijuana smokers, the results clearly indicated that their immune responses were intact and vigorous. All 22 showed a response to even a small (50-microgram) dose of DNCB, and in 21 of the 22 the response was severe (3-plus or 4-plus). Even with only a 25-microgram dose, 21 of the 22 showed an immune reaction, and 14 of the reactions were 3-plus or 4-plus. No resemblance was found to the immune reactions of a control group of cancer patients. Tests with other foreign substances confirmed this finding of a normal immune response in marijuana smokers.

"...There is no clinical or epidemiologic evidence to suggest that chronic marijuana users might be more prone to the development of neoplastic [cancerous] or infectious processes," Dr. Silverstein and Ms. Lessin noted. "Since responses were normal in the chronic marijuana users we tested, it would appear that chronic marijuana smoking does not produce a gross cellular immune defect that can be detected by skin testing."

3. Birth defects and hereditary disease. The Stenchever report that marijuana damages chromosomes, like earlier claims that LSD damages chromosomes, is being heavily challenged by contradictory evidence.

At the Institute for Medical Research in Camden, N.J.,

for example, Dr. Warren W. Nichols and his associates performed a well-controlled study of marijuana effects on chromosomes. They first checked the chromosomes of 24 occasional marijuana smokers and found them to be in good condition. They then gave their 24 subjects measured doses of marijuana daily for five or 12 days and checked their chromosomes again. No damage was detected.

Other investigators who have failed to find marijuana damage to chromosomes include Dr. Thorburn of the University of the West Indies (in the Jamaica study), Dr. Henry B. Pace and his associates at the University of Mississippi, and Dr. Richard L. Neu of the Upstate Medical Center, State University of New York. Animal studies have also failed to provide evidence of chromosome damage.

As for the Morishima report that the lymphocytes of marijuana smokers have *fewer* than the normal number of chromosomes, two difficulties should be noted.

First, all of the lymphocytes studied by Dr. Morishima and reported by him to the Eastland subcommittee came from just three marijuana smokers and three nonsmokers; this is an extremely modest base from which to anticipate, in Dr. Morishima's words, "potential danger in [the] immune defense system, development of cancer . . . genetic mutation and birth defects."

The second difficulty: if more than 30 per cent of the lymphocytes of chronic marijuana smokers contain fewer than 31 chromosomes instead of the normal 46, how could this gross lack of chromosomes have escaped the attention of Drs. Nichols, Stenchever, Thorburn, Pace, Neu, and others who have been intensively examining lymphocytes for chromosome breaks and other minor abnormalities?

4. Lung damage. Though the evidence to date is far from decisive, there is no reason to doubt that marijuana smoke, like tobacco smoke and other kinds of smoke, may damage human lung cells. *How much* damage remains an unanswered question. But the extent of damage is probably more closely related to the amount of smoke inhaled than to the type of smoke. Thus, it is hardly plausible at this stage of scientific knowledge to worry that someone who is smoking a pack of tobacco cigarettes a day—140 a week—may experience further lung damage by adding two or three marijuana cigarettes a week.

For very heavy users who smoke many marijuana cigarettes a week, of course, the risk of lung damage may be serious. Dr. David E. Smith of the University of California at San Francisco Medical School, who is also medical director of the Haight-Ashbury Free Clinic, has accordingly suggested that such users switch from marijuana smoking to other forms of marijuana consumption—such as drinking marijuana tea—to protect their lungs from smoke.

5. Sterility and impotence. Back in 1971, Dr. Kolodny and his associates at the Masters-Johnson sex research center in St. Louis reported that male homosexuals have lower testosterone levels than male heterosexuals. That report, like the Kolodny report on low testosterone levels in marijuana smokers, was widely circulated by the mass media. Within two or three years, however, three efforts to replicate the Kolodny finding failed, and it is now generally agreed that no significant difference exists between homosexual and heterosexual testosterone levels. The Kolodny report on testosterone levels and marijuana is now experiencing a similar challenge.

In November 1974, Dr. Jack H. Mendelson and his associates at the Alcohol and Drug Abuse Research Center, Harvard Medical School-McLean Hospital, reported a carefully controlled study of marijuana effects on testosterone. Like the Kolodny study, the Mendelson study was published in The New England Journal of Medicine.

The Mendelson group selected for its study 27 young male marijuana smokers, some of them casual smokers and others heavy smokers who had consumed more than one marijuana cigarette a day for the past year and who had been smoking marijuana for an average of 5.6 years (range, three to nine years). All subjects were requested to refrain from marijuana smoking for two weeks and were then admitted for a 31-day stay in a locked hospital ward, where access to marijuana and other drugs was rigorously controlled.

During the first six days of the experiment, no marijuana was permitted. Testosterone levels were measured each morning. The average levels were in "the upper range of normal adult male levels." The heavy smokers had somewhat higher levels than the casual smokers, but the difference was not statistically significant.

During the next 21 days, the subjects were allowed to "earn" marijuana by performing a simple manual task. They were required to smoke this marijuana under observation to make sure it was really consumed. As the days rolled by, both the casual and the heavy marijuana smokers gradually increased their consumption, some of them to very high levels. Their testosterone levels did not fall. Under these carefully controlled conditions, the Mendelson group concluded, "high-dosage marijuana intake was not associated with suppression of testosterone levels. . . ."

THE PATTERN OF EVIDENCE

Out of all of these many studies (and others not reviewed here), a general pattern is beginning to emerge. When a research finding can be readily checked—either by repeating the experiment or by devising a better one—an allegation of adverse marijuana effects is relatively short-lived. No damage is found—and after a time the allegation is dropped (often to be replaced by allegations of some other kind of damage due to marijuana).

If the test procedure is difficult—like the air encephalograms that Dr. Campbell employed, or like Dr. Heath's work with electrodes implanted deep in the brain—independent repeat studies are not run in other laboratories. So these allegations of damage continue to be cited in the scientific literature and in the lay press. Then they, too, are eventually replaced by fresh allegations of marijuana damage.

After reviewing the voluminous evidence available up to January 1972, CU did not conclude in "Licit and Illicit Drugs" that marijuana was "harmless." On the contrary, we then pointed out, "no drug is safe or harmless to all people at all dosage levels or under all conditions of use." We see no need to withdraw or modify that conclusion.

We do, however, see a need to comment on the adverse legal and social consequences of misinformation about the health effects of marijuana. We shall do so next month.

Marijuana and Heroin: A Study of Initiation of Drug Use by Heroin Addicts

David F. Duncan
School of Public Health,
University of Texas Health Sciences Center, Houston, Texas

Abstract

Many studies have explored the question of whether or not marijuana use leads to heroin use. An unstated assumption in most of these studies seems to be the presupposition that marijuana use was the drug user's initiation into use of drugs. In two samples of ex-heroin addicts it was found that a majority of the subjects had not begun their drug use with marijuana.

The relationship between marijuana use and heroin use has been an issue for over thirty years. As Glatt (1969) points out, "many 'opponents' base their main objections to cannabis on the 'escalation' argument, i.e. the risk of progressing from cannabis to the 'hard' drugs, heroin and cocaine." A classic statement of the "escalation" or "stepping-stone" hypothesis may be found in an article entitled "Marijuana—A Calling Card to Drug Addiction" by former U.S. Narcotics Bureau Commissioner Henry L. Giordano (1968)*. Mr. Giordano supports his statement of the hypothesis with the assertion that most heroin addicts have experienced use of marijuana prior to their first use of heroin.

This assertion is, in fact, supported by a number of studies. Chein, *et al.*, (1964) reported that of ninety-six addicts in their study, eighty-three had used marijuana prior to their first use of heroin. Chapple (1966) reported that eighty of a sample of one-hundred British heroin addicts had used marijuana before their first use of heroin. In his study of 119 Puerto Rican addicts discharged from the U.S. Public Health Service Hospital in Lexington, Kentucky between 1935 and 1962, Ball (1967) found that opiate use was usually preceded by smoking marijuana with neighborhood friends. In yet another study, Ball, Chambers and Ball (1968) studied all the addict patients released from the U.S. Public Health Service Hospitals at Lexington, Kentucky and Fort Worth, Texas; they found that for patients from the sixteen states with highest rates of heroin addiction, seventy per cent of the heroin addicts had used marijuana prior to use of heroin.

The obvious flaw in such studies is that it gives no idea how many marijuana users did not become heroin addicts. If in a given sample there are 1,000 heroin addicts and ninety-five per cent were previously marijuana users, but there are 10,000 marijuana smokers in the same sample population, then less than ten per cent of the marijuana smokers became heroin users.

* See also: Harms, 1972; Bindelglas, 1973; and Nahas & Greenwood, 1974.

A second set of studies have approached the problem from the other end, conducting prospective studies with identified marijuana users to determine what per cent would subsequently become heroin users. The Institute for the Study of Crime and Delinquency (1967) found that fifteen per cent of the juveniles arrested in Los Angeles for possession of marijuana were subsequently identified as heroin users. In a follow-up study of adults arrested for marijuana possession, the California Bureau of Criminal Statistics (1968) found that fifteen per cent of the males and five per cent of the females were subsequently arrested for possession of heroin. In contrast to these two studies conducted in California, Glazer, *et al.*, (1969) conducted follow-up studies of adolescent offenders in New York City, arrested in 1957, and in 1962, determining how many were listed on the New York City Health Department's Narcotics Register as heroin users between 1963 and 1968. They found that 39·8 per cent of the marijuana users in the 1957 sample and 41·3 per cent of those in the 1962 sample were so listed. This compared to non-drug users at 12 per cent of the 1957 sample and 15·1 per cent of the 1962 sample; 49·0 per cent of the heroin users in the 1957 sample and 52·5 per cent of those in the 1962 sample were listed on the Narcotics Register from 1963 to 1968.

These studies also raise some obvious questions. For one thing, are arrest statistics or listings on a Narcotics Register an accurate reflection or use? The answer probably is no. For another, are arrested drug users typical of drug users in general? It does not seem likely that arrested drug users, especially among juveniles, are representative of the total drug-using population, and furthermore the sociocultural and personal variables which effect the probability of a person being arrested (C. F.: Piliavin and Briar, 1964) may be closely related to the casual factors in heroin addiction. And finally, the fact of being arrested and labelled a delinquent may raise the probability of engaging in further and more diverse deviant behaviour; being labelled as a drug abuser may particularly increase the probability of further and more diverse drug abuse. (Duncan, 1969).

Eliminating these objections, a survey of a national population sample conducted for the National Commission on Marijuana and Drug Abuse found that four per cent of their sample of former marijuana users had used heroin. The same study showed that less than one-half of one per cent of the non-marijuana users had used heroin. In an additional study of 105 selected, middle class, young, working adult marijuana smokers from California, only two per cent of the marijuana users were also heroin users. The Commission did find, however, that there was a definite association between marijuana usage and the use of other drugs in general, but reported that in the majority of cases the use of other drugs was experimental only and did not become a regular pattern of use (National Commission, 1972).

Glatt (1974) has pointed out that since marijuana is an illegal drug, its user is necessarily exposed to groups of fellow law-breakers and may come to be influenced by them and by society's judgements of them and him to accept the definition of himself as an "asocial character." In purchasing marijuana he must enter into a black market situation in which he is likely to come into contact with users and sellers of heroin. "In this way cannabis users run a much greater risk than the average person of being introduced to heroin." Furthermore, having already violated the societal rule against drug use, and experienced no apparent ill-effects from its use, he may find it a small step to using other drugs. "It would seem therefore,"

Glatt (1974) concludes, "that going on to heroin is certainly a greater hazard for the smoker than for non-smokers, but it is by no means inevitable and it happens only in a (probably relatively small) minority."

An unstated assumption in all of the preceding studies seems to be the presupposition that use of marijuana not only preceded use of heroin, but was the drug user's initiation into the use of illicit drugs. The only report in the literature dealing directly with this issue seems to be Harms (1972) study in which he reports that from 75 to 85 per cent of heroin users began their drug use with marijuana. No detail of the study or of the sample(s) is given.

This paper will report two surveys examining the initial drug used by persons who subsequently became heroin addicts. The same criticisms with regard to unrepresentativeness of samples which have been made of the studies reviewed above may certainly be made of these two samples. Nevertheless, they should serve as a starting point in bringing this issue under systematic examination.

Inmate Sample

Sixty inmates of a Southern United States prison, who had been identified as serving sentences for drug or drug-related offenses and who were admitted heroin addicts, were interviewed concerning their history of drug abuse. The median age of the sample subjects was twenty-two. Their mean educational achievement was ninth grade. The two most common offenses for which they were currently imprisoned were possession of narcotics and burglary (in support of their drug habit).

Each subject was asked six questions, as follows: (1) What was the first illegal drug you used? (2) What was the second? (3) Had you used alcohol prior to using narcotics? (4) Were you a heavy drinker prior to using narcotics? (5) Did you first use drugs while in jail or in a juvenile or adult correctional institution? (6) Did you first use narcotics while in jail or in a juvenile or adult correctional institution?

Marijuana was named as the first illicit drug used by only two (3·3 per cent) of the subjects and as the second drug by ten of the subjects (16·6 per cent). The most frequently named initial drug was "speed" (amphetamines), which was reported as the first illicit drug used by thirty-seven (61·6 per cent) of the subjects. Complete results for questions one and two are reported in Table 1.

Table 1. *Inmate Sample*

Drug Type	First Drug Used		Second Drug Used	
	#	%	#	%
Barbiturates	5	8·3	23	38·0
Hallucinogens	0	0·0	2	3·3
Marijuana	2	3·3	10	16·6
Narcotics	4	6·6	17	28·3
Solvents	6	10·0	0	0·0
Speed (amphetamines)	37	61·6	6	10·0
Syrup (cough syrup)	6	10·0	2	3·3

Forty-four (73·3 per cent) of the subjects reported use of alcohol prior to use of narcotics, but only sixteen (26·6 per cent) reported that they had been a "heavy drinker" prior to use of narcotics. Twenty-two subjects (36·6 per cent) reported that their first use of illicit drugs occurred in a jail or correctional institution. First use of narcotics while incarcerated was reported by twenty-eight (46·6 per cent) of the subjects.

Methadone Patient Sample

A second sample of nineteen subjects were drawn as volunteers from the patient population of a methadone rehabilitation program located in a major Southern U.S. city, one and one-half years after the initial sample. The subjects were sixteen male and three female patients. Their median age was twenty-three.

Subjects were asked to report the order in which they first used each of the seven major categories of abusable drugs. They were also questioned about their history of arrests and incarcerations.

Two subjects (10·5 per cent) reported that marijuana was the first drug they had used for intoxication. Six subjects (13·5 per cent) reported that marijuana was the second drug they had experienced. Alcohol was most frequently reported as the first drug used, being reported by fourteen of the nineteen subjects (73·6 per cent). See Table 2. for complete results on this question.

Table 2. *Methadone Patient Sample*

Drug Type	First Drug Used		Second Drug Used	
	#	%	#	%
Alcohol	14	73·6	0	0·0
Barbiturates	0	0·0	3	15·2
Hallucinogens	0	0·0	0	0·0
Marijuana	2	10·3	6	31·5
Narcotics	1	5·2	4	21·0
Solvents	2	10·3	4	21·0
Speed (amphetamines)	0	0·0	2	10·5

All nineteen subjects reported that they had been incarcerated at least once in a jail or detention home. Ten (52·5 per cent) reported that they had been in prison or a juvenile correctional institution. Fourteen subjects (73·6 per cent) reported that they had been arrested prior to their first use of drugs other than alcohol. Fifteen subjects (78·9 per cent) reported that they had been arrested before their first use of narcotics. Four reported their first use of drugs while in a correctional facility. The same number reported their first use of narcotics in a correctional facility.

Out of this sample six respondents (31·5 per cent) reported that they had used narcotics prior to their first use of marijuana. Five of these were young users (aged 18–22 years) and the sixth was the oldest in the sample group.

Summary and Discussion

This study has found that in two samples of heroin addicts, marijuana was not the starting point for drug use in a majority of the cases. There are a multiplicity of

starting points for drug dependence, marijuana use is one of them, but it is only *one* of the many possibilities.

Alcohol is the predominant drug in Western culture (along with tobacco and caffeine, which were not considered in this study), hence it is predictable that most heroin addicts will have had experience with alcohol prior to use of narcotics. If heroin addicts tend to come from populations in which marijuana use is widespread (as it is among young people in many parts of the world today), then we can expect many heroin addicts to have experienced marijuana smoking. By the same light, if heroin addicts come from populations in which milk is commonly consumed, most heroin addicts will have drank milk prior to their first use of heroin.

That is not to say that marijuana use is an unrealted to heroin use as is milk drinking. Rather, it is meant only to point out that association does not necessarily denote causality and that the logic of *post hoc, ergo procter hoc* is a logical fallacy and not a research tool.

Some users of marijuana are seeking escape. Some of those users will go to other drugs seeking a better pharmacological means of escape. And some of those will find that means in heroin. But the crucial deciding factors lie in the persons and his environment, not in the pharmacology of a drug.

Narcotics (opium) date to the stone age, marijuana nearly as far back into history, but the epidemic of drug dependence we face today is a product of our times. The sooner we stop putting the full blame on inanimate drugs or on pitiful drug addicts and start looking for the social and interpersonal factors which produce escape behaviour on an epidenic scale, the sooner we will begin to learn how to stop that epidemic.

MARIHUANA—CONTRADICTING SCIENTISTS' FINDINGS

(By Gordon S. Brownell)

Recently, The Examiner published a misleading article headlined "Scientists Shift on Marihuana" by writer Karen Peterson, which portrayed a distorted picture of the present climate of medical and scientific thinking regarding marihuana.

The article dealt with research which emphasized alleged dangers from marihuana use, without reference to the preponderance of contrary evidence and studies conducted by private and governmental researchers which have shown marihuana not as dangereous as once believed.

There was no mention of the exhaustive, two-year study by the National Commission on Marihuana and Drug Abuse which was appointed by President Nixon. The commission concluded that while further marihuana research is necessary, there is no reason to continue to criminalize and jail the individual user.

On the federal level, the research being conducted by the Department of Health, Education and Welfare comprises the most objective and thorough evaluation of the effects of marihuana available in the United States. Its findings are at variance with the conclusions reached by the scientists described in the Aug. 29 article.

As the first case in point, there is the "brain-damage" monkey which is one of the subjects of Dr. Robert G. Heath's research at Tulane University. According to the article, the monkey's "brain waves are not normal. He is a steady marihuana smoker, that's why."

What the article did not point out is that the dosage levels used in Dr. Health's experiments with rhesus monkeys were extraordinarily high, up to 300 grams or 120 marihuana cigarettes daily. Researchers have long known the effects of marihuana are dose related, but there are few, if any, marihuana users capable of consuming such huge amounts of cannabis regularly, if ever. The National Commission on Marihuana and Drug Abuse pointed out that while heavy users smoke several (3 to 7) cigarettes daily, the overwhelming majority of users consume much less. Thus, it seems hardly appropriate, if not absurd, to base our social policy towards the use of marihuana on data which assumes users smoke 120 cigarettes a day.

The Peterson article also cited research of Dr. Gabriel Nahas of Columbia University. His well-publicized study that marihuana use leads to a breakdown of the immunization process and renders the user more susceptible to infectious diseases remains unsubstantiated by other research. In fact, Nahas' findings are contrary to the most respected and significant double-blind clinical study of chronic use conducted to date, which was commissioned by the federal government.

As the third annual H.E.W. Report to Congress, "Marihuana and Health (1973)" states:

"The Jamaican study of long-term chronic ganja smokers found no deleterious effects that could be attributed to cannabis. The potency of ganja (marihuana) normally smoked in Jamaica is much higher than that of 'pot' and the frequency and duration of ganja smoking is greater than in the U.S. There was no difference in the incidence of disease and no 'adverse effects' were reported in the offspring of the smokers."

Among other researchers mentioned in the article were Dr. Morton Stenchever of the University of Utah and Professor Hardin Jones of the University of California. Both have reported alleged chromosome damage from marihuana use. Professor Jones has made the startling observation that "the chromosome damage found by Professor Stenchever, even in those who use cannabis 'moderately', is roughly the same type and degree of damage in persons surviving atom bombing with a heavy level of radiation exposure (approximately 150 roentgens). The implications are the same."

In contrast, the third annual H.E.W. Report to Congress cited above states:

"The possibility that cannabis preparations might cause genetic or birth defects has been a source of concern although there has been little evidence to support it. The bulk of the present evidence, particularly that of well controlled studies, suggests that the likelihood of genetic or neonatal abnormalities arising from cannabis use at present levels of use is low. There is no convincing evidence that chromosome abnormalities arise from marihuana use."

It is sad however, that the extensive research of the National Commission and the Dept. of H.E.W. does not attract the prominent headlines and media coverage that the more sensational and fear-arousing studies do. The present state of marihuana criminalization has resulted largely from the general tendency of the media to attach an unwarranted amount of credibility to the "scare" techniques often employed by the more evangelic anti-marihuana propagandists.

In the thirties and fourties, for instance, the mainstay of the marihuana's prohibitionists was marihuana's alleged casual relationship to crimes of violence and insanity. In the fifties and up until the mid-sixties, the fear of heroin and marihuana's "stepping-stone" addictive qualities received wide-spread attention

In recent years, the focus has shifted to marihuana's effects on the brain, chromosomes and possible birth defects. In each phase of marihuana prohibition, a different fear-arousing rationale for maintaining criminal penalties against the user has been put forth, to the unfortunate subjugation of saner, less strident, voices.

In any event, it is questionable of the wisdom of whether medical effects alone can provide the basis for formulating the most effective permanent public policy on marihuana. Decriminalization is not based upon the premise marihuana use is harmless, but rather that such use should fall within the ambit of individual choice permitted in a free society. It is a social policy aimed at reducing the harm caused by defining marihuana users as criminals.

This point was made strongly by Dr. Robert Kolodny, research director of the Reproductive Biology Research Foundation in St. Louis, whose findings that heavy marihuana use may interfere with male sexual response were cited by writer Peterson. In his appearance before the Senate Internal Security Subcommittee hearings on marihuana last May, Kolodny spoke for the authors of this study:

"However, we wish to draw the distinction between our role as scientists and as concerned citizens . . . (As scientists) our position is simply that of wanting the legislators and the public to be well-informed on all sides of this issue . . . (As concerned citizens) we would now like to state our personal hope for a move toward the decriminalization of marihuana possession."

"We must continue to investigate the possible harmful consequences from marihuana use," Dr. Thomas E. Bryant, president of the independent and highly respected Drug Abuse Council in Washington, D.C., has stated. "But we cannot allow science to become a political tool, perverted in order to achieve a desired result."

[From JAMA, Vol. 235, No. 12, Mar. 22, 1976]

MARIHUANA INGREDIENT HAS VARIOUS MEDICAL USES

(Medical News)

Marihuana, grass, maryjane, or pot. The names are different, the connotation the same—a euphoric experience, a "high." But the fact is that marihuana contain a pharmacologically active agent—Δ^9-tetrahydrocannabinol (THC)—that may be therapeutic as far as patients with glaucoma, bronchospastic diseases, and terminal cancer are concerned.

Sydney Cohen, MD, hopes that the social reputation of the drug will not preclude its potential benefits. He is clinical professor of psychiatry at the University of California Los Angeles School of Medicine and he has studied the effects of THC in patients with glaucoma and asthma. In an interview with Medical News he explained that the intraocular pressure-lowering effects of THC have been known since 1971. In normal persons, the reaction is dose-related and clinically significant while in patients with glaucoma, THC lowers intraocular pressure "as well as any good antiglaucoma agent currently available."

Intraocular pressure dropped 30% (for four to five hours) in seven of 11 patients with wide-angle glaucoma. Unfortunately, Dr. Cohen said, the compound also caused a "high"—and this may be interpreted as unpleasant in some older patients. Robert S. Hepler, MD, at UCLA is now trying to develop a form of the drug that will reduce intraocular pressure without the "high." According to Dr. Cohen, the answer probably lies in THC eye drops that would have a direct effect on the eyeball, or possibly a synthetic agent.

At a New York Academy of Sciences Conference on Chronic Cannabis Use, Dr. Cohen reported that "in rabbits, topically instilled THC in sesame oil produced a 40% reduction in intraocular pressure when compared to a group given

only sesame oil. So far, tolerance to the intraocular pressure reduction has not been established."

The bronchial effects of aerosolized THC are also being studied and "may be surprising," he added. Despite the initial, significant narrowing of the smaller and larger airways after inhalation of cannabis, the airways *dilate* with THC.

In a single-blind study by Donald P. Tashkin, MD, at UCLA, bronchospasm was induced in asthmatic volunteers by exercise and methacholine. The investigators then compared the effects of 10 mg of smoked THC to aerosolized isoproterenol, and placebo. Both drugs (but not the placebo) promptly relieved bronchospasm. Although isoproterenol achieved a higher and earlier peak effect, the effect of the THC lasted longer. With *aerosolized* THC, the mean peak increase in specific airway conductance was 90% above baseline—"much greater than when equivalent amounts (10 mg) of THC are smoked," the investigator reported. Also, such systemic effects as tachycardia and the "high" were not as pronounced with aerosol THC.

The mechanism of action is not clear, Dr. Cohen said, but apparently is not β-adrenergic blockade. The effects of THC in some ways resemble those of isoproterenol and atropine, but the mechanisms involved are different. Propranolol does not block THC-induced increases in specific airway conductance (it does block this effect of isoproterenol). Also metacholine blocks atropin-induced increases in bronchial diameter, but does not seem to interfere with similar effects of THC.

When Dr. Tashkin reported his results at the Conference on The Therapeutic Aspects of Marihuana at Asilomar, Pacific Grove, Calif., he said that "it is of interest that the smallest dose of aerosolized THC (5 mg) results in a peak bronchodilator effect approximating 80% of that following 20 mg of Δ^9-THC and comparable to that following 1,250μg of isoproterenol."

In addition, he said, "the bronchodilator effect of 5 mg of Δ^9-THC was longer-lasting than that following isoproterenol (five hours vs 30 minutes)." Bronchodilation resulting from 5 mg of aerosolized THC was accompanied by only a modest (11%) short-lived (15-minute) increase in heart rate and no significant "high." In contrast, 10 to 20 mg of aerosolized THC produced significant pulse and psychological changes lasting up to two hours.

In Dr. Tashkin's view there may be therapeutic advantages to smaller doses of aerosolized THC over smoked and oral THC with respect to the magnitude, speed of onset, and duration of bronchodilation. This method of administration may also have fewer cardiac and central nervous system effects.

Another speaker at the Asilomar conference, Joel R. Butler, PhD, of North Texas State University, Denton, described the effects of THC on 54 patients with advanced cancer. One purpose of the study was to gather data on THC's acute and chronic psychological and physiological effects in patients with limited life expectancy. The investigators also wanted to determine the compound's toxicity and proper dose size. One area of psychological interest was THC's possible beneficial effect on terminal patients, such as reversal of depressive trends and anxious behavior, analgesia and antiemesis, and appetite stimulation—all problems associated with advanced cancer.

The result: THC did in fact act as both a tranquilizer and a euphoriant when administered as a "general tonic" in 5-mg capsules (suspended in sesame oil) supplied by the National Institute on Drug Abuse. There was no indication of cognitive impairment and the cancer patients showed a definite tendency to maintain weight. Dr. Butler said these positive results may have been due to drug-induced psychological improvement, diminished pain and neusea, and—possibly—even some specific effect on the "elusive machanisms" that produce cachexia in cancer patients. He added a word of caution: his data are too preliminary to serve as guidelines for any clinicians.

[Newhouse News Service Article]

New Federal Report Outlines Medical Applications of Pot

(By Susan Fogg)

Almost lost amid reports on the ill effects of marihuana on human health were findings that the drug shows some promise as a medical application to a variety of physical and emotional ailments.

The bulk of the official federal report on "Marihuana and Health" (the government continues to favor the "h" spelling released last week was devoted to detailing the latest research on the dangers of pot smoking.

But the report also outlined some of the therapeutic applications of marihuana that researchers have been testing. These findings are tentative, and have little or no application to recreational use of the drug.

Perhaps the most striking study was conducted with 34 cancer patients at the Medical College of Virginia, where patients receiving marihuana showed a number of benefits.

Marihuana apparently served as an appetite stimulant which helped check weight loss. The drug also helped suppress nausea, and worked as a pain killer.

Marihuana also served as a mood elevator and tranquilizer, but without giving the cancer patients the "high" experience by street users.

The researchers attributed this lack of a high both to the hospital setting and to the fact that the patients did not know what drug they were taking.

Other tests on lab animals indicated that marihuana may have some potential as an adjunct to anesthesia during surgical procedures. Initial studies show, according to the federal report, that use of marihuana as a sedative may reduce the amount of anesthesia needed.

Other research into the usefulness of marihuana as a sedative in treating disorders like insomnia and emotional depression has shown mixed results, but the federal report said further investigation was warranted.

In one study five retarded children with grand mal epilepsy were treated with a synthetic drug based on the active ingredient in marihuana, with results as good or better than conventional medications.

However, animal studies indicate that the anti-convulsive properties of marihuana may be limited by an apparent increase in tolerance for the drug, so that doses must be increased for it to continue to work.

Traditionally, marihuana was used in Western medicine as a treatment for convulsions, chronic pain, opiate and alcohol addiction, and asthma.

Over the past two years, researchers have again been looking at marihuana in the treatment of asthma, on the basis that in normal users, smoking marihuana dilates the major airways into the lungs.

However, scientists are concerned with other findings that smoking can cause respiratory damage. Nonetheless, the report concluded that "further investigation is desirable."

Other studies reported in "Marihuana and Health" indicate that the drug can impair driving ability, temporarily lower male sex hormone level and possibly bring about changes in cell structure that could lead to lowered body resistance to infection or genetic damage.

These hormonal and cellular effects of marihuana—still unconfirmed—could have especially serious effects on either the young adolescent or on the old, the federal report said.

Attention: smoking grass may be good for your health

By Richard Lance Christie

In the last few months, a rash of government reports, medical studies and newspaper stories have begun – once again – to trumpet the dangers of marijuana. Not since the days of Reefer Madness, *the hysterical movie made in the '30s about a murdering marijuana freak, has there been such sound and fury over grass. Marijuana Causes Male Impotency! Marijuana Interferes with Body Immunity Mechanism! Marijuana Affects Fundamental Chemistry of Living Cells! After releasing the latest HEW report on marijuana a couple of weeks ago, the top White House expert on drugs, Dr. Robert J. DuPont, warned that "the health consequences are unknown and potentially quite severe." Sen. James Eastland (D-Miss.), whose Internal Security subcommittee released its own report on the marijuana-hashish "epidemic," even went so far as to suggest that it stems from a Communist plot.*

Once again we are being exposed to the latest opinions of a relatively small group of investigators and authorities who believe the products of the hemp plant are either insidiously dangerous or menacingly unknown. But the fact is that marijuana is one of the oldest and most widely used drugs for intoxication and medicine known to man. And our research knowledge about the chemical action and public health implications of cannabis is at least as good as our equivalent knowledge about aspirin.

Today, roughly 14 percent of all Americans older than 12–or some 28 million people–have tried smoking marijuana at least once. Last year 420,000 of them were arrested for possessing or dealing marijuana–twice the number in 1970. And, despite the fact that DuPont and the man who preceded him at the White House, Dr. Jerome Jaffe, have both said they oppose prison terms for marijuana users, two bills to decriminalize grass are languishing in the House and Senate.

To clear the air around what is emerging as a major issue on the national agenda–the legalization or at least decriminalization of marijuana–we have asked a leading marijuana researcher to lay out what is known about the weed's medical properties, sorting out the hard medical fact from the soft moralistic opinion. Richard Lance Christie was the research coordinator and then project director of the UCLA Longitudinal Marijuana Study, funded by the National Institute of Mental Health, for 3½ years. Now completing his Ph.D at UCLA on the relationship between marijuana use and cultural stance, Christie is also working as chief of research and evaluation for the New Mexico Department of Hospitals and Institutions, which is in charge of drug abuse, mental health and retardation.

Used in moderation, grass will *not* make you impotent, damage your memory or kill you. But it *could* help cure your asthma, relieve your migraine, inhibit cancer and give you a new lease on life

As he explains below, "the killer weed" has many positive medical properties and, if further research is encouraged, might prove to be an unexploited wonder drug of the future.

Information about the effects of the cannabis plant on man are impressive in both amount and antiquity because the drug has been used for so long. Archaeologists have found that cannabis was used in Europe by the Bylony Culture 7,000 years ago, and an urn filled with marijuana leaves dating from 500 B.C. was recently unearthed near Berlin, Germany. The mythical emperor Shen Nung's herbal, written about 1000 B.C., mentions several uses of cannabis, and the drug was being used as an anesthetic in China around 2000 B.C. Cannabis is highly praised in the Aryan *Vedas*, dating from 2000 B.C. through several centuries after Christ. In Hindu mythology, the gods are depicted as giving the drug for the welfare of mankind, bringing joy to and relieving anxiety in the user. A papyrus of Pharaoh Ramses advises washing sore eyes with cannabis extract. Most native cultures in Asia and Africa knew of and used cannabis as a medicine and intoxicant, and do so today.

Cannabis was formally introduced to Western medicine in 1839 by W. B. O'Shaughnessy, M.D., a brilliant 30-year-old British doctor serving in India. He reviewed 900 years of medical uses of cannabis there, and then experimentally investigated the drug's toxicity and effects on animals and men. He found, as have investigators since, that the cannabis drugs are relatively nontoxic as drugs go and that they can be effective as a pain reliever, anticonvulsant and muscle relaxant. Sir J. Russell Reynolds, M.D., Queen Victoria's personal physician, conducted research on cannabis for 30 years (whether the queen served as guinea pig is unknown). He confirmed cannabis's lack of toxicity, and found it particularly effective as a pain reliever in cases he saw as involving a psychosomatic, emotional component, as in aborting migraine headaches and relieving menstrual cramps.

As a result of the favorable reports, cannabis came into widespread use medically for an expanding number of complaints in the West. The 1851 *U.S. Pharmacopeia* listed "neuralgia, gout, rheumatism, tetanus, hydrophobia, epidemic cholera, convulsions, chorea, hysteria, mental depression, delirium tremens, insanity and uterine hemorrhage" as the complaints for which cannabis "has been specially recommended." Popularity of cannabis as a medicine waned, however, because of two problems. First, cannabis could not be injected into the bloodstream because of poor water solubility, and onset of effect by mouth is very slow, the peak taking two to four hours to attain. Second, effects were hard to predict with a given dose. We know now that a large part of this latter problem was due to lack of control over the potency of preparations sold to and by pharmacists. The concentration of the 30-odd cannabinoids in cannabis varies as a function of temperature, water, soil conditions and the genetic strain of the plant, and some of the medically active cannabinoids degenerate with exposure to heat and air over time after harvesting. In addition, in common with all drugs to a greater or lesser degree, there is considerably individual variation in people's responses to a given dose of cannabis.

The effects of use of cannabis on man have been thoroughly studied, but the information thus obtained has yet to be rationally considered in forming social policy. The Indian Hemp Drugs Commission, for example, issued their seven-volume report in 1894 after two years of investigations. The British commissioned the study in hopes it would document ill effects from using cannabis so that the drug could be banned and Scotch whiskey sold instead at a sizable profit in taxes to the Crown. The nine-man commission interviewed every doctor practicing in what is now India and Pakistan, reviewed the records of every criminal case and mental hospital case in which use of cannabis was alleged to be involved, and viewed the effects of cannabis generally on a culture that had been using it for 2,600 years. They concluded that "moderate" use of the hemp drugs is not injurious mentally, physically or morally, while "excessive" use produces ill effects on body and mind and "both indicates and intensifies moral weakness." Commissions in 1931, 1944, 1968, and the contemporary LeDain Commission in Canada and the U.S.A. National Commission on Marihuana and Drug Abuse (which concluded that only the heaviest 2 percent of pot users in the U.S. were a population "at risk" from a public health point of view) all replicated the general finding of the Indian Hemp Drugs Commission.

Marijuana is an emotion-laden subject about which hundreds of myths and popular beliefs have evolved. Most of these are poorly supported in fact, and instead appear to serve needs related to issues larger than the merits of marijuana. On one hand, such countercultural gurus as Timothy Leary and Jerry Rubin advocated marijuana and hallucinogen use as instrumental to producing revolutionary (as opposed to "conditioned") consciousness. On the other hand, certain investigators have engaged in what Harvard University's Dr. Lester Grinspoon calls "psycho-pharmacological McCarthyism," conducting poor research or interpreting results out of perspective in order to demonstrate that marijuana has catastrophic ill effects. What this illustrates is that the

All drugs are damaging and lethal in sufficient amounts; aspirin, for example, causes massive bleeding from the intestines, irreversible kidney damage and toxic psychosis

National Commission on Marihuana was referring to by labeling its report, "Marihuana: Signal of Misunderstanding." Marijuana, in this culture, has come to be associated with an anti-technological, anti-authoritarian, anti-conventional and pro-hedonistic value system (this is not true in some other cultures). Some people seek to present marijuana as good because they like these associated values and lifestyles, and others seek to demonstrate marijuana is evil because they oppose them. A person committed to scientific values cannot help but see these positions as a modern equivalent of Tweedledum and Tweedledee, since the legitimate object of science is to find those things which will prove themselves.

Since misconceptions about marijuana seem to be the loudest school of thought on the subject today, let's examine them first.

Smoking grass lowers your resistance to disease: A group of investigators at Columbia University headed by Gabriel Nahas reported in *Science* that they found the T-cell immune responses of a group of young cannabis users to be depressed relative to those of a much older control group of cancer patients, and superior by only a small margin to a group of organ transplant patients whose T-cell immunity was deliberately disabled to prevent rejection of the transplant. These results imply that marijuana users could not resist cancer, among other speculative consequences.

At UCLA, however, Nahas's results could not be confirmed using a chronic marijuana-using population and using a different test of T-cell immune response which is better validated to predict prognosis in cancer patients than that used by Nahas.

The UCLA research makes Nahas's finding suspect, and suspicion is increased by checking the available literature concerning disease and mortality rates among cannabis-users vs. their nonusing peers. If there is a difference, it has not been observed. It is true that in many cultures cannabis users belong to the lowest and most wretched classes, with cannabis being used to ease the burden of their existence, which tends to be disease-ridden and brief. When users are compared to nonusers in the same social class, however, no difference in disease and mortality rates is noted.

It is even less surprising that Nahas, et al., have not enjoyed much support in their findings when one observes Nahas's previous concern for scientific values. In a review of Nahas's 1972 book, *Marihuana: Deceptive Weed*, by Barry Liskow, M.D., in the conservative *Journal of the American Medical Association* (April 30, 1973, p. 631), it is noted that: "To support his [Nahas's] essentially moralistic viewpoint [that marihuana is evil], examples of biased selection and interpretation of studies and omissions of facts abound in every chapter. . . so much of the volume is distorted that one must know the marihuana literature in order to judge the accuracy of each statement."

Marijuana causes chromosome damage: The media widely reported the recent findings of Dr. Stenchever, an obstetrician at the University of Utah, who reported a higher rate of chromosome breakage in the blood cells of marijuana users than nonusers. Regrettably, the media does not bother to do literature reviews. I did, and found the "box score" on studies of chromosome damage from cannabis is now 1:5:1: that is, one study (Dr. Stenchever's) "for" marijuana use being related to chromosome breakage, five studies "neutral" in finding no relationship in humans, and one study among Jamaicans using the equivalent of 27 joints of American-grade marijuana a day

for an average of 17 years daily finding a *lower* rate of chromosome damage in users than in a matched group of nonusers.

Marijuana use by pregnant women will cause birth defects in the unborn: Research on this issue is far from satisfactory, and an attitude bordering on paranoia is appropriate when considering use of chemicals by pregnant women. The adverse effect of tobacco smoking on the unborn child's development, for example, is well documented. However, research with animals, although there is considerable difference between species, indicates that it takes huge amounts of cannabis to influence fetal development. If one makes the dubious assumption that dosage in a female rat can be extrapolated to a female human, the dosage of marijuana which begins to cause stunting in size of the offspring figures out to about 1,300 joints of American-grade marijuana per day, for a 115-pound woman.

Marijuana makes men impotent: Recently, Kolodny, Masters, Kolodner and Toro of the Reproductive Biology Research Foundation reported a preliminary study of 20 young males who had used marijuana at least four days a week during the preceding six months. They found in the experimental group that blood levels of the male sex hormone, testosterone, was 44 percent lower than in a control group and that one-third had depressed sperm counts. This study is presently being replicated under controlled conditions at UCLA. So far the St. Louis group's results are being confirmed. THC (the "high"-producing chemical among the 60-odd cannabinoids in marijuana) is similar structurally to the female sex hormone estradiol, and cannabis has central nervous system effects that could influence the reproductive system through a variety of pathways. What these results mean is unclear, however. Kolodny, et al., speculate that heavy use of marijuana by a pre-adolescent boy could inhibit puberty, and by a pregnant woman carrying a male fetus might inhibit sexual development of the infant. Public health records on cultural groups using cannabis heavily are not detailed enough to adequately check these speculations, but no obvious effects are noted in these groups. The concerns of most people, however, center on what these hormonal findings mean to the sex life of adult males. As to effects on sex drive, the main mediator of sexual desire in both male and female is androgen, with some evidence available that testosterone has more to do with aggression than with sex. In our data on both college marijuana users and long-term heavy users of marijuana outside college, we find a systematic *positive* association between frequency of marijuana use and frequency of sexual activity among males, and this association cannot all be removed by manipulating other variables. Those heavy marijuana users with poor sexual adjustment typically have long histories of poor psychological adjustment as well, often verifiable as predating drug involvement.

Since we are unable to demonstrate any gross negative impact of marijuana use on male sex drive and behavior in our field data, what we may be observing in these laboratory hormone studies is the discovery that marijuana is a somewhat active male contraceptive and aggression-reducing agent.

Smoking marijuana will give you lung cancer: Preliminary evidence indicates that marijuana smoke is at least as damaging to lung tissue as tobacco smoke. However, the changes in lung tissue which presage cancer occur, on the average, after 20 "pack-years" of exposure in tobacco smokers, i.e., 20 years of one pack per day (20 cigarettes), or 10 years of two packs per day, etc. Since the average consumption of marijuana cigarettes by daily users in the U.S. is only 2.5 cigarettes a day, precancerous changes would be expected to occur after 160 years of a typical daily marijuana use regimen. It does not seem likely that marijuana smoking will cause a notable increase in the incidence of lung cancer.

Queen Victoria's physician found marijuana particularly effective as a pain reliever, aborting migraine headaches and relieving menstrual cramps

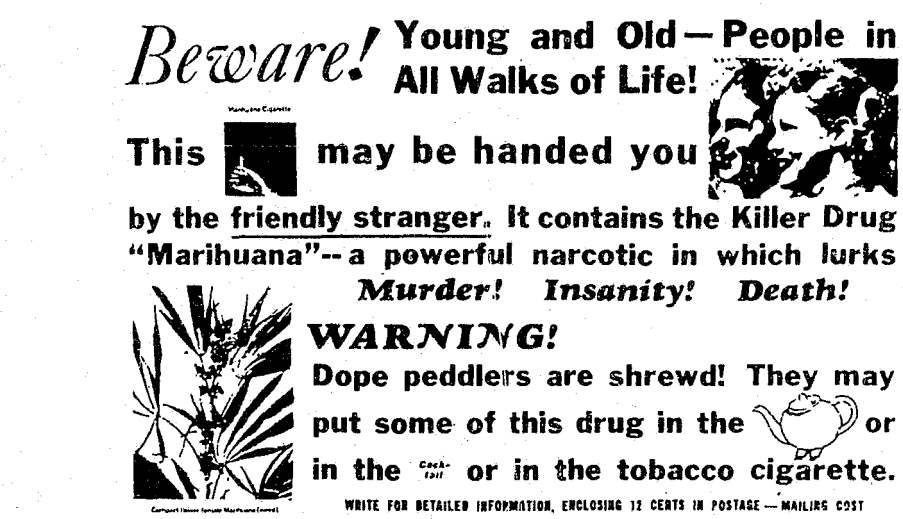
Marijuana causes males to grow breasts: Thirteen cases of young males growing breasts (gynecomastia) after heavy marijuana use have been reported. I suspect this represents an idiosyncratic reaction involving the youth's metabolisms mistaking THC for the female hormone estradiol, which has a similar chemical structure. Given the rate of breast development observed among the half million young men using marijuana as heavily in the U.S.A. (and millions more using more heavily overseas) as these 13 men afflicted with unforeseen developments, most males' metabolisms apparently don't do this.

Grass damages one's memory: Anyone who has toked up with friends knows how easy it is to forget what the conversation was about or where a certain train of thought began. Only after much backtracking along a distinctly nonlinear conversation can the original idea be recaptured. This experience has led some users to suspect these temporary memory lapses might be taking a more permanent toll.

Until recently, when some clinical studies, chiefly by Kolansky and Moore, presented case histories of people who allegedly degenerated mentally as a result of using marijuana in ordinary social doses, evidence to this point was largely anecdotal. The problem with selected populations of people referred for treatment to psychiatrists is that one cannot tell which came first, or what causes what. For example, one might observe that a number of people who killed their families with axes had a great devotion to *Kung Fu* and karate movies. An authority who concluded that watching *Kung Fu* causes homicidal mania would be laughable, since it is common knowledge that millions watch the same show without such consequences. However, authorities have attributed degeneration of memory and personality to social levels of marijuana use despite the fact that several large, representative studies like ours at UCLA have not found such degeneration to occur with marijuana use except rarely. In most cases where marijuana use and memory deterioration occur together, other factors appear to be responsible, with the marijuana use more understandable as a symptom of the problem rather than as its cause.

One encounters a number of cases, however, in which marijuana use itself appears to have been the cause of disturbing mental ill effects. The most sensible possibility to account for these rather rare cases is that some people react adversely to marijuana as some do to every food and drug. Just as penicillin and bee stings are lethal to a few people but not to most, marijuana may cause severe memory and personality problems in a few people who are in effect "allergic" to it.

It is also possible for the individual who uses marijuana quite heavily to suffer "hangover effects" from large accumulations of cannabinoids in the body which may interfere with memory. Our own experiences and those of investigators abroad indicate this condition will clear up after abstinence from the drug for 7 to 14 days. There is no good evidence that there is a permanent effect on memory and a good amount of evidence that there



Reefer madness propaganda distributed by the Feds in the 1930s.

is not.

Marijuana causes brain damage: This contention, inherited from the *Reefer Madness* days when marijuana was the drug of insanity and death, has received new publicity lately with widely ballyhooed research from England and Tulane University. The English study reported finding cerebral atrophy (shrinking of the brain due to cell death, normally found in senility) in 13 young "cannabis users." The media failed to mention that these subjects were culled from thousands of patients in metropolitan London precisely because they had symptoms of senility, and that juvenile-onset cerebral atrophy has always affected a certain number of young people who are not drug-involved. They also failed to point out that all the 13 were either heavy multiple-drug users or were known to have histories of brain damage, or both.

In short, we have a situation equivalent to selecting only *Kung Fu* viewers who have committed axe murders, and then displaying them as typical *Kung Fu* viewers; and secondly, all the 13 subjects had one or more *more probable* causes for cerebral atrophy in their histories than cannabis use. The fact that the British investigators fixated on cannabis use as their choice for the cause of brain shrinkage says more about their biases than about marijuana's effects.

The Tulane University study has received wide exposure this year. At the university, Dr. Heath has had 10 monkeys smoking or being injected with marijuana, and has observed death and brain damage to result in some. Further, he alleged the dosages he used are equivalent to those used by high schoolers in the United States. Examination of his data, however, indicates he has a strange idea of what high schoolers use. Calculating his dosages in terms of the weight and potency of samples of marijuana actually taken from users over the past few years, they add up to be the equivalent of from 20 to 240 joints per day per monkey. Even for a human that's a lot of dope. Only those monkeys in the highest dose conditions died or showed severe pathology.

All drugs are damaging and lethal in sufficient amounts; aspirin, for example, causes massive bleeding from the intestines, irreversible kidney damage and toxic psychosis. Further, many drugs like alcohol have a lethal dose to intoxicating dose ratio of 10:1. Thus, what Heath's data actually shows is that marijuana is so nontoxic that it takes extended exposure to a ratio of 240:1 to produce lethal effects. If Heath had been studying the effects of alcohol on man by using equivalent overdoses, all his monkeys would have died the first day of the study, and with aspirin they probably would have died or showed damage sooner. Further, cannabis undergoes significant chemical changes when pyrolized (burned). The applicability of findings using injected cannabis extracts to determine the effects of social use is therefore very questionable.

Moreover, aside from the defects of these studies, no brain damage was found in such well-controlled studies of chronic users as that in Jamaica, funded by the National Institute of Mental Health. Subjects in this study had smoked the equivalent of from 7 to 24 American joints a day of "ganja" for an average of 17 years. When compared to a matched group of nonusers from the same social strata, no differences were found in any aspect of mental or physical function. Field studies involving about 2,000 sub-

jects' social behavior, life histories, work output, etc., also showed no differences between those using ganja, however long or heavily, and those not using it. In Jamaica, 60 percent of the adult male population uses ganja, but no social stereotypes exist about ganja users being different from nonusers. Possibly as a result, there are no differences, even in lifestyle and attitudes.

It is worth noting that some of the studies alleging brain damage from cannabis use come from the Middle East or from studies of Middle Eastern hashish users in Europe. Middle Eastern hashish has been found to contain high concentrations of a quite toxic group of cannabinoids known as cannabivarins. The presence of these substances, plus the curious habit of using camel dung as a binder in hashish manufacture, may account for the relatively high incidence of observed ill effects from heavy hashish use.

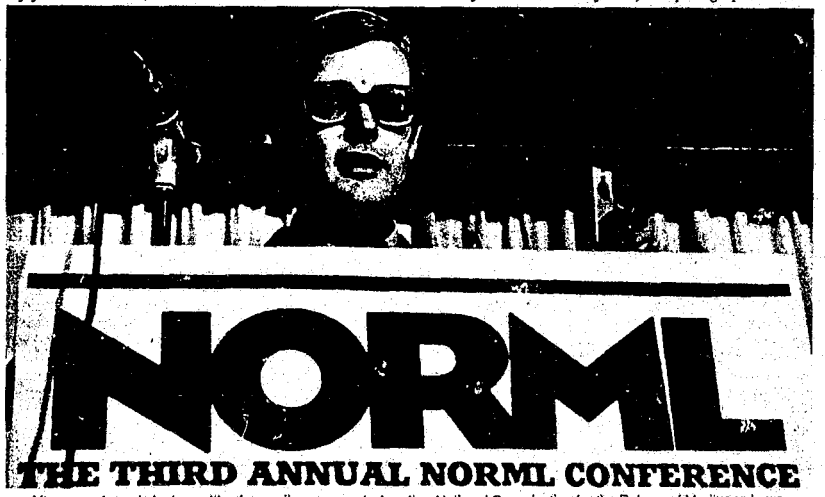
Grass is an aphrodisiac: Some native cultures believe cannabis is an aphrodisiac, while others scoff at the idea. In fact, several cultures use cannabis as a means of reinforcing sexual abstention. In summary, it seems correct to say that smoking cannabis can make one more relaxed and attuned to a sensual state of consciousness, and this, plus a seeming intensification of the senses, may be beneficial to some people's sexual behavior and enjoyment. In others, intrusive associations, physical reactions, etc., may interfere with sexual performance, although this is less common. Since sexuality is an area uncommonly susceptible to the effects of suggestion, the expectations of the user about the effects of marijuana on sex, whatever they are, are highly likely to fulfill themselves.

"Pot" keeps insects away: This view is not in vogue in the United States, but in folk medicine, cannabis plants are grown around cabbages to repel caterpillars, and twigs of cannabis are hung in bedrooms to repel gnats and flies. Whether or not this is effective remains to be tested under controlled conditions, although we know of only one species of insect that will attack cannabis.

So much for the rumors and half-truths. They abound largely because competent research in recent years has been stunted by the legal constraints on the plant and on those who study it—not to mention the political and social stigmas associated with it. Nevertheless, a substantial amount of unbiased research is currently being done on marijuana; and far from demonstrating the hazards of its use, the evidence points to many positive medical effects. This work has been conducted under sound methodological standards, and is consistent with what we know historically—but has received scant attention outside the research community.

Intraocular pressure: At UCLA in 1972, Hepler and Petrus of the Jules Stein Eye Institute found that, within minutes of smoking ordinary marijuana, the pressure of fluid in the eyeball drops, and remains depressed for about four to five hours, returning to its original level in about eight hours. Recent findings indicate it is the "high"-producing delta-9 tetrahydrocannabinol (THC) in marijuana that is responsible. This could be of great importance because a major cause of blindness in the United States is glaucoma, a disease in which excessive fluid pressure in the eye can destroy the retina unless controlled. In preliminary studies, Hepler and his associates have found that glaucoma patients who were given marijuana to smoke show fluid pressure drops to the normal range. Existing medication for glaucoma is far from satisfactory in terms of reliability and side effects, so these findings are viewed with great interest.

Bronchial dilation: For centuries, one of marijuana's uses in folk medicine was as an asthma remedy and antitussive. In the U.S., pre-rolled marijuana cigarettes were manufactured by Grimault and Sons at the turn of the century and marketed in drugstores as an asthma remedy. At UCLA's pulmonary function laboratory, Tashkin and his associates found in 1972 that smoked marijuana is more effective than isoproterenol (the medication usually used) in opening up constricted



After opposing criminal penalties for marijuana users before the National Organization for the Reform of Marijuana Laws, White House drug expert Robert DuPont hedged his position by sounding the alarm on the weed's health hazards.

bronchial airways in asthmatics, and these results have been confirmed by others.

Primary suggestibility: Before the turn of the century, marijuana was used by some psychiatrists to produce a state of heightened suggestibility so that otherwise nonresponsive patients could be hypnotized. Recent experimental studies have not supported these reports that marijuana can assist in hypnotizing people. In 1965 at Stanford University, Sjoberg demonstrated that the major hallucinogens LSD and mescaline enhance primary suggestibility (receptivity to hypnotic-type suggestions) during a waking state to a magnitude comparable with deep hypnosis. This study stimulated great interest in whether or not marijuana has similar effects. Helen Joan Crawford demonstrated in our laboratory this year that both low and high "social" doses of marijuana on the average enhanced primary suggestibility to a magnitude comparable with the state produced by hypnosis in the same subjects. Several subjects who were not responsive to hypnosis when "straight" showed significant suggestibility enhancements when "stoned," a finding which could have implications for psychotherapy. This heightened suggestibility while under the influence of marijuana provides an explanation for the subjective reports of heightened "sensitivity" to people and environments while "high." It also casts new light on users' common observations that smoking marijuana makes group experiences more easily shared and seems to "lower inhibitions," but in a very different way than does the depressant alcohol.

People who are bored, jaded and generally disinterested in life could become activated by marijuana's stimulating effect on imagination and the intensity of perceived sensation

Anesthesia: Harris and his associates, at the University of North Carolina Medical School, and Smith, at the University of Pennsylvania, have been investigating the properties of cannabis as an anesthetic, a use that dates back to 2000 B.C. in folk medicine. Early reports indicate that administering massive quantities (in humans, the equivalent of 1,000 joints or so) of a cannabinoid preparation produces anesthesia in the animal subject. Although unconscious, the animal shows no depression of respiration and heart action, retains life-maintaining reflexes such as gagging, and, in addition, shows a marked lowering of body temperature (hypothermia). Most anesthetics do depress vital signs and reflexes; thus cannabis may provide an improved way to relieve pain in circumstances where limited medical attention is available, such as among accident victims and battlefield casualties. Since hypothermia extends the time tissues can survive without oxygen, this effect of cannabis anesthesia is additionally attractive. However, Smith's results with human clinical research are not released, and there may be undesirable effects or difficulties in use of cannabis with man that counteract these advantageous features of the drug as an anesthetic.

Antibiotic: Czechoslovakian researchers have found that the classic use of cannabis in many cultures as a poultice for use on wounds, piles, corns, burns, sore feet and as a wash for sore eyes is based on sound medical properties. The fresh cannabis plant contains a cannabinoid called Cannabidiolic acid, which is a potent gram-positive antibiotic. The Czech research shows that it is effective against staphylococcus, streptococcus, enterococcus, the germs causing pneumonia, diphtheria, typhoid, tuberculosis and numerous other bacteria causing human and animal diseases. Cannabidiolic acid is effective against strains of bacteria entirely resistant to penicillin and other antibiotics currently used, and has the same potency as penicillin. Unfortunately, Cannabidiolic acid is deactivated rapidly in the blood, and degenerates swiftly in the presence of oxygen and heat. It can be stabilized in a medical base, but until the incompatibility with human blood can be worked out, it is usable for external infections only. The Czechs got excellent clinical results using Cannabidiolic acid as a salve or poultice for the conditions listed above, and in irrigations of body passageways such as the urinary tract and ear canal. The researchers also found that their cannabis preparations exerted a local anesthetic action on the treated tissues, yielding particularly good clinical results when applied to burns, the nipples of nursing women, bed sores, exposed pulp in dental cases and skin infections in animal handlers.

In addition to clearly demonstrated pharmacological properties, marijuana has a number of promising properties suggested either by as yet unconfirmed new research or by observation of folk medicine uses of the drug which seem to be effective across cultures.

Anticonvulsant: In folk medicine, cannabis is commonly used for cough, headache, menstrual cramps, as a relaxant and the like. Western doctors working with cannabis in the 1800s substantiated the effectiveness of cannabis for these purposes. Several decades ago, Davis and Ramsey conducted a study with brain-damaged epileptic children whose seizures were not being controlled by the traditional combination of Phenobarbital and Dilantin. Using synthetic THC (synhexyl), they obtained as good or better results in all cases than with previous medication. Consistent with the findings of British doctors, including Queen Victoria's personal physician, our research at UCLA shows that female marijuana users report significantly less time lost from work and school because of menstrual difficulties, and less cramping and pain. British researchers also found that cannabis stops spotting between menses. Our subjects commonly report that they use cannabis to good effect in aborting migraine headaches and similar tension-related problems, an effect substantiated in the last century by the British. Currently in the U.S., there is work now being done on the anticonvulsant properties of cannabis.

Anorexia nervosa: This condition consists of a pathological loss of appetite, leading to wasting of the body from malnutrition. Asian physicians, including modern practitioners trained in the West, report effective use of cannabis to restore appetite in such cases. Any marijuana user experiencing the "blind munchies" can testify to the drug's effect on appetite.

Addictive drug withdrawal and maintenance: Cannabis has been used clinically from time to time to aid in the "abstinence syndrome" (withdrawal) from "addicting" drugs such as heroin, barbiturates and alcohol, with mixed results. What investigatois have not dealt with systematically is what Brecher, author of *Licit and Illicit Drugs*, identifies as the "post-abstinence syndrome": periodic attacks of "anxiety, depression and craving" for the drug persisting up to several years after the physical dependence has ceased.

Brecher marshals evidence that suffering the post-abstinence syndrome motivates detoxified addicts to return to the use of a dependence-producing drug, although they may choose a different drug than they previously used. For example, in New Mexico some 60 percent of heroin

addicts become alcoholics within two years after withdrawal from heroin. Mikuriya and other investigators have reported cases in which alcoholics have successfully substituted marijuana for alcohol, and in our research we have observed a number of such cases. We have also encountered cases in which former heroin addicts self-medicate with marijuana when they feel distress, and have remained heroin-free for many years following this practice. Whatever the depressant involved, what is immediately obvious in these cases is that the individual is highly functional while maintaining on marijuana by comparison to his sorry state when drinking or mainlining. Several married subjects among the ex-addicts I have studied have middle-aged, "straight" wives, all of whom I observed to be quite anxious that their husbands not run out of marijuana. When the husbands use pot, the wives report them to

In folk medicine, cannabis plants are grown around cabbages to repel caterpillars, and twigs of cannabis are hung in bedrooms to repel gnats

be affable, interested in staying home and playing with the kids, making love, eating hungrily and listening to music; able and willing to work steadily and stay out of trouble.

When on alcohol, these men were typically abusive, belligerent, in jail or otherwise not working frequently, and when working or in possession of money most of it went for alcohol. Whatever the merits of marijuana use in the average person, it is certainly the opinion of these women that chronic marijuana intoxication is greatly preferable to chronic alcohol intoxication. Research to determine what role, if any, marijuana might play generally in ex-addict maintenance and recidivism is under way.

A tonic for the blahs: Cannabis has been used for centuries in folk medicine to restore the spirits. It is reputed to have a tonic-like action, increasing energy, interest in life and appetite. Various early research projects in this century obtained conflicting results with true clinical depression, and it seems fair to summarize that cannabis does not relieve the kind of cyclic depressive condition, unrelated to circumstances in life, that has become increasingly common in recent years and is commonly treated with tricyclic antidepressants like Equanil. Instead, careful reading of the literature and observation of the effects of marijuana today lead me to suspect that these early folk healers were treating ennui, not clinical depression. People who are bored, jaded and generally disinterested in life could become activated by marijuana's stimulating effect on the imagination and the intensity of perceived sensation, or simply by the mild change in perspective produced by getting stoned.

During the 1950s, according to one unverified story told among drug researchers, a research team administered marijuana to patients on a hospital geriatrics ward with marked positive results: a renewed interest in food, social interaction and trips off the ward.

In a related vein, research on terminally ill cancer patients is currently in progress at UCLA to determine the effects on appetite, sleep, mood and need for pain-killing drugs produced by taking marijuana.

Cancer cure: In August of 1974, a group of pharmacologists at the Medical College of Virginia reported that the "active ingredient" in marijuana which causes the high—THC—inhibits the growth of a number of different kinds of cancer, including viral leukemia, in mice. Although a powerful drug recently introduced for cancer treatment in humans was somewhat more effective in inhibiting cancer growth than was THC, its side effects are seemingly far more serious. This research directly contradicts the findings of Nahas, et al., who claim marijuana reduces the T-cell immune response, which allegedly combats cancer and viruses. In addition, an attempt by a UCLA research team to replicate the Columbia findings met with failure. These conflicting results and the immense interest in finding cancer cures should stimulate intense future research in this area.

Given the large number of alternative possibilities for medical use of cannabis, it is probable that at least a few will prove out well enough in clinical practice to be adopted into Western medicine's pharmacopeia. One hopes that rationality will somehow come to prevail in the political arena so that research to determine what the benefits and hazards of marijuana use truly are, in objective comparison to other drugs, can be conducted and decisions made on the basis of sound information. ●

University Press of Virginia
Charlottesville

Selected Bibliography

This selected bibliography lists many of the published books and articles to which we referred in researching and writing this book. Of equal importance, however, were the letters, papers, and unpublished memorandums in the files of the Bureau of Narcotics and Dangerous Drugs in Washington, D.C., and the microfilm newspaper files in many of the nation's libraries. In many instances, the identifying information for specific memorandums and letters, as well as newspaper clippings, was incomplete. In such cases, we simply recorded the available data, which are included in the preceding compilation of reference material. We have not listed these sources here.
