ACQUISITIONS

INTRODUCTION

The Illinois Victim-Level Murder (VLM) file contains the most accurate and complete data available on murders known to the police in Illinois from 1973 to 1981, in a format that allows the counting and analysis of the characteristics of each murder.

The VLM file was created from the Supplementary Homicide Report (SHR) files collected by the Illinois Department of Law Enforcement (DLE). Illinois SHR files may contain more than one record for a murder victim. The Illinois VLM file, on the other hand, contains only one record per murder victim. "Victim-level" data are necessary to answer certain questions about murders or murder victims, such as "What proportion of murder victims were killed with a knife in a certain year?" or "How many murders in a certain jurisdiction were attributed to an acquaintance of the victim?"

The VLM data file contains all the information contained in the SHR file. This information includes: the characteristics of the victim; the characteristics of the offender; time, month, year, and jurisdiction of the offense; circumstances; weapon; and victim-offender relationship. The only difference between the VLM and SHR data files is the treatment of murder incidents involving more than one offender. While the SHR may contain a separate record for each known offender, the VLM contains only one record per victim. Multiple offender information in the VLM file is included on the single victim record. For example, multiple offender sex information is coded: all male, all female, or both male and female offenders.

This report contains three parts. The first part discusses the creation of the victim-level file from the SHR. It describes the Illinois SHR files, discusses the necessity for a victim-level file, and describes the SHR-to-VLM recoding methods. The second section describes the investigation into the quality of Illinois SHR data, conducted by the Statistical Analysis Center in cooperation with the Illinois Department of Law Enforcement. This investigation checked SHR information against original police and sheriff's office murder files. The second section describes the results of this quality audit and discusses typical errors that were discovered. The final section is a codebook to the VLM file. In the SHR, and therefore in the VLM, data definitions and categories vary somewhat over time and between jurisdictions. The codebook explains, in detail, these definitions.

Part II of this report, the "Technical Manual," contains detailed information for those who need to access the VLM data files. It includes a complete set of VLM frequencies for Chicago and the rest of the state for each year from 1973 through 1981. It also contains detailed instructions for SHR-to-VLM recoding, instructions for accessing the files, and programs for creating SPSS system files of the VLM data.

CREATION OF THE VICTIM-LEVEL MURDER FILE

Supplementary Homicide Reports

Under state law, the Illinois Department of Law Enforcement (DLE) functions as the state repository of crime data. It collects monthly crime statistics from individual Illinois police agencies, and reports the totals to the FBI under the Uniform Crime Reports (UCR) system. DLE also publishes the Illinois, or IUCR, totals in an annual report entitled Crime in Illinois.

Among the types of I-UCR data are offense data; arrest data; property loss, damage and recovery data; and the Supplementary Homicide Reports (SHR). The SHR contains data on every homicide reported in the state, including information on the age, race and sex of the victim and the offender, the murder weapon, and the circumstances leading to the murder.¹

Each police jurisdiction in Illinois submits, when applicable, a monthly SHR form to DLE, detailing information on any homicide (murder, justifiable and reckless homicide, voluntary and involuntary manslaughter) known to have occurred in that month.² Exhibit 1 is an example of the SHR form. DLE has collected these reports since 1974. The Illinois Criminal Justice Information Authority receives SHR files annually from DLE by computer tape. In addition, The Authority has received a copy of the 1973 Illinois SHR computer file from the FBI.

The data that appear on the SHR file represent the investigating police officer's assessment of each incident. If a police investigation finds an incident to be a murder, even if the suspect is later cleared of murder in court, the incident is still counted as a murder on the SHR. All offender information on the file pertains to the person(s) that the police considered to be the most likely suspect(s), not the person(s) who might have been eventually convicted of murder.

The Need For a Victim-Level File

The DLE SHR file is not victim-level. Where there is more than one known suspect in an incident, there is usually one record for each suspect, and thus more than one record for the victim. SAC converted the SHR file into a new victim-level murder (VLM) file, with one record per murder victim.

¹Offender information is generally available only since 1976, although it is provided in some instances back to 1973.

²Murder is the willful killing of a person (Ill.Rev.Stat.Ch. 38,9-1). Voluntary manslaughter is the death of a person caused by gross negligence of an individual other than the victim (Ill. Rev.Stat.Ch. 38,9-2). The Victim-Level Murder File includes only murders, not any other type of homicide.

The existence of duplicate records for multiple offender victims makes it impossible to count the actual number of murder victims in the 1976 to 1981 SHR files. For example, if a victim were killed by three offenders with a handgun, there would be three records of murder with a handgun in the file, instead of one. Thus, the total number of handgun murder records in the 1976 to 1981 Illinois SHR file does not equal the number of people murdered with a handgun. To count the number of victims, we must disregard the duplicate records for multiple offenders.⁴

It is not possible to write a computer program that will automatically disregard duplicate records in the SHR file, because the file does not have a unique identifying code for each victim. Therefore, we used the following method to create an SHR victim-level murder file for 1976 to 1981 data.

For all multiple offender murder cases, we listed all of the information on each multiple offender record, and then matched records pertaining to the same victim. If two or more multiple offender records followed each other in the file, were submitted by the same agency, and had the same circumstances, we decided that they were records of the same victim.⁵

3The Illinois SHR files contain different amounts of offender information, depending on the year. The 1973, 1974 and 1975 SHR files contain one record for each victim. Each of the 1974 and 1975 victim records contain, when available, information on the age, sex and race of one suspected offender. Even if the victim were killed by more than one person, information about only one suspect per victim appears on the 1973 through 1975 SHR files.

4If more than one victim were killed in the same incident by the same offender, there would be two victim records, but they would not be duplicates. If two victims were killed by multiple offenders, however, there will be more than two victim records, and the duplicate offender records should be disregarded.

5 See Part II, the "Technical Manual", for detailed coding instructions.

We then deleted all but one record for each victim, and re-coded the offender information on each victim-level record so that it accurately reflects the multiple offender situation. For example, for the field "Offender's Sex", "1" indicates one or more males, "2" indicates one or more females, and "3" indicates multiple offenders, at least one of whom is male and one female. Thus, The Authority has two murder files available for use--the original SHR file with multiple offender records, and the Victim-Level Murder file.

Table 1 shows the number of records in the SHR file from 1973 to 1981, and the number of records in the VLM file since 1976. Note that the number of cases in the SHR file is greater than the number in the VLM file because the SHR file contains records for 100 or more multiple offenders yearly.

Table 1
Number of Murder Records in VLM and SHR Files*

<u>Year</u>	<u>VLM File</u>	<u>SHR File</u>
1973	1,127	1,127**
1974	1,282	1,282**
1975	1,164	1,164**
1976	1,156	1,331
1977	1,118	1,250
1978	1,146	1,308
1979	1,186	1,407
1980	1,195	1,313
1981	1,219	1,441

*Note: these files have been updated and corrected, so that they contain the most accurate homicide data available as of September, 1982. As a result, the yearly totals presented here may not coincide exactly with those found in other publications.

**The SHR files for these years have no multiple offender information, and thus were already victim-level.

QUALITY OF VLM AND SHR DATA

To determine the quality of the victim-level recoding methods, we compared information in the VLM files to information in the original police files. We did not find any errors that were caused by SHR-to-VLM recoding. However, we did discover some possible errors and incomplete data in the SHR file. Because the quality of the VLM file depends upon the quality of the SHR file from which it was created, we investigated the cause of each possible error. With the help and cooperation of DLE, we corrected the DLE/SHR files and the SAC/VLM files to reflect the best information available as of September, 1982.

This investigation consisted of two steps: a general audit of 1976 through 1980, which utilized a screening device for possible errors, and a detailed case-by-case audit of 1981 data. We also developed a process for ensuring quality of the VLM data files in future years.

The initial screen compared VLM figures to figures from the IUCR Offense and Clearance data for total murders occurring in each year, 1976 to 1980, for each Illinois jurisdiction. This comparison was used as an auditing device to screen for possible errors. The audit was not concerned with the quality of IUCR offense records, but only with the quality of VLM and SHR records. IUCR offense data are monthly totals of murder and other offenses known to the police. These monthly totals become part of the "Index crime" data series, appear in Crime in Illinois, and are sent to the FBI as "Form A" reports. In contrast, the SHR consists of separate data for each homicide, not aggregate monthly totals. To compare the two, we totaled these individual SHR murders for each jurisdiction and year.

For those jurisdictions in which there was a discrepancy between SHR and IUCR offense totals in any year from 1976 through 1980, we contacted each agency to determine the number of murders according to agency records.⁶ We also obtained the most recently updated SHR files, and worked with DLE and agency staff members to resolve any remaining questions regarding each murder case.

In the second step, we used the information gathered in the 1976-1980 audit to examine the 1981 SHR file case-by-case for coding errors, duplicate cases and other problems, and to develop a quality auditing process for future years.

⁶We did not check the records of each Chicago case, because the percent possible error was so small (two of 855 murders in 1979 and two of 861 in 1980). Also, since SHR and IUCR offense data are separate indicators, collected at different stages of investigation, some small difference between them is possible.

1976-1980 SHR File Audit

The results of the initial comparison of SHR and IUCR offense murder totals for each jurisdiction and each year are listed in Table 2.

Table 2

Year	# of Illinois Jurisdictions Reporting Murders	SHR/IUCR Offense Discrepancies	
		# of Juris- dictions	Number of Murders in Question*
1976	123	22 (18%)	89
1977	129	11 (8%)	34
1978	112	9 (8%)	37
1979	135	5 (4%)	14**
1980	140	16 (11%)	89**

*Note: in some jurisdictions, the number of murders appearing in the SHR file was greater than the number in the IUCR offense files; in others it was lower.

**In these two years, there was a discrepancy between SHR and IUCR offense totals for Chicago. In 1979, the SHR showed 855 murders versus 857 on the IUCR offense files. In 1980, the numbers were 861 and 863, respectively. The 14 and 89 murders in Table 1 are the number of SHR murders in the other jurisdictions.

Between 1976 and 1980, 58 jurisdictions showed an SHR/IUCR offense data discrepancy in at least one year. In each of these jurisdictions, we contacted the agency's record-keeping staff and checked for the actual number of murder records in their files.⁷ In all, we investigated 61 jurisdiction/years as having possible SHR record errors.⁸

⁷Because the Chicago discrepancy was so small, relative to the total number of murders, we did not attempt to search through the 1,716 murder cases to clarify a discrepancy of four cases. See note 6, above.

⁸Four jurisdictions, Bloomington, Chicago, Decatur and East St. Louis, had discrepancies in two years. Peoria had discrepancies in three years.

In almost half of these cases (29 of 61), the agency records matched the SHR figure. The number of murders appearing in the SHR file for these agencies was correct. The use of IUCR offense figures as a screening device, therefore, turned up a fair number of "false positives" (cases where the agency records matched the SHR figures).

For the remaining 32 cases, we contacted DLE to see if any of the problems could be resolved with the most current, updated SHR files. DLE corrects and updates its SHR files as new murder information is received from each agency.⁹ Seventeen of the 32 cases of possible SHR record errors were cleared up in this manner. In other words, the most current DLE/SHR files agreed with the information in agency records. The updated SHR information added 26 murders to the VLM file.

Table 3 shows the status of the SHR audit at this point.

Table 3

Resolution of Possible SHR Errors, Illinois Agencies

Year	Initial Screening Audit	False Positives**	Resolved by Updates	Remaining Possible Errors
1976	22	8	5	9
1977	11	7	4	0
1978	9	5	1	3
1979*	4	3	0	1
1980*	15	6	7	2
Total	61	29	17	15

*Chicago not included. See note 6, above.

**False positives are the number of cases where the agency records matched the SHR figure. Thus, there really was no error in these cases.

⁹Until this audit, The Authority received DLE's SHR tapes once a year, but was not notified of any later additions or updates to the files. Because the audit demonstrated the extent to which DLE/SHR files are periodically updated and corrected, The Authority now has made arrangements with DLE to receive updated SHR files on a regular basis.

The 15 remaining unresolved cases involved 15 different jurisdictions, and a possible total of about 20 murders.¹⁰ Relative to the number of murders statewide outside of Chicago (1,653 between 1976 and 1980), this is a very small possible error (1.2 percent).

In seven of the unresolved cases, agency records were not available to resolve the possible errors. Two of these seven occurred in the earliest year, 1976. The Sangamon County Sheriff's Office has two entries for April 16, 1976, that are almost identical to two entries for May 16, 1976, but agency records are not available to confirm that these are indeed duplicates.

In the remaining eight unresolved cases, agency records were available, and did not match the information in the SHR files.¹¹ In six of these, agency records showed murders that did not appear on the SHR.¹² Possibly a check of the original paper SHR files that DLE received from the agencies could determine the reason for these discrepancies. The other two cases involved duplicate records on the SHR. The Chicago Heights Police Department has two entries for November 25, 1977, and the Aurora Police Department has two entries for December 16, 1978, that appear to be duplicates. Agency records confirmed that these are duplicate cases.

In summary, the 1976-1980 SHR file audit began with an initial screen that compared SHR to IUCR offense totals and found 61 discrepancies. In 46 of these cases (75%), agency records actually agreed with the most current SHR data. Relatively few unresolved possible errors remained. However, in conducting this 1976-1980 audit, we became aware of some types of possible SHR errors. We used this information to conduct a more detailed, case-by-case audit of the 1981 SHR files. This audit is discussed in the following section.

¹⁰This figure is based on the differences between the SHR, IUCR offense, and agency totals. It is not comparable to the figures in the righthand column of Table 2, which are based on the total number of murders appearing on the SHR.

¹¹In these eight cases, agency records apparently disagree with the information in the SHR files. However, DLE does not want to change its SHR file records until it can conduct an audit of these files. Unlike the current (1981) SHR files, the files of earlier years are difficult to access. Because it is important to keep information in the VLM file consistent with information in the DLE/SHR file, SAC will not correct the VLM file to agree with agency records until DLE audits and corrects its SHR file. However, users of VLM and SHR data who would like more detail on these eight unresolved cases may contact SAC.

¹²There was one additional case in which DLE's updated SHR file had one, but not all, of the three murders that appeared in agency records. This case is counted above in the "resolved" column, although it certainly fits both places.

1981 SHR Audit

Beginning with the 1981 SHR file, SAC established an audit process that ensures the quality and accuracy of future years of VLM data. This section describes the recoding to VLM and the quality audit of the 1981 file.

First, when recoding the 1981 SHR file into a victim-level file, the data were examined case-by-case for apparent coding errors. For example, we found a multiple offender case in which the two offender records had different victim races for the same victim. In another instance, we discovered that two different agencies submitted records for the same murder, and the one murder thus was counted twice. We contacted DLE with a list of such problems. Because they involved the most recent year of data, DLE was able to investigate and solve all of the problems, change the SHR, and give us the results with which to change the VLM.

Typical errors included the following:

1) Duplicate cases. This problem occurs when an agency sends in an SHR form when a body is discovered, and then later sends in an updated form when additional information becomes known. For example, a suspect may have been identified in the interim. In several cases, both forms were counted as individual murders. Duplicate cases also occur when two agencies, for example city police and the sheriff's office, both report a murder that each agency investigated.

2) Date discrepancy. This error can occur, for example, if someone dies in March as a result of an attack in December. One record might list the murder in March, and the other in December. The correct date would be December, because the date of the offense, not necessarily the date of death, is the date to be coded (see the "Codebook", p. 18).

3) Manslaughter/Justifiable Homicide. The SHR form (Exhibit 1) asks for a total count of the number of each type of homicide occurring in each month (murder, justifiable use of force, manslaughter, etc.) Each case is then to be listed separately, with all descriptive information included. These descriptions do not always designate which cases are the murders, and which are other types of homicides. The DLE staff can usually determine which cases are the justifiabilities, based on the "circumstance" information provided for each case. For the majority of jurisdictions, which have very few yearly homicides, distinguishing between the cases is not a problem.

Problems can occur, however, if a determination that a homicide was justifiable is made in a month after the one in which the original report was made. Although the procedures for

reporting data changes are spelled out in the IUCR manual, a jurisdiction may not report the changes, or may report them incorrectly.¹³

Not all agencies submit their monthly IUCR reports to DLE promptly.¹⁴ Problems can arise if SHR and IUCR offense forms are submitted at different stages of a murder investigation. For example, an SHR form is submitted when a body is found, and the case is listed as a murder. However, if by the time the IUCR offense form is filled out, the investigation has found that the incident was really a justifiable use of force, the IUCR offense and SHR information may not match.

To solve the problem of incomplete and updated files, we have arranged with DLE to receive the most current version of its SHR files one year after we have received the initial version. We will update the VLM with this current information. This update will be done with each subsequent year of data.

Race, Ethnicity Classification

Beginning in 1980, the FBI asked all agencies that report to the UCR program to begin to report "ethnicity" in addition to race. The agencies were given the choice of reporting in one of two formats:

1. Combined Format (Single Variable):

- White, not of Hispanic Origin
- Black, not of Hispanic Origin
- Asian or Pacific Islander
- American Indian or Alaskan Native
- Hispanic

2. Separate Format (Two Variables):

<u>Race</u>	<u>Ethnicity</u>
--White	--Hispanic Origin
--Black	--Not of Hispanic Origin
--Asian or Pacific Islander	
--American Indian or Alaskan Native	

¹³Conversation, Ray Floyd, Department of Law Enforcement, March, 1982.

¹⁴For example, according to DLE's Crime in Illinois Semi-Annual Report, 1982, as of September 20, 1982, 42 agencies were delinquent two or more months of reports, and 29 others were delinquent for one month's data.

Under the combined format, all Hispanics, whether white or black, are combined into one category. The advantage of this format is that it is consistent with the white, black, Hispanic classification of earlier years. This is the preferred format of DLE.

Under the separate format, there are two pieces of information for every victim and offender: their race and whether or not they are of Hispanic origin. Chicago is the only agency in Illinois that reports race data in this format.¹⁵ Format 2 is the preferred format of the FBI.

Although Chicago reports to DLE in the separate format, DLE carries the data in the combined format only. DLE puts the Chicago race data into the combined format and ignores the Chicago ethnicity variable. For this reason, Chicago race data since 1980 cannot be aggregated with or compared to race data for the rest of the state, and must be analyzed separately.¹⁶

The chart below summarizes the differences between Chicago and non-Chicago race data in DLE/SHR files.

DLE "Race" Variable, 1980 to Present

<u>Chicago</u>	<u>Not Chicago</u>
1. White (includes Hispanics)	1. White (not Hispanic)
2. Black (includes Hispanics)	2. Black (not Hispanic)
4,5,8. Other: includes Asian/ Pacific Islanders, American Indians and Alaskan Natives	3-8. Other: includes Hispanics, Asian/ Pacific Islanders, American Indians and Alaskan Natives

¹⁵Chicago reports directly to the FBI as well as to DLE, and chooses to report to both in the FBI's preferred format (race and ethnicity in separate fields). However, the ethnicity data reported to DLE are in the form of aggregate totals (i.e. total number of Hispanics, total non-Hispanics) rather than individually for each murder record. Therefore, ethnicity data are unavailable for use with the SHR/VLM. Users of Chicago data that are interested in more detailed ethnicity breakdowns should consult the Chicago Police Department's annual publication Murder Analysis.

¹⁶According to the Chicago Police Department, Chicago race data for earlier years is comparable to Chicago post-1980 race data. Frequencies indicate that before 1980, Hispanics were coded as either white or black, although there are a few coded as Puerto Rican (see Part II).

If you are interested in obtaining Chicago race data with Hispanics separated from the white and black categories, see either the Chicago Police Department's annual publication Murder Analysis, or contact the FBI.

OFFENDER'S AGE*

Actual age(s) of suspected offender(s), according to police investigation.

- 01. One year old or younger
- 02. Two years old
- 03. Three years old
- ..
- ..
- ..
- 90. Ninety years old and older.
- 91. Multiple offenders, 15-19 years old.
- 92. Multiple offenders, 20-24 years old.
- 93. Multiple offenders, all 25 or older.
- 94. Multiple offenders, all under 20 (at least one under 15 and at least one 15-19).
- 95. Multiple offenders, at least one under 15 and one over 20.
- 96. Multiple offenders, all 20 or older (at least one 20-24 and one 25 or older).
- 97. Multiple offenders, 15-24 years old (at least one 15-19 and one 20-24).
- 98. Multiple offenders, all under age 15.
- 99. Multiple offenders, all 15 or older (at least one 15-19 and one over 24).
- 0. Missing data.

OFFENDER'S SEX**

Sex(es) of suspected offender(s), according to police investigation.

- 1. Male
- 2. Female
- 3. Multiple offenders, at least one male and one female.
- 0. Missing data

*Offender data are missing for 1973. In 1974 and 1975, they are missing for Chicago, and for the rest of Illinois they refer to only one offender per victim. There is no multiple offender information for these three years.

**In 1973, this information is present in only 8 percent of the cases.

OFFENDER'S RACE*

Race or ethnic origin(s) of suspected offender(s), according to police investigation.

Not Chicago

Chicago

NUMBER OF VICTIMS AND OFFENDERS IN INCIDENT**

- 1. Single victim/single offender
- 2. Single victim/unknown offender(s)
- 3. Single victim/multiple offenders
- 4. Multiple victim/single offender
- 5. Multiple victim/multiple offenders
- 6. Multiple victim/unknown offender(s)

0. Missing data.

*Offender data are missing for 1973. In 1974 and 1975, they are missing for Chicago, and for the rest of Illinois they refer to only one offender per victim. There is no multiple offender information for these three years. See pages 13-14 for a detailed explanation of the race and ethnicity codes used by Chicago and the rest of the state.

**These codes used only after 1976.

VICTIM-OFFENDER RELATIONSHIP*

Relationship(s) of victim to the suspected offender(s), according to police investigation.

Family

1. Husband
2. Wife
3. Common-law husband
4. Common-law wife
5. Mother
6. Father
7. Son
8. Daughter
9. Brother
10. Sister
11. In-law
12. Stepfather
13. Stepmother
14. Stepson
15. Stepdaughter
16. Other family, or multiple offenders with different family relationships to victim

Acquaintance

20. Neighbor
21. Acquaintance
22. Boyfriend
23. Girlfriend
24. Ex-husband
25. Ex-wife
26. Employee
27. Employer
28. Friend
29. Homosexual relationship
30. Other people known to victim, or multiple offenders with different acquaintance relationships to victim.
40. Stranger, or multiple offenders, all strangers to the victim.

(continued on next page)

41. Multiple offenders, at least one family and one acquaintance relationship.
42. Multiple offenders, at least one family and one boyfriend, girlfriend, ex-husband or ex-wife (code 22, 23, 24 or 25) relationship.
43. Multiple offenders, at least one acquaintance and one stranger relationship.
44. Multiple offenders, at least one family and one stranger relationship.
45. Multiple offenders, at least one each: family, acquaintance, and stranger relationship.
0. Missing data

*Relationship data are missing for all agencies in 1973, for Chicago in 1974 and 1975, and for more than half of homicide victims outside of Chicago in 1974 and 1975. However, some victim-offender relationship information occurs in the CIRCUMSTANCE field (see pages 25-26). All multiple offender data are missing for 1974 and 1975.

WEAPON(S) USED BY THE OFFENDER(S) IN THE MURDER

Firearm

- 11. Firearm, type not known.
- 12. Handgun (pistol, revolver, etc.)
- 13. Rifle
- 14. Shotgun
- 15. Multiple offenders using different types of firearm.*

Other

- 20. Knife or cutting instrument (icepick, screwdriver, axe, etc.)
- 30. Blunt object (hammer or club, but not hands or feet.)
- 40. Personal weapons (hands, feet, etc.)
- 50. Poison (not including gas)
- 55. Pushed or thrown from window**
- 60. Explosives
- 65. Arson ***
- 70. Narcotics or drugs (includes sleeping pills)
- 75. Drowning**
- 80. Strangulation or hanging.
- 85. Asphyxiation (includes gas).***
- 90. Other. ***
- 92. Multiple offenders, at least one with a firearm (any type) and one with a knife.
- 93. Multiple offenders, at least one with a knife and one with a weapon other than a knife or firearm.
- 94. Multiple offenders, at least one with a firearm (any type) and one with a weapon other than a knife or firearm.

0. Missing data

*In 1973, this code is "Other Gun". There was only one case that year.

**Not used in 1973.

***Code 65, Arson, is used in 1973 only. For 1976-1981, arson offenses are coded as WEAPON = 85 or 90, but CIRCUMSTANCES = 9.

CIRCUMSTANCES, MOTIVE OR PRECIPITATING EVENT

(Codes used from 1976 to present).*

Felony

- 02. Rape
- 03. Robbery
- 05. Burglary
- 06. Larceny
- 07. Motor Vehicle Theft
- 09. Arson
- 10. Prostitution, commercialized vice
- 17. Other sex offense
- 18. Narcotic drug offense
- 19. Gambling offense
- 26. Other felony, or multiple offenders with different felony circumstances.
- 32. Abortion

Non-felony

- 40. Lover's triangle
- 41. Child killed by babysitter
- 42. Brawl due to influence of alcohol
- 43. Brawl due to influence of narcotics
- 44. Argument over money or property
- 45. Other arguments

Other

- 46. "Gangland" killings
- 47. Juvenile gang killings
- 48. Institutional killings
- 49. Sniper attack
- 60. Other non-felony, or multiple offenders with different non-felony circumstances.
- 70. Suspected felony. Circumstances suggest a felony, but evidence is insufficient to determine type of felony.
- 92. Multiple offenders, at least one with a robbery motive and one with an argument or brawl motive.
- 93. Multiple offenders, at least one juvenile gang and one non-felony.
- 0. Missing data.

*See page 26 for codes used in 1973, 1974 and 1975, and page 27 for 1973 SUB-CIRCUMSTANCE codes.

CIRCUMSTANCES, MOTIVE OR PRECIPITATING EVENT

(Codes used in 1973, 1974 and 1975).*

Non-Felony

Within family

- 11. Spouse killed spouse
- 12. Parent killed child
- 13. Child killed parent
- 14. Other family, relationship known
- 19. Family, relationship unknown (for example, "domestic argument")

Outside family, but between friends or acquaintances

- 21. Lover's triangle
- 22. Brawl due to alcohol.
- 23. Argument over money or property.
- 24. Revenge (used in 1972, and possibly later).
- 25. Gangland (used in 1972, and possibly later).
- 29. Other arguments.

Crime-related murder

- 31. Gangland killings**
- 32. Sex motive (used in 1972, and possibly later).**
- 33. Institutional killings (used in 1973).**
- 34. Felony (includes all felony types.)**
- 35. Suspected felony.

- 37. Found murdered - reason unknown.
- 39. Complete mystery.

51. Illegal abortion

- 0. Missing data

SUB-CIRCUMSTANCES SURROUNDING MURDER

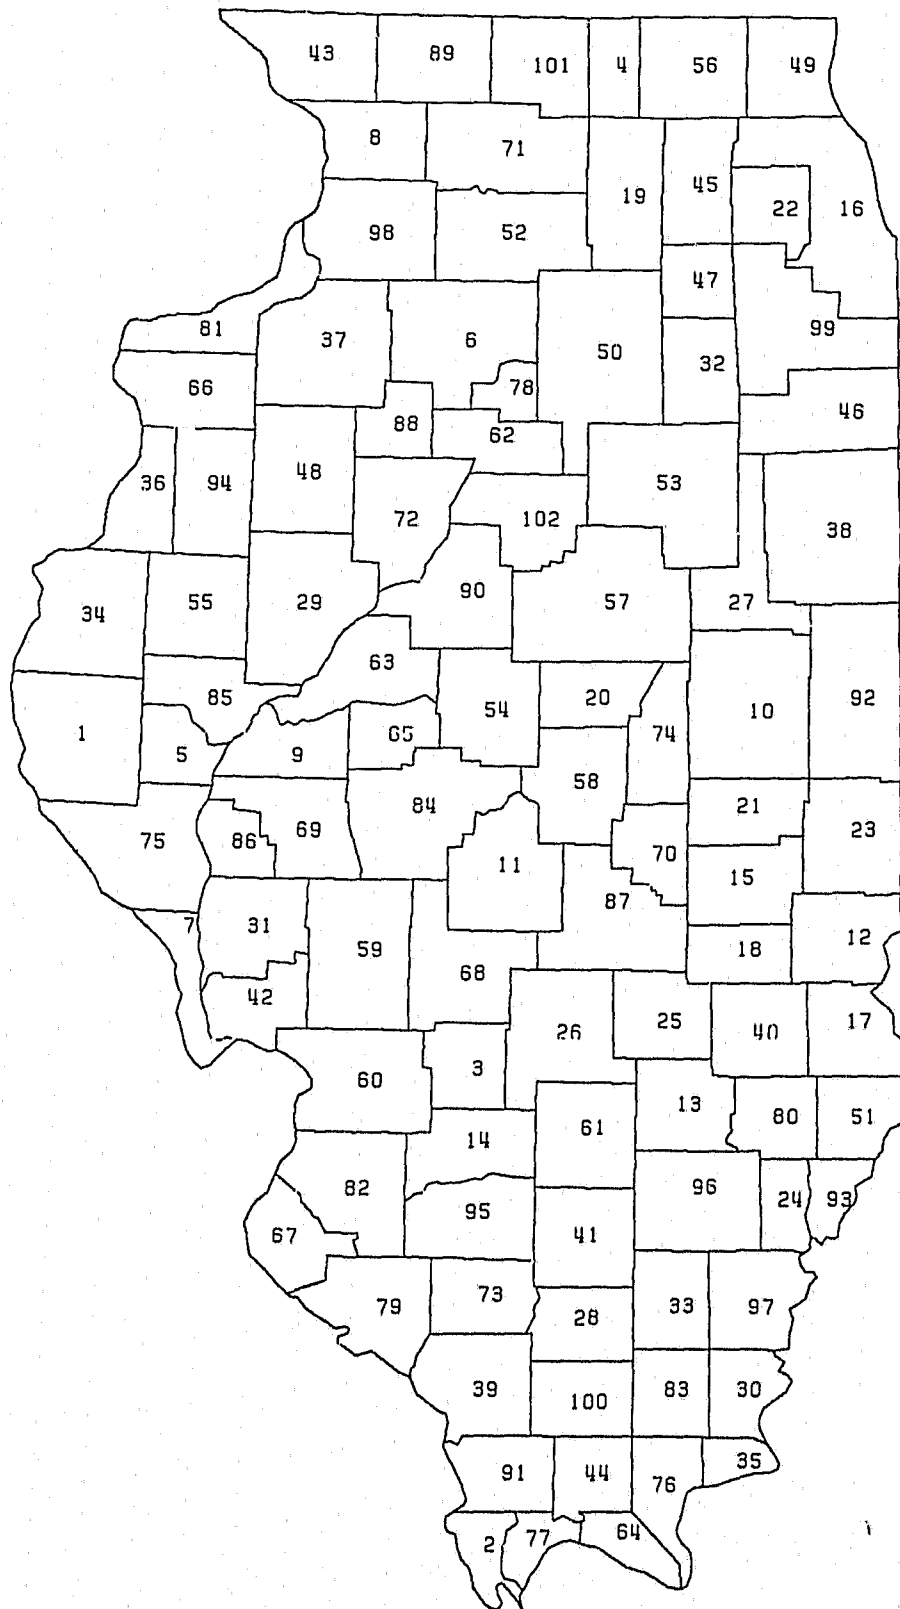

(Code used only in 1973, when CIRCUMSTANCE 31, 33 or 34 were used).

- 2. Rape
- 3. Robbery
- 5. Burglary
- 6. Larceny
- 7. Motor Vehicle Theft
- 9. Arson
- 16. Prostitution, commercialized vice
- 17. Sex offenses
- 18. Narcotic drug law
- 19. Gambling
- 20. All other offenses, i.e. revenge
- 0. Not applicable (not CIRCUMSTANCE codes 31, 33 or 34).

*See page 25 for codes used from 1976 to present. Also, see page 27 for 1973 SUB-CIRCUMSTANCE CODES.

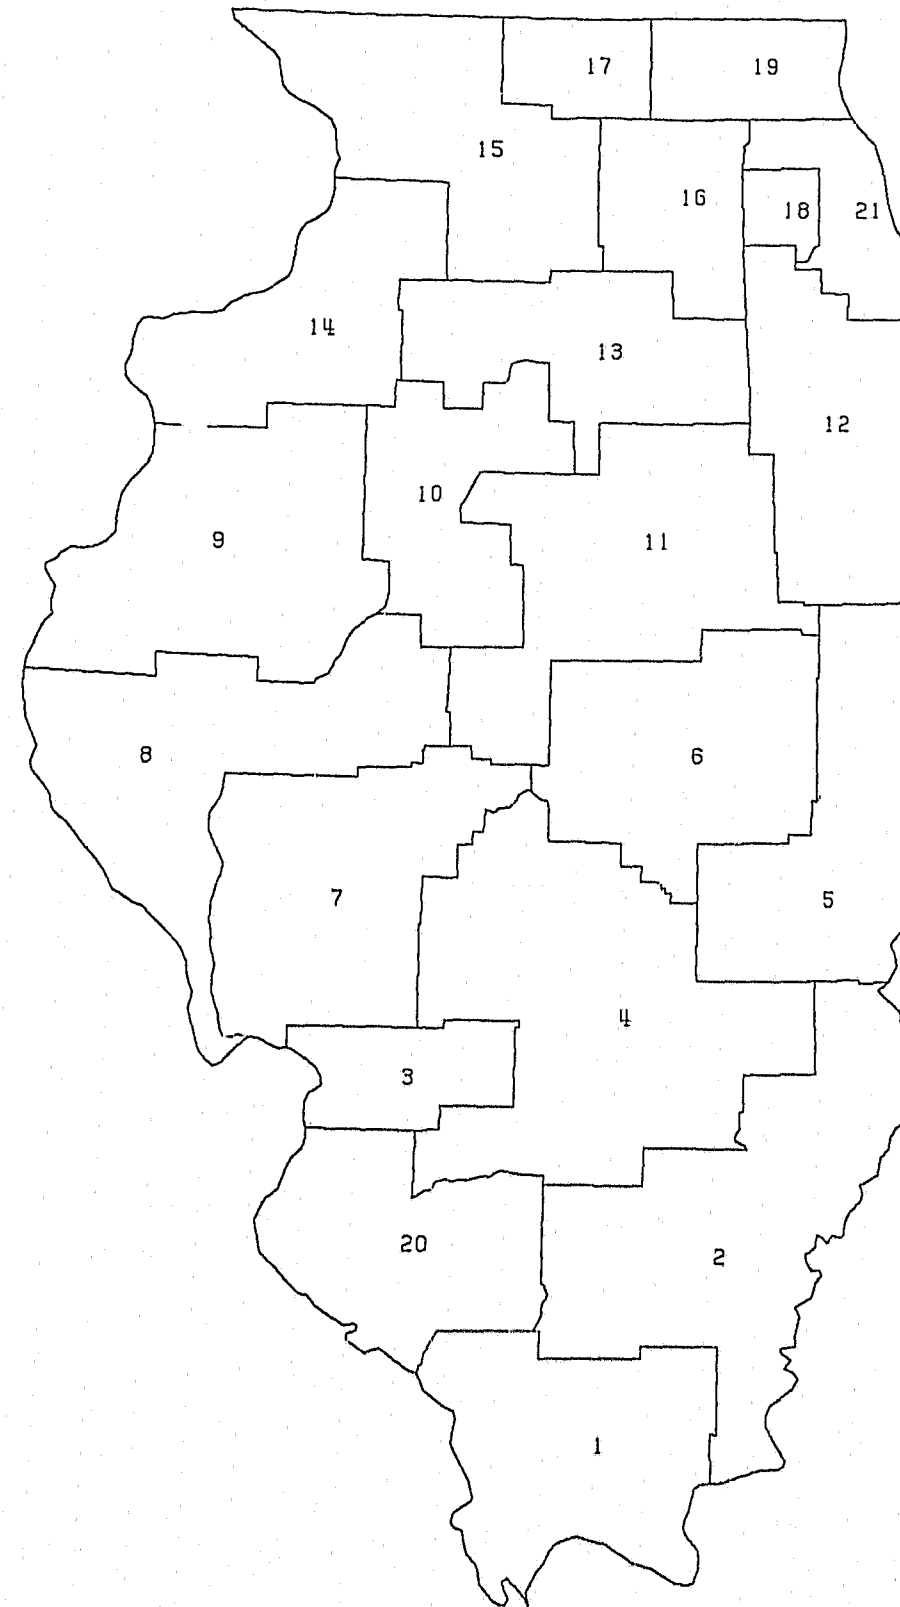

**See page 27 for SUB-CIRCUMSTANCE codes.
