About the Technology Assessment Program

The Technology Assessment Program is sponsored by the Office of Development, Testing, and Dissemination of the National Institute of Justice (NIJ), U.S. Department of Justice. The program responds to the mandate of the Justice System Improvement Act of 1979, which created NIJ and directed it to encourage research and development to improve the criminal justice system and to disseminate the results to Federal, State, and local agencies.

The Technology Assessment Program is an applied research effort that determines the technological needs of justice system agencies, sets minimum performance standards for specific devices, tests commercially available equipment against those standards, and disseminates the standards and the test results to criminal justice agencies nationwide and internationally.

The program operates through:

The **Technology Assessment Program Advisory Council (TAPAC)** consisting of nationally recognized criminal justice practitioners from Federal, State, and local agencies, which assesses technological needs and sets priorities for research programs and items to be evaluated and tested.

The **Law Enforcement Standards Laboratory (LESL)** at the National Bureau of Standards, which develops voluntary National performance standards for compliance testing to ensure that individual items of equipment are suitable for use by criminal justice agencies. The standards are based upon laboratory testing and evaluation of representative samples of each item of equipment to determine the key attributes, develop test methods, and establish minimum performance requirements for each essential attribute. In addition to the highly technical standards, LESL also produces user guides that explain in non-technical terms the capabilities of available equipment.

The **Technology Assessment Program Information Center (TAPIC)** operated by the International Association of Chiefs of Police (IACP), which supervises a national compliance testing program conducted by independent agencies. The standards developed by LESL serve as performance benchmarks against which commercial equipment is measured. The facilities, personnel, and testing capabilities of the independent laboratories are evaluated by LESL prior to testing each item of equipment, and LESL helps the Information Center staff review and analyze data. Test results are published in Consumer Product Reports designed to help justice system procurement officials make informed purchasing decisions.

All publications issued by the National Institute of Justice, including those of the Technology Assessment Program, are available from the National Criminal Justice Reference Service (NCJRS), which serves as a central information and reference source for the nation's criminal justice community. For further information, or to register with NCJRS, write to the National Institute of Justice, National Criminal Justice Reference Service, Washington, DC 20531.

TABLE OF CONTENTS

FOREWORD

Documentation of the Personal FM Transceivers testing program results is organized in two volumes to facilitate reader orientation. The two volumes are entitled and described as follows:

Vol. I: Police Personal FM Transceivers Report-
Volume I: Executive Summary

This volume provides an overview of transceiver compliance with the requirements of the test standard. An individual compliance summary for each transceiver tested is included.

Vol. II: Police Personal FM Transceivers Report-
Volume II: Test Data

Volume II contains a lengthy compilation of the test data upon which Volume I is based. Because of the technical orientation of the material, no general distribution of Vol. II will be made. Copies may be obtained by request directed to the International Association of Chiefs of Police or to the National Criminal Justice Reference Service.

METHODOLOGY

Upon approval of the transceiver testing program, a survey of communications equipment manufacturers was conducted to identify the personal FM transceiver models currently in production for law enforcement use in the United States. Eight manufacturers identified equipment models in production. Twenty-six transceivers, representing the basic models produced by the eight manufacturers, were selected for the program. Included among the twenty-six models were two Type I (25-50 mHz), fifteen Type II (150-174 mHz), and nine Type III (400-512 mHz) transceivers. Effort was made to select transceivers in proportion to: estimated usage by type; the number of models produced by each manufacturer; and RF output power. Individual transceivers ordered for the program were of one or two channel types ranging in carrier output power from approximately two to six watts. When possible, universal type transceivers were obtained to provide the additional input-output jacks that would facilitate testing.

Substantial time and effort was expended in selection of the best qualified laboratories for the testing program. Based on responses to the IACP's Request for Proposal and follow-up visits to the laboratories to further assess their capability to perform the desired testing, two contracts were awarded. Recipients of the contracts were Dayton T. Brown, Inc., Bohemia, Long Island, New York, and E-Systems, Melpar Division, Falls Church, Virginia.

As a preliminary phase of the testing program, each laboratory was required to completely test one each of two similar personal FM transceivers in accordance with the procedures and requirements of the Standard. Various phases of the testing were monitored by technical representatives of the IACP and NBS to follow progress of the testing and resolve any questions that might arise in the application of the Standard. During the on-the-site visits test instruments, environmental chambers, and vibration excitors were inventoried and checked for calibration. Upon satisfactory completion of the initial transceiver testing, the two laboratories were judged to be qualified and were directed to proceed with the testing of the main quantity of transceivers.

During transceiver testing, transceiver-to-test-instrument interface accessories such as adapter cables, battery blocks, external power supply adapters, and antenna adapters were used when specified by the manufacturer. All batteries were recharged in chargers specified by the manufacturer for the particular battery supplied with the transceiver.

In the structuring of the tests, it was the consensus of the TAPAC that many purchasers of transceivers would not have the facilities to check and adjust transceivers purchased and therefore the transceivers should be tested in the as received condition. With one exception, tests were to be conducted on each transceiver in the condition that it was received from the manufacturer. The exception was made that, in the event of a complete failure of a transceiver component, the testing laboratory was authorized to return the transceiver to the manufacturer or to a manufacturer's authorized service facility for repair in order that testing of the transceiver could be completed. Occurrences of transceiver repair during the transceiver testing program are noted in the test data reports.

THE STANDARD

The advisory council, TAPAC, adopted the standard "Personal FM Transceivers", NILECJ-STD-0209.00* for use in this testing program. This Standard is a Law Enforcement Equipment Standard developed by the Law Enforcement Standards Laboratory (LESL) of the National Bureau of Standards (NBS), accepted and issued by the National Institute of Justice (NIJ) formerly the National Institute of Law Enforcement and Criminal Justice (NILECJ). This Standard hereinafter referred to as the Standard, consists of performance and other requirements together with detailed descriptions of test methods.

Equipment which can meet the requirements of the Standard is judged to be of superior quality and suited to the needs of law enforcement agencies. Transmitter requirements of the Standard meet or exceed those specified in the Rules and Regulations of the Federal Communications Commission (FCC).

General as well as specific differences in performance requirements, test conditions and test procedures exist between this Standard and other standards such as Electronic Industries Association (EIA) Standard RS-316-B which also sets forth test procedures and performance requirements for personal FM transceivers.

It is important to note that all transceivers in this program were tested in accordance with the procedures of this Standard, and evaluations were made with reference to the performance requirements of this Standard. In a few instances, where applicable, comments on the test data have been made in reference to Federal Communications Commission (FCC) requirements (italicized in the test summaries) and requirements of RS-316-B. Testing of all transceivers in precisely the same manner, under the same conditions and to identical performance requirements of the Standard accomplished the principal objective of the program which was the development of objective, comparative performance data on personal FM transceivers available for law enforcement use.

In application of this Standard in this testing program the advisory council, TAPAC, recommended that three exceptions be made: 1) that the Audio Output Power (Earphones) test not be conducted; 2) that the Shock Test (drop test) not be conducted; and 3) that the testing sequence specified in the Standard be modified to require testing of the transceiver first under ambient temperature conditions followed by testing under the environmental conditions of vibration and extremes of temperature and humidity. The objective of the changes was to reduce testing costs and still produce the greatest amount of pertinent performance data.

*For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Stock No. 027-000-00728-0.

FM TRANSCEIVER TEST DATA

A general summary of the transceiver test data is contained in Tables 1 and 2. The tables group the transceivers according to Types I, II and III and indicate only that a transceiver was or was not in compliance with the minimum performance requirements of the Standard. The results are shown for tests under both ambient (A) temperature test conditions and tests under conditions of environmental (E) extremes for the twenty-six transceiver characteristics tested.

Complete test data upon which Tables 1 and 2 are based is contained in the Appendix. The data represent performance measurements made under ambient temperature conditions, under high and low voltages with respect to nominal operating voltage, under vibration, and under conditions of high and low temperatures and high humidity.

For ease of reference the FM Transceiver Test Data reports are filed in the Appendix in numerical sequence of the IACP identification number assigned to each transceiver. The identification number of each transceiver appears at the top of the columns in Tables 1 and 2, and at the top and bottom of Appendix pages.

The test data for each transceiver is presented in the same manner on a standardized report form. The format of the form is explained in detail in the Appendix.

APPENDIX

FORMAT
OF
FM TRANSCEIVER TEST DATA REPORT

The first page of the four-page report of each transceiver contains the following identification information:

Name of Manufacturer
 Transceiver Model Number
 Transceiver Serial Number
 Transceiver Type - by classification in the Standard
 - by Frequency Band
 IACP Item Number
 Nominal RF Power
 Transmit and Receive Test Frequencies

The test results are reported in a six-columnar format that correlates test procedures, minimum performance requirements and test results for every test performed on each transceiver. Contents of the columns are as follows:

1. The entry in the first column identifies the paragraph of the Standard in which the applicable test procedure is set forth.
2. Column two contains a listing of each transceiver characteristic tested and the applicable test conditions.
3. The letters in column three identify the minimum performance requirement as set forth in Tables 1 through 4 of the Standard.
4. Column four contains the numerical value of the minimum performance requirement for each transceiver characteristic tested.
5. Column five contains the numerical value of the test results.
6. Column six contains references to notes and comments on test data.
 - An (*) indicates that the minimum performance requirement (Column 4) was not met.
 - The numbers refer to comments of the testing laboratory.
 - The letters refer to comments of the transceiver manufacturer.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2180

1. No test data was obtained. The transceiver would not break squelch with +13 dBm input under low and high temperature conditions of -30°C and 60°C, and humidity condition of 50°C and 90% relative humidity.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

- ITEM NO.: 2181
1. All test data was not obtained. The transceiver failed operation at -30°C, but recovered operation at ambient temperature.
 2. All test data was not obtained. The transceiver audio output was too low to make measurements at +60°C temperature and at 50°C, 90% relative humidity.
 3. Output was too low for measurement.
 4. The transmitter failed operation during the battery test after one hour and eight minutes operation. At this point, the battery measured 11.5 volts.
- A. The manufacturer has advised that this unit was not put into production.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2183

1. No test data was obtained. The transceiver produced no audio output power at a temperature of -30°C.
2. No test data was obtained. The battery did not produce one-half of rated audio output power of the transceiver at a temperature of -30°C.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2187

1. Test data was not obtained. The transmitter and receiver ceased to function during the humidity test at 50°C, 90% relative humidity. The transceiver recovered operation upon drying out under ambient temperature and humidity conditions.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2192

1. Audio hum and noise measurement of -90.8 dB represent the measuring limit of the test instrumentation. The audio hum and noise was less than the measuring capability of the test instrumentation.
- A. Low frequencies are deliberately attenuated to improve rejection of CTCSS tone.
- B. The microphone element provides the pre-emphasis in our audio circuit. A microphone simulator is required for audio response measurements. All unit data indicates that the unit will pass when measured with the simulator circuit.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2195

1. The transceiver would not produce the required 500mW output at -20% of nominal voltage. Results indicated are for -10% reduction of nominal voltage.
2. The transceiver was within the compliance requirement at 10-30 Hz vibration but not during the 30-60 Hz vibration.
3. The transceiver failed to operate during the radiated spurious emissions and antenna efficiency tests.
4. The transceiver did not produce one-half of nominal power at -30°C or +60°C. No test could be conducted.

NOTES AND COMMENTS

ITEM NO.: 2198

1. No test was conducted. The battery did not produce one-half of rated audio output power of the transceiver at -30°C.
- A. The microphone element provides the pre-emphasis in our audio circuit. A microphone simulator is required for audio response measurements. All unit data indicates that the unit will pass when measured with the simulator circuit.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

- ITEM NO.: 2201
1. No test data was obtained. The transceiver produced no squelch under 50°C temperature and 90% relative humidity conditions.
 - A. Low frequencies are deliberately attenuated to improve rejection of CTCSS tones.
 - B. The microphone element provides the pre-emphasis in our audio circuit. A microphone simulator is required for audio response measurements. All unit data indicates that the unit will pass when measured with the simulator circuit.

NOTES AND COMMENTS

ITEM NO.: 2207

1. No test data was obtained. The receiver had no audio output during humidity test at +50°C, 90% relative humidity. The transceiver recovered operation upon drying out under ambient test conditions. A defective audio module in this transceiver was replaced with a properly operating module prior to the testing under humidity conditions.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2208

1. All test data was not obtained. Audio output of the transmitter was intermittent during the humidity tests at 50°C, 90% relative humidity. The transmitter ceased functioning but resumed operation upon drying out at ambient temperature.
2. No test data was obtained. The transceiver failed to operate at -30°C during battery service life test.

NOTES AND COMMENTS

ITEM NO.: 2230

1. This unit failed during the room temperature measurements (no RF output) and it was returned to a General Electric service shop for repair. Upon return of the repaired unit the room temperature tests were completed. During the vibration testing the RF output was found to be intermittent. NO measurements could be made. When the unit was checked without vibration, its operation was normal. During the +60°C portion of the battery service life test the test unit produced no audio output power.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2231

1. The test item operated properly for all room temperature tests excluding vibration, radiated spurious emissions and antenna efficiency. During the vibration test the RF output was found too intermittent and no measurements were performed. Spot checking the transmitter without vibration indicated normal operation. During the +60°C environment, the test unit failed to operate. The unit was spot checked at room temperature and found not to be operating. The unit was sent to a General Electric service facility for repair. The long turn-around time for the repair prohibited any further environmental testing to be performed. Upon return of the repaired unit, it was spot checked and found to be operating, but during the radiated spurious emissions and antenna efficiency tests, the unit failed with an indication of no RF output power.

NOTES AND COMMENTS

ITEM NO.: 2232

1. No test was conducted. The mechanical push-to-talk (PTT) switch used in this transceiver was not adaptable for making accurate measurements of carrier attack time, and battery service life.
2. The unit failed to operate (no RF output power) during the radiated spurious emissions and antenna efficiency tests.

FM TRANSCEIVER TEST DATA (continued)

NOTES AND COMMENTS

ITEM NO.: 2233

1. The test unit had intermittent audio output during the +60°C and -30°C environmental conditions. Data that was recorded at these conditions is of limited value because of the above observations. A spot check of the test item at room temperature conditions indicated normal operation.
2. The transceiver met the vibration requirement during 10-20 Hz vibration with an attenuation of 29.2 dB. During 30-60 Hz vibration deviation was too unstable to permit measurement to be made.

NOTES AND COMMENTS

ITEM NO.: 2234

1. The receiver failed to produce 500 mW of audio at -30°C but operated normally during post room temperature check.
2. The transmitter failed to produce RF output power at +60°C and -30°C but operated normally during post room temperature check.
3. The transmitter produced intermittent RF output during vibration but operated normally during non-vibration spot check.
4. The transmitter failed to operate during radiated spurious emission test. (Last test to be performed.)
