ia

Ever since the Garden of Eden man has been concerned with allocation problems created by scarce means and unlimited ends. Then it was allocating four fig leaves between two people; now it is spending billions of dollars to pacify millions of people.

Hanley H. Hinrichs

I. INTRODUCTION

There is clearly a limit to resources available to state agencies for service provision. Agencies are mandated by state and federal statutes and regulations to provide certain services to specific client groups. Concurrently, funds available to pay for the services are regulated. Since resources are finite it is prudent that those available be utilized in the most efficient and effective way possible and that an accounting of the allocation be made.

Cost/benefit analysis is a useful tool for analyzing the economic results of a course of action. It does not, however, provide ready-made decisions since dollar valuations cannot be attached to every significant variable in the model. Also, while empirical in method, it does rest upon assumptions and projections.

The consulting firm of Booz-Allen-Hamilton, Inc. was contracted to work with project staff in developing a methodology for a cost/benefit analysis of the SID project.* The methodology was to be of sufficient detail to allow SID staff to conduct data entry and analysis independently.

This Volume presents SID's implementation of the cost/benefit methodology. There are three sections: methodology and assumptions underlying the model; results; discussion and conclusions.

* The full report entitled "Methodology for a Cost/Benefit Analysis of the Service Integration for Deinstitutionalization Project" was appended as Appendix Z to the January 1974 SID Progress Report.

II. METHODOLOGY

A. FRAMEWORK

The framework for the cost/benefit analysis is defined by four considerations:

- 1) the analytical question to be addressed which in turn depends on the goal and objectives of the SID project and on the intent of the analysis;
- 2) the point of view to be taken for defining costs and benefits;
- 3) the target group of clients to be studied using the methodology developed;
- 4) the time frame for the analysis.

Each element is discussed in turn.

1. Analytical Question

The central purpose of SID is to establish a systematic procedure for the orderly deinstitutionalization of residents of state institutions. That goal will be achieved when clients adjust to community living and do not return to institutions, when movement toward independent living situations is made by clients, when comprehensive and continued care of clients in a community setting are available, and when improved integration of community services takes place.

The SID model assumes that any person can reside in a community setting rather than a state institution, given sufficient service resources in the community. The analyt-

ical question is derived from the assumption that SID's systematic deinstitutionalization procedure is successful, i.e., that clients once placed in the community continue to remain there. In analytic terms, then, the question addressed by the analysis is: Do the benefits of deinstitutionalizing a client and maintaining him in the community, using the SID model, exceed the costs?

Formulation of the question in this manner results in a direct answer to the question of differential costs and benefits associated with community living versus institutional living.

2. Perspective

The choice of perspective depends primarily upon who is to use the cost/benefit analysis results and for what purpose. It is expected that persons at all levels of government will use them when confronted with the task of opting for or against programs geared toward deinstitutionalization. Thus, the costs and benefits of successful deinstitutionalization are classified from the perspective of society-at-large. Costs and benefits from other perspectives--such as federal, state, and local governments--are calculated separately so that costs and benefits for such subgroups are available.

3. Target Group

The target group of clients selected for the cost/benefit analysis are those mentally ill and mentally retarded clients who are judged to be successfully deinsti-

tutionalized. Juvenile offender clients have been excluded as explained in paragraph IIB below.

Recidivists are dropped from the analysis, as are clients judged likely to be re-institutionalized, since these persons represent a failure in the community services delivery system and an abridgment of the SID goal. The analytical question as defined (see paragraph IIAl, above) precludes inclusion of this group for the current analysis.

4. Time Frame

The time frame chosen must balance the necessity of including future streams of costs and benefits with the inherent risk of making projections.

It is tempting to select the term of the project as the time frame since this would allow exclusive use of empirical data and would not require reliance upon the uncertainties involved with projections into the future. However, that time period is too short to obtain a meaningful answer to the analytic question.

Adoption of the lifetime of the SID clients would have the advantage of accounting for all future cost and benefit streams. However, given the uncertainties of projecting housing, income, and other service needs over decades, a time frame of ten years (or the client's lifetime, if expected to be less than ten years) has been chosen.

B. EXCLUSION OF JUVENILE OFFENDER CLIENTS FROM THE TARGET GROUP

The analytical question and the time frame for conducting the analysis for mentally ill and retarded clients do not apply to juvenile offender clients. For the mentally ill and mentally retarded group, the cost/benefit method analyzes the economic consequences over a relevant period of time (ten years) of implementing one course of action (deinstitutionalization) versus another (continued institutionalization). With juvenile offenders, it is not realistic to assume that one alternative occurs to the exclusion of the other. The juvenile offender will be released at least at age 21.

The central economic question regarding the juvenile offender client group is:

Is there any long-term dollar advantage to releasing juveniles under a planned, service-integrating, service-monitoring procedure (such as SID) over releasing them without this kind of elaborate social machinery?

To answer this question, a longitudinal survey of many years duration is required. Thus, the juvenile offender client group has been excluded from the present analysis.*

C. STRATIFICATION OF DEINSTITUTIONALIZED CLIENTS

The net economic effect of the deinstitutionalization effort can be determined by analyzing the costs and benefits

*

A methodology has been developed by Booz-Allen-Hamilton, Inc. and given to appropriate officials in the Department of Corrections for their consideration.

in the deinstitutionalization of a target group of clients. However, if the target group is analyzed only as a whole, valuable information about portions of the group may be obscured. For example, clients being supported by welfare versus clients being supported by their own earnings are likely to have very different costs and benefits from society's viewpoint.

The target group has been stratified by those factors most likely to affect the results and each stratum is analyzed separately. Three variables were judged to have the most influence on costs and benefits associated with deinstitutionalization and maintenance: housing, employability, and primary source of funds.

1. Housing

The client's type of housing is used as the primary indicator of level of disability. The types of living arrangements are grouped into three categories:

- Intensive Care (IN) (containing nursing home, home for adults giving close supervision, and training school for the blind)
- Intermediate Care (IM) (containing boarding house, residential hotel, home for adults giving moderate supervision, foster home, halfway house, V.R. residential facility, and group home)
- Family or Independent Care (FI) (containing relative/guardian's home or own home or apartment)

2. Employability

Prognosis for employment rather than employment status is used. If labor-market conditions are such that oppor-

tunities for employment exist and if the SID model is operating successfully in locating employment for clients, then employability will equal employment. Employability is more stable than employment as it is not affected by the success or failure of the model or society.

Employability is broken into three categories:

- Employable Full Time (FE) (the client is employable full time in a competitive environment)
- Employable Part Time (PE) (the client is employable part time in a competitive environment or is employable full/part time in a sheltered workshop)
- Not Employable (NE) (the client has physical, emotional, or mental problems that will most likely always preclude him from being gainfully employed)

3. Primary Source of Funds

Money payments to the client to be used at his discretion (as contributions toward housing or supportive services, or for food, clothing, or other necessities) are broken into two groups:

- Private (PR) (at least 50% of support comes from client's savings, assets, employment, family/guardian of client, Social Security income--earned or retirement, other disability benefits, or pension)
- Public (PU) (at least 50% of support comes from public assistance income grant, Supplemental Security Income, Medicaid, or Medicare)

The three variables just described, with their accompanying categories, form a matrix of 18 cells or strata. Some of the cells are realistically contradictory or non-plausible. For example, it is unlikely that there are

clients employable full time, living in intensive care arrangements, and receiving public (or private) funds. After exclusion of such cells, there are likely to be no more than 15 active cells. Since the number of clients in the target group is small, this "cell-loss" will enhance the analysis.

Data are collected and processed on a per client basis for each specific living arrangement, employment position, income source, and other service provided. As detailed in paragraph E, below, clients were assigned to strata when empirical data were collected for the last time (December 31, 1974). This procedure proved more reliable than trying to assign each client to a stratum when deinstitutionalization first occurred since there tended to be a "settling-in" period before a client's situation stabilized and his future became more predictable.

A major reason for stratification is to allow decision-makers to determine those types of clients for which it is relatively more cost/beneficial to implement a program of deinstitutionalization. Consequently, costs and benefits for each stratum are analyzed separately.

Clients may be expected to shift from one stratum to another across time. The decision-maker may need to know the extent of, and the economic implication of, this phe-

nomenon. Therefore, cross-tabulations are made to show the relationship between descriptor variables at the time of client release and at the time of projection.

D. COST AND BENEFIT ELEMENTS

Conceptually, specific cost and benefit elements result from effects or consequences of SID model operation. Since these effects are virtually limitless in number, the task becomes one of sorting, selection, and categorization to make the analysis manageable.

The myriad of SID model-associated happenings have been categorized into ten principal model effects which, from the perspective of society-at-large, were then classified as costs or benefits. There are six major cost elements and four major benefit elements. Some of these elements have been divided into smaller but distinct units (called "items") for clarification.*

1. Cost Elements

a. Community Supportive Services

These include costs or services provided by agencies, facilities and other organization to SID clients in the community for meeting their social, physical, psychological, and educational needs. Supportive services are arranged by SID on behalf of the client and are provided by community resource persons. Both ongoing service

*

Appendix A contains a chart showing for each cost and benefit element and item its components and the terms included in each component.

delivery costs and the costs associated with start-up of services are included.

b. Client Maintenance

The housing and subsistence items comprising this element may not be mutually exclusive since some housing facilities also provide subsistence. They are separated for data entry purposes but are combined in the final analysis.

c. Service Integration Costs

This element includes personnel costs not included in Items 1a, 1b, or 1d incurred by SID staff, A&P teams, institution staff, and community service providers in the process of deinstitutionalizing successful clients and maintaining them in the community. Costs incurred during assessment, determination of placement, and client tracking and service monitoring of the target group are taken into account.

d. Deinstitutionalization Costs

These are the costs incurred by the institution in the process of releasing SID clients.

e. Lost Economic Productivity

This is an implicit cost element. Should the relative or guardian of a client decide to quit his job in order to care for the client, the lost labor represents a lost contribution to economic productivity.

f. Community-Related Costs

Intangible, external effects of the SID model which relate to the reactions of community citizens toward placement of SID clients in their community are included in this element. Fear, confusion, and misunderstanding are all feasible reactions which cannot be measured and assigned a commonly acceptable or reasonable cost.

2. Benefit Elements

a. Savings of Institutional Costs

If a SID client lives in a community rather than an institution, society saves the cost of providing institutional care for the client.

b. Increased Economic Productivity

This is the client's contribution to economic productivity, i.e., his or her labor valued as the market dictates.

c. Psychosocial (Client)

Improvements in a client's well-being resulting from community placement are intangible effects that can be quantified but not easily valued in dollars. SID does measure these effects but does not attempt to put a dollar value on them for purposes of the cost/benefit analysis.

d. Psychosocial (Community)

Community placement of SID clients and SID service integration efforts affect the community. There is, hope-

fully, an increased public awareness of the problems and needs of the mentally ill and mentally retarded client. Also, service providers may achieve greater integration and develop information upon which to base resource development. These benefits are not feasibly measured in dollar terms, however.

E. DATA COLLECTION AND ADJUSTMENTS

Empirical data for the cost/benefit analysis were collected from the time each client was first placed into the community until December 31, 1974. At the data cutoff date, housing, source of income, employability, and support service requirements were projected over the next ten years of the client's life.

Projected lifespans were determined on the basis of actuarial tables (Commissioner's Ordinary Table, 1974, Federal Tax Facts). Projections for each client's service requirements in the community were based on the empirical data gathered during his community tenure and on the judgments of SID staff and service providers working with the client.

Clients were assigned to strata and analysis of data proceeded on a per stratum basis.

Data were adjusted for a number of economic factors which could not be measured directly.

1. Fringe Benefits

These are considered to be a portion of the compensation a worker receives for his labor. Fringe benefit rates are included in the direct labor costs for all personnel who in one way or another serve the client.

2. Overhead

The overhead factor is applied to the direct labor costs of all employee groups thereby accounting for the additional indirect costs of providing a service.

3. Inflation

Costs and benefits incurred over a period of time change in dollar amounts as a function of inflation (or deflation). The rate or pattern of future inflation cannot be accurately estimated. Therefore, the analysis conducted disregards the inflation/deflation phenomenon.

Ignoring future inflation patterns does not detract from the quality of cost-benefit comparisons made in the analysis since there is no reason to assume that an increase or decrease in relative dollar values of costs versus benefits will occur over time.

4. Discount Rate (Opportunity Costs)

Capital invested in the past, when viewed in the present, has expanded in dollar amount because of investment earnings over time. Dollars invested in the future will have had no opportunity to accrue earnings. Because of this economic phenomenon, today's dollar is more valuable than the same dollar ten years from now over and above inflation reasons.

All monetary values in the analysis are treated in terms of today's dollars. To correct for the "lack-of-opportunity" of future dollars, these are discounted to present dollar values.

5. Adjustment Factor

In addition to the above adjustments, an "adjustment factor" is necessary to account for the cost of unrecorded, non-direct service delivery time spent in such activities as arranging for a service, determining client eligibility, producing reports, attending staff meetings, etc. The adjustment factor is estimated to be a percentage of direct labor costs and is a dollar value added to the documented costs of providing a specific service to a client.

F. SUMMARY

The purpose of the cost/benefit analysis in the SID project is to provide another tool for the evaluation of a service-integrating model for deinstitutionalization. The results can be interpreted only in the context of other data generated by the project.

The methodological approach addresses economically measurable costs and benefits incurred in the successful operation of the SID model in deinstitutionalizing and maintaining mentally ill and mentally retarded clients in the community projected over a period of ten years. Costs and benefits are determined from the perspective of society-at-large.

To refine the analysis, clients are stratified by housing, employability, and source of income. Clients are expected to occupy no more than 15 of the possible 18 cells.

Data are entered on an individual client basis for each of five cost and two benefit elements to which dollar values can be attached. (One other cost element and two benefit elements are intangible.) The dollar amounts used throughout the analysis are expressed in terms of today's dollar value and represent costs and benefits related only to the target group of successfully deinstitutionalized clients.

III. RESULTS

This section describes the resultant sample of clients included in the cost/benefit analysis, specifies the calculation methods associated with the analysis, and presents the cost/benefit findings.

A. SAMPLE

A total of 52 clients met the criteria for inclusion in the cost/benefit analysis. These clients were either mentally ill or mentally retarded and were judged to be and likely to remain successfully deinstitutionalized. Table 1 presents a breakdown of the sample of clients by institution

of residence prior to placement.*

The majority of the client sample came from Western State Hospital (WSH). This result is due largely to the fact that the processing of clients from that institution began several months before clients from Lynchburg Training School and Hospital or Southside Virginia Training Center entered the project and about one year before the first clients from Central State Hospital were processed.

Clients from WSH have, on the average, been residing in the community longer than clients from the other three institutions. (See Table 2.) The actual time spent in the community by individual clients ranges from one month to 18 months. The average length of time spent in the community for all 52 clients is 8.5 months.

Ten additional clients were once included in the analysis but later dropped due to re-entry into an institution. (See Table 3.) Even if clients were subsequently re-released, as three were, they no longer met the terms set by the analytical question.

*
Tables 1-22 are presented at the end of Section III, RESULTS, p. 34.

The demographic characteristics of the sample of 52 clients were found to be as follows:

- The mean age at assessment was 52.76 years.
- 53.8% are female.
- 82.7% are white.
- 7.7% are married.
- 5.8% have one or more children over the age of 18.
- The mean length of the last institutionalization was 13.23 years.
- The mean number of prior institutionalizations was 1.27.
- 12.5% have a committee assigned.
- 69.4% of the clients expressed a desire to live outside the institution while 4.1% wished to remain in the institution.
- 51.9% are of normal appearance.
- 72.5% are completely mobile.
- 39.2% are moderately, severely, or profoundly retarded or of undeterminable intelligence despite testing.
- The mean grade level attained in a regular school setting is 4.53 years.
- Institution staff held that 32.7% could be either completely or partially self-supporting in the community.
- 52.9% were held by institution staff as able to use public transportation.
- The percentage of institutional costs borne by the Commonwealth of Virginia and/or third party payers was 87.3% at WSH and 100% at the other three institutions.

* See Appendix B for Assessment Digest on the resultant sample of clients.

These discrete facts yield a picture of isolated individuals with a potential for normalcy but with few family or community supports.

The A&P teams prescribed a wide variety of housing types and ancillary services for these clients. Tables 4 and 5 summarize the prescriptions written.*

Types of housing prescribed ranged from the most intensive arrangement (nursing home) to the most independent (independent living). Several supportive services were prescribed for each client with most falling into the areas of physical and social/psychological health.

Table 6 presents a matrix showing the initial and final (December 31, 1974) housing modes for the clients.

Four clients have moved from one housing type to another: one from a foster home to a home for adults giving close supervision, one from a boarding house to a home for adults giving moderate supervision, one from his own apartment to a foster home, and one from a boarding house to an apartment.

Clients were assigned to strata based on their housing, employability, and primary source of income as of December 31, 1974. (For a description of the stratification variables, see IIC, above.) Placing the 11 housing types

*

See Appendix C for Prescription Digest on the sample of clients.

shown in Table 6 into the three housing strata, a comparison between client location in initial and final housing strata can be made. Table 7 presents the results.

Only three clients (5.8% of the total) have moved from one housing strata to another. Clients are very evenly distributed among the three housing strata at the time of close-out for analysis.

Table 8 shows the distribution of clients among the categories included in the employability and income variables.

54% of the clients are employable at least on a part-time or sheltered basis as judged by the broker advocate assigned. 58% are receiving at least half their income from public sources.

Twelve of the 18 cells produced by the intersecting of the three housing, three employability, and two income strata contain clients. Table 9 shows each client's stratum (cell) assignment, age, and projected remaining lifetime. The mean age and the mean projected remaining lifetime for clients falling into each stratum are also presented.

Strata 1, 2, 4, 8, 12, and 13 are empty. A client who is employable full time, living in an intensive care situation, supported by public (stratum 1) or private (stratum 2)

funds is not likely to exist. Similarly, it is not likely that a person in family/independent care and employable full time will require funds from public sources (stratum 13). Clients may have entered strata 4, 8, and 12 had the sample size been larger.

Of those strata containing clients, the number included ranges from one (strata 7 and 15) to 10 (stratum 5). The mean age ranges from 18.0 years (stratum 7) to 79.8 years (stratum 6); the mean projected remaining lifetime ranges from 9.5 years (stratum 6) to 58.6 years (stratum 7).

A summary of individual stratum data also appears in Table 10 accompanied by summary data for the major housing, employability, and income categories. The smallest number of clients falling into any of the large categories is 10 (Employed Full Time).

The mean age of those clients in intensive care is double that of clients living in family/independent care (69.0 years versus 34.5 years). Those clients who are not employable are, on the average, more than twice the age of those clients employable full time (66.5 years versus 30.2 years). Clients receiving public funds are slightly older, on the average, than those supported by private sources (57.8 years versus 47.2 years).

These data suggest that the younger the client the more apt he is to be (a) living with family or independent-

ly (b) employable full time and (c) maintained by private funds.

B. CALCULATION METHODS IN TREATING THE DATA

The manner in which adjustments were calculated and assumptions accommodated in treating the cost and benefit data follows.

1. Fringe Benefit and Overhead Rates

Most professional service providers interacting with SID clients in the community were employees of the Commonwealth of Virginia. The current fringe benefit rate for these employees is 12.0%. However, it is not unusual for private firms to offer fringe benefit packages of 15% or even 17%. Assuming that the Commonwealth will one day be competitive with private industry, a 15% fringe benefit rate was used to adjust all salaries.

The overhead rate is defined as all costs incurred by an agency in other than direct service provision. In the SID program all salaries other than broker advocate salaries and all other costs (electronic data processing, rent, etc.) constitute 65% of the total budget. Accounting personnel for the Department of Mental Health and Mental Retardation and the Department of Welfare indicated that the rates for their respective agencies were between 40% and 50%. Since it was difficult to arrive at a figure consistent among all agencies involved, the higher SID overhead rate of 65% was used throughout.

Using the overhead rate of 65% and the fringe benefit rate of 15% means that all salaries of personnel serving SID clients were increased by 80%. For example, if a social worker whose hourly salary is \$5.50 spent one hour with a client, the calculation is:

$$[\$5.50 + (\$5.50 \times .8)] = \$9.90$$

Any direct expenditure for goods or supplies, such as medication, was determined separately from salary or service.

2. Adjustment Factor

An adjustment factor of 40% times direct service-time costs was used to increment the actual costs associated with both SID staff and other service provider time. Inquiries of SID broker advocates regarding how much non-direct service provision was involved in their work routine produced a range of responses but averaged at 45%. Welfare department reports in Massachusetts and West Virginia indicate that 34% and 38% respectively of their staff time is spent in indirect service delivery.

Extending the examples used in paragraph B1, above, the formula for calculating the cost of the social worker's time becomes:

$$[\$5.50 + (\$5.50 \times .8)] + .4[\$5.50 + (\$5.50 \times .8)] = \$13.86$$

The basic hourly salary of \$5.50 therefore expands to a cost of \$13.86 when consideration is given to overhead, fringe benefit, and non-service delivery activity.

3. Discount Factor

When projecting dollar values of costs and benefits over the next 10 years a discount rate of 8.0% was used to convert future dollars to present dollars. Studies often use both 5% and 10% discount rates to test the sensitivity of the analysis to these rates. SID opted for a mid-range value.

4. Projections

Projections regarding each client's costs and benefits over the next 10 years (or the client's lifetime if expected to be less than 10 years) were based on:

- 1) the client's history of costs and benefits during his or her observed period of community tenure;
- 2) the broker advocate's prediction of the client's future service needs;
- 3) in those cases where the foregoing did not provide adequate information, a comparison among clients in the same strata with respect to a specific cost or benefit dollar value.

Projections of costs were based on a liberal assessment of what the client would be likely to require in the way of services. For example, if a client is currently employed in a sheltered workshop (or is on the waiting list for entry to a workshop), it was assumed that he would remain in such an employment situation for the entire period even though a certain percentage of persons in sheltered employment do move to more independent situations and contribute further to society through payment of higher taxes.

It was further assumed that a person salaried at the level of a SID broker advocate would follow each client for the full period at a frequency only slightly below that of the first year of follow-up. It is unlikely that contact by a client advocate would be required so frequently over a long time period.

5. Society Costs-versus Total Costs

All costs and benefits are presented from the point of view of society-at-large except where otherwise stated. As discussed above, society costs and benefits are separately defined as those attributable to federal, state, or local governmental entities. Total costs and benefits include private dollars such as those contributed by the family of the client or the client personally.

For example, if a client's institutionalization cost \$6,000 per year and the state paid \$5,000 and the family \$1,000 of this cost, the "savings of institutional costs" from society's point of view is \$5,000 per year while the total benefit is valued at \$6,000 per year.

The difference between societal and total costs and benefits is probably underestimated in the analysis since it is not possible to accurately attach a dollar value to all private costs and benefits. For instance, what does it cost a parent to have his child at home and, on the other hand, what are the benefits from such? In these cases, private costs and benefits are not included in the analysis.

6. Federal, State, Local Contributions

For each individual stratum, dollar values attached to each cost were distributed among federal, state, and local sources. The percentages used for the distribution were based on discussion with agency personnel regarding the proportion of their budget received from each source. If a portion of their monies came from private sources, these were included in the total but not the societal cost.

To illustrate: SID funding is 89% federal and 11% state until the fall of 1975 when Title XX is expected to take over funding of the program. At that time, the funding percentages will change to 75% federal and 25% state.

Dollar values attached to each benefit were also distributed among the funding sources. In the case of "savings of institutional costs" the cost of each client's last ward assignment was used as the cost from which to ascertain funding sources and future projections. The reimbursement offices of the institutions were able to provide data regarding which funding source(s) presently met these costs. The client's contribution to society through personal labor was calculated as the value of the taxes paid to federal and state sources. Another aspect of client labor or earnings is the effect on the economy of

the client's utilization of money; it was not possible to attach a dollar value to this benefit.

With the exception of the SID program, no attempt was made to predict how funding mixes for the various agencies will change. It is quite likely that these will alter over time but no sound basis for making specific predictions were available.

C. FINDINGS

The cost/benefit findings (valued in discounted present dollars) are presented with respect to (a) analysis of individual strata and (b) analysis of aggregate strata. Detailed findings associated with each analysis appear in a series of Exhibits attached at Appendices D and E.

Appendix D contains exhibits presenting summary data for individual strata. Five data displays are provided for each stratum and are referred to as Exhibits I, II, III, IV, and V. These are organized on a stratum basis and since there are five different exhibits for each of the 12 strata there is a total of 60 displays. The contents for each stratum are:

- 1) Exhibit I ("Summary of Economic Costs and Benefits") - provides the dollar values attached to each cost and benefit element as well as the ratio of economic benefits over economic costs;
- 2) Exhibit II ("Average Annual Cost and Benefit Dollars Over All Clients in Stratum") - the average dollar amount and the sum of the averages are shown for each cost and benefit element and major item for each of the ten years under analysis;

- 3) Exhibit III ("Cost and Benefit Dollars Over the Next 10 Years") - the raw dollar values for each element and major item on a per client basis and a sum of the averages is provided;
- 4) Exhibit IV ("Sources and Recipients of Cost/Benefit Dollars") - breaks down the sum of the averages for the stratum into federal, state, and local funding components;
- 5) Exhibit V ("Total Cost/Benefit Dollars Versus Societal Cost/Benefit Dollars") - compares the differential between public versus public plus private contributions and receipts.

Appendix E contains displays presenting data aggregated across selected strata. Ten different groupings are presented: eight groups based on the stratification variables (see margins of Table 10); a "Nursing Home Care" group of clients from strata 5 and 6 and living in nursing homes; and, the total group of 52 clients.

The five Exhibits described above are at Appendix E for the "Nursing Home Care" group of clients. Only two Exhibits are presented for each of the other groups:

- 1) Exhibit I ("Summary of Economic Costs and Benefits") - same as for individual strata;
- 2) Exhibit II ("Average Annual Cost and Benefit Dollars Over All Clients in Stratum") - same as for individual strata except that calculations are presented only for cost and benefit elements (not items).

1. Findings in Individual Strata

Table 11 presents data excerpted from each Exhibit I in Appendix D. It provides a comparison among strata with regard to the benefit/cost ratios (i.e., average economic benefits divided by average economic costs). It also shows the average net benefits per client.

The only stratum for which costs exceeded benefits was stratum 5 which contains clients who are in intensive care housing, not employable, and receiving at least half their income from public sources. Ratios of benefits to costs for the other strata ranged from 1.52 to 11.86. Average net benefits per client over the 10 years ranged from \$13,000 to over \$46,000 in those strata where the ratio exceeded 1.00. In stratum 5, the average net cost per client for 10 years was \$395.93.

Exhibit II for each stratum lists average dollar values of cost and benefit elements per client for each year in the 10-year period. (Exhibit II for stratum 9 is shown as Table 12 as a representative example.) Note that values in 1974 are generally lower than those in 1975. This is because the average length of community tenure to date is 8.5 months thus making 1975 the first full year considered in the analysis for most clients.

Due to the 8% discount rate used, the pattern in all strata between 1975 and 1983 is a steady decrease in dollar amounts. Services were projected to continue at the current rate of provision unless the client's record clearly indicated an increase or decrease in certain rates.

Table 13 is derived from Exhibits II and shows the proportional contributions of cost and benefit elements.

Maintenance (housing and subsistence) was the major cost in all strata except stratum 16. The proportion of supportive services costs varied from 3.1% to 62.0% of the

total while service integration and deinstitutionalization costs together did not comprise over 25% in any stratum and generally fell under 10% of total costs.

As would be expected, the major benefit item was the savings of institutional costs. Most clients are not gainfully employed and taxes paid by persons earning under \$200 per month are insignificant compared to savings of institutional costs ranging up to \$8,500 per year.

Table 14 presents the proportional contributions of the components of the on-going service delivery item.

Job training/placement services constituted a large percentage of costs for clients who are partially employable or in a sheltered workshop. This is because such workshops are supported by public funds in addition to their contracts with private industry. For those not in sheltered employment, physical health and social/psychological health costs made up most of the total. Few educational services are provided for the clients in the sample.

With maintenance and supportive services as the major cost elements, it is reasonable to ask by how much these would have to be increased in order for the benefit/cost ratio to be reduced to break-even. Table 15 provides this information.

Excluding stratum 5 (which has a benefit/cost ratio of slightly less than 1.00), maintenance costs would have to be incremented by 0.95 (or nearly doubled) as a mini-

mum (stratum 18) and raised by a factor of 16.92 as a maximum (stratum 6). Supportive services would also have to increase substantially to bring the benefit/cost ratios to break-even.

Exhibit III for each stratum shows the dollar values of the costs and benefits for each client. (Exhibit III for stratum 9 is shown as Table 16 as a representative example.) An examination of the dollar values among clients reveals a great deal of variation. This is due in part to the varying length of time clients are expected to live, different housing modes included within each stratum, and varying supportive services required. Table 17 provides the ratios of benefits to costs for each client.

There is wide variation between individual client benefit/cost ratios. This is true even within certain of the strata (e.g., strata 6, 14, and 16). However, only two clients outside stratum 5 have benefit/cost ratios under 1.00 (clients #25 and #47).

Exhibits IV show the sources and recipients of cost/benefit dollars and Table 18 summarizes these data.

On the societal cost side, the federal sources carry much of the load in maintaining the deinstitutionalized client:

-the federal contribution to costs is over 75% in five strata (14 clients) and over 50% in 10 strata (48 clients);

- the state contribution to costs is over 50% in one stratum (one client) and less than 25% in eight strata (34 clients);
- the local contribution is more than 20% in two strata (four clients) and less than 8% in the remaining 10 strata (48 clients).

On the benefit side, these proportions for state and federal sources are reversed:

- federal sources receive more than 30% of the benefits in two strata (14 clients) while they receive less than 8% in six strata (20 clients);
- state sources receive more than 80% of the benefits in 10 strata (38 clients) and over 65% in the remaining two strata (14 clients);
- since local sources do not contribute to the cost of institutionalization or levy income taxes, no benefits accrue to these sources.

Data can be ordered in still another way to compare the relative contributions of federal and state funding.

Table 19 presents the benefit/cost ratios when the federal and state costs and benefits are isolated separately.

When federal monies are considered, only stratum 6 has a benefit/cost ratio greater than 1.00. From the point of view of the Commonwealth of Virginia, the benefit/cost ratios decidedly favor community residence with values ranging from 1.89 to 113.67.

Bearing in mind that many private costs and benefits are not obviously measurable, Table 20 compares the benefit/cost ratios from society's point of view with the total dollar values attributable to costs and benefits.

There are no extreme differences between the ratios although using the total societal costs does alter most

ratios slightly. For the sample of clients studied, the private sector (at least outside the family) is not absorbing costs or receiving benefits at a significant level.

2. Findings Across Strata

Table 21 is based on Exhibits I at Appendix E and presents the benefit/cost ratio and the average net benefits per client for the 10-year period for each group.

The benefit/cost ratio was greater than 1.00 in every instance and the ratios interrelate in the expected ways:

-The ratio for those in Nursing Home Care was less than that for clients in Intensive Care which was less than that for those in Intermediate Care which in turn was less than that for those in Family/Independent Care.

-Similarly, those receiving primarily Public Funds had a lower ratio than those receiving primarily Private Funds.

The overall benefit/cost ratio for the entire group of 52 clients was 1.98. The average net benefits per client ranged from \$2,500 over 10 years for clients in Nursing Home Care to \$29,000 over the period for clients Employable Full Time.

Table 22 is derived from Exhibits II of Appendix E and shows the proportional contributions of cost and benefit elements.

As in the individual strata, maintenance comprised the largest proportion of costs while savings of institutional costs contributed most to the dollar value of the benefit elements. The proportion of supportive services to the total cost varied, with the presumably least active clients (in Intensive Care and Not Employable) receiving the fewest supportive services. Service integration and deinstitutionalization costs comprised less than 11% of the total for any group.

An inspection of the Exhibits II themselves reveals the same pattern noted in the individual strata displays, i.e., increased costs between 1974 and 1975 followed by a steady decrease in present dollar amounts through 1983.

IV. DISCUSSION AND CONCLUSIONS

The methodology of the cost/benefit analysis addressed the question of whether the benefits of deinstitutionalizing a mentally ill or mentally retarded client and maintaining him in the community, using the SID model, exceed the costs.

To answer this question, a number of steps were taken:

- 1) A stratification matrix based on three variables was used to group clients;
- 2) Measurable costs and benefit elements were identified;
- 3) Necessary adjustments for fringe benefits, overhead, and other factors were identified and rates attached to each;
- 4) Projections regarding the individual client's service requirements over the next ten years were made by the broker advocate assigned;
- 5) Dollar amounts for each measurable cost and benefit element were calculated on an individual client basis for each of the 52 individuals in the sample;
- 6) Calculations resulting in benefit/cost ratios for each of 12 strata containing clients and each of ten aggregate strata groups were carried out.

Inspection of the data suggest two major conclusions:

- 1) It is cost-beneficial to place and maintain clients in the community;
- 2) Benefits accruing to state funding sources through deinstitutionalization far exceed those accruing to federal funding sources.

Caution must be attached to conclusions drawn from the data presented. Even though the relationships among the benefit/cost ratios from the various strata and groupings yield logical and plausible results and even though SID staff

made a concerted and consistent attempt to overestimate costs and underestimate benefits, there are limitations to be considered in interpreting the findings:

- 1) Sample Size: Only 52 clients are included in the sample and these are residents of only two regions in the Commonwealth. A larger sample size including clients from other regions would increase the generalizability of the findings.
- 2) Community Tenure: The average client spent 8.5 months in the community prior to December 31, 1974. Over 90% of the data attached to both costs and benefits over the 10-year time span of analysis were based on projections. A much longer follow-up period for community residents is required so that observational data rather than projections can contribute in greater proportion to the numerical analysis.
- 3) Sensitivity to Altered Assumptions: The sensitivity of the data to changes in the discount rate or the assumption that costs and benefits will be affected similarly by inflation/deflation circumstances were not tested.
- 4) Confounding of Maintenance and Supportive Services: In calculating costs, supportive services were broken out separately from maintenance wherever possible; in calculating benefits, supportive services (i.e., professional care rendered by institutional staff) formed an indeterminable part of "total institutional costs" throughout the analysis. It is not clear to what extent lumping supportive services with maintenance in arriving at benefit dollar amounts affected the resultant benefit/cost ratios. Without imposing an entirely new accounting system on institutional personnel, there would be no satisfactory resolution to this methodological impasse.

In addition, the psychosocial benefits to the client and community associated with community placement of institutional residents are not measured in the cost/benefit analysis. They are formally addressed in other facets of

the SID program and the results obtained reinforce the conclusion that clients should be placed outside state institutions. * Clients prefer community living and the recidivism rate among SID clients is low. Community service providers feel a strain on their abilities to give services due to the placement of these individuals, but seem to prefer working with clients deinstitutionalized through SID to dealing with those placed by the institution without the benefit of SID coordination and following.

It is a comment on the state of the evaluative art and the stage of development of the SID program that only a qualified answer can be given to the simplest analytical question possible regarding the dollar values of costs and benefits associated with deinstitutionalization. Although other more complex questions arise from this basic question, replication of the findings of this study is required before these are confronted.

SID staff plan to continue the analysis (with the addition of automation to increase capability) as part of ongoing program evaluation. Others will hopefully address the same question and base their results on other client groups. Only such parallel efforts will yield a definitive statement of whether, in general, the benefits of deinstitutionalizing and maintaining a mentally ill or mentally retarded client in the community outweigh the costs.

*

See Volume 4 for a discussion of client attitude toward community living, receipt of services, behavioral changes, and a summary of the impact of the SID program on communities.

Appendix A

Cost and Benefit Elements

6a

SID

COST AND BENEFIT ELEMENTS

Cost Elements and Items **Components** **Terms Included in Each Component**

**Element 1. Community
Supportive Services**

**Item A. Ongoing Service
Delivery Costs**

• Job Training/ Placement Services	(1) Cost per Service Unit	- Salaries and fringe benefits of service providers
• Physical Health Services	(2) Number of Service Units	- Overhead expenses
• Social/Psychological Services	(3) Source of payment	- Direct cost of material, supplies
• Educational Services		

**Item B. Costs of Service
Start-Up**

• Job Training/ Placement Services	(1) Cost per contract (SID and service providers) includes cost of resource search by provider	- Salaries and fringe benefits of service provider
• Physical Health Services		- Overhead expenses
• Social/Psychological Services	(2) Sources of payment	- Direct costs of materials, supplies
• Educational Services		

Element 2. Client Maintenance

Item A. Housing

- (1) Cost per month of providing housing and any inseparable maintenance costs, e.g., meals in boarding homes, health services in nursing homes.
- (2) Number of months during which client resided in housing facility
- (3) Sources of payment
- Salaries and fringe benefits of house employees
- Overhead expenses
- Direct cost of materials, supplies, etc.
-

Item B. Subsistence

- (1) Amount per month
- (2) Number of months received
- (3) Sources of income
- Client income minus client payments towards housing and/or supportive services
-

Element 3. Service Integration

Item A. Assessment

- | | |
|---|--|
| (1) Cost of gathering and furnishing assessment information on client | - Salaries and fringe benefits of SID staff (BA) |
| (2) Sources of payment | - Overhead expenses (SID) |
| | - Direct costs |
-

Item B. Determining Placement and Writing Prescription

- | | |
|---|---|
| (1) Cost of Placement and writing prescriptions | - Salaries and fringe benefits of A&P team and other resource persons |
| (2) Sources of payment | - Overhead expenses |
| | - Direct costs |
-

Item C. Filling Prescription

- | | |
|----------------------------------|--|
| (1) Cost of filling prescription | - Salaries and fringe benefits of SID staff (BA) |
| (2) Sources of payment | - Overhead expenses (SID) |
| | - Direct costs |
-

Item D. Final Decision

(1) Cost of final decision on placement	-	Salaries and fringe benefits of A&P team members and BA
(2) Sources of payment	-	Overhead expenses
	-	Direct costs

Item E. Tracking and Monitoring

(1) Costs of client tracking and monitoring	-	Salaries and fringe benefits of SID staff and community resource contact person
(2) Sources of payment	-	Overhead expenses (SID and community resource)
	-	Direct costs

Element 4. Deinstitutionalization
Costs

(1) Cost per client release procedure	-	Salaries and fringe benefits of institution staff
(2) Sources of payment	-	Overhead expenses
	-	Direct costs

Element 5. Lost Economic Productivity

- (1) Cost of client's relative/guardian giving up employment to care for client - Monthly salaries and fringe benefit of relative/guardian
- Number of months relative/guardian is out of work because of client
-

Element 6. Community-Related Costs

- (1) Cost to community of client release and community placement - Fear
- Confusion
- Dislike

Benefit Elements

Components of Each Element

Items Included in Each Component

Element 1. Savings of Institutionalization Costs

- (1) Differential treatment costs
- (2) Depreciation
- (3) Recipients of benefits

- Cost per patient day (maintenance and operating costs)-- type of treatment plan
- Depreciation for institution (equipment and buildings)

Element 2. Increased Economic Productivity

- (1) Value of client's labor as a contribution to economic growth

- Salary and fringe benefits of client

Element 3. Psychosocial (Client)

- | | | |
|--|---|-------------------|
| (1) Benefits of community living on client's psychological and social well-being | - | Life satisfaction |
| | - | Behavior |
| | - | Social adjustment |
| (2) Recipients of benefits | | |

-68-

Element 4. Psychosocial (Community)

- | | | |
|---|---|----------------------------|
| (1) Benefits of client placement on community | - | Increased public awareness |
| | - | Better understanding |
| | - | Service integration |
| (2) Recipients of benefits | | |
