CHAPTER 1
GENERAL INTRODUCTION TO DAWN

PURPOSE OF THE STUDY

Project DAWN is a nationwide program co-sponsored by the Drug Enforcement Administration and the National Institute on Drug Abuse, and conducted under contract by IMS America, Ltd.

The general goal of Project DAWN is to gather, interpret, and disseminate data on drug abuse from selected locations within the continental United States. The Drug Enforcement Administration uses this information in its enforcement, compliance, scheduling, and research programs; the National Institute on Drug Abuse applies the information in its forecasting, education, prevention, treatment, and rehabilitation programs.

The more specific objectives of the project are:

1. To identify drugs currently being abused and/or associated with harm to the individual and to society.
2. To the extent feasible, to determine existing patterns of drug abuse and to monitor changing trends, including the detection of new abuse entities and new combinations.
3. To provide current drug abuse data which can be used in appropriate cases to assess the relative hazards to health and the relative potentials for abuse of different chemical substances.
4. To provide data needed for the rational control and scheduling of both presently existing and new substances of potential abuse.

HISTORICAL DEVELOPMENT

For purposes of clarification and evaluation of data generated through this system, the overall program is represented in terms of the following phases:

- Phase I: The initial Project DAWN, covering the time interval of September 1972 through April 1973. This phase is covered in the "DAWN I Analysis" on file with the National Technical Information Service, Department of Commerce, Washington, D.C.
- Phase II: A modified and expanded Project DAWN covering the time interval of July 1973 through March 1974. This phase is covered in the "DAWN II Analysis" on file with the Drug Enforcement Administration, U.S. Department of Justice, Washington, D.C.
- Phase III: A continuation of Phase II covering the time interval of April 1974 through April 1975. This phase is covered in "Project DAWN III" on file with the Drug Enforcement Administration, U.S. Department of Justice, and the National Institute on Drug Abuse, U.S. Department of Health, Education and Welfare, Washington, D.C.
- Phase IV: A continuation of Phase III covering the time interval of May 1975 through April 1976. This phase is covered in "Project DAWN IV" on file with the Drug Enforcement Administration, U.S. Department of Justice, and the National Institute on Drug Abuse, U.S. Department of Health, Education and Welfare, Washington, D.C.
- Phase V: A continuation of Phase IV covering the time interval of May 1976 through April 1977. This phase is covered in "Project DAWN V" on file with the Drug Enforcement Administration, U.S. Department of Justice, and the National Institute on Drug Abuse, U.S. Department of Health, Education and Welfare, Washington, D.C.
- Phase VI: A continuation of Phase V covering the time interval of May 1977 through April 1978. This phase is covered in "Project DAWN VI" on file with the Drug Enforcement Administration, U.S. Department of Justice, and the National Institute on Drug Abuse, U.S. Department of Health, Education and Welfare, Washington, D.C.
- Phase VII: A continuation of Phase VI covering the time interval of May 1978 through April 1979. The "Project DAWN Annual Report - 1978" overlaps part of Phase VI and VII in summarizing data for calendar year 1978 and is on file with the Drug Enforcement Administration, U.S. Department of Justice, and the National Institute on Drug Abuse, U.S. Department of Health and Human Services.
- Phase VIII: A continuation of Phase VII covering the time interval of May 1979 through April 1980. This Project DAWN Annual Report - 1979 overlaps part of Phase VII and VIII in summarizing data for calendar year 1979.

DEFINITIONS OF DRUG ABUSE

The following definitions were adopted for use in the DAWN program.

Drug Abuse is defined as the non-medical use of a substance for any of the following reasons: psychic effects, dependence, or self-destruction (suicide attempt or gesture), i.e., the use of:

- a) Prescription drugs in a manner inconsistent with accepted medical practice, or
- b) Over-the-counter (OTC) drugs contrary to approved labeling, or
- c) Any other substance (heroin, marijuana, glue, aerosols, etc.) for psychic effects, dependence, or self-destruction (suicide attempt or gesture).

A drug-involved death is defined as either:

- a) Drug-caused, involving a drug "overdose" where evidence of a lethal level of the substance(s) is found or suspected, or
- b) Drug-related, where the drug usage is a contributory factor but not the sole cause, i.e., accidents, diseased state, withdrawal syndrome, etc.

Drug abuse reports for episodes involving children under six years of age are not collected; it is generally held that those which occur by children under six are primarily accidental poisoning incidents rather than actual drug abuse.

SAMPLE SELECTION

Initially, the DAWN network was to represent the drug-abusing population as reported by hospital emergency room and in-patient facilities, student health crisis and emergency room centers, medical examiners and crisis centers. Hospital in-patient units reported to DAWN from September 1972 through April 1975. Student health crisis centers and emergency rooms in colleges and universities participated in the DAWN network from September 1972 through March 1973. Starting in May 1978, only data from hospital emergency rooms and medical examiners were maintained as the most appropriate sources for studying drug abuse trends and drug abuse demographic profiles. Consequently, the collection of data from crisis centers was discontinued. The hospital emergency rooms which have been selected to participate in DAWN since September 1972, have had to meet certain specific criteria:

1. Open 24 hours a day
2. Located in non-federal short-term hospitals
3. At least 1,000 emergency visits of all kinds were made to the hospital in a year

Specialty hospitals, hospital units of institutions, and pediatric hospitals are excluded. Medical examiner information is gathered from both medical examiner and coroner facilities located in the 26 Standard Metropolitan Statistical Areas shown on page 4, Table 1.1.

During 1979, the DAWN reporting panel was composed as follows:

1. Twenty-six SMSAs (Standard Metropolitan Statistical Areas),¹ twenty-three of which were in DAWN II, and III. Kansas City SMSA was in the study since DAWN I but did not become a saturated SMSA² until DAWN IV. San Diego replaced Omaha between DAWN III and DAWN IV; Norfolk SMSA replaced Raleigh SMSA between DAWN IV and DAWN V. As of May 1977, the start of DAWN VI, only emergency room facilities within San Francisco County were continued in the DAWN panel; facilities from other counties in the San Francisco SMSA were discontinued at that time. Facilities in the Baltimore and St. Louis SMSAs were recruited into the system in January 1979 and began reporting in March 1979.

¹ Standard Metropolitan Statistical Areas are statistical units composed of a relatively large core city or cities and the immediately adjacent geographic areas. Conceptually, SMSAs are integrated economic and social units with a large population nucleus. Present DAWN SMSAs were originally defined by the Bureau of Census in 1972; see: U.S. Department of Commerce, Bureau of the Census, Statistical Abstracts of the States, 1972 (Washington, D.C.: U.S. Government Printing Office, 1972).

² Strictly defined, saturation means enlistment of and reporting by every eligible facility in each specified SMSA. Recognizing the realities of data collection in a voluntary reporting system such as DAWN the co-sponsoring agencies define a "saturated" SMSA as one in which the contractor makes a best effort to contact and recruit each eligible emergency room within the SMSA and negotiates a reporting arrangement. (For results of this effort, see Table 1.1.)

For the New York, Chicago and Los Angeles SMSAs, the size of the region precluded saturation reporting. Therefore, in 1973 (for DAWN II) a sample of approximately forty hospitals for each of the three SMSAs was randomly drawn.¹ By agreement with DEA and NIDA, this sample was later extended to increase DAWN coverage to a minimum of 50% of total emergency room visits possible among eligible hospitals within each SMSA; the method of achieving this increased participation was by adding selected and geographically distributed large hospitals to the DAWN reporting panel. In addition, since DAWN II, a small percentage of the original facilities has dropped out, and has been replaced by others. The facility samples for these three SMSAs cannot, therefore, be considered statistically random, but may be considered representative of the majority of facilities in the area.

2. In 1973, a national panel of 200 emergency rooms from areas outside the DAWN SMSAs was randomly selected from the universe of all facilities meeting DAWN criteria in the continental United States. Although some of the facilities in this original "National Panel" have been replaced by others, most (83%) still remain in the system. The panel presently consists of approximately 180 hospitals.
3. As of May 1979, 32 of the 125 medical examiners previously reporting to DAWN from the SMSAs no longer report to the system. These medical examiners accounted for fewer than 20 drug-related deaths during their last year of participation in DAWN. Eight "special panel" medical examiners from outside the SMSAs were also dropped in May 1979.

GEOGRAPHIC DISTRIBUTION OF SMSA FACILITIES

The numbers of each type of facility in each SMSA and in the total DAWN system as of December 1979 are shown in Table 1.1.

In each case, the named city is the central city in a Standard Metropolitan Statistical Area (SMSA) as defined by the United States Bureau of the Census in 1972. The geographic boundary of each sampling point is therefore the boundary of the SMSA instead of that of the central city. For example, Philadelphia SMSA includes five Pennsylvania counties (Bucks, Chester, Delaware, Montgomery and Philadelphia) and three New Jersey counties (Burlington, Camden and Gloucester).

As previously stated, the goal of "saturation" was to enlist in the DAWN reporting system every eligible hospital located within the 22 "saturated" SMSAs, all emergency rooms within San Francisco County and a representative sample of emergency rooms in the New York, Chicago and Los Angeles SMSAs. Table 1.1 also shows the degrees of saturation and coverage (ratio of DAWN emergency room visits to total SMSA emergency room visits) achieved for emergency rooms and the level of saturation for medical examiners.

When the term "total DAWN system" (TDS) is used in this report, it refers to the sum of data from all facilities in all SMSAs and in the National Panel that report to DAWN; it is not intended to be interpreted as representing the entire United States or truly national totals.

1979 U.S. Census - When this term is used in the text or in tables, it refers to the 1979 U.S. Bureau of the Census estimates² of the population of the entire country, not the total populations of the SMSAs in the DAWN system. Differences in demographic distributions in the population between the total DAWN system and the entire U.S. population are unlikely to be great since the DAWN SMSAs and National Panel include over one-third of the U.S. population.

¹ Hospitals listed in the American Hospital Association: Guide to the Health Care Field (Chicago: American Hospital Association, 1973), were assigned numbers. Then a random number method was employed to select the numbers of the hospitals which would comprise the New York, Chicago and Los Angeles samples.

² U.S. Bureau of the Census, Current Population Reports, Series P-25, No 870, "Estimates of the Population of the United States, by Age, Sex, and Race: 1976 to 1979" (Washington, D.C.: U.S. Government Printing Office, 1980).

^a Population figures are the updated (1978) population estimates obtained from the U.S. Bureau of the Census, Current Population Reports, Population Estimates and Projections, Series P-25, No. 873, February 1980. Boston SMSA figures obtained from the U.S. Bureau of the Census, 1977 Population Estimates for Counties, Incorporated Places, and Minor Civil Divisions in Massachusetts, Series P-25, No. 834, November 1979.

^b Facilities in DAWN as of December 1979.

^c One year's total obtained from the 1978 Annual Survey of Hospitals tape, American Hospital Association, and DAWN reported visits for 1979, updated through April 30, 1980.

^d Two medical examiners report from Suffolk County.

^e Four medical examiners report from Niagara County.

^f San Francisco County only

^g One medical examiner reports for three areas: Fairfax County, VA; Fairfax City, VA; and Falls Church, VA.

^h The percent is based upon total emergency rooms and emergency room visits obtained from the 1976 Annual Survey, American Hospital Association.

DATA COLLECTION

As each facility was recruited, a responsible reporter and an alternate were appointed by the facility administration. Four percent (4%) of the emergency room reporters had an administrative position in the hospital, 27% of the reporters were head nurses or nursing supervisors, 17% emergency room nurses, 36% trained emergency ward secretaries, 13% medical records specialists, and the other 1% was drawn from emergency room physicians, pharmacists, medical students and residents.

The total number of daily facility visits and total daily number of visits related to drug abuse are entered into a DAWN log for each reporting week; the details of each drug abuse episode are recorded on DAWN data forms designed by the co-sponsoring agencies. A technical assistance specialist who is a health services professional familiar with hospital data systems is responsible for personally training all facility personnel who retrieve and report DAWN data. This specialist also monitors the consistency and timeliness of DAWN reporting by each facility. When facility reporters have been sufficiently trained and tested, regular communication with the facility reporters is established and continued by a field monitor assigned to all facilities in that SMSA. This monitor is responsible for checking incoming data forms, contacting the reporter for missing data, answering questions, and working with reporters in stressing the importance of submitting data on time. Monitors routinely talk with each reporter at least once a month, more frequently if there are problems.

A copy of the form used by each facility type is displayed on pages 6 and 7 of this report.

AT NO TIME IS ANY INFORMATION GATHERED FROM THE FACILITIES WHICH CAN IDENTIFY AN INDIVIDUAL AND AT NO TIME ARE THE IDENTITIES OF PARTICIPATING FACILITIES RELEASED WITHOUT THEIR PERMISSION.

(C) REMARKS

DRUG EPISODES AND DRUG MENTIONS

A patient contact (or abuse episode) represents a death or an emergency room visit to a DAWN facility as reported by that facility. In the DAWN context, visits are not synonymous with the number of individuals involved, since one person may make more than one visit to an emergency room, or to several emergency rooms, or have contact with more than one type of facility. Neither are numbers of visits synonymous with numbers of drug mentions, numbers of motivations for taking drugs or numbers of drug sources. Each patient will be recorded as one visit but may mention from one to several drugs with one or more motivations for each. Furthermore, a single drug may have been obtained from several sources. (For example, as a gift from a friend supplemented by the purchase of more from a "pusher".) Unique patients are in no way identified in DAWN to protect the confidentiality of patients and other patient rights.

An important consideration when using DAWN data is that the system only collects data concerning drug abuse episodes that have resulted in a crisis (emergency medical situation or death). The person involved in the reported abuse episode has typically sought emergency medical help (or died) and the incident has subsequently been reported by one of the two facility types (emergency room or medical examiner). The system reports only that portion of total drug abuse occurrences which result in such crises and which surface at one of the two DAWN facility types. Refer to page two for DAWN definition of drug abuse.

In certain situations, a drug abuse episode may be reported to DAWN some time after the episode occurred. This occurs primarily with medical examiners, who may wait until confirmation of the drug-relatedness of the death is ascertained and/or confirmed by completed lab tests, autopsy reports, etc. before filing a report. Thus, the data are continually being updated by the addition of these episodes, referred to as "back data." Of the episode reports submitted each month by emergency rooms, 90% are for the "current" month and the other 10% represent back data. Medical examiner data are 90% complete after six months.

Care must also be taken in analyzing information on motivation. The current DAWN forms report all the motivation responses given without reference to the drug involved. Hence, if motivation is associated with a specific drug (unless only one drug was used) erroneous conclusions could be reached. Because the present DAWN form provides for multiple-drug mentions but only a single motivation for taking the substances, caution must be observed in interpreting specific cross-tabulations of drug/motivation data.

Since DAWN accepts from one to six substances per episode (patient contact), the drug mentions (named substances) must be equal to or exceed the number of episodes. During the period January-December 1979, each episode from emergency rooms generated an average of 1.57 drug mentions, as compared with 2.00 mentions per episode for medical examiner cases.

This report contains the narrative description of DAWN data collected during the period January through December 1979.

TABLE 1.2
TOTAL DAWN SYSTEM
DRUG ABUSE EPISODES AND DRUG MENTIONS
BY FACILITY TYPE
JANUARY - DECEMBER 1979

	Medical Examiners	Emergency Rooms
Number of Facilities	85	806
Drug Abuse Episodes	3,626	117,949
Drug Mentions	7,237	185,270
Average Episodes per Facility	43	146
Average Mentions per Facility	85	230
Average Mentions per Episode	2.00	1.57

Deaths reported by medical examiners are frequently the direct consequence of an overdose of several drugs.

The reader should note that the drug(s) may or may not be the confirmed "cause" of the episode. When a single drug substance is reported, and a causal relationship seems apparent, allowance should still be made for missing reportable drugs.

Medical examiner data, on the other hand, are more definitive since cause and manner of death are requested (see Medical Examiner form). However, care must be taken to distinguish clearly between the terms "drug-related" and "drug-caused" (drug-induced) deaths.

DEFINITION OF DAWN DRUG VOCABULARY

The substances reported to DAWN are grouped into general categories, most of which are therapeutic classifications (TCs) such as tranquilizers, narcotic analgesics, non-narcotic analgesics, etc. for purposes of uniformity. The exceptions, hallucinogens, cannabis substances, alcohol-in-combination with other substances, cocaine, and substances abused by inhalation are grouped into separate classifications. A list of therapeutic classifications used in DAWN is given on page 10. These DAWN assignments are based primarily upon a pre-existing classification used in the National Drug and Therapeutic Index (IMS America, Ltd.).

Within each therapeutic class or category, drugs are grouped generically. Thus street names, trade names, or both, may be included in these generic groups. Street names are carried in DAWN due to the inability of some drug users to reliably identify the compound other than by its street name. Reference to substances such as speed may, therefore, appear in a table or in the text. Information obtained subsequently may confirm the street name as a known substance thereby updating the drug records for that substance, and providing more complete information in response to queries on drug substances in DAWN. The DAWN drug groupings are constantly reviewed in order to reflect the most recent changes in pharmaceutical classifications and drug legislation.

The term "drug unknown" is used in connection with approximately 6% of the drug mentions. "Drug unknown" may be recorded when the user did not know what had been taken or perhaps did not wish to reveal the truth (particularly if it were an illicit substance), or data were not available on the hospital records.

MOST FREQUENTLY MENTIONED DRUGS

Since its inception, the DAWN system has accumulated a vocabulary of approximately 4,000 substances mentioned in incidents of abuse. However, only 25 of these substances account for 63% of all drug mentions from emergency rooms. Thus, nearly two-thirds of all drug mentions are attributed to a very limited number of commonly-reported substances.

When reviewing this report the reader should note that DAWN does not gather data on episodes caused by the ingestion of only alcohol; alcohol is presently reported in DAWN when used concomitantly with another abused substance. Therefore, all alcohol mentions are combination mentions.

Some clarification regarding heroin and morphine is also in order. Although heroin may be the ingested drug, it is metabolized in the body to morphine. To prevent confusion, therefore, particularly with respect to attributions of cause of death, "heroin/morphine" is treated as a single drug, and the number of its mentions is the sum of the numbers of heroin and morphine mentions actually reported.

DRUG PROFILES

In Chapter 3, each drug and drug group is described in terms of the demographic characteristics of the drug abusers, whether the substance was taken alone or in combination with other substances, and (for emergency room patients) the source of and motivation for taking the drug. Emergency room data are broken down by SMSA in order to demonstrate variations in the patterns of drug abuse in different areas of the country. Comparisons between SMSAs should be tempered by considering the relative size of the cities, the absolute frequency of mentions, and the rank of the drug in the SMSAs.

For age data, two breakdowns are provided. The first grouping, used in other DAWN reports, provides a basis of continuity with previous DAWN publications. The second set of categories matches the grouping used by CODAP (Client Oriented Data Acquisition Process) a federal reporting system for drug abuse treatment programs and facilitates the use of both the DAWN and CODAP categories.

THERAPEUTIC CLASS ASSIGNMENTS USED IN DAWN

TC #	Therapeutic Class	TC #	Therapeutic Class
01	Antacids without Antispasmodic Action	51	Corticoids, Plain
02	Antacids with Antispasmodic Action	52	Corticoids, Analgesic Combinations
03	Antidiarrheals, Intestinal Adsorbents	53	Corticoids, Anti-Infective Combinations
04	Antispasmodics, Anticholinergics	54	Corticoids, Other Combinations
05	Bile Therapy	55	Thyroid Preparations
06	Laxatives	56	Antithyroid Preparations
07	Ataractics, Tranquilizers	57	Iodine Therapy
08	Oral Muscle Relaxants	58	Diabetic Therapy
09	Surgical Muscle Relaxants	59	Anabolic Agents
10	Hospital Solutions	60	Androgens
11	Psychostimulants	61	Estrogens
12	A. Amphetamine Preparations B. Cocaine	62	Androgen-Estrogen Combinations
13	All Other Antiobesity Preparations	63	Progestogen-Estrogen Combinations
14	Antihistamines	64	Other Hormones
15	Bronchial Dilators	65	Lipotropics
16	Cough Preparations	66	Cholesterol Reducers
17	Cough, Cold Preparations	67	Digestants
18	Oral Cold Preparations	68	Protein Lysates
19	Topical Nasal, Ophthalmic Decongestants	69	Hyaluronidase
20	Diagnostic Aids	70	Rauwolfias
21	Broad, Medium Spectrum Antibiotics	71	Other Hypotensives
22	Penicillin	72	Vasodilators, Coronary
23	Streptomycin, DHS, Combinations	73	Vasodilators, Periphera]
24	Sulfonamides	74	Digitalis Preparations
25	Antibiotic-Sulfonamides	75	Xanthine Derivatives
26	Penicillin-DHS Combinations	76	Other Cardiovascular Preparations
27	Other Topical Antibiotics	77	Anticoagulants
28	Urinary Antibacterials, Antiseptics	78	Hemostatics
29	Solvents/Volatile Materials/Aerosols	79	Diuretics
30	Codeine Combinations	80	Pediatric Vitamins
31	Amebicides, Trichomonacides	81	Prenatal Vitamins
32	Antimalarials	82	Other Multivitamins
33	Anthelmintics	83	Geriatric Vitamins
34	Tuberculosis Preparations	84	Vitamin B Complex with Vitamin C
35	A. Cannabis B. Drug Unknown	85	Other Vitamins
36	Topical Contraceptives	86	Infant Formulas
37	vaginal Cleansers	87	Electrolytes, Miscellaneous Nutrients
38	General Antibacterials, Antiseptics	88	Hematinics with/without Iron
39	Hallucinogens	89	Allergens
40	Narcotic Analgesics	90	Biologicals
41	Non-Narcotic Analgesics	91	Antipruritics
42	Antiarthritics	92	Coal Tar, Sulfur, Resorcinol Preparations
43	Anesthetics, General Inhalants	93	Emollients, Protectives
44	Anesthetics, General Injectables	94	Fungicides
45	Anesthetics, Local Topical	95	All Other Dermatologicals
46	Barbiturate Sedatives	96	Hemorrhoidal Preparations
47	Non-Barbiturate Sedatives	97	Oxytocics, Parasympathetic Agents
48	Anticonvulsants	98	Miscellaneous
49	Antinauseants	99	Miscellaneous
50	Corticoids, ACTH		

NOTE: The data on the underlined TC classes are given in this report.

RANKS OF LEADING DRUGS OF ABUSE

Various tables in this report display rankings by mention count of the leading drugs of abuse within each facility type (emergency rooms and medical examiners) for the total DAWN system and for each SMSA. The ranks of these drugs within individual SMSAs indicate the relative frequency of each drug to the given SMSA.

However, rank ordering presents data in a format which lends itself to misinterpretation. A difference in rank should be considered only as indicative of a difference in frequency among drugs reported to DAWN, no matter how small, and not as necessarily denoting a meaningful or significant difference. For example, a difference of one between ranks of drug mentions could mean a difference of one between the actual numbers (a trivial difference) or a difference of many, which would indicate a more significant difference.

STANDARD NOTATION RANKING PROCEDURE

The occurrence of equal values (ties) for two or more drugs listed in the ranking tables has been given in Standard Statistical Notation form starting with the DAWN IV Final Report.

The Standard Statistical Notation Procedure is best illustrated by the following table:

DRUG	SMSA # 1		SMSA # 2		SMSA # 3	
	# of Mentions	Rank	# of Mentions	Rank	# of Mentions	Rank
A	250	1	250	1	250	1
B	200	2	200	2.5	200	3
C	175	3	200	2.5	200	3
D	150	4	150	4	200	3
E	100	5	100	5	100	5

It will be noticed that when a drug is not tied, it retains the rank which it would have if there were no ties in the list (e.g., drugs D and E in SMSA #2, and E in SMSA #3). When two or more drugs are tied, the rank they have is the average of the ranks they would have had if not tied. Thus in SMSA #2, B and C fit into slots 2 and 3, whence their rank is $\frac{2+3}{2} = 2.5$. Similarly, in SMSA #3, drugs B, C, and D fit into

slots 2, 3, and 4, whence $\frac{2+3+4}{3} = 3$ is the tied rank of all three drugs. In the case of ties,

therefore, rankings may be denoted either by whole numbers or by fractions, and gaps will exist in the sequence of rank numbers.

SYSTEM CAVEATS

The 1979 DAWN Annual Report contains primarily unrefined data as received from the reporting facilities. That is, the data are uncorrected for various forms of interference such as changes in the facility clientele or elimination or replacement of facilities in the reporting panel. Consequently, certain apparently feasible conclusions and comparisons between 1979 and earlier years may be unjustified because of the absence of a uniform and continuous basis for such comparison.

Furthermore, changes in statistics such as percentage share or rank of a specific drug may occur not because of changes in the frequency of abuse episodes of that drug but through opposite changes in the abuse of other drugs.

Some of the most important of these potential misunderstandings are discussed here as a brief guide to the reader. Users of the 1979 DAWN Annual Report who are unfamiliar with the terminology, nomenclature, or conventions of the DAWN Project report series should carefully study the introductory material in this publication.

When all of the eligible facilities in a given Standard Metropolitan Statistical Area (SMSA) report to DAWN, termed "saturation" reporting, the data base will reflect maximum representation of the actual SMSA population. As a partial assistance to the reader, the rate of saturation of each SMSA in the DAWN system is listed in Table 1.1.

To avoid misinterpretation of the raw data, the reader should cross-reference drug profiles (Chapter 3) with leading drug ranks and facility profiles (Chapters 1 and 2).

Cross-checking of the tables in various chapters is advisable when interpreting data to ensure that the reference levels of the items being compared are identical or adequately adjustable. For example, the occurrence of ten mentions of abuse of drug X from region A may refer to a more, or a less, severe problem than the same number of mentions from region B. This can easily be seen if we imagine A to be a large city of 5,000,000 population and B a small city of only 5,000 population. In the former, an abuse level of ten mentions per month might be negligible; in the latter this might be a matter for serious concern.

For reasons such as those given in the preceding paragraphs, extreme caution should be exercised in comparing data from different SMSAs, or comparing the data from the same SMSA reported at different times. The 1979 DAWN Annual Report does not include any attempt at time series or trend analyses. Trend analysis for broad drug groupings is given in the DAWN Quarterly Reports (available from the National Clearinghouse on Drug Abuse Information, National Institute on Drug Abuse, or the Drug Enforcement Administration). The Quarterly Reports provide over two years of data for selected drugs for both the entire system and by individual DAWN SMSAs. In addition, summary analyses and graphs are presented for data reported from each SMSA during the current quarter.

The response rate for the large majority of the data cells on the DAWN reporting forms is quite satisfactory. However, there are others (motivation and source of substance) for which the proportion "unknown/no response" is high. This does not represent a lack of responsiveness, training or unwillingness on the part of personnel in participating facilities to report fully on all data cells. DAWN is a file review system. If an item does not occur on the emergency room admissions record, it can not be reported on the DAWN form. The following are some of the factors that may inhibit the inclusion of information in the emergency room admissions record:

1. As a matter of policy some hospitals do not ask questions regarding source and form of substance.
2. The attending physician did not supply data on his report relative to each cell on the DAWN form though he may have questioned patient and elicited a response. Consequently DAWN, which depends on a review of emergency room admission records, cannot capture the unrecorded elements of data.
3. Patient refused to supply information which would be carried in the hospital record containing data on the episode.
4. As a matter of state, city or county policy certain elements of data may not be collected.
5. In a few cases, data are collected by the hospital, but the administration refuses to divulge these data to any outside source, etc.
6. The data because of any of the above reasons 1-5 do not appear on any hospital record.

"Missing data" are included in the percentaging base of the tables throughout this report. It is, therefore, important that the reader be aware of the potential distortion in percentages of positive values in tables where the "unknown/no response" factor is significant. Interpretation of these data must always be tempered by recognition of the proportion of unknown (missing) data and the ways the findings could be affected.

Finally, the strength of DAWN data is in indicating the relative frequency of kinds of drug abuse. The number of patient episodes and drug mentions reported by DAWN should not be taken as an absolute measure of all drug abuse occurrences in a given SMSA. First, not all eligible facilities report to DAWN in many SMSAs, and second, drug abuse tends to be somewhat underreported. (Current efforts to improve DAWN data are designed to reduce underreporting.) A recent quality assurance study demonstrated that while underreporting varied by drug class, the relative ranking of drugs was unchanged with the inclusion of missing data. Therefore, figures reported in the 1979 DAWN Annual Report are representative of the SMSAs for indicator purposes. However, sophisticated statistical manipulation such as inference to larger populations, should be attempted with caution and knowledge of the idiosyncrasies of DAWN reporting.

I. Introduction

This chapter presents descriptive information concerning the salient aspects of drug abuse episodes reported by DAWN emergency rooms and medical examiners during the calendar year of 1979. Over this period there were 121,575 drug abuse episodes reported by DAWN facilities, 117,949 of which were from emergency rooms and 3,626 from medical examiners. These episodes combined account for 192,507 drug mentions representing an average of 1.57 drug mentions per episode for emergency rooms and 2.00 mentions per episode for medical examiners (Table 1.2).

II. Drug Mentions

The therapeutic class of tranquilizers (38,457 mentions) accounts for 20.8% of the 185,270 emergency room mentions (Table 2.1). Within this therapeutic class, mentions of diazepam constitute the largest percentage (48.3%). Tranquilizers, alcohol-in-combination, non-narcotic analgesics and non-barbiturate sedatives combined account for 51.9% of the total mentions.

Reports from medical examiners show that drugs of the therapeutic classes of barbiturate sedatives and narcotic analgesics are most frequently associated with drug deaths, with the combined mentions of these classes accounting for 35.4% of the total mentions. Heroin/morphine (619 mentions) and secobarbital (256 mentions) are the two predominant drugs within these two therapeutic classes. Alcohol-in-combination, with 993 mentions, is the leading substance of abuse reported by medical examiners during the January-December 1979 period.

III. Sex, Age, Race Characteristics

A. Sex

Table 2.2 compares the distribution of demographic characteristics associated with DAWN emergency room and medical examiner episodes with the 1979 United States Census and the 1977 National Death Rate. The distribution of males and females as reported from the DAWN system emergency rooms varies four percentage points from the corresponding distribution according to the 1979 census estimate. Females are overrepresented in DAWN and conversely, males are underrepresented.

When the distribution of males and females drug abuse episodes is broken down by age group, the difference between males and females changes with the age category (see top of Table 2.3). The most noticeable change occurs between the 10-19 age group, where females are represented by 4.1% more than males, and the 20-29 age group, which represents 47.2% of all male drug abuse episodes versus 39% of all female drug abuse episodes. Males in the 20-29 age group appear significantly more often than females in DAWN reports.

B. Age

The largest number of drug abusers represented in DAWN data falls into the 20-29 age category. This number is equal to 43.1% of total DAWN emergency room episodes for 1979, compared with 19.4% of the U.S. population (Table 2.2). Twenty to twenty-nine year olds are represented in 38.2% of DAWN medical examiner episodes versus 2.7% in the 1977 National Death Rate statistics. The percentage of 10-19 year olds who enter the DAWN-reporting facilities is similar to the U.S. population (22.1% in DAWN compared with 19.3% of the U.S. population).

C. Race

As displayed in Table 2.2 blacks account for 11.8% of the U.S. population, but 26.2% of the DAWN episodes. By contrast, 86.3% of the U.S. population is white, while only 69.2% of the DAWN emergency room population is represented by whites. The percentage of whites in DAWN data may be very slightly understated because people of Hispanic, Asian and American Indian descent are always classified as "Other Races" in DAWN whereas in the U.S. Census, respondents classify themselves.

IV. Motivations for Use of Drugs Associated with Emergency Room Drug Abuse Episodes

Almost forty percent (39.9%) of the motivation citations overall is suicide attempt/gesture (Table 2.5). Slightly more than one-half of the female citations is suicide attempt/gesture whereas only slightly more than one-fourth of the male citations is suicide attempt/gesture. Male motivation citations are more evenly dispersed among psychic effects, dependence and suicide attempt/gesture than are female motivation citations.

The examination of motivation by race reveals that motivation citations by white and other racial groups are concentrated in the suicide attempt/gesture category. Motivation citations by blacks, however, are more evenly distributed across psychic effects, dependence and suicide attempt/gesture categories.

With the exception of the 10-19 age group, Table 2.5 shows that the percentage of motivation citations for suicide attempt/gesture within each category increases with age. The percent of suicide attempt/gesture motivation citations for the 10-19 age group more closely resembles the 30-39 age group than the 20-29 age group. In contrast, beginning with the 10-19 age group, the percent of psychic effect motivations decreases with age.

Table 2.7 displays motivation citations associated with the top 20 most frequently used drugs. For two of these, PCP/PCP combinations and marijuana, psychic effects is the predominant citation with 54.1% for PCP and 53.9% for marijuana. Psychic effect motivations for methaqualone (38.3%) and cocaine (38.8%) are also remarkable. Dependence is the primary motivation cited in the use of heroin/morphine and methadone, 73.7% and 63.2% respectively. For each of the eight other drug groups, acetaminophen, amitriptyline, aspirin, chlordiazepoxide, diazepam, d-propoxyphene, flurazepam and over-the-counter (OTC) sleep aids, the major motivation cited in more than 50% of the total motivation citations, was suicide attempt/gesture.

V. Source of Drugs (Emergency Room Data Only)

Table 2.6 reveals that legal prescriptions are the predominant source of drugs for all age and sex categories. Whites are more likely than non-whites to secure drugs through a legal prescription. By contrast, non-whites are more likely than whites to secure drugs on the street. With the exception of the 6-9 age group, examination of the age distribution shows that the proportion of legal prescriptions as a source increases as the age increases.

Table 2.8 which displays the distribution of source mentions associated with the 20 most frequently abused drugs reveals a pattern of source mentions congruent with expectations. Aspirin, alcohol-in-combination, acetaminophen, and over-the-counter sleep aids are most likely obtained over-the-counter. Legal prescriptions are the main source for all prescription drugs listed with the exception of secobarbital/amobarbital and methaqualone which are primarily obtained on the street. Users of secobarbital/amobarbital and methaqualone are also likely not to mention source (52.1% and 38.9% of all source mentions respectively). Over 35% of the users of diazepam and PCP/PCP combinations also did not report source.

VI. Top 20 Drugs: Sex, Race, Age (Emergency Room and Medical Examiner Episodes)

A. Sex

There appears to be an association between the sex of the user and the preference for specific drugs. Table 2.9 shows that over 60% of all emergency room reports of heroin/morphine, PCP/PCP combinations, marijuana, methadone and cocaine are from males. By contrast, over 60% of all emergency room mentions of diazepam, aspirin, flurazepam, d-propoxyphene, amitriptyline, chlordiazepoxide, acetaminophen, and over-the-counter sleep aids are generated by females.

The drugs mentioned in medical examiner reports (Table 2.10) also show a relationship between sex and certain drugs. Males account for over 60% of the mentions of heroin/morphine, methadone, PCP/PCP combinations, methaqualone, cocaine and alcohol-in-combination. Drugs such as amitriptyline, phenobarbital, aspirin, and flurazepam tend to be associated with females. Mentions of the other ten of the top 20 drugs reported by medical examiners are more equally distributed between males and females.

B. Race

Table 2.9 reveals at least 60% of the mentions of 13 of the top 20 drugs are mentions by whites. The percentage of mentions by blacks exceeds the percentage of mentions by whites for only one drug - heroin/morphine.

The medical examiner data (Table 2.10) show that whites account for the majority of mentions of all top 20 drugs with heroin/morphine exhibiting the smallest share (54.8%). This share represents 339 deaths related to heroin/morphine abuse out of a total of 619 deaths which occurred during calendar year 1979. Drugs most reported in deaths of blacks were PCP/PCP combinations (40.2%), heroin/morphine (37.2%), methadone (22.6%), codeine (22%) and alcohol-in-combination (21.1%).

C. Age

As noted in preceding sections, the 20-29 age category is significant. Table 2.11 clearly shows the predominance of this age group with respect to involvement in episodes of abuse. The seven drugs for which the share of mentions in the 20-29 age category exceeds 50% are heroin/morphine, PCP/PCP combinations, secobarbital/amobarbital, methadone, methaqualone, amphetamine, and cocaine.

The 10-19 age group accounted for 21% of all emergency room episodes. In Table 2.11, mentions of eight drugs by 10-19 year olds exceeded this percentage: marijuana (37.5%), PCP/PCP combinations (34.3%), aspirin (40.8%), acetaminophen (36.4%), methaqualone (29.3%), d-propoxyphene (23.5%), over-the-counter sleep aids (27.7%) and amphetamine (23.6%). Medical examiner drug mentions for the 10-19 group (Table 2.12) tend to cluster around 5% with the exception of PCP/PCP combinations and methaqualone. For these substances, 10-19 year olds account for 12.0% and 23.0% respectively of the total medical examiner mentions.

Table 2.12 focuses on the top 20 drugs reported by medical examiners. The pattern of percentages in Table 2.12 differs primarily from the pattern displayed in Table 2.11 with respect to the 50 and over age category. For five drugs listed, secobarbital, phenobarbital, pentobarbital, aspirin, flurazepam, this age category is the dominant one; in the case of pentobarbital, mentions in this category comprise a 48.3% share of all mentions.

VII. Drug-Induced Deaths and Drug-Related Deaths

During 1979, DAWN medical examiners reported 3,626 deaths either drug-induced or drug-related. Eighty two percent (82%) of the deaths are listed as drug-induced (Table 2.13).

The drugs most frequently reported by medical examiners are barbiturate sedatives, narcotic analgesics and tranquilizers. These three therapeutic classes of drugs account for 47.5% of the total mentions. Alcohol-in-combination, heroin/morphine, amitriptyline, d-propoxyphene and methadone are the five most frequently-encountered substances associated with drug deaths.

Table 2.14 displays the manner of drug-induced deaths associated with drug mentions. Forty-three percent (43%) of all drug-induced deaths are attributed to suicidal overdose. Drugs of the therapeutic classes of barbiturate sedatives, tranquilizers and psychostimulants are the major ones used for suicidal overdose. Specific substances identified by medical examiners as most frequently used in cases of suicidal overdose are alcohol-in-combination, amitriptyline, d-propoxyphene, secobarbital and pentobarbital.

Accidental or unexpected overdose occurs in 30% of the cases of drug-induced deaths. Alcohol-in-combination, heroin/morphine, codeine, d-propoxyphene, diazepam, and methadone account for 52.3% of all drug mentions associated with deaths from accidental/unexpected overdoses.

VIII. Ranking of Top 20 Drugs for the DAWN SMSAs

Tables 2.15 and 2.16 display the ranking by frequency of mention of the top 20 drugs as reported by DAWN emergency rooms and medical examiners within the 26 SMSAs. Since the ranking of each drug is based on the number of times it was mentioned in connection with an abuse episode, its rank order is an indication of the relative importance of that drug within that SMSA. Differences in ranks across SMSAs may be trivial or significant depending on the absolute number of drug mentions. Slight differences in rankings of the drugs across the SMSAs should not be emphasized while large differences in the rank ordering of the drugs may suggest a variation that is in fact significant.

Methaqualone mentions demonstrate the tentative nature of inter-SMSA comparisons. In San Francisco (County), Washington, D.C., and Detroit methaqualone was ranked 11.5, 16, and 25.5, respectively (Table 2.15). However, in San Francisco, 63 methaqualone mentions were recorded as opposed to 62 in Washington, D.C. and 61 in Detroit. Within SMSA differences in rank tend to have greater face validity. For example, in Miami, methaqualone was ranked second (905 mentions) and phenobarbital was ranked eleventh (160 mentions).

NOTE: Ranks are based on numbers of mentions of drugs excluding Drug Unknown within SMSA.

*Below top 20 drugs

**See Introduction

***See page 3, no. 3

^aIn the Baltimore SMSA thioridazine, amphetamine, cocaine, methaqualone, codeine, PCP/PCP combinations and marijuana each had 1 mention and a rank of 20.

^bIn the Detroit SMSA cocaine and thioridazine each had 4 mentions and a rank of 20.5.

^cIn the Los Angeles SMSA glutethimide and thioridazine each had 11 mentions and a rank of 20.5.

^dIn the Miami SMSA oxycodone, amobarbital and clorazepate each had 4 mentions and a rank of 20.

^eIn the San Diego SMSA thioridazine, amobarbital, methamphetamine, flurazepam and pentazocine each had 2 mentions and a rank of 20.

^fIn the Washington, D.C. SMSA aspirin, pentobarbital, meprobamate, meperidine HCl, glutethimide, thioridazine and chlorthalidone each had 1 mention and a rank of 23.

CHAPTER 3
DRUG PROFILES

Presented in this chapter is comprehensive information on 42 drugs and 12 therapeutic classes each profiled on a separate table. These 54 tables display the following data for emergency rooms: the number of mentions, proportion of alone usage mentions, drug rank and distribution of demographic variables by SMSA and the total DAWN system. The information included on drugs and drug classes reported by medical examiners is similar to that for emergency rooms but is displayed for the total DAWN system only. In addition, supplementary information concerning the pharmacological aspects of use is given for each drug and drug class profiled.

This material is presented in this way to offer the reader an overall view of the demographic characteristics of the individuals involved in the abuse episodes, to display the sources and other information pertinent to the drug itself, and to provide a display of these data across the 26 DAWN SMSAs.

The reader should note that since only one mention can logically be reported for each drug, mentions and episodes are equal in number when the basis of comparison is the drug. When, however, the basis of comparison is the drug user, numbers of mentions will generally exceed numbers of episodes since each user may take, and hence mention, more than one drug. Furthermore, when sources and motivations are provided the numbers of source and motivation citations may also exceed the number of episodes: a user may have obtained a drug through more than one channel or have taken a drug for more than one reason.

It has been noted earlier in the introduction that the response rate for the large majority of the data cells on the DAWN reporting forms is quite satisfactory. On the succeeding profiles the reader will be aware, however, there are others (motivation and source of substance) for which the proportion "unknown/no response" is high. This does not represent a lack of responsiveness, training or unwillingness on the part of personnel in participating facilities to report fully on all data cells. It is rather indicative of one or many of a set of circumstances peculiar to individual hospitals such as:

1. As a matter of policy some hospitals do not ask questions regarding source and form of substance.
2. The attending physician did not supply data on his report relative to each cell on the DAWN form though he may have questioned patient and elicited a response. Consequently DAWN, which depends on a review of emergency room admission records, cannot capture the unrecorded elements of data.
3. Patient refused to supply information which would be carried in the hospital record containing data on the episode.
4. As a matter of state, city or county policy certain elements of data may not be collected.
5. In a few cases, data are collected by the hospital, but the administration refuses to divulge these data to any outside source, etc.
6. The data because of any of the above reasons 1-5 do not appear on any hospital record.

However, since the inclusion of missing data in the percentaging base of the tables throughout this report is a mandatory specification of the report format, it is important that the reader be aware of the potential distortion of determinate categories' percentages (i.e., percentage of responses in categories such as psychic effects or overdose) in tables where the "unknown/no response" factor is significant. Interpretation of these data must always be tempered by recognition of the proportion of unknowns (missing data) and the ways the findings could be affected.

THERAPEUTIC CLASS ASSIGNMENTS USED IN DAWN

TC #	Therapeutic Class	TC #	Therapeutic Class
01	Antacids without Antispasmodic Action	51	Corticoids, Plain
02	Antacids with Antispasmodic Action	52	Corticoids, Analgesic Combinations
03	Antidiarrheals, Intestinal Adsorbents	53	Corticoids, Anti-Infective Combinations
04	Antispasmodics, Anticholinergics	54	Corticoids, Other Combinations
05	Bile Therapy	55	Thyroid Preparations
06	Laxatives	56	Antithyroid Preparations
07	Ataractics, Tranquilizers	57	Iodine Therapy
08	Oral Muscle Relaxants	58	Diabetic Therapy
09	Surgical Muscle Relaxants	59	Anabolic Agents
10	Hospital Solutions	60	Androgens
11	Psychostimulants	61	Estrogens
12	A. Amphetamine Preparations B. Cocaine	62	Androgen-Estrogen Combinations
13	All Other Antiobesity Preparations	63	Progestogen-Estrogen Combinations
14	Antihistamines	64	Other Hormones
15	Bronchial Dilators	65	Lipotropics
16	Cough Preparations	66	Cholesterol Reducers
17	Cough, Cold Preparations	67	Digestants
18	Oral Cold Preparations	68	Protein Lysates
19	Topical Nasal, Ophthalmic Decongestants	69	Hyaluronidase
20	Diagnostic Aids	70	Rauwolfias
21	Broad, Medium Spectrum Antibiotics	71	Other Hypotensives
22	Penicillin	72	Vasodilators, Coronary
23	Streptomycin, DHS, Combinations	73	Vasodilators, Peripheral
24	Sulfonamides	74	Digitalis Preparations
25	Antibiotic-Sulfonamides	75	Xanthine Derivatives
26	Penicillin-DHS Combinations	76	Other Cardiovascular Preparations
27	Other Topical Antibiotics	77	Anticoagulants
28	Urinary Antibacterials, Antiseptics	78	Hemostatics
29	Solvents/Volatile Materials/Aerosols	79	Diuretics
30	Codeine Combinations	80	Pediatric Vitamins
31	Amebicides, Trichomonacides	81	Prenatal Vitamins
32	Antimalarials	82	Other Multivitamins
33	Anthelmintics	83	Geriatric Vitamins
34	Tuberculosis Preparations	84	Vitamin B Complex with Vitamin C
35	A. Cannabis B. Drug Unknown	85	Other Vitamins
36	Topical Contraceptives	86	Infant Formulas
37	Vaginal Cleansers	87	Electrolytes, Miscellaneous Nutrients
38	General Antibacterials, Antiseptics	88	Hematinics with/without Iron
39	Hallucinogens	89	Allergens
40	Narcotic Analgesics	90	Biologicals
41	Non-Narcotic Analgesics	91	Antipruritics
42	Antiarthritics	92	Coal Tar, Sulfur, Resorcinol Preparations
43	Anesthetics, General Inhalants	93	Emollients, Protectives
44	Anesthetics, General Injectables	94	Fungicides
45	Anesthetics, Local Topical	95	All Other Dermatologicals
46	Barbiturate Sedatives	96	Hemorrhoidal Preparations
47	Non-Barbiturate Sedatives	97	Oxytocics, Parasympathetic Agents
48	Anticonvulsants	98	Miscellaneous
49	Antinauseants	99	Miscellaneous
50	Corticoids, ACTH		

NOTE: The data on the underlined TC classes are given in this report.

SUPPLEMENTARY INFORMATION

Meprobamate is considered an antianxiety agent and muscle relaxant, which acts as a depressant on the central nervous system. Meprobamate shows similar effects to the barbiturates with respect to tolerance, physical dependence, psychic dependence, and ability to be potentiated by alcohol and other central nervous system depressants.

SUPPLEMENTARY INFORMATION

Oxazepam is a sedative - anti-anxiety agent, chemically similar to diazepam, that acts on the central nervous system. It is used medically in the control of anxiety, tension, agitation and in the treatment of alcohol withdrawal. Tolerance, psychic dependence and physiological dependence have been noted in cases of chronic oxazepam overdose. Alcohol, barbiturates and other central nervous system depressants may potentiate the effects of oxazepam.

SUPPLEMENTARY INFORMATION

Butabarbital is a short-to-intermediate acting barbiturate. Its depressant action on the central nervous system makes the drug easily potentiated by other central nervous system depressants, especially alcohol. The tolerance effects of the barbiturates, which usually require larger doses to maintain the same results, may lead to both psychological and physical dependence.

SUPPLEMENTARY INFORMATION

Glutethimide is a non-barbiturate sedative which works as a depressant on the central nervous system. Like the barbiturates, excessive use of glutethimide can result in both physical and psychological dependence. Alcohol, barbiturates and other central nervous system depressants can potentiate glutethimide effects, producing respiratory depression, coma, and death.

SUPPLEMENTARY INFORMATION

DAWN only collects data on alcohol that is taken concomitantly with another substance; not alcohol used alone. Alcohol is a depressant of the central nervous system and is slowly metabolized. Since alcohol has the ability to potentiate many drugs, it may be mentioned in many drug abuse episodes reported to DAWN where the ingested amounts of either the alcohol or the accompanying drug(s) would not result in a medical emergency if taken alone.

SUPPLEMENTARY INFORMATION

Oxycodone is a semisynthetic narcotic analgesic with multiple actions qualitatively similar to those of morphine, although quantitatively it is slightly less potent. It can also produce physical and psychological dependence effects similar to morphine.

SUPPLEMENTARY INFORMATION

Pentazocine, a non-narcotic analgesic, is more than twice as potent as meperidine, but less effective than morphine in both potency and duration of action. Tolerance may develop, and instances of psychological and physical dependence on pentazocine have been noted. The respiratory depressant effects of pentazocine may be potentiated by other central nervous system depressants such as alcohol and barbiturates.

SUPPLEMENTARY INFORMATION

Products in this therapeutic class contain amphetamine or one of its derivatives and are used as antiobesity preparations or central nervous system stimulants. Amphetamines have a high potential for abuse. Tolerance, extreme psychological dependence and severe social disability can occur. Side effects may include dryness of the mouth, anorexia, euphoria, insomnia, and headaches. Physical dependence, however, does not occur.

SUPPLEMENTARY INFORMATION

"Speed" is a common street name for stimulants such as amphetamine, methamphetamine, and d-amphetamine. These are synthetic amines that exert a stimulating action on the central nervous system. Characteristics of the general amphetamine group frequently include tolerance effects, a potential for psychological dependence, and the absence of physical dependence.

SUPPLEMENTARY INFORMATION

Methylphenidate is a mild cortical stimulant that differs chemically from central nervous system stimulants such as the amphetamines, but resembles them in numerous pharmacological respects. It is often prescribed as an antidepressant or as a "diet drug". This drug tends to have a euphoric effect on the user. Chronic abuse can lead to marked tolerance and psychic dependence with varying degrees of abnormal behavior. Frank psychotic episodes and severe depression can occur.

SUPPLEMENTARY INFORMATION

LSD (d-lysergic acid diethylamide) is a semi-synthetic derivative of lysergic acid known to have hallucinogenic effects. The drug is considered highly unpredictable and its pharmacology is not fully understood. While tolerance occurs very rapidly and psychological dependence may develop, LSD does not cause physical dependence even after long term use.
