ACKNOWLEDGEMENT OF ASSISTANCE

All manuscripts utilizing data made available through the Consortium should acknowledge that fact as well as identify the original collector of the data. The ICPSR Council urges all users of the ICPSR data facilities to follow some adaptation of this statement with the parentheses indicating items to be filled in appropriately or deleted by the individual user.

The data (and tabulations) utilized in this (publication) were made available (in part) by the Inter-university Consortium for Political and Social Research. The data for the Deterrent Effects of Arrests and Imprisonment in the United States, 1960-1977 were originally collected by Thomas F. Pogue with funding provided by the National Institute of Justice. Neither the collector of the original data nor the Consortium bear any responsibility for the analyses or interpretations presented here.

In order to provide funding agencies with essential information about the use of archival resources and to facilitate the exchange of information about ICPSR participants' research activities, each user of the ICPSR data facilities is expected to send two copies of each completed manuscript or thesis abstract to the Consortium. Please indicate in the cover letter which data were used.

INTRODUCTION

DATA COLLECTION DESCRIPTION

Emerging from the tradition of econometric models of deterrence and crime, this study attempts to obtain improved estimates of how crime rates are affected by the apprehension and punishment of persons charged with criminal activity. Like previous studies, this study employs available statistical techniques to estimate relationships between sanction levels and reported crime rates for particular geographic areas (states and Standard Metropolitan Statistical Areas--SMSAs) and to assess the extent to which estimated relationships can be plausibly interpreted as evidence that the sanctions have deterrent effects. It is important here to note that a distinction is commonly made between "deterrence" and "incapacitation." To quote Blumstein (1978, p.3) "DETERRENCE is the inhibiting effect of sanctions on the criminal activity of people other than the sanctioned offender. INCAPACITATION is the effect of isolating an identified offender from the larger society, thereby preventing him or her from committing crimes in that society."

The theory of deterrence employed in econometric studies of deterrence rests on the assumption that criminal activity by a given set of individuals depends on their perceptions of the relative gains and costs of legal and illegal behavior. Objective sanction levels, as reflected by arrest and imprisonment probabilities and sentences served, affect crime rates as they influence perceived sanction levels and hence the perceived costs of criminal behavior. Higher sanction levels deter crime if and to the extent that they increase the costs of criminal behavior as perceived by potential offenders. The main objective of this study was to analyze the observed variation of crime rates and sanction levels in a manner that distinguishes cause from effect. To do so, it was necessary to specify a model of how crime rates are determined in general and how they are related to observed sanction levels in particular. The central question in the analysis of such data is the extent to which the estimated relationships can be plausibly interpreted as evidence that sanctions have deterrent effects. The units of analysis are states and SMSAs; the data on crime rates, sanction levels, and factors that may influence either or both are for the years 1960-77.

It should be emphasized that this study, like previous studies, provides estimates of only MARGINAL effects of criminal sanctions; that is, it provides estimates of the

extent to which differences or changes in sanction levels generate differences or changes in crime rates. Thus, the study provides a basis for statements about MARGINAL deterrence but not about ABSOLUTE deterrence. Questions about marginal deterrence are of the form: Would an increase in either the certainty or the severity of the penalty for a particular crime reduce the rate at which that crime is committed? Absolute deterrence is the concern of the question: Would crime rates be higher if no penalties were applied? A conclusion that marginal deterrence is weak or non-exis tent does not mean that the absolute deterrence is zero. For policy making purposes, the central concern is with the magnitude of the marginal deterrence, since the public policy issue typically is whether to apply sanctions that are more or less severe or more or less certain and not whether to eliminate sanctions entirely.

Crime rates may influence sanction levels and resource inputs as well as the converse. In particular, objective sanction levels depend on crime rates and the resources used to apply sanctions--to arrest, convict and imprison. And, the amount of these resources may depend in turn on the rates of various types of criminal activities and the costs that the public imputes to such activites, as well as the public's perception of the effectiveness of sanctions in deterring crime.

Previous studies have recognized in varying degrees this potential interdependence of crime rates, sanction levels, and resource inputs. Some studies have assumed that sanction levels and the resources used to apply sanctions are exogenous determinants of crime rates. Others have assumed that crime rates and sanction levels are jointly determined, with resource inputs being exogenous. Still other studies have employed models in which crime rates, sanction levels, and resource inputs are simultaneously determined. [See Blumstein (1978, pp. 99-111) for a review of the assumptions that previous studies have made about these relationships.] This study supposes that none of these assumptions is entirely appropriate. Instead, it seems likely that the relationships among these varibles, rather than being contemporaneous, are characterized by significant lags.

More specifically, the sanction levels achieved in a particular period seem unlikely to affect perceived sanction levels in that period and thus are unlikely to affect crime rates in that period. One reason for this lag is that statistics reflecting sanction risks and severity are published with some delay and not in a form that would typically be available to potential offenders. Indeed,

imprisonment probabilities are not published as such. And, data required to calculate the probabilities, as well as data on time served, have not been published since 1970, and then only for 33 states. Data on clearance rates are not published except in the form of national averages. Thus, it is not plausible that potential offenders' decisions are based on published data on sanction risks and severity. Instead, potential offenders must rely on non-official sources that provide piece-meal information about sanctions. They must form expectations about arrest and imprisonment probabilities and about sentences on the basis of their own experience (if they are offenders), the experience of offenders whom they know, newspaper and word-of-mouth accounts of the arrest, imprisonment, and sentencing of persons charged with crimes in their community, etc. With sufficient time to make observations, individuals' perceived sanction levels may, but need not, approach actual levels.

Also, perceived sanctions may adjust to actual sanctions with a lag because individuals do not continually update their subjective estimates of sanction levels. Or, even if they do consider all current information, they may only gradually modify their subjective or perceived sanction levels. This latter, "adaptive" response of perceived sanction levels to information about sanctions is a plausible form of behavior when the new information being used to revise perceived sanction levels is of uncertain value.

Thus, one possible lag in the model being tested here is that with which perceived sanction levels and hence crime rates respond to actual sanction levels. If there is a lag of one year then sanction levels achieved in any given year affect crime rates only in subsequent years. And, crime rates in the current year depend on the pre-determined sanction levels attained in previous years. These sanction levels cannot depend in turn on the crime rates of the current year, although they may depend on crime rates in previous periods.

A second lag arises because criminal justice system budgets and employment for a particular period are determined largely by decisions made in a prior period on the basis of information available at that time. Thus, resources employed in applying criminal sanctions in the current year (police protection expeditures, employment, etc.) are predetermined; they cannot be readily or significantly adjusted in the current period in response to current crime rates. They may, however, have been determined in part on the basis of crime rates in previous periods.

Exploiting a richer data base than has been available in previous limited cross-sectional samples, it was possible to test for lags in the response of crime rates to sanction levels; the stability of the relationships estimated from data for individual cross-section years; and the hypothesis that adults respond differently to sanctions than do juveniles. Only property crimes (burglary, larceny, robbery and auto theft) were considered.

DATA COLLECTION PROCEDURES

Data was collected over the period January 1 through May 31, 1979 from published state and SMSA data for the years 1960-1977 and from unpublished FBI data on reported crimes and crimes cleared by arrest. Data was obtained for each major crime category (i.e., the FBI index crimes: murder, robbery, rape, assault, burglary, auto theft and larceny).

Data Sources

[See Note(s) 2 and 3 for complete listing of data sources]

Except as noted, data to be used are available in published sources.

The main data categories and their sources are:

1. Crimes and crimes cleared by arrest (offenses known and cleared by arrest):

   U.S. Department of Justice, Federal Bureau of Investigation, UNIFORM CRIME REPORTS, U.S. Government Printing Office, Washington, D.C., annual.

   Unpublished FBI data, primarily on clearances. Some of these data have been obtained (for 1967-1968 and 1971-1973); others will be made available as per earlier conversation with Mr. Paul Zolbe, Chief, Uniform Crime Report, FBI.

2. Data on prison populations and sentences served:

   Various National Prisoner Statistics publications of the U.S. Department of Justice, Bureau of Prisons, and in recent years, U.S. Department of Justice, National Criminal Justice Information and Statistics Service.

3. Data on government expenditures, tax bases, intergovernmental grants, criminal justice system expenditures and employment:

   a) U.S. Department of Commerce, Bureau of Census, GOVERNMENTAL FINANCES, various years.

   b) U.S. Department of Commerce, Bureau of Census, CENSUS OF GOVERNMENTS, 1962, 1967, 1972.

   c) U.S. Department of Commerce, Bureau of Census, and U.S. Department of Justice, National Criminal Justice Information and and Statistics Service, EXPENDITURE AND EMPLOYMENT DATA FOR THE CRIMINAL JUSTICE SYSTEM.

4. Socio-economic and demographic data:

   Various publications of the U.S. Department of Commerce, Bureau of Census and U.S. Department of Labor.

Both states and SMSAs were used as units of observation because each has particular advantages. The main advantage of states as units of observation is data availability. SMSAs have the advantage of being more homogeneous units than states. SMSAs are superior to states as units of observation to the extent that there is a local market for a crime, with the supply of criminal activity in each SMSA depending on the local characteristics or the region. In some cases, variables measured for a state were employed in regressions in which the basic unit of observation is the SMSA. Such variables were for the state in which the SMSA is located; averages of the relevant state variables were used for SMSAs that are located in more than one state.

In collecting and integrating data from a number of sources, the central concern was to obtain data for a set of states and a set of SMSAs that are consistent both across states (or SMSAs) at each point in time and across time for each state (or SMSA) included in the sample. The resulting data base for this study is a state data panel consisting of observations on the 48 contiguous states for the years 1968-1977 and an SMSA panel for 53 large SMSAs for the years 1968-1977.

FILE STRUCTURE

The Deterrent Effects of Arrests and Imprisonment in the United States, 1960-1977 is available from the ICPSR in two formats: card-image and OSIRIS. The card-image file contains several decks per case in a format based on 80 column punched cards. The data are sorted by case with all decks for a case together in ascending order.

The OSIRIS dictionary gives the format and other information for each variable in the OSIRIS data file. The dictionary or dictionary-codebook file is used in conjunction with the OSIRIS software package. The OSIRIS data file is constructed with a single logical record for each case.

FILE NAME	NUMBER OF VARIABLES	NUMBER OF CASES
PART 1: STATE DATA	484	50
PART 2: SMSA DATA	232	77

The OSIRIS data file can be accessed directly through software packages or programs which do not use the OSIRIS dictionary by specifying the tape locations of the desired variables. These tape locations are given in the OSIRIS dictionary-codebook.

CODEBOOK INFORMATION

The example below is a reproduction of information appearing in the machine-readable codebook for a typical variable. The numbers in brackets do not appear but are references to the descriptions which follow this example.

```
.....................................................................

[1] VAR 0055  [2] LARCENY CRM RATE: 1971     [3] MD=-100000
    REF 0055       [4] LOC 424  WIDTH  9  [5] DK     COL
                                      [6] IMP DEC=   5

   [7] Crime rate:  1971

   [8] The number of offenses known to police in 1971, per
       100,000 inhabitants.

---------------------------------------------------------------

   [9] [SEE NOTE(S)  nn]

  [10] [Actual number is coded.]

       [11]  [12]

       [mm].
         .
         .
       [MM].

.....................................................................
```

[1] Indicates the variable and reference numbers. A variable number and a reference number are assigned to each variable in the data collection. In the present codebook which documents the archived data collection these numbers are identical. Should the data be subsetted or rearranged by an OSIRIS program (e.g., MMP to intersperse data from another source, or TCOT to produce an analysis deck), the variable numbers would change to reflect the order of the new data collection, while the reference number would remain unchanged to reflect the variable number in the codebook describing the archived data collection.

[2] Indicates the abbreviated variable name (maximum of 24 characters) used in the OSIRIS system to identify the variable for the user. An expanded version of the variable name can be found in the variable description list.

[3] Indicates the code values of missing data. In this example, code values equal to -1 are missing data (MD=-100000). Alternative statements for other variables are "MD=0," "MD GE 9," or "NO MISSING DATA CODES." Some analysis software packages (including the OSIRIS software package) require that certain types of data which the user desires to be excluded from analysis be designated as "MISSING DATA," e.g., inappropriate, unascertained, unascertainable, or ambiguous data categories. Although these codes are defined as missing data categories, this does mean that the user should not or cannot use them in a substantive role if so desired.

[4] Indicates the starting location and width of this variable when the data are stored on a magnetic tape in the OSIRIS format. If the variable is of a multiple-response type, the width referenced is that of a single response. In this example the variable named "LARCENY CRM RATE: 1971" is 9 column(s) wide and is located in the 424th column within the record.

[5] Indicates the location by deck and column(s) of this variable when the data are stored on cards or in card-image format (80-column format)

[6] A variable containing data with implied decimals is denoted by the message "IMP DEC= dd," where dd is the number of decimal places implied in the variable.

[7] This is the full text (question) supplied by the investigator to describe the variable. The question text and the numbers and letters that may appear at the beginning reflect the original wording of the questionnaire item.

[8] Indicates an additional comment or explanation appended to the variable description.

[9] A variable which has a footnote associated with it is denoted by the message, "SEE NOTE(S) nn" where nn is the number of the footnote referenced.

[10] If the variable is continuous the phrase "Actual number is coded." appears.

[11] Indicates the code values occurring in the data for this variable.

[12] Indicates the textual definitions of the codes. Abbreviations commonly used in the code definitions are "DK" (Do Not Know), "NA" (Not Ascertained), and "INAP" (Inappropriate).

ICPSR PROCESSING INFORMATION

The data collection was processed according to the standard ICPSR processing procedures. The data were checked for illegal or inconsistent code values which, when found, were recoded to OSIRIS missing data values. Consistency checks were performed. Statements bracketed in "[" and "]" signs in the body of the codebook were added by the processors for explanatory purposes.
