Buren of Justice Secisies Special Report

Prison Admissions and Releases, 1981

By Lawrence A. Greenfeld and Stephanie Minor-Harper BJS Statisticians

This report is the first in a regular series describing the characteristics of persons admitted to and released from State prisons in the United States. These characteristics are important for assessing the use of prisons throughout the Nation. Traditional yearend counts are used for describing inmate populations on a given day. Such information, however, is greatly affected by those prisoners serving longer than average terms. By contrast, data on admissions and releases during a given year provide information on annual dispositions to imprisonment and the duration of sentences to incarceration. Such data further an understanding of sanctioning decisions across jurisdictions and over

During 1981, there were an estimated 183,000 admissions from courts and admissions of conditional release violators. Nationally, there were an estimated 142,000 conditional and unconditional releases that year. The data on which this report was based were obtained from 33 States and the District of Columbia and covered 121,211 prison admissions (about twothirds of the estimated admissions nationwide) and 101,943 prison releases (72% of the estimated releases nationwide).

Details on the numbers and types of prisoner movements in each jurisdiction are available from <u>Prisoners in State</u>

September 1984

Offender-specific data on those persons entering and leaving the Nation's prisons form an important complement to existing yearend information on prison populations and incarceration rates. Such data increase our understanding and ability to respond to fundamental questions about imprisonment posed by the public, legislators, corrections administrators, and researchers such as: Who enters prison? What kinds of sentences are imposed for different crimes? How long do offenders typically stay in prison for a given crime and sentence? Is punishment more severe now than in the past?

This report reveals both continuities and variations over time and among jurisdictions in the use of prison. Sentence length and time served were found to vary little over time for the Nation as a whole. By contrast, compared to earlier periods, imprisonment was found to be more prevalent among the adult

population, the entering population was more likely to be convicted of violent crimes, and those leaving prison were less likely to exit by a discretionary parole board decision.

Future data on admissions and releases will encompass the entire spectrum of imprisonment and its use beginning with admission to prison and continuing through final exit from the justice system. This effort, known as the National Corrections Reporting Program, will make available, for the first time, publicaccess data on this important part of the sanctioning process.

The analyses contained in this special report were made possible by the generous cooperation of 33 States and the District of Columbia reporting offender-specific data on admissions and releases for 1981 and prior years. Given the value of this information for an informed public debate on correctional policy, it is our hope that all States will soon join in providing such annual data.

Steven R. Schlesinger Director

and Federal Institutions on December 31, 1981, NCJ-86485.

ADMISSIONS, 1981

Demography

Sex (table 1). Of every 100 inmates

admitted during 1981, 94.5 were male. This disproportion of males has been quite stable since 1926, when such data were collected for the first time (in 1926, 93.2% of prison admissions were male). The only period since that time in which the proportion of males admitted was relatively low was during World

War II (males were 90.3% of admissions in 1942, 90.6% in 1944, and 90.9% in

Of the States reporting in 1981. Massachusetts admissions reflected the highest proportion of females (10.5%) and North Dakota the lowest (1%).

Race (table 1). Approximately 53.5% of those admitted to prison in 1981 were reported to be white. Black offenders composed 43.5% of the prison entries; other racial groups accounted for 1% of the admissions. Of those classified as other, 78% were Native Americans; the remainder were principally reported to be Asians or Pacific

Since 1926, admissions to State prisons classified as other than black or white have varied little, consistently representing between 0.8% and 1% of all admissions. By contrast, the proportion of white and black admissions has changed considerably. The fraction of admissions classified as white declined consistently from about three-quarters of all admissions in 1926 to about two-thirds of all admissions between 1941 and 1960. By 1981, it was estimated that slightly over half of all admissions were white. Blacks represent a growing fraction of all admissions, composing about onequarter of all admissions during 1926, about one-third of all admissions between 1941 and 1960, and 43.5%, of all admissions estimated for 1981.

During 1981, jurisdictions varied considerably in the racial composition of those admitted to prisons. The District of Columbia reported that nearly 97% of its admissions were black, whereas North Dakota and South Dakota reported that about 1% of their admissions were black. Hawaii reported the largest percentage of admissions of persons of other races (68.8%)-160 of 234 total reported admissions were Asians or Pacific Islanders (1 Native American was also admitted). Jurisdictions with large proportions of admissions classified as other included South Dakota (23.6%), Montana (19.1%), North Dakota (14.0%), Minnesota (8.8%), and Nebraska (6.2%).

Age. For the jurisdictions able to

¹The Federal Bureau of Investigation's Uniform Crime Reports for 1981 indicate that there were 430,105 arrests of male adults (aged 18 or older) for the offenses of murder, rape, robbery and burglary-four offenses that account for about 56% of 1981 prison admissions. Of those arrested for these offenses, 250,210 (or 58.2%) were white, 174,949 (or 40.7%) were black, and 4,946 (or 1.1%) were of other races. The distribution of arrests for these offenses is quite close to the distribution obtained for entering prisoners in 1981 (55.5% white, 43.5% black, 1.0% other). See table 36, p. 181, Crime in the United States, 1981), FBI.

- commitments and conditional release
- ² The other category includes Asian-Americans, Native Americans, Pacific Islanders, and other groups.

report such data, the median age of persons admitted to prisons during 1981 was 25 years (table 1). Median age for admissions changed slightly over the preceding 55 years. From 1926 to 1935. jurisdictions reported a median age at admission of 26, which climbed to 27 years old between 1936 and 1942. In 1960, the median age was reported to be 27. The median age reported for the period 1974 to 1981 has remained constant at 25 years, suggesting that inmates received in the recent past are somewhat younger than in prior historical periods.

In 1981, about 1.3% of all admissions were estimated to be less than 18 years old and 0.2% were estimated to be at least 65 years old (table 2). Approximately 43% of all admissions were between 18 and 24 years old, 39% were between 25 and 34 years old. nearly 12% were between 35 and 44 years old, and nearly 5% between 45 and 64 years old.

Table 1 shows that among jurisdictions, the youngest median age at admission was reported by Wisconsin

	Admi:	ssions ¹	Rele	ases ²

(23) and the oldest by New Mexico (28). It is especially important to note that age may be affected by differences in sentencing practices. In California, for example, many young adult inmates (ages 18-24) are subject to California Youth Authority jurisdiction and are excluded from State prison counts.

² Of the 101,943 releases reported,

101,248 provided data on age.

Offenses and sentences

Offenses. Burglary (27.2% of admissions) and robbery (18.9% of admissions) represented the two most prevalent offenses for which persons were admitted to prison in 1981 (table 3). The aggregate proportion of violent offenders (murder, manslaughter, rape, robbery, other sexual assault, and other violent offenses) was 39% of all admissions. The proportion of offenders entering for violent crimes varied between 24% and 29% from 1926 to 1941 and reached 32% of all admissions in 1943, reflecting more selective incarceration policies during World War II (table 4). In 1960, violent offenders constituted 27% of admissions. Between 1978 and 1981, the proportion of violent offenders admitted remained steady at 39%.

During 1981, jurisdictions varied considerably in the proportion of violent offenders admitted (table 5).

²As table 4 shows, the court commitment rate (defined as the number admitted to prison from court per 10,000 resident adults in the civilian population) reached its lowest recorded point during World War II. This fact, coupled with the high proportion of admissions for violent offenses and the longer median sentences given in that period, suggests a relatively selective use of incarceration.

Table 4. Admission trends for selected years,

Year	Admissions from court per 10,000 adult popu- lation	Percent admitted for violent crimes ²	Median maximum sentence (months)

- Data not available or could not be utilized.
- l Violent offenses were defined as murder, manslaughter, rape, other sexual assault, robbery, aggravated assault, and other
- violent offenses. First release defined in Time Served, p. 6. First releases coult not be distinguished from all releases.

of their admissions classified as violent offenders were Alabama (30%), Georgia (30%), Mississippi (32%), Montana (30%), Nebraska (26%), North Carolina (28%), North Dakota (25%), South Carolina (30%), Tennessee (30%), West Virginia (31%), and South Dakota (18%).

Age and offense. Table 6 demonstrates the age-specific nature of imprisonable crimes. Public order offenders (gamblers, habitual offenders, weapons violators, etc.) reflect the oldest median ages (30); that is, the age representing the 50th percentile, where half the cases fall above and half below. Those entering for burglary and auto theft were found to have the youngest median ages (both 23 years). Median ages for murder, manslaughter, drug, and forgery/fraud/embezzlement offenders are between 28 and 29 years; larceny, rape, and aggravated assault offenders had median ages between 26 and 27. The median age for robbers was 24.

The relationship between age and offense is further illustrated in table 7. which shows that the proportion of those admitted in each age group for murder, manslaughter, aggravated assault, and public order offenses escalates with age. That is, while approximately 3 to 4% of those admitted in the age groups 34 years old or less have committed murder, more than 10% of those in the age group 55 to 64, and nearly 15% of those in the 65 and over age group are murderers. By contrast, robbery and burglary demonstrate a different pattern with respect to age. Robbery offenses are more common among those admitted under the age of 18 than among other age groups (perhaps reflecting the predisposition to send only the most serious offenders under the age of 18 to prison). About 1 of every 3.5 offenders under age 18 has a sentence for robbery, but only about 1 of every 44 admissions in the oldest age group has a conviction for robbery. Similar to robbery, those in the younger age groups are much more likely to be admitted as burglars than those in the older age groups. Rape offenses are most common among those age 35 to 44 vears and among those less than age 18. Forgery/fraud/embezzlement and drug offenders are most prevalent among the 45-to-54-year-old prisoners admitted. Larceny reflects no particular distribution with age except that the oldest admissions to prison are the least likely to be admitted with this

Sentences. Sentence length is perhaps the most variable characteristic of admissions across reporting jurisdictions. Sentence length is not a clear indicator of how harsh a State might be

Offense	Number	Less than 18	18-24	25-34	35-44	45-54	55-64	65 and over	Median (years)

A total of 121,211 admissions were reported. Of these, 90% or 108,901 cases provided information on age and offense.

Other offenses include other sexual assault. other violent, other property, and other miscellaneous offenses.

in its reaction to criminality. It is a unique formulation based upon the kinds of offenses and offenders deemed worthy of imprisonment, the degree of latitude or discretion inherent in sentencing statutes, and specific assumptions about how good time (time deducted from a sentence to incarceration for good conduct, meritorious achievements, etc.) and parole policies will interact to produce a set period of incarceration. For these reasons, sentence lengths are not comparable over time, across jurisdictions or even within the same jurisdiction over time.

Another important aspect of sentence length relates to the objective or set of objectives inherent in a sentence. The indeterminate sentence, popular during the 1950's to early 1970's, was closely linked to a rehabilitation objective, but over the last 5 years jurisdictions have been moving steadily toward sentences that focus upon increasing the predictability and deterrent value of both the sentence and the ultimate time to be served.

For maximum sentences to State prisons in 1981, the median was estimated to be 53 months (tables 3 and 8). The median sentences for murder/ manslaughter (160 months) and rape (112 months) were the longest; the shortest were public order (25 months) and larceny (33 months). Median sentences for other offenses were-

- robbery, 68 months:
- aggravated assault, 48 months:
- burglary, 41 months; • drugs, 41 months;
- auto theft, 38 months; and
- forgery/fraud/embezzlement, 34 months.

Particularly in the case of auto theft (1.5% of admissions), however, the relatively long sentences (compared to forgery/fraud/embezzlement or larceny) may reflect a very selective

process whereby those entering prison for this offense are mostly recidivists or large-scale auto thieves. This same observation applies to burglary and other property crimes.

The median for maximum sentences in individual States ranged from 30 months to 113 months. Table 5 shows that median sentences in Massachusetts were 113 months compared to California sentences of 32 months for prison admissions. In 1960, National Prisoner Statistics data reveal that States with definite sentences (much like California's current determinate sentencing scheme) had median sentences of 34.5 months (quite similar to California's median of 32 months) and indeterminate sentence States reported medians of 71.3 months. The 1960 report concluded that in general, the length of the definite term was approximately 30% of the indeterminate maximum term (California's determinate sentences are approximately 28% of Massachusetts' indeterminate sentences).4 This difference in sentencing procedures is critical to understanding variations in sentence lengths across the States.

This observation is also central to examining table 4 on admissions trends. which shows that aggregate median sentences in the United States varied little from 1926 to 1978. However, beginning with the change in Maine in 1976 and California in mid-1977 to more fixed sentencing strategies and away from the indeterminate sentence, median sentence lengths appear to de-

cline. At the end of 1981, nine States were reported to have passed legislation or administrative guidelines sharply reducing the use of the indeterminate sentence. By then, the majority of the States also had enacted a wide variety of mandatory minimum sentences designed to restrict the use of the indeterminate sentence. Whether the apparent decline in sentence length is a result of changes in sentencing practices or the result of missing data from jurisdictions cannot be determined. It does seem probable, however, that prison sentences imposed in 1981 are not generally longer than those imposed in earlier periods.

A second point that should be made regarding sentencing relates to the probability of entering prison in a given year. Table 4 shows that the rate of prison commitment (the number of prison commitments from courts per 10,000 adult residents in the civilian population) rose sharply between 1978 and 1981 compared to earlier years. The 1981 rate of nearly 9 offenders admitted from courts per 10,000 adult population represents a substantial growth in the fraction of the adult population entering prison (about 41% higher than in 1960). The growth in the commitment rate is not a clear indicator of a change in the probability of

1Defined as the number of persons in the civilian resident population aged 18 and over.

confinement given a crime or conviction, but it is evidence that a larger segment of the adult population is experiencing incarceration.

Table 9 shows that commitment rates from courts also varied across States during 1981. Jurisdictions ranged from a high of 23 per 10,000 adults in the District of Columbia to a low of less than 3 per 10,000 in Hawaii and Minnesota.

Given differences in underlying philosophy, sentencing procedures, and probability of being imprisoned, comparison of sentence lengths produces

³Data from the 1979 Survey of Prison Inmates and from early years of the National Prisoner Statistics confirm this point. In 1926, approximately 55% of the burglars admitted had prior confinements compared to 30% of the homicide offenders and 24% of the rape offenders. In 1979, according to self-report survey data, nearly 70% of those admitted to prison for burglary had prior confinements. Characteristics of State Prisoners, 1960,

little in the way of definitive gradients of harshness or leniency across jurisdictions. Sentences reflect an interaction of values, objectives, and crime problems unique to each jurisdiction.

RELEASES, 1981

Demography

Sex (table 1). As with admissions, the population exiting prisons was principally male (94.5% of admissions and 94.4% of releases). Male disproportionality has been evidenced by the release population since 1926 (when releases were 94% male). The only period since 1926 in which the proportion of males among releases declined occurred, as with admissions, during World War II and shortly thereafter (males were 93% of releases in 1943, 92% in 1944, 91% in 1945, and 91% in 1946). Of the reporting jurisdictions in 1981. Massachusetts reported the highest proportion of female releases (16.1%) and North Dakota the lowest (approximately 0.6%).

Race (table 1). Releases in 1981 reflected the same racial mix as admissions that year. Nationally, 55.2% of releases were white, 43.8% were black and 1% were classified as other. From 1926 to 1981, the proportion of releases in each of the three race groups has mirrored the pattern described in the section on admissions.

Of the jurisdictions reporting in 1981, there was considerable variation in the racial composition of those released. Louisiana reported that 64.3% of their releases were black; North Dakota was the only jurisdiction in the Nation that did not release a black offender from prison that year. 5 As with admissions, Hawaii reported the largest fraction of releases classified as other (70.8%). Other jurisdictions with large proportions of releases in the other category were: South Dakota (27.4%). Montana (18.6%), North Dakota (14.4%), Minnesota (8.6%), and Nebraska (4.7%).

Age. The median age of prison releases during 1981 was 28 years old (table 1). Historical data on trends in the ages of prison releases are not available.

Among the reporting jurisdictions, Maine (30), California (29), and New Mexico (29) reported the oldest median age for releases; West Virginia reported the youngest (25). As noted in the section on admissions, the California Youth Authority has jurisdiction over many young adult offenders (18 to 24) who, in other States, would typically be

Table 10. Offense distribution for all releases, releases reporting time served, and first releases, 1981

Note: Of 101,943 releases reported, 85,803 cases provided data on most serious offense; 69,692 cases provided data on most serious offense and time served; and 55,579 cases were

reported to be first releases with data on most serious offense and time served.

imprisoned; this accounts for the older median age of California releases.

Though those under 18 years old accounted for 1.3% of admissions during 1981, offenders less than 18 accounted for only 0.3% of all releases (table 2). Conversely, those aged 65 or older represented about 0.2% of admissions but 3.7% of releases. More than three-fourths of all releases were between 18 and 34 years old.

Offenses and time served

Offenses. Of the 85,803 prison releases for whom the most serious commitment offense was known (101,943 releases were reported by the jurisdictions), 45.7% had been incarcerated for either burglary or robbery (table 10). Overall, just over 35% of those released had been incarcerated for a violent crime (compared to 39% for admissions).

Table 5 shows that jurisdictions differ considerably in the proportion of releases classified as violent. Massachusetts releases tended to have the highest concentration of violent offenders (72%); North Dakota releases were the least likely to have been in prison for a violent offense (14%).

Time served. Time served before first release represents the most important component of the entire program in admissions and releases (first releases are defined as those offenders experiencing their first exit from prison on a sentence as opposed to those who may have served prior prison time on the same sentence). That is, data on the actual period of confinement permits comparisons over time and across jurisdictions and for similar groups of offenders that are not possible by

looking only at sentence length.

States were able to provide data on offense and time served for 69,692 offenders or 69% of all those released. Of these, 55,579 (nearly 80%) were reported to be first releases. Table 11 shows that the median time served for first releases was 17 months for all offenses. Approximately two of five first releases (39.4%) served 12 months or less, and 1.1% served more than 10 years.

- First release murderers served a median of 63 months. About two-thirds (67.1%) of the murderers released served 7 years or less. Approximately one of every seven murderers (15.1%) served more than 10 years.
- Manslaughter offenders served a median term of 25 months. About one in five served 12 months or less, two-thirds served 3 years or less, and 1% served more than 10 years.
- Rapists served a median term of 33 months or about a third longer than manslaughter offenders and about half as long as murderers. Approximately 1 of every 28 rapists served more than 10 years, and 7 of 10 served 4 years or less.

Table 11. Percentage distribution of time served, in months, by offense: 1981 first release $^{\rm l}$

					Nu	mber of	months	served

- First release defined in Time Served, p. 6. Of 101,943 releases reported, 55,579 were first releases for whom offense and time served data were provided.
- Other offenses include other sexual assault, other violent, other property, and other miscellaneous offenses.
- Robbers served approximately the same amount of time in prison as manslaughter offenders (a median of 25 months). Approximately one in six robbers served 12 months or less, nearly 70% served 3 years or less, and about 1 of every 100 served more than 10 years.
- Offenders convicted of aggravated assault served a median prison term of 17 months, the same as the median for all offenders. More than two-thirds served 24 months or less, and 1 of every 167 served more than 10 years.
- The median time served for burglary was 13 months or about half the time served for robbery and manslaughter and 20% of the time served for murder. Nearly four of every five burglars were confined for 2 years or less prior to release, and fewer than 0.5% served more than 10 years.
- e Larceny releases had a median time served in prison, prior to first release, of 11 months. Nearly 88% of the larcenists served 2 years or less, and about 1 in 200 served more than 10 years.
- Auto thieves, who constituted 1.2% of first releases, served a median term in prison of 12 months. Four of five (83%) served 2 years or less, and 1 of every 333 served more than 10 years.
- Those first releases convicted of forgery, fraud, or embezzlement served median terms equal to that of larcenists (11 months). The distributions of these two offenses are quite similar, suggesting approximately equal severity in their punishment.
- Drug offenders served a median incarceration equal to that of burglars (13 months). More than three-fourths

of the drug releases served 24 months or less, and about 1 in 1,000 releases served more than 10 years.

• Public-order offenders (such as gamblers, weapons violators, etc.) served a median term of 10 months in prison, the shortest of all the offense groups. One of every 3.4 offenders served 6 months or less, and more than 85% served 2 years or less.

Table 5 indicates the median time served for all first releases for reporting jurisdictions and the percentage of releases classified as violent. Generally, the shortest median terms (10 months each) were found for Alabama, Kentucky, and North Dakota. By contrast, the longest median terms were served by prisoners released from the District of Columbia (40 months), Hawaii (33 months), New Mexico (24 months), and Massachusetts and New York (22 months each).

Time served for specific offenses is described in table 8, which shows that for robbery the range was from 14 to 53 months; burglary, 7 to 44 months; and larceny, 5 to 33 months. The seemingly wide ranges for similar offenses may be

⁵North Dakota reported only two black inmates admitted during 1981.

¹ First release defined in Time Served, p. 6.

The remainder of the section on time served will focus only on first releases, because States could not systematically report prior time served on earlier imprisonments for the same sentence. In addition, available historical data have generally used the first release as the unit of analysis for comparative purposes. In the interests of insuring the equivalence of historical comparisons and minimize the effect of missing data on prior prison time, first releases have been selected for analysis. The amount of time served by all releases would be somewhat higher than the figure reported for first releases.

accounted for, in part, by differences in the offender composition—jurisdictions with higher proportions of recidivists among their releases would presumably require more time to be served.

Table 12 shows the median time served, for selected years, for first releases between 1926 and 1981. Generally (excluding the years during World War II when the number of offenders declined and sentences and time served increased), median prison terms for all offenses have ranged between 17 and 21 months. The years between 1933 and 1936 reflected the same median time served for all offenses as in 1981.

By offense, time served for robbery is about 6 months shorter in 1981 than in 1926 and about 9 months shorter than in 1960. By contrast, the median prison stay for rape in 1981 was about 9 months longer than in 1926 and 3 months longer than in 1960. Time served for aggravated assault, which had a median of 17 months in 1981, was also 17 months in 1926 and 20 months in 1960. Time served for burglary in 1981, however, was about 7 months less than the 20-month medians reported in 1926 and 1960. Larceny showed median terms of 17 months in 1926 and 1960 and 11 months in 1981.

Table 13 indicates, for selected States, changes in median time served over the 30 years between 1951 and 1981. Some jurisdictions may show rather striking changes from earlier years, perhaps reflecting changes in sentencing and release policies as well as the effects of court orders relating to prison crowding.

Another facet of the time-served discussion is illustrated in tables 3 and 5. The percentage of the maximum sentence served shows how sentence length and time served relate to one another. Overall, offenders released in 1981 served about 36% of their maximum sentences (table 3). The fraction of a sentence served varies by offense, with robbers and rapists serving the highest proportion (44% and 42%, respectively) and murder/manslaughter offenders and auto thieves the lowest (31% and 30%, respectively).

Table 5 shows that two determinate sentencing states, Maine and California, had the highest proportion of maximum sentence served (61% and 59%, respectively), while Massachusetts and Ohio had the lowest (12% and 14%, respectively). Over the years for which

data are available, the percentage of maximum sentence served has generally ranged between 31% and 42% (table

In table 12, it is interesting to note that the rate of parole use (percentage of conditional and unconditional releases exiting prison by a parole board decision) retreated to its historical levels of 55% to 57% of releases during 1980 and 1981 compared to 72% in 1977. Accompanying the decline in parole use was an increase in the percentage of sentence served but relative stability in the median time served. This suggests that the movement toward more fixed sentences has had substantial impact on the use of parole and some impact on the length of sentences, while time served has remained fairly constant.

The effects of these changes have probably been greatest on the probability of entering prison. Table 4 shows that the court commitment rate increased consistently (from 7.2 per 10,000 adults to 9 per 10,000 adults) between 1978 and 1981. By 1981, it appears that the chance of entering prison was increasing, the sentence imposed was slightly shorter (as a result of fixed and mandatory sentences), the

pared to previous years.

Life sentences (tables 14 and 15). Sentences to life imprisonment are interesting to examine because they are generally the most severe sanction available (death sentences are rarely imposed and highly likely to be modified to a life sentence). In 1981, jurisdictions (excluding California) reported that 1,996 offenders were admitted with a life sentence and 1,165 were released from prison after having served time on a life sentence. Of the 1,165 releases, 844 were first releases (time served data was available for 840 of these).

Table 14 shows that most life sentence admissions were for murder (63.3%); however, a significant proportion were imposed for drug offenses (14.4%). Overall, more than 92% of those admitted with life sentences were convicted of murder, rape, robbery, or drug offenses.

Table 15 indicates that the median term served by first releases with a life sentence was 51 months or about 4.25 years. Although this appears surprising, given the offense composition of those with life sentences and the time typically served by similar offenders without a life sentence, it is not wholly unexpected. Table 11 shows that the median time served for murder is 63 months, for rape 33 months, for robbery 25 months, and for drug offenses 13 months. Given the estimated offense composition of released prisoners

Table 15. Distribution of time served for first releases with life sentences

	Time served (months)									
Number	12 or less	13-24	13-24 25-36 37-48 49-60 61-84		61-84	85- 108	109- 120	Over 120	Median	
840	57	103	171	72	67	94	89	32	155	51*
Cumulative percent	6.8%	19.1	39.4	48.0	56.0	67.1	77.7	81.5	100.	.0% -

*Assuming that those released from prison with a life sentence reflect roughly the same composition as those admitted with life sentences (see table 14), a median time served can be predicted that is quite close to 51 months. That is, more than 92% of those entering prison with a life sentence were sentenced for murder, rape, robbery, or drug offenses. The 840 releases are estimated to distribute approximately as follows:

filenses. The 640 releases are estimated to distribute approximately as follows:

Murder 576
Rape 46
Robbery 87
Drugs 131
Total 840

Multiplying the number of estimated releases in each offense group by the median time served for that offense (see table 11) would produce an estimate of 50 months as follows:

Murder 576 x 63 months = 36,288
Rape 46 x 33 months = 1,518
Robbery 87 x 25 months = 2,175
Drugs 131 x 13 months = 1,703
41,684 / 840

This suggests that time served on a life sentence closely approximates the time served on a typical sentence of years or months for the same offense.

serving life sentences, the estimated median length of stay would be 50 months. Table 11 also shows that two-thirds of those convicted for murder stayed in prison 7 years or less; table 15 indicates that two-thirds of those with life sentences served a prison term of 7 years or less.

These data suggest that there is probably, in reality, little difference between a sentence to life imprisonment and a maximum sentence of years or months. Generally, it can be expected that the time served will be approximately the same, depending upon the offense.

Limitations of the data

States vary enormously in their ability to provide detailed information on prisoner movements. This is partly because the mechanisms by which offenders enter and depart prison, as well as their eligibility to be imprisoned, differ among States. Seven jurisdictions operate combined jail and prison systems. A number of States do not distinguish those physically held in their custody from those who are subject to their jurisdiction. In addition, States differ on the minimum sentence length for which prison may be imposed. In most States, jails, houses of correction, or other locally operated facilities are principally used when sentences are less than 12 months. Finally, laws and administrative procedures are in constant flux, resulting in year-to-year as well as jurisdiction-to-jurisdiction differences in the offense mix of entering prisoners and the manner in which time

served on a particular sentence is determined.

All States and the District of Columbia were asked to provide detailed information on each prisoner received and released during 1981 with a maximum sentence exceeding 1 year. Aggregate information received indicated that there were approximately 183,000 admissions from courts or admissions of conditional release violators from the 51 jurisdictions. These jurisdictions also reported more than 142,000 conditional and unconditional releases during 1981. Offender-specific information on admissions was submitted by 33 jurisdictions covering 121,211 admissions or about two-thirds of the estimated admissions nationally. For releases, 33 jurisdictions reported offender-specific information on 101,943 offenders or about 72% of the estimated releases nationally.

In the interest of as much uniformity as possible, only those admissions and releases with sentences greater than 12 months were analyzed. In addition, only those releases originally received as new commitments from courts and experiencing their first prison release on a sentence (referred to as first releases) were analyzed to derive time served data. Finally, each State's offense listing was recoded into 83 uniform categories using, to the maximum extent possible, Federal Bureau of Investigation offense coding procedures for the Uniform Crime Re-

ports. As a result, those offenses involving an attempt or a conspiracy to commit are categorized as completed offenses (for example, attempted robbery was coded as robbery).

Because of the need to present national data uniformly, the uniqueness of each State's sentencing and releasing processes may be obscured. This may affect the interpretation of a particular State's data. It is impossible to know, as well, how missing jurisdictions and missing cases within reporting jurisdictions might have affected the analyses conducted. For these reasons, readers should exercise extreme caution in comparing States and in using the national estimates. The data do not represent a scientifically derived sample. However, the large number of offenders for whom substantial data are available make this study an important resource for improving understanding of sanctioning.

Bureau of Statistics Special Reports are prepared principally by BJS staff and edited by Jeffrey L. Sedgwick, deputy director for data analysis. Marilyn Marbrook, publications unit chief, administers their production, assisted by Millie J. Baldea, Betty J. Sherman, and Joyce M. Stanford. This report was written by Lawrence A. Greenfeld and Stephanie Minor-Harper. Data tabulations were provided by Robert Tinari, Susan Schechter-Ryan, Gertrude Odom, and other staff of the U.S. Bureau of the Census.

September 1984, NCJ-95043

⁷In Georgia, more than 2,800 offenders had their sentences commuted and were released early because of a court order relating to prison overcrowding.

⁸Capital Punishment, 1981 shows that 65% of releases from death row in that year resulted from resentencing or commutation and 1% resulted from executions.

⁹The seven jurisdictions are Connecticut, Rhode Island, Delaware, the District of Columbia, Vermont, Alaska, and Hawaii.

¹⁰States may include or exclude from their data those prisoners held in other States, local jails, or Federal institutions.

¹¹ There were 149,186 admissions from courts and 33,965 admissions of conditional release violators (table 12, <u>Prisoners in State and Federal Institutions on December 31, 1981</u>).

12 There were 117,984 conditional releases and

¹²There were 117,984 conditional releases and 24,505 unconditional releases (table 12, Prisoners in State and Federal Institutions on December 31, 1981).
