DESCRIPTION OF PAROLE VIOLATORS

NCJRS

WIN 18 1981

ACQUISITIONS

IN 1977-1979

#### ABSTRACT

Between January 1, 1977 and December 31, 1979, there were 1,183 cases of parole violation in Kentucky, with the number increasing each year. Nearly half of the offenders were returned on technical violations, most of which involved absconding.

The racial makeup of the parole violators is very similar to that of the general prison population. Whites were more likely to be returned on technical charges; blacks, with a new felony conviction.

The median age of the sample is 27 years.

More than half of all parole violators were Class D felons. Blacks were slightly more likely to be Class B offenders.

Two-thirds were first offenders, and most were violating parole for the first time.

Sample members with prior adult incarcerations generally served longer terms than first offenders in the same crime class. The average time served for the entire sample was 36 months.

The majority of the sample made parole at their first hearing, or received one deferral.

Almost half of the sample were paroled from KSR and waited one month or less between recommendation and release.

Most parolees were on maximum supervision with the median time on parole being 12 months.

Nearly one-third of those who violated were paroled to Jefferson County. Sample members paroled within the six months following the effective date of the Polsgrove Decision are very similar to those released in the previous six months. During the three years between January 1, 1977 and December 31, 1979, there were 1,183 cases of parole violations resulting in re-incarceration in the Commonwealth of Kentucky. This total number of cases was not distributed evenly over the three years. Instead, the number of cases of returned parole violators jumped from 220 in 1977 to 569 in 1979 (Table 1). In 1979, parole violators accounted for 20.4% of the commitments. In addition to the number of offenders returned for parole violations, the percentage of the parole caseload who violated increased from 9.6% in 1977 to 25.0% in 1979 (Table 2). Coinciding as it did with litigation concerning prison overcrowding, this drastic increase in offenders returned to prison aroused grave concern and generated numerous questions. Therefore, this report presents a profile of Kentucky parole violators for this threeyear period.

The list of parole violators returned from 1977 through 1979 was obtained from Weekly Population Movement Summaries kept in the Offender Records Section. Because of the large size of the population to be studied, the number of variables to be coded had to be limited. Background information such as drug use and employment history was not coded due to the length of time it would have taken to compile this data. Variables were selected on the basis of their probable relevance to parole violation and the relative ease with which they could be located within an offender file (Appendix 1). Of the total 1,183 cases, information was available on 1,035. In cases where an individual had violated more than once, information was gathered on the latest parole violated. Therefore, although some inmates had violated parole twice during this time period, they are included in the study only once.

#### I. Type of Parole Violation

Nearly half of the parole violators in the sample were returned for technical violations and, as shown in Table 3, there was some shift in the pattern of type of parole violation committed during this three-year period. From 1977 to 1978, the percentage of technical violators decreased 13.3%, while feleny violators increased at an almost identical rate. From 1978 to 1979, the percentages in these two categories were stable. The percentage Of/misdemeanants remained the same for all three years.

Of those who violated, 38.4% were for a single technicality, while 61.5% violated more than one condition of parole. Overall, the most frequent reason for technical violation was the dual offense "Failure to Report and Absconding", which comprised 48.8% of the sample, followed by "Absconding", which comprised 18.8% of all violators. Absconding was also listed in other cases as one of the reasons for technical violation. In all, 71.7% of the technical violations involved absconding. Appendix 2 gives a complete breakdown of the reasons for technical violations as a total for the three-year <sup>\*</sup>period; in Appendix 3, they are broken down by Parole Supervisory Districts.

## II. Demographic Characteristics

The racial breakdown of the sample of parole violators is very similar to that of the general prison population (Table 4). The percentage of blacks who vio / d has increased slightly over the three-year period. In addition, the type of parole violation differs by race. White parolees were more likely to be returned on technical violations (51.6%), whereas 44.9% of the blacks were returned on new felony convictions.<sup>1</sup> The number of violators returned on misdemeanor charges varied only slightly between the racial groups.

<sup>1</sup>If an offender had both a criminal (felony) and technical violation, he was considered a "new felony" violator.

<sup>2</sup>Bureau of Corrections Fact Sheet, prepared February, 1980

While whites are consistently more likely to be technical violators, the vielation pattern of blacks changed during the three years of the study (Table 5). In 1977, the majority of black violators were returned on technical charges. However, in 1978 and 1979, most of the blacks were returned on new felony convictions.

Black violators are slightly more likely to be sentenced on Class B felonies (Table 6). Another difference between racial groups was age; blacks were younger than whites in all crime classes except D. All of the parole violators were slightly older than 1977 releases. The median age of parole violators was 27 years; of releases, 24 years.<sup>3</sup>

The parole violators ranged from 19 to 73 years of age. The average age was 30 years and the median (or middle) age was 27. To determine if differences were evident, the ages were split into two groups at this middle value. New felony and misdemeanor violators tend to be young (Table 7), although technical violators, particularly blacks, are more likely to be above the median age. However, this relationship was not statistically significant.

Women represented 4.3% of the parole violators; this is almost identical to the 4.1% women in the Kentucky prison population. A complete breakdown of the sample by race and sex is given in Table 8 and Figure 8A. Although such a small number precludes any detailed analysis, a brief comparison of males and females revealed several differences. One notable contrast was that women were more likely to receive technical violations than men (Table 9).

0

The racial composition of the group of female parole violators was significantly different from that of the men. Blacks comprised 54.5% of the « women; whereas, 26.3% of the men were black.

MEN AND WOMEN: TYPES OF PAROLE VIOLATION

Women	Men					
61.4% (27)	46.1% (457)					
22.7% (10)	33.3% (330)					
15.9% (7)	20.6% (204)					

With regard to age, the women were only slightly younger than the men. The majority of the females, 59.1%, were less than 28 years old, with a median age of 26.9 years. Of the men, 51.1% fell into that age category. The median age for men parole violators was 27.4 years. This data was compared to that obtained from a study of offenders admitted in 1978.<sup>4</sup> When the median ages of the two groups were compared, women are about the same: parole violators were 26.9 years, admissions, 26.2 years. However, male parole violators were older: 27.4 years as compared to 23.9 years of the men in the admissions sample.

#### "III". Criminal History

More than half (53%) of the violators were Class D felons and tended to be younger than those convicted of more serious offenses, especially for white offenders. Blacks who violated parole were more youthful than whites in all other crime classes (Table 10).

<sup>o</sup> When crime class of the violators was compared to that of inmates recommended for parole between January, 1977 and December, 1978, it was found that a higher percentage of violators were Class B felons and a slightly smaller percentage were Class C felons (Table 6). However, this may be explained by the fact that the more serious offenders have longer sentences and are under supervision for a longer period of time. Therefore, they have more "opportunity" to violate parole. No difference in the type of violation was evident among the specific classes of crimes.

In addition to class of crime, prior adult felony incarcerations were used as a measure of criminal sophistication. As Table 11 shows, two-thirds of the parolees were first offenders, which is slightly lower than the

percentage of first offenders in the Polsgrove study sample (Table 12). First offender status was not related to either race or the type of violation committed.

<sup>#</sup>Information on whether the offender had a parole or shock probation violation on the current charge indicated that 27% of the sample had previous violations. A history of previous violations, however, was not related to type of violations during this study (Table 13).

IV. Institutional History

Because of the selective process involved in classifying offenders to specific institutions and in granting parole, institutional factors and interaction with the Parole Board were reviewed.

The average number of months served for the entire sample was 36 months. Obviously, those in higher crime classes generally served longer prison terms. Time served for the total sample increases in all crime classes if there is a prior incarceration (Table 14). However, differences were evident between races. For first offenders, blacks convicted of Class B felonies served longer terms, and among those with prior incarcerations, blacks in Class D are serving longer than whites.

Although these differences cannot be explained in terms of sentence lengths or number of deferrals, no effort was made to control for seriousness of crime within classes, multiple counts, or other factors which might affect the time served.

The majority of the sample were granted parole at their first eligibility date or received one deferral (Table 15). Deferrals do not appear to be strongly linked to race, nor is there a systematic relationship between deferrals and sentence length.

#### TABLE 12

Prior

3 or more	8.3	86

When the length of time served is compared to the type of parole violation, blacks and whites in new crime and misdemeanant categories appear similar. However, for technical violators, blacks are more likely to serve longer than whites.

The total number of inmates paroled from each institution was obtained from Monthly Population Movement Summaries. The rate of parole violations for each institution was calculated using the number of parole violators released from each facility. As shown in Table 16, the rate of violation increases with the security level of the institution, with KSP having a return rate of 26.2% as compared to 15.4% for minimum security facilities, excluding BCC. The median sentence given parole violators returned with a new felony conviction was five years. The length of time parolees had to wait between recommendation by the Parole Board and release averaged one month or less for all institutions. Race, prior incarcerations, and prior parole violations made no difference in the amount of time an inmate waited for parole.

V. Supervision

Er.

3

Level of parole supervision is, in one respect, a measure of time out on parole because it influences the frequency and mode of reporting to the parole officer. All newly paroled felons are required to remain on maximum supervision for sixty days. Considered another way, supervision level is a measure of success on parole. Reclassification depends partly upon the accomplishment of certain objectives, i.e., permanent employment. Parolees may also be placed on maximum supervision if they are free on bond awaiting trial for an offense committed while on parole. Procedures for reducing supervision may vary throughout the state.

VI. Parole Supervisory Districts under supervision (Table 18).

D

of whites with new felony convictions than blacks. Although the average time spent on parole supervision was 18 months, several extremely large values influenced this figure. Therefore, the median or middle figure of 12 months is more representative. The median time on parole for blacks, 14 months, was slightly higher than for whites, 11 months.

Of the violators paroled in-state, 48.1% of the cases were on maximum supervision at the time they violated (Table 17). Since only 8.7% of the sample violated within three months, it appears that the majority of the sample were not making good progress on parole. It could be, however, that parolees are often not reclassified so that the parole officer can maintain close contact with the client. Level of supervision did not appear to be affected by class of crime, race, or prior parole/shock probation violations. <u>VI. Parole Supervisory Districts</u>

During the time period covered by this study, there were eleven Parole Supervisory Districts in the state (see map - Figure A). Nearly one-third of the sample (30.0%) was paroled to District 4, Jefferson County. District 9, which includes Lexington, had the next largest number of parole violators under supervision (Table 18).

In most of the districts, the majority of returned violators had technical violations. In Districts 2 and 9, however, the majority of parole violators were convicted of a new felony (Table 19). Remembering that blacks were more likely to violate parole with a new felony conviction, a table comparing race by district shows that next to Louisville, Districts 2 and 9 also have the highest percentage of black parole violators in the state (Table 20). Districts 4 and 9 show a relationship that parallels the one for the whole sample, but District 2, which includes Bowling Green, has a higher percentage of whites with new felony convictions than blacks.

were on maximum supervision at the time they violated parole. VII. Impact of the Polsgrove Decision Because of numerous speculations that the increase in parole violators was due to the Polsgrove<sup>5</sup> releasees returning, the parole violators were divided into two groups: those released six months prior to and six months after the effective date of the Polsgrove Decision in March of 1978. Sample members who were released within six months after the effective date of the Polsgrove Decision do not seem to vary from those released in the previous six months. The groups are roughly equivalent in terms of race, age, prior incarcerations, number of months served, and class of crime. More of the pre-Polsgrove group do have prior parole/shock probation violations. A higher percentage of blacks than whites are returned for new crimes in each group. This compares with the total sample; however, both of these six-month periods include a higher percentage of releasees who were returned as misdemeanants.

an.

<sup>D</sup>The Polsgrove Decision mandated that accumulated jail time be counted toward total time served, resulting in a large number of felons being released during a relatively short time span.

Like the total sample, most of the parolees in each individual district
