

Bureau of Justice Statistics Special Report

Reporting Crimes to the Police

by Caroline Wolf Harlow, Ph.D. BJS Statistician

Of the 37,115,000 crimes that took place in 1983, as estimated from the National Crime Survey, 35%, or 12,880,000, were reported to police. These include:

• 48% of the violent crimes of rape, robbery, and assault;

26% of personal thefts (purse snatching, pocket picking, and larceny without contact away from home); and
37% of the household crimes of burglary, household larceny (theft in or near the home) and motor vehicle theft.

The specific crimes most likely to be reported were motor vehicle theft (69%) and aggravated assault (58%). The specific crimes least likely to be reported were household larceny (25%), personal larceny without contact (26%), and pocket picking (29%).

These findings are based on interviews conducted twice a year with approximately 128,000 persons ages 12 and older in 60,000 households, conducted as part of the ongoing National Crime Survey (NCS). Other key findings on the reporting of crimes to the police 'cclude:

• Completed crimes are more likely to be reported than attempted crimes. This difference is especially pronounced The National Crime Survey (NCS) was initiated at the beginning of the last decade to provide a reliable measure of crimes in the United States, whether or not the crimes are reported to the police. The survey has shown that each year about twothirds of personal and household crimes are not reported to the police.

This special report examines in detail the reporting levels in 1983 for different kinds of crimes, the connection between the likelihood that a crime will be reported and its seriousness, whether different kinds

for motor vehicle theft (88% vs. 33%) and robbery (63% vs. 35%).

• When the victim sustains an injury the crime is more likely to be reported to police than when the victim is not injured. Moreover, the reporting rate is higher for crimes resulting in serious injuries than for those resulting in minor injuries.

• The proportion of crimes reported to police increases as the value of property theft or damage goes up. This is true of virtually all crimes, violent and nonviolent. Overall, crimes are about twice as likely to be reported to police if the cash or property loss is \$250 or more than if there is no loss.

• Generally, demographic characteristics of victims make less difference to reporting rates than does the type of crime. Nonetheless, the proportions of crimes reported to police are somewhat

December 1985

of victims are more or less likely than others to report crimes, what proportion of crimes are reported by someone other than the victim, and the reasons victims give for reporting and for not reporting crimes.

The findings of this report highlight the essential role played by citizens in the fight against crime and provide valuable information to policymakers and practitioners interested in increasing reporting levels.

Steven R. Schlesinger Director

lower when teenagers or those with less than a high school education are victimized. Considering only crimes of violence, the proportions of crimes reported are higher when the victims are females rather than males, or blacks rather than whites.

• Three percent of reported personal crimes are discovered by police. Sixty percent are reported by the victim, 13% by another household member, and 22% by someone else.

• Two percent of reported household crimes are detected by police. Eightyeight percent are reported by a member of the household and 10% by someone else.

• The particular reason most frequently mentioned for <u>not</u> reporting a crime was that it was not important enough (30%). For violent crimes the reason most often given for not reporting was

¹The total number of crimes analyzed in this report is somewhat greater than the number presented in other Bureau of Justice Statistics publications because it includes attempted assaults of individuals that occur at the same time as commercial crimes. Commercial crimes are excluded from the erimes measured by the National Crime Survey.

that it was a private or personal matter (28%).

• Among reasons mentioned for reporting crimes to police, victims of violent crimes most often said to keep it from happening again (31%); whereas victims of personal theft and of household crimes most often cited a desire to recover property (43% and 35% respectively).

• When the crime resulted in no economic loss, reasons expressing a sense of obligation were by far the most frequently given for reporting for every crime studied. When the loss was \$250 or more, economic incentives (to collect insurance or recover property) dominated for completed crimes of theft and completed household crimes.

The citizen's role

One role which citizens play within the criminal justice system is a preventive one of reducing the circumstances and situations in which crimes are likely to be committed. In recent years, for example, citizens have banded together in programs like "neighborhood watch" through which participants combat crime by marking property to make it more secure. increasing surveillance of public areas, and promoting behavior to increase citizen safety (for example, avoiding walking alone after dark).

Essential to the effectiveness of these crime prevention measures is enhanced willingness on the part of citizens to call the police about suspicious criminal activity. Even when police take no action other than answering a citizen observation of suspicious behavior, police presence can serve as a warning that citizens and police are vigilant to the possibility of crime and are willing to take additional steps, if necessary.

Another role which citizens play is after the fact: reporting actual crimes to the police. In calling the police, victims and others introduce crimes to the criminal justice system. Contacting the police activates the process through which society seeks to apprehend and punish wrongdoers and thereby to promote a peaceful and orderly existence for its members. If criminal incidents are not made known to the police, they are likely to remain outside of, or hidden from, the system which has been established to deter wrongdoing.

In presenting a statistical analysis of patterns of reporting crimes to police, this report provides information

necessary to understand this essential dimension of citizen involvement in the criminal justice system.

Table 1. Whether crime was reported to police, 1983

Characteristics of the crime

The likelihood that a crime will be reported to the police is strongly related to the seriousness of the crime. in the aggregate, violent crimes are more likely to be reported (48%) than household crimes (37%) or crimes of personal theft (26%) (table 1). Other measures of seriousness show the same pattern: attempted vs. completed crimes, existence and degree of injury, amount of loss, and personal confrontation with the offender.

Attempted vs. completed crimes

When crimes of violence, crimes of personal theft, and household crimes are completed, they are more likely to be reported to police than attempted crimes. This is particularly true for robbery, burglary, and motor vehicle theft (table 2). In the National Crime Survey, assaults are defined as completed if the victim is injured and attempted if the victim is not injured. Attempted aggravated assault, in which the victim is either threatened or attacked with a weapon but not injured, is the most likely to be reported of all attempted crimes.

Degree of injury

By definition, violent crimes are those in which the victim is threatened or attacked, and sometimes injured. Robberies and assaults are more likely to be reported when the victim is injured (table 3). In addition, the reporting rate is higher when injuries are serious rather than minor: not lower than 69%.

Table 2. Proportion of attempted crimes repo				
	Percent reported to police			
Type of crime	Attempted	Completed		
Crimes of violence ⁸	42%	58%		
Robbery Assault ^D	35	63		
Aggravated	56	63

^aSerious injury includes knife wounds, gun shot or bullet wounds, broken bones and teeth, internal injuries, being knocked unconscious or undetermined injuries that require at least 2 days hospitalization. Minor injury includes bruises, cuts and other minor injury or undetermined injury requiring less than 2 days hospitalization. Assaults with serious injury are defined as

aggravated; assaults with no injury or minorinjury are defined as an aggravated (sault if the offender displays a weapon and simple assault if no weapon is displayed.

In both violent and property ffenses victims may sustain economic iss either through actual theft or rough damage to property or possesons. For example, even an unsuccessil burglary attempt may result in amage to such property as doors. indows, or alarm systems.

conomic loss

For virtually all crimes-violent and phyiolent-the likelihood of reporting police goes up as the value of proprty theft or damage increases. Over-, crimes are about twice as likely to reported if the economic loss is \$250 more than if there is no loss.

Larceny without contact, household ceny, and pocket picking involve loss property without any threat to the vsical well-being of the victim. all proportions (10% or less for rsonal and household larceny) of ese crimes are reported to police en these thefts involve objects of tle value; the proportion rises as the onomic value of the theft and dame increases (table 4). Attempted cenies with no economic loss were orted at about the same proportion completed larcenies with a loss of 0 to \$49. Moreover, if damage was nsiderable, attempted larcenies were orted in approximately the same portions as completed larcenies.

The proportion of burglaries ported to police also increases with e value of the property stolen or maged. When there is a very small ss (less than \$10), burglaries that -volve unforced but still unlawful itry into a home are less likely to be ported than burglaries involving rcible entries, whether attempted or mpleted. When the loss is great ^e 250 or more), this difference in porting rates for these different pes of burglaries is much less.

verall, motor vehicle theft is the erty crime with the highest bility of being reported to police le 1). As with other property es the reporting rate is strongly lated to the value of the loss. When le loss is \$250 or more, the proportion motor vehicle thefts reported to plice (88%) is comparable to the proortion of burglaries reported (83%) but gher than some property crimes such pocket picking (43%) and household rceny (61%) (table 4).

In the case of robbery, the existence either an economic loss or an injury akes the incident more likely to be ported to police:

Confrontation with offender Like most other crimes, confrontational crimes of theft such as robbery and purse snatching are more likely to be reported to police as the amount of economic loss increases. Moreover, these confrontational crimes are more likely to be reported than nonconfrontational thefts with losses of equivalent value (personal larcenies without contact and household larcenies).

data. ^aThe value of theft/damage is the sum of the

value of cash and property stolen and the

	Percent of robberies reported to police, 1983					
	No loss	Loss				
No injury	24%	58%				
Injury	48	72				

The presence of both factors increases the reporting more than either factor alone. However, when losses are \$250 or more, injury no longer increases the reporting rate (table 4). (By definition robberies with no loss are attempted crimes.)

Includes rape, which is not displayed as a separate entry because of the small number in the sample.

Another crime in which the victim is confronted by an offender or offenders is assault. In the National Crime Survey assaults are classified as either aggravated or simple, depending on the severity of the injury, if any, and/or the presence of a weapon. If a weapon was used or the injury was serious, the assault is classified as aggravated. If no weapon was used and any injury sustained is not serious, the assault is classified as simple.

The use of a weapon in assaults has a marked impact on reporting rates. even when there is no injury. For most values of economic loss, an assault with a weapon with no injury to the victim (classified under NCS definitions as an attempted aggravated assault with weapon) is more likely to be reported to police than an assault without a weapon that results in minor injuries (classified as a simple assault with injury). Most assaults do not involve direct economic loss; nonetheless, when property is damaged, reporting increases as the amount of loss goes up whether or not

the injury is serious, a weapon is present, or the assault is completed.

Characteristics of victims

Whether a crime is reported to police can also be examined in terms of the characteristics of the victims. (For household crimes the characteristics analyzed are those of the household head.) Generally, the demographic characteristics of victims make much less difference to reporting rates than does the type of crime (table 5). This analysis indicates that crimes experienced by such social groups as blacks and the elderly are not seriously over- or under-represented among all crimes reported to the police.

Sex

When women are victims of violent crimes, the police are more likely to be contacted than when men are the victims. This is particularly true for robbery and aggravated assault. For personal thefts and household crimes, sex makes no difference to the proportion of crimes reported. Attempted household burglaries, however, are somewhat more likely to be reported if the household head is female (39%) than male (32%).

Зe

Overall, the race of the victim makes little difference in whether

police are informed of a crime. For violent crimes, however, a higher proportion of incidents are reported when the victim is black. The same pattern holds for completed burglaries.

Age

When teenagers are victimized by a crime of violence or personal theft, the crime is less likely to be reported to police than for every other age group. Only 13% of crimes of personal theft against teenagers are reported to police. Household crimes are somewhat more likely to be reported to police when the heads of households are between the ages of 40 and 64.

4

Family income

Overall, family income makes little difference to the proportion of crimes reported to the police. Nonetheless, the proportion of robberies and household crimes reported increases somewhat as family income goes up. For aggravated assaults, on the other hand, a slightly lower proportion are reported to police when the victim has a family income of at least \$30,000. For personal thefts there is no difference based on income.

Total

100%

Education

Violent crime victims with little

education have a lower proportion of their crimes reported to police than those with more education. For personal crimes of theft and for burglaries. reporting increases as educational attainment goes up. There appears to be no relationship between education and the reporting rate for household larcenies or motor vehicle theft.

Who reports crimes

Whether or not crimes are reported to the police is not simply the result of the decisionmaking process of victims, for a substantial fraction of all crimes reported to the police are reported by someone other than the victim. Specifically, about two-fifths of all personal crimes reported to police are reported by someone other than the victim (table 6). For violent crimes this proportion is almost half (46%); for crimes of personal theft it is just over one-third (37%). Of all the personal crimes made known to the police, pocket picking is the one with the highest proportion reported by the victim (87%).

The vast majority of household crimes are reported by a household member. Nonetheless, about 1 in 8 are brought to the attention of the police in another way (table 7). The police themselves discover relatively few crimes: 3% of all personal crimes and 2% of household crimes. However, they discover about 7% of assaults and 6% of motor vehicle thefts.

When victims are injured in violent crimes the proportion reported by someone other than the victim rises from 43% to 51% (table 8). In some cases the victim may not be able to call the police (if unconscious, for example) or may deem medical treatment for injuries a more immediate need than calling the police. In other cases the victim may not think the matter serious enough to report to police.

Just over one-fifth of all reported personal crimes and about one-tenth of all reported household crimes are brought to the attention of the police by someone other than the victim, another household member, or by the police themselves.² The person reporting may be another victim, a witness to the event, a person who becomes involved in the effects or aftermath of the incident, or someone who is told of the crime or has it

 2 The NCS does not collect information on the identity or characteristics of persons who report crimes other than the respondent, except determining whether the crime was reported by another household member or by someone else.

reported to him or her. Neighbors, bystanders, or proprietors may observe a crime. Health professionals or school principals may be called after an incident. A person in any of these roles

that a crime or possible crime has taken place or is occurring and must decide that police involvement is appropriate. This decision process may be an immediate reaction to a sudden event (for example, after spotting a burglary in progress), or it may be a more prolonged reasoning process (as might confront someone who suspects that a neighbor is a victim of spousal abuse).

The characteristics of criminal incidents and of victims can be examined in greater detail to determine whether certain kinds of victims or victims of certain kinds of crimes are more likely to be the ones who report crimes to the police.

Value of loss

As the value of theft or damage from an incident goes up, not only is the incident more likely to be reported to police, the proportion of crimes reported by the victim or a household member also increases (tables 9 and 10). This relationship holds true for each of the major crime categories: violent crimes, crimes of personal

theft, and household crimes. Contrary to the general pattern, a high proportion of attempted personal thefts with no financial loss are reported by someone other than the victim or another household member (61%). One possible explanation for this is that someone else, perhaps a bystander, reported a crime in progress to police and thereby prevented its completion. When attempted crimes of theft and attempted household crimes result in financial loss, victims and household

members, respectively, report the crime in the same proportions as they report completed crimes with the same amount of loss.

Sex

When women are victims of violent crimes, the crimes are somewhat more likely to be reported to police than when men are the victims. It is also true that female victims of reported violent crimes are more likely than

aracteristics are those of head of usehold. Income is that of the family. ghest year attended. male victims to be the ones who contact the police (table 11). The opposite relationship holds for reported crimes of personal theft. Moreover, attempted personal thefts are significantly less likely to be reported by the victim, for both men and women victims, than completed personal thefts.

For reported household crimes there is little measurable difference in the likelihood that the crime will be reported by a household member, whether the household head is male or female (table 12).

Race

Race makes very little difference to the proportion of reported crimes that are made known to the police by the victim (tabl. s 11 and 12). Although black victims generally report slightly higher proportions of reported personal crimes than do white victims (63% vs. 61%), this difference is not statistically significant. Nonetheless, a substantially higher proportion of reported robberies of whites are reported to police by someone other than the victim or another household member (30%) than is the case for robberies of blacks (19%).

Members of households headed by blacks and whites report about the same proportion of reported burglaries and household larcenies. Households headed by blacks report a slightly higher proportion of reported motor vehicle thefts than households headed by whites.

Age

Not only are a smaller proportion of violent crimes reported to police when the victims are teenagers (as discussed above), a significantly smaller proportion of reported violent crimes are reported by teenage victims themselves than by older victims. For reported crimes of theft, however, teenage victims are as likely to report as those between the ages of 40 and 64, but less likely than those 20-39 and 65 and older.

Of household crimes brought to the attention of the police, a smaller proportion are reported by a household member when the household is headed by a teenager than by someone older.

6.2

Family income

Family income makes little difference to the proportion of all crimes reported to the police. However, of reported violent crimes, the proportion reported by the victim decreases some-

what as his or her family income increases. This relationship holds for robbery and simple assault. Income makes no difference in who calls the police for aggravated assault. The proportion of reported personal thefts reported by the victim also decreases as family income goes up. Income does not appear to have any effect on the proportions of any type of reported household crimes reported by a household member.

Level of education

As the level of a victim's education increases, the likelihood that the victim him or herself will report a violent crime, especially a robbery or aggravated assault, goes up, while the likelihood that the crime will be reported by another household member goes down. The proportion of reported crimes of theft reported by the victim increases with higher levels of education.

The level of education of the head of the household makes little difference in the proportion of reported crimes reported by a household member.

Reasons for not reporting crimes to the police

Victims of unreported crimes were asked to give the reasons why the police were not notified and to indicate the most important reason. About 34% gave most important reasons indicating that the incident was not serious enough to report to police, with 30% saying it was not important enough and 5% indicating that the object was recovered or the attempt was unsuccessful (table 13). Another 27% indicated that nothing could be done, either because the victim did not realize a crime was committed until later, the property was difficult to recover, or they lacked proof or some means to locate or identify the offender. Lack of proof or inability to identify or locate the offender was mentioned proportionately more often for crimes of theft and household crimes than for crimes of violence.

In 11% of the cases victims said they did not notify the police because they had reported the incident to someone else. About 10% of victims said the police wouldn't think the incident important enough or would be inefficient, ineffective, or insensitive. About 9% indicated that it was a personal or private matter. This reason, however, was the most important one in 28% of the violent crimes not reported to the police. Infrequently mentioned as the most important reason for not reporting a crime were unwillingness to take the time or fear of reprisal.

Reasons varied by both the type of crime and whether the crime was completed or not. That the incident was not serious was more frequently mentioned for a personal theft or household crime that was attempted rather than completed. Together, the reasons that a crime was not serious or that nothing could be done were given for at least 60% of personal thefts and of household crim: not reported to police. For violent crimes, particularly aggravated and simple assault, the most frequently mentioned reasons were that it was a personal or private matter or that it was not serious.

Reasons for reporting

When victims who reported their crimes were asked their most important reason for calling the police, 40% gave economic reasons, either to recover property or to collect insurance (table 14). Economic reasons were more likely to be given by victims of personal theft and of household crimes than by victims of violent crime. Reasons relating to personal obligation—that it

rounding.

Too few cases to obtain statistically reliable data.

was a crime, it was their duty, or to keep it from happening again or to others--were cited as most important by 35% of victims who reported their crimes, including more than half of those victimized by attempted theft and about half of those who suffered an assault or an attempted household crime. Retribution, that is, punishing the offender, was the most important reason for 7%. Both obligation and retribution were given more often by victims of violent crimes.

Considering all the reasons cited by victims for calling the police and

separate entry because of the small number in the sample.

grouping these according to the degree of economic loss in the crimes gives further insight into the reasons victims report crimes (table 15).

When there was no loss or damage, reasons relating to personal obligation were given most often. This was true for each crime examined.

63

As the value of financial loss rose, so did the frequency of economic reasons (to collect insurance or recover property) for reporting crimes to police. The sense of obligation was menioned less frequently, although it was still an important factor. When the loss was \$250 or more, economic reasons dominated for completed crimes of theft and completed household crimes. For the attempted property crimes, reasons of obligation were most often mentioned.

Methodological note

The Price A States

The data for this report are taken from the National Crime Survey, which twice yearly asks 128,000 members of a probability sample of 60,000 households if they have been victimized by crime within the past 6 months. When a criminal incident is mentioned by a respondent, NCS interviewers collect information about the event, including whether it was reported to police and the reasons for reporting or not reporting. In this study, reporting to police is defined as an affirmative response to the question, "Were the police informed or did they lind out about this incident in any way?"

In conducting the NCS, information about victimizations of 12- and 13vear-old household members is usually given by a proxy respondent, most often a parent. In a limited number of other situations interviewers can use a proxy respondent, for example, if a respondent will be away from home during the entire data gathering period or cannot give an interview because of mental or physical incapacity. In table 6, the estimates for the categories of "victim" and "other household member" were adjusted for those victimizations in which proxy interviews were given. The adjustments were needed because in a proxy interview NCS interviewers are instructed to code the "respondent" as having reported to police if the person giving the interview contacted the police. They code "other household member" as having reported if the victim reported the crime.

In all proxy interviews "respondent" was recoded as "other household member," because normally proxy interviews are given by someone else in the household. Proportions of the "other household member" category were allocated to the "respondent" category according to the following rules:

• If the proxy was given because the victim was physically or mentally incapable of giving an interview, it was assumed that the victim was incapable of reporting to the police and no part of the number of crimes reported by other household members was allocated to the "victim" number.

• If the proxy interview was given because the victim was temporarily

absent, the number of crimes reported by other household members allocated to the "victim" column was equal to:

A(B/C)

where A is the number of crimes reported by other household members in proxy interviews when the victim was temporarily absent; B is the number of crimes reported by victims in nonproxy interviews; and C is the number of crimes reported by all members of the household ("respondent" plus "other household members") in nonproxy interviews. This calculation was done for each type of crime.

• In the case of those under 14 for whom proxy interviews were given, the same formula was used, grouping crimes in the categories of violent crimes and crimes of theft and using data on 14-year-olds to estimate reporting rates for 12- and 13-yearolds. These adjustments were made to 1.5% of weighted incidents reported to police.

All relationships described in this report are significant at the 95% confidence level unless the findings are qualified by language such as "somewhat," indicating significance at the 90% confidence level.

Bureau of Justice Statistics Special Reports are prepared principally by BJS staff under the direction of Joseph M. Bessette, deputy director for data analysis. This report was written by Caroline Wolf Harlow and edited by Mr. Bessette. Marilyn Marbrook, publications unit chief, administered report production, assisted by Millie Baldea, Tina Dorsey, Kim Nwala, and Joyce Stanford. Gertrude Thomas provided statistical assistance.
