

✓ **MARIJUANA USE AND THE EFFECTS OF MARIJUANA DECRIMINALIZATION\***

Lloyd D. Johnston, Ph.D.  
Program Director/Research Scientist  
Institute for Social Research  
The University of Michigan  
Ann Arbor, Michigan

\*Testimony delivered at hearings on the effects of marijuana held by the Subcommittee on Criminal Justice, Judiciary Committee, United States Senate, on January 16, 1980 in Washington, D.C.

## INTRODUCTION

I would like to thank the Subcommittee for providing me this opportunity to testify. Copies of my comments with supporting information will be made available after my testimony is completed.

Most of what I will be discussing today derives from a series of nationwide youth surveys that my colleagues and I have been conducting over the past six years at The University of Michigan's Institute for Social Research.\* Each year since 1975 we have surveyed approximately 17,000 high school seniors drawn to be representative of seniors in public and private high schools nationwide.\*\* This work has drawn its primary support from research grants from the National Institute on Drug Abuse. Our questionnaires ask students about their own use of various drugs; their attitudes about those drugs; the availability of the drugs to them; their opinions concerning decriminalization of marijuana; and also questions about a host of other values, attitudes, and behaviors. Since this stream of new entrants into the adult citizenry constitutes most of the nation's adult population in the decades to come, we have entitled the study Monitoring the Future.

Before presenting some results from this study, however, I would like to put them in perspective by mentioning a few facts about marijuana use across the full age spectrum.

What we know from adult surveys is that marijuana use currently tends to peak in the 18 to 21 range, and that rates of current use tend to be much higher for those in their late teens and early twenties than for younger or older age groups.\*\*\* Since most marijuana use is initiated between ages 14 and 18—in other words, during junior and senior high school—the proportion of 12 or 13 year olds who have tried marijuana tends to be quite small (8% in 1977), though it has been rising. Similarly, a very small fraction of Americans over 35 years old (around 7% in 1977) reported ever having used marijuana. The majority of those in the age range 18-25 (about 60% in 1977) reported having done so. Thus the high school seniors in our surveys are near the age of peak use. We also know that today's seniors have had more experience with marijuana by age 18 than any previous birth cohort in American history.

## LEVELS AND TRENDS IN USE

In the class of 1979, six in every ten seniors has at least tried marijuana, half had used it in the prior 12 months, and over a third (37%) reported using it in the month prior to the survey. More important, one in ten reported using on a daily or near daily basis—that is, on 20 or more occasions in the prior month. (I should mention that, given what we know about the likely biases in this type of survey, we view these numbers as being, if anything, slightly low.)

One in ten is a significant portion of the age group to be using daily, and presumably these are the ones at greatest risk for detrimental effects. Most of the daily users (77%) give as their average daily intake between one and six joints per day. Overall, daily users average  $3\frac{1}{2}$  joints per day. However, a significant proportion indicate that they smoke more than 7 joints daily (13% of daily users—1.3% of the age group).

Unfortunately, we do not yet have a clear picture of how many of these frequent users will show a continuing pattern of heavy use long term; but we do know from follow-ups of our own seniors that a substantial fraction remain heavy users for at least three years beyond high school. To be more specific, we find that about 60% of the daily users in high school are still using daily two years afterward, and nearly 50% are still using daily three years afterward. So, there does appear to be some considerable stability across time in heavy use.

As you probably are well aware, marijuana use rose consistently across the decade of the 70's for those of high school age, as well as for most other age groups. The good news is that in 1979 we have evidence for the first time that marijuana use among high school students may be leveling off. (See Table 1.) Daily or near-daily use rose at an alarming rate between 1975 and 1978, nearly doubling in just three years from 6% to 11% of seniors. In 1979, however, this increase abruptly halted, as did the rise in monthly and annual use. We believe that this fact may be attributable to the increased attention paid, by both the media and government officials, to the potential hazards of regular marijuana use. This interpretation is supported by our finding that significantly more seniors in 1979 than in 1978 believed the regular marijuana user runs a "great risk" of harming himself (see Table 2). Also, the proportion of seniors saying they personally disapprove of regular marijuana use has been increasing very gradually over the past two years (see Table 3).

A limitation on the availability of the drug definitely does not explain this stabilization of use, since fully nine out of every ten seniors say they could get marijuana fairly easily, if they wanted some. This high level of perceived availability in this age group has existed consistently since the study began in 1975. Unfortunately, I cannot comment on the role that increased price may have played in limiting use.

## ATTITUDES AND BELIEFS ABOUT MARIJUANA

It should be noted that young people today make a rather clear distinction between marijuana and other illicitly used drugs, and they also distinguish different degrees of involvement with marijuana. (See Tables 2 and 3.) Over three quarters of seniors disapprove of even experimenting with any of the other illicitly used drugs, yet only a third disapprove of trying marijuana. The majority (55%) are also accepting of occasional use. But when it comes to regular marijuana use, the great majority (nearly 70%) disapprove of such behavior, even for adults.

Concerning the perceived harmfulness of marijuana, very few seniors (14%) see a great risk of harming themselves (physically or in other ways) if they use the drug occasionally. More feel that regular use can be harmful; and among those who have never used marijuana, or who have stopped using, over half list among their reasons a concern about the possible physical and/or psychological effects of the drug. But there still remain fair-sized proportions of all seniors who feel that there is little or no risk associated with regular marijuana use (29%), or at most a moderate risk (27%). As I stated earlier, the proportion concerned about the effects of regular use has been rising, but the majority still do not feel the risk is great.

The reasons offered for using marijuana (by recent users) are very similar to the reasons offered for using alcohol: as an enjoyable activity with friends, to feel good or get high, and (to a lesser extent) to relieve tension and relieve boredom.\* Coping motives—such as to deal with anger and frustration, to relieve tension, to escape problems, or to deal with boredom—these motives play a more prominent role for the heavier users.

## EFFECTS OF MARIJUANA

Concerning the possible effects of marijuana use, our data do not directly address the issue of physiological effects, about which you will be hearing a great deal of testimony from other witnesses. They do, however, address the question of possible effects on certain other behaviors.

In relation to effects on the use of other drugs, we have two sorts of findings. First, there is little evidence that marijuana use displaces alcohol use, as was once alleged, since rates of drinking among seniors have not declined as marijuana has gained in popularity. Second, it also has been alleged that increased marijuana use in the population would lead to an increase in the use of other illicit drugs; but our data really do not support this contention very well either. Although the proportion of seniors involved in marijuana use increased appreciably in the last half of the seventies, the proportion of these young people going beyond marijuana to other

---

\* See J.G. Bachman, L.D. Johnston, and P.M. O'Malley. Questionnaire Responses from the Nation's High School Seniors, 1978. Ann Arbor: Institute for Social Research, 1980, pp. 44 and 48.

illicit drugs has not changed appreciably (see Figure C). In other words, most of the increase has been due to more people using only marijuana. That is not to say that other drugs are not rising and falling in popularity—they are—but rather that the proportion of students becoming involved with any such drugs has changed rather little.

Turning to other behaviors, it was once a widely held belief among adults that marijuana use caused young people to become involved in illegal activities unrelated to drug use. Using longitudinal data from a previous national survey of male students, we have demonstrated to our own satisfaction, at least, that this is not so.\* Those who took up marijuana use did not become any more delinquent over time, relative to those who abstained.

### DECRIMINALIZATION

Regarding the decriminalization bill per se, there are several facts of relevance in our data. First, it must be recognized that the norms in younger age groups are quite different than those in older age groups. Marijuana use is not disapproved by the great majority of young people, if done in moderation. In fact, for them the norms are not very different than the norms regarding alcohol use. Thus, the prevailing law is out of step with the social norms of youth, much as was true during Prohibition for nearly all age groups. Like Prohibition, this situation leads to a winking at the law by the majority of young people, and very likely to increased disrespect for the agents of the law.

Asked specifically how they felt about legal sanctions, only a quarter of the Class of '79 stated that they thought marijuana use should continue to be a criminal offense, while over 60% thought it should either be decriminalized or made entirely legal (30% and 32% respectively; see Table 4). In fact, the majority of all graduating classes since 1975 have favored the removal of criminal sanctions, while remaining quite conservative about the legal status of the other illicitly used drugs (see Table 5). The majority (62%), however, would not permit the legal use of marijuana in public places; but would permit smoking marijuana in private (58% in favor, 14% undecided). Asked if marijuana should be sold legally if use were to be made legal, nearly two thirds of all students (64%) said yes; but most of those (52% of the total sample) would want sale limited to adults only.

Anticipating the move toward decriminalization, we have asked each class since 1975 what effect legal sale and use of marijuana would have on their own behavior. (Note that this hypothetical situation goes considerably beyond "decriminalization" to actual legalization of use and of sale.) In each of the last five graduating classes, students in the aggregate have predicted that they would be little affected even by these broad changes in the law. In 1979, half of the respondents said they would not use the drug, even if it were legalized, and another 29% said they would simply continue their current rate of use. Only 6% said they

\* L.D. Johnston, P.M. O'Malley, and L.K. Eveland. Drugs and Delinquency: A Search for Causal Connections in D.B. Kandel (Ed.) Longitudinal Research on Drug Use: Empirical Findings and Methodological Issues. Washington, D.C.: Hemisphere, 1978.

would use it more often than at present, while another 6% said they would try it for the first time. (About 6% were unsure how they would react.)

Naturally, we had some concern about the validity of the answers to such a hypothetical question. One way to deal with the problem was to directly assess the impact of decriminalization on this age group. Fortunately, we were able to supplement our ongoing series of surveys with a satellite effort to accomplish this. We enlarged our samples of seniors in several of the states where decriminalization has taken place (including California, Ohio, and New York); and then we measured rates of marijuana use among students before, during, and after decriminalization. Before mentioning any results, I must preface what I will say with the caution that our analyses of these data are still in a preliminary stage.

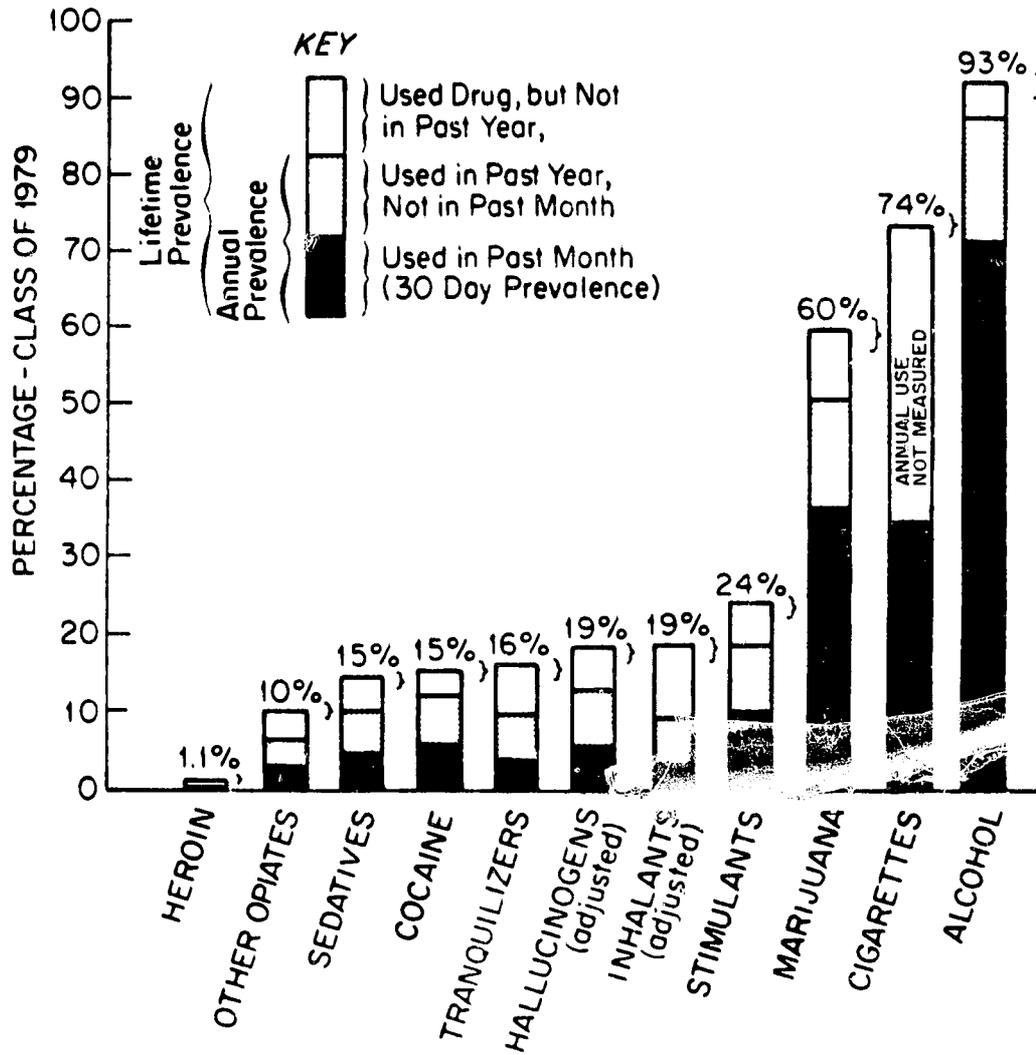

Looking at the impact of decriminalization on marijuana use between 1975 and 1979, we find little evidence of differential change in marijuana use between those states which decriminalized and those states which did not. Put another way, any increase in marijuana use in the decriminalized states, taken as a group, was equal to or less than the increases being observed in the rest of the country where decriminalization was not taking place. Thus the conservative response to decriminalization, which seniors themselves predicted in the aggregate, seems to be what in fact has taken place. Naturally, we will be doing a more thorough analysis and reporting of these data; but, given the importance of the deliberations of this committee, we judged that this preliminary reporting was justified.

Frankly, we did not find these early results surprising, given what we already know about the widespread availability of the drug to this age group, the tolerant norms existing among age-peers, and the high usage rates already attained prior to decriminalization. My own prediction has been and remains that, to the extent decriminalization has an effect of usage levels, the effect will be greatest on older age groups where these conditions do not yet pertain. However, should the advertising of marijuana ever be permitted, presumably as a concomitant of legalized sale, all bets are off. I think that legalized advertising could and would have a substantial effect on usage rates in all age groups and, therefore, holds the greatest danger inherent in any move toward removing legal sanctions. However, decriminalization—as distinct from legalization—is certainly consistent with a continuing ban on the legal sale of the drug and, therefore, with a ban on advertising, as well.

This concludes my testimony. I would be glad to try to answer any questions you may have.
